2015 SPECIFIC PROJECTS

FP #	Pipeline Projects	District	Notes
200687	Anacortes Bare Steel Replacement - Phase III	Mt. Vernon	Bare steel replacement as part of Pipe Replacement Program.
200686	Longview Bare Steel Replacement - Phase IV	Longview	Bare steel replacement as part of Pipe Replacement Program.
306996	Kelso Mill Street Replacement	Longview	100 ft @ S. 11th to repair leak. Costs will be higher due to restoration in the street. Replace for safety & reliability.
200080	Kitsap Phase IV Construction	Aberdeen	HP line to parallel 8" Kitsap line. Growth/reliability is driving project.
306982	Vance Creek Exposure	Aberdeen	8" Grays Harbor Line - pipe exposed in creek. Replace approx. 800 ft. by HDD for safety & reliabililty.
306983	Camp Creek Exposure	Aberdeen	8" Grays Harbor Line - pipe exposed in creek, off CC 100. Replace approx. 800 ft by HDD for safety & reliability.
307181	Ferndale Reinforcement	Bellingham	Reinforcement near Olson Road and Mountain View Road to increase low pressure area and prepare for growth.
306986	3" Burlington HP Line ROW	Mt. Vernon	Obtaining ROW to replace problematic line as part of 2015 project. Project driven for safety & reliability.
302588	Hildebrand Boulevard HP Main	Kennewick	HP main to accommodate new growth and coordinate with City of Kennewick construction.
200076	Handord DOE	Kennewick	12" HP line to Hanford Nuclear Reservation.
200688	Bend Bare Steel Replacement - Phase IV	Bend	Continuation of bare steel replacement project.
304022	4" Grandview HP Line #3 Replacement	Yakima	Replacing aged line that commission has commented on. Part of MAOP validation work.
307026	Ontario 6" IP Replacement	Eastern Oregon	≈ 300 feet long. Multiple leaks on corroded pipe (pre-CNG). Safety & reliability issue.
307027	Highway 3 Casing Removal	Bremerton	Replace casing/carrier pipe. High priority due to shorted casing.Project driven by safety & reliability.
307024	Sunnyside 2" IP Main	Yakima	Remove R-58 and replace former house piping with main and service lines at Sunnyside mental facility. Safety & reliability issue.

FP #	Gate Projects	District	Notes
101505	Arlington Gate Upgrade	Mt. Vernon	Increase gate capacity. Has been planned for approximately 5 years.
302645	McCleary Gate Heater	Aberdeen	Necessary for 2015 to coordinate with Williams.
302724	McCleary Gate Upgrade	Aberdeen	Station rebuild with R-10, R-52, and O-2. Also includes replacing 8" line between CNGC and Williams. Unodorized gas for ≈ 100 ft, piting @ regs and odorizer, incorporates heater.
302648	Southridge Gate Station Project	Kennewick	Gate station to accommodate new growth.
200282	Sun River Gate Upgrade	Bend	Increase gate capacity. Has been planned for approximately 4 years.
304020	Bellingham Gate Upgrade	Bellingham	Carry over from 2014.

FP #	Reg Projects	District	Notes
302652	R-26 Relocate	Bremerton	Vault in narrow lot in residential area. Will require a new reg station with a building to reduce noise. Existing station is a safety & reliability issue.

FP #	Valve Projects	District	Notes
302705	V-22	Bremerton	Burwell & Callow in Bremerton, 8" Rockwell plug valve located in driveline at bottom of hill. Need to relocate to parking area, out of driveline, safety & reliability issue.
302714	V-23 Retirement and New Valve	Pendleton	Valve near college baseball fields and RR tracks. To be retired and replaced near R-52 to allow isolation of Pilot Rock line. Safety & reliability issue.
306999	V-13	Bremerton	Sidney Avenue and Radey Street in Port Orchard. In a vault in drivelane with a bad lid. Want to relocate to back of ROW or in an easement. Safety & reliability issue.
307001	V-29	Pendleton	4" valve off of 8" Boardman line. Safety and reliability issue.
307002	V-9	Aberdeen	In a vault on Grays Harbor line. Safety & reliability issue.

FP #	Bridge/Exposure Projects	District	Notes
302663	Bellingham Bridge Crossing Removal	Bellingham	Removing pipe from bridges, installing new reg station & 1,700 ft of 2", and remove ≈ 25 HPSS. Part of MAOP validation work.
200394	Squalicum Creek Exposure	Bellingham	Contractor bid from Michels Pipeline for $405,000. Commission has commented. Safety & reliability issue.
307025	Shelton 4" IP Bridge Removal	Aberdeen	Metal-metal/metal-concrete bridge crossing. Safety & reliability issue.
307212	Kelso Grade Street Bridge Removal	Longview	Metal-metal/metal-concrete bridge crossing. Safety & reliability issue.

FP #	Forced Relocations	District	Notes
307003	Dakota Creek Bridge Relocate - Blaine	Bellingham	Forced relocate.
302670	R-47 Relocate	Bremerton	County project to restore fish habitat. May replace or remove and add piping. Forced relocate.
302672	Bremerton R-146 Project - Tremont Road	Bremerton	Includes relocating R-146, ≈ 400 ft of 2" steel IP main, ≈ 300 ft of 2" steel HP main, and ≈ 1,500 ft of 4" steel HP main, and ≈ 7 HPSS. Forced relocate.
307213	Woodland Roundabout Forced Relocate	Longview	Lewis River Road and Old Pacific Highway. Forced relocate.
305740	College Place CARS Project	Walla Walla	Forced relocation along College Avenue.

FP #	Other Projects	District	Notes
302715	16" N. Whatcom Valve Vaults	Bellingham	Part of MAOP validation work.

Cascade Natural Gas Conservation Incentive Program Existing & New Homes Incentives

New & Existing Homes

Energy-Saving Measure	Basic Specifications	Incentive
High-Efficiency Natural Gas Furnace[1]	95% + AFUE	$250
High-Efficiency Natural Gas Hearth (Fireplace)	70% + FE (Fireplace Efficiency)[2] 80% + AFUE (Annual Fuel Utilization Efficiency)	$150 $250
High-Efficiency Combination Domestic Hot Water and Hydronic Space Heating System using pre-approved Tankless Water Heater[3]	90% + AFUE	$825
Condensing High-Efficiency Natural Gas Tankless Water Heater	0.91 + EF	$150
Conventional High-Efficiency Natural Gas Water Heater	0.67 + EF	$45
High-Efficiency Exterior Door[1]	U ≤ 0.21	$50

Existing Homes Incentives

Energy-Saving Measure	Basic Specifications	Incentive
Floor Insulation[4]	Equal to or greater than R-30 or to fill cavity[5], prior condition must not exceed R-11	$0.30/sq.ft.
Wall Insulation[4]	Equal to or greater than R-11 or to fill cavity, prior condition must not exceed R-4	$0.35/sq.ft.
Ceiling or Attic Insulation[4]	Equal to or greater than R-38, prior condition must not exceed R-18	$0.30/sq.ft.
Whole House Residential Air Sealing[4]	Equal or less than 0.0003 Specific Leakage Area through pre and post blower door testing[6]	$100

Efficient New Home Packages

Energy-Saving Measure	Basic Specifications	Incentive
ENERGY STAR® Certified Home + U.30 Window Glazing[7]	92% AFUE furnace + U.30 glazing	$600
Upgrade to ENERGY STAR Premium High-Efficiency Natural Gas Furnace[8]	95% + AFUE	$250
Built Green Certified Home[7]	Requires Built Green Certification	$600

1. Home must be heated by natural gas.
2. Must use intermittent ignition device.
3. Water must be heated with a tankless system. Pre-approval from CNGC required. Boilers do not qualify.
4. All insulation and air sealing must be performed by a CNGC qualified Trade Ally in order to be eligible for a rebate through the Conservation Incentive Program. Attic insulation cannot be filled to cavity.
5. Minimum of R-19 or higher to fill cavity.
6. Requires WA Department of Commerce Combustion Safety Test Report Exhibit 5.3.1A. Whole House Residential Air Sealing must comply with Washington State Energy Code section 502.4.5
7. These incentives are only applicable to new homes, not available to existing homes.
8. Only eligible on ENERGY STAR Certified homes. These incentives are only applicable to new homes, not available to existing homes.

Cascade Natural Gas Conservation Incentive Program Existing & New Homes Incentives

Elegibility Reqirements

- Qualifying measures must be purchased and installed by December 31 of the current calendar year and applications must be postmarked no later than March 1 of the following calendar year.
- Applicant must be a Washington customer of Cascade Natural Gas on residential rate schedule 503 (see your gas bill).
- Fuel for the home's primary heat source must be provided by Cascade Natural Gas for all heating incentives.
- Water-heating fuel must be provided by Cascade Natural Gas for all water-heating incentives.
- Customer **must not use a heat pump** for heating and/or cooling with a natural gas furnace back-up.
- Energy-saving measures must meet program requirements. Details at www.cngc.com/conservation.
- All equipment and service measures must be installed by a Washington-licensed contractor.
- All insulation and air sealing measures must be performed by a CNGC qualified Trade Ally in order to be eligible for a rebate through the Conservation Incentive Program. 1.866.626.4479 for a list of qualified Trade Allies in your area or visit http://cngconserve.com/interactive-map.
- Appliances and building materials specified by Washington state code are not eligible for Cascade Natural gas incentives.
- ENERGY STAR homes must be approved by an ENERGY STAR verifier.
- Built Green Homes must present Built Green Certification.
- Incentives may be subject to change and are only applicable for tariff approved measures in place at the time of installation.

How to qualify for Cascade Natural Gas incentives:

1. Establish your eligibility. Call 1.866.626.4479 or visit **www.cngc.com/conservation** for program requirements.
2. Install energy-efficient home improvements. Contact a participating Trade Ally contractor or Washington licensed contractor to install eligible measures. Please visit **www.cngc.com/conservation** for a list of qualified trade allies. Note: if installing insulation or air sealing you must use a CNGC qualified Trade Ally.
3. Acquire the appropriate incentive form online at **www.cngc.com/conservation** or call 1.866.626.4479.
4. Complete, sign and submit form along with a copy of your contractor's invoice marked "Paid in Full" to:

Mail: Cascade Natural Gas
Conservation Incentive Program
Rebate Processing Center
3800 Watt Ave., Suite 105
Sacramento, CA 95821

Fax: 1.800.506.9073

Upon receipt of completed application please allow six to eight weeks for processing and payment of incentives.

Home Energy Saver Kit

Water-saving shower heads and faucet aerators available upon request.
Please call 1.866.626.4479 for details or apply online at:
www.cngc.com/conservation.

For questions or more information, please visit us online at www.cngc.com/conservation or call 1.866.626.4479.

Last Updated 02/2015

Cascade Natural Gas Conservation Incentive Program Commercial/Industrial Standard Incentives

Warm Air Furnaces - $3.00/kBtu/hr High Efficiency Condensing Furnace—Min 91% AFUE	**Ozone Injection Laundry[3] - $2,500** Venturi injection or bubble diffusion - Min 125 lb. total washer/extractor capacity. **Pre-approval required.**
HVAC Unit Heater - $1.50/kBtu/hr High Efficiency Non-Condensing Min—86% AFUE	**Motion Control Faucet[3] - $105** Maximum flow rate of 1.8 gpm WaterSense® Certified and Below Deck Mixing Valve
HVAC Unit Heater - $3.00/kBtu/hr High Efficiency Condensing Min—92% AFUE	**Clothes Washer[3] - $180** Commercial gas washer—1.8 MEF
Radiant Heating - $6.95/kBtu/hr Direct fired radiant heating	**Gas Convection Oven - $450** ENERGY STAR® ≥42% Cooking Eff/ ≤13,000 Btu/hr Idle Rate
Boiler - $4.00/kBtu/hr High Efficiency Condensing Boiler Min 90% Thermal Eff & 300 kBtu input	**Gas Griddle - $350** ENERGY STAR® ≥38% Cooking Eff/ ≤2650 Btu/hr sq ft Idle Rate
Boiler Vent Damper - $1,000 Min 1,000 kBtu input	**Gas Conveyor Oven - $600** Greater than 42% tested baking efficiency
Boiler Steam Trap[1] - $125 Min 300 kBtu in; steam pressure at 7psig or >	**Connectionless 3 Pan Gas Steamer - $850** ENERGY STAR® or CEE/FSTC Qualified ≥38% Cooking Eff / ≤2,083 Btu/hr/pan Idle Rate
Domestic Hot Water Tanks[3] - $2.50/kBtu/hr Condensing tank, Min 91% Thermal Eff	**Connectionless 6 Pan Gas Steamer - $1,200** ENERGY STAR® or CEE/FSTC Qualified ≥38% Cooking Eff / ≤2,083 Btu/hr/pan Idle Rate
Domestic Hot Water Tankless Water Heater[3] - $60/gpm ENERGY STAR® .82 EF	**Double Rack Oven - $2,000** FSTC Qualified ≥50% Cooking Eff/ ≤3,500 Btu/hr/Idle Rate D Rack
Attic Insulation - (retrofit only) **Tier 1:** Min R-30 - **$0.50/sq ft** **Tier 2:** Min R-45 - **$0.65/sq ft**	**ENERGY STAR® Gas Fryer - $600**
Roof Insulation - (retrofit only) **Tier 1:** Min R-21 - **$0.60/sq ft** **Tier 2:** Min R-30 - **$0.80/sq ft**	**Door Type Dishwasher Low Temp Gas[3] - $650** ENERGY STAR® ≤.6 kw Idle Rate/ ≤1.18 gallon/rack
Wall Insulation[2] - (retrofit only) **Tier 1:** Min R-11 - **$0.50/sq ft** **Tier 2:** Min R-19 - **$0.56/sq ft**	**Multi-Tank Conveyor Low Temp Dishwasher[3] - $1,000** Gas Main w/Electric Booster ENERGY STAR® ≤2.0 kw Idle Rate; ≤ 0.50 gallons/rack
Energy Savings Kits[3] - FREE **A:** Kitchen Pre Rinse Spray Valve & Bath Aerators **B:** Low Flow Showerhead	**Recirculation Controls[3] - $100** Continuous Operation DHW Pump **Pre-Approval required.**

If you are planning equipment or building upgrades that do not fit within the standard incentives, but significantly reduce natural gas consumption, please call 866.450.0005 to learn about custom project opportunities.

Mixed purpose facilities that include buildings on both Residential Rate Schedule 503 **and** qualifying Rate Schedules 504, 505, 511, 570, and 577 as part of the same Cascade Natural Gas customer account shall also be eligible for custom conservation incentives.

Please note: Standard incentives are available on the qualified measures above to Cascade Natural Gas Corporation (CNGC) customers on rate schedules 504, 505, 511, 570 and 577.

[1] This measure will only be allowed where the customer agrees to regular trap maintenance and replacement every seven (7) years.

[2] Minimum value of R-11 applies only where existing walls have no internal insulation cavities.

[3] Incentive eligibility dependent on use of gas fired domestic hot water serving the specified measure equipment or fixture.

Cascade Natural Gas Corporation®
A Subsidiary of MDU Resources Group, Inc.

In the Community to Serve®

Updated 09/14

Who is eligible to participate?

- Must be a new or existing commercial or industrial customer of CNGC on one of five qualifying rate schedules: 504, 505, 511, 570 or 577.
- Incentives apply on qualified high-efficiency natural gas equipment such as heating, insulation, water heating systems, cooking equipment installed as replacement, retrofit as well as new installation in place of standard efficiency equipment. If the equipment installation, replacement, or retrofit provides significant increase over existing high-efficiency equipment, and is not listed here please contact program representative for potential custom incentive.
- Insulation measures must be installed in an existing building, heated by natural gas, without functional insulation.
- Eligible measures installed are subject to the available incentives coinciding with the date of the installation as outlined in CNGC's tariff.
- Customers requesting incentives for site-specific energy efficiency measures must submit estimated costs and natural gas savings associated with the project. Natural gas savings are to be calculated using standard engineering practices. CNGC will review the natural gas savings calculations, and reserves the right to modify energy savings estimates.

How to qualify for Cascade Natural Gas incentives

1. Establish your eligibility. Call 1.866.450.0005 or visit www.cngc.com/conservation for program requirements.
2. Install energy-efficient upgrades. Contact a participating Trade Ally contractor or licensed contractor to install eligible measures.
3. Acquire appropriate incentive form online at www.cngc.com/conservation.
4. Sign and submit the following forms:

C&I Standard Incentive application • W9 form • Copy of recent CNGC gas bill • Quote for proposed equipment • Final invoice marked "paid" • Manufacturer's spec sheet.

Send forms to:

Mail: Cascade Natural Gas Corporation, c/o Lockheed Martin Energy and Environmental Services
22121 20th Avenue SE, Bothell, WA 98021

Fax: 1.877.671.2998

Upon receipt of completed application, please allow six weeks for processing and payment.

Get started today!

To apply for an incentive, download a C&I Standard Incentive application at www.cngc.com/conservation and return to us via email at conserve@cngc.com or by fax at 1.877.671.2998

Questions on food service, lodging or health care projects? Call Autumn Marks at 1.877.508.7116.

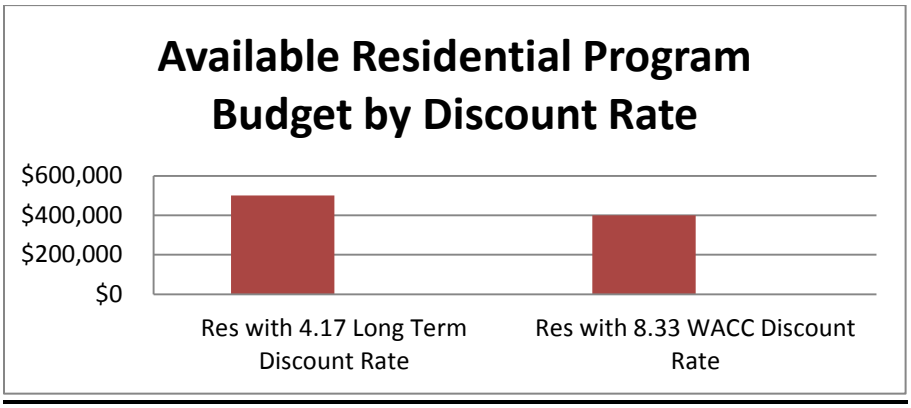
All measure assumptions were adjusted as appropriate based on Nexant's findings. All measures were run under the Company's 4.17% long term discount rate as per discussion with its Conservation Advisory Group. Additional scenarios have been screened under the UCT and utilized the 8.33% WACC discount rate recommended for residential measures weighed under the UCT per policy statement UG-121207 with bond rate used for the TRC under the residential scenarios.and can be referenced in Appendix __. This was performed in the Company's standard program planning and cost-effectiveness assessment tool and became the final version approved by the CAG and forwarded to the WUTC for implementation in September.

At the time two main options were considered for the Residential sector and for the C&I sector. Each option presented the best possible outcomes under the WACC and Long Term discount rate scenarios. In this instance "Best Possible Outcome" resulted in a portfolio that:

1. Maximized the inclusiveness of viable, industry-acknowledged conservation measures
2. Did so while maintaining incentive levels that send a meaningful market signal to consumers to upgrade to high-efficiency equipment and measures
3. Remained cost effective at the Company's most recently acknowledged avoided costs, even if participation levels remained on par with prior year's achievements (for residential)

Residential Scenarios

As suggested above, residential offerings have been screened for cost-effectiveness and synchronized with the corresponding scenarios in TEAPOT. The TEAPOT model was built to include the Company's current portfolio measures so coordination between the Nexant model and the internal program planning tool was a straightforward process.



Scenarios were built from measures identified by Nexant and our program delivery team. The portfolios were then run through TEAPOT once more so generalized Achievable Potential targets could be set. This is described in more details in the sections below.

Portfolios were developed to maximize the number of rebates available to our customers— with rebates set at incentive levels attractive enough to encourage the desired conservation behavior. Administrative costs were set to levels commensurate with our 2014 budget, with downward adjustments made to minimize the sacrifice to program measures if forced to utilize the WACC as the discount rate. The WACC had not been used previously by the Company at the program planning and evaluation level because it artificially devalues the savings associated with long-term measures and reduces the pool of viable incentives.

We set an administrative budget in order to plan and operate programs. This budget must ensure an acceptable ratio of costs balanced with therm savings achievements. Since therm savings offset the costs of administrative investment, the greater the achievement, the more cost-effective our programs. If the budget or therm savings upon which the portfolio is built are unrealistic, we risk developing a scale-dependent portfolio doomed to failure.

Below is a chart comparing the "optimized" budget of $500k (maximum) for our Residential programs against the upward threshold of $400k under a scenario in which we must use the WACC. The $500k reflects the estimated expense of a continued vendor/in-house approach to program offerings with a small buffer for unforeseen expenses.

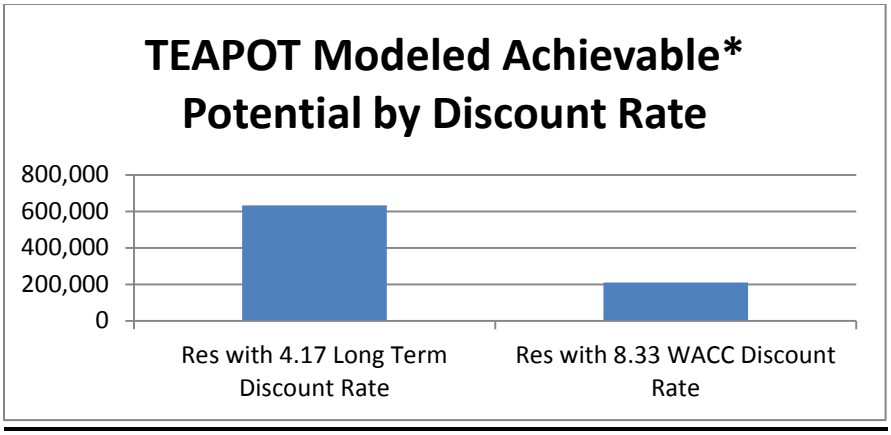


Figure 6 - 6

As described above, the budget by necessity must shrink if we were required to utilize the WACC discount rate. If the budget were to remain the same under both scenarios, more measures would have needed to be reduced or removed to maintain the balance necessary to maintain a levelized avoided cost of $.31 or less under the UCT. If more measures had been removed, the overall potential would have been likewise reduced, creating a vicious cycle of cuts that would severely (and unnecessarily) handicap the Company's conservation efforts.

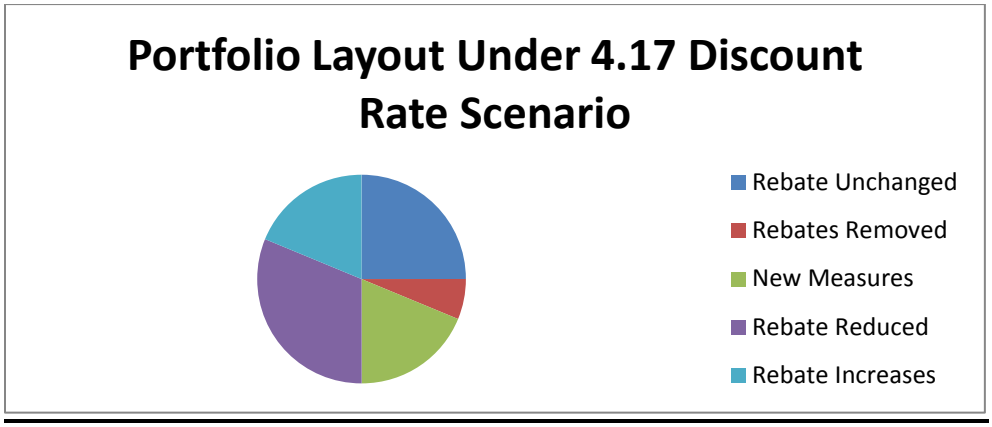
Next, we will look at the overall Achievable Potential identified by Nexant's TEAPOT model based on the portfolio of measures deemed cost effective under the Long Term vs. WACC discount rate scenarios.

Figure 6 - 7

***For program planning Achievable Potential means the likelihood of measure adoption under realistic market and societal conditions in the CNGC service territory. However, Achievable Potential should not be confused with Program Potential, which is influenced by Regulatory Policy and company budgets/tariffs. Cascade will aggressively strive towards Achievable Potential, but will build programs against the threshold of lower more Program-realistic targets in order to ensure maintained cost effectiveness.**

Under the 4.17% Long Term Discount Rate, Cascade was able to grow and maintain a portfolio of measures with a total Achievable Potential of 632,913 utilizing the UCT. Under the 8.33% WACC Discount Rate, the total Achievable Potential dropped to 209,752. This is because the total number of cost-effective measures plummets when the savings of long-lived measures are severely discounted.

In order to keep programs operating within a severe discounting scenario, costs needed to be reduced as well as incentive levels. Programs take first priority, so Step One was to reduce administrative costs to lowered levels without profoundly harming daily program operations. Setting the budget at $400k should reasonably have achieved this goal. However, it was not enough to lower the budget and maintain the full portfolio available under the 4.17% long term discount rate. The UCT still exceeded the avoided levelized cost threshold. The TRC also remained prohibitive in its current state. So the next step was to reduce rebate levels. The first rebate levels lowered were those above the ".30 of cost" threshold, since Nexant indicated rebates at this level were adequate for incentivizing conservation behavior. Small downward adjustments were also made to measures that were significantly above .31 levelized cost under the UCT on an individual basis. If rebates needed to be significantly shrunk in order to maintain the portfolio, and could not be offset by other adjustments, they were removed. As measures were removed, the overall Achievable Potential dropped.



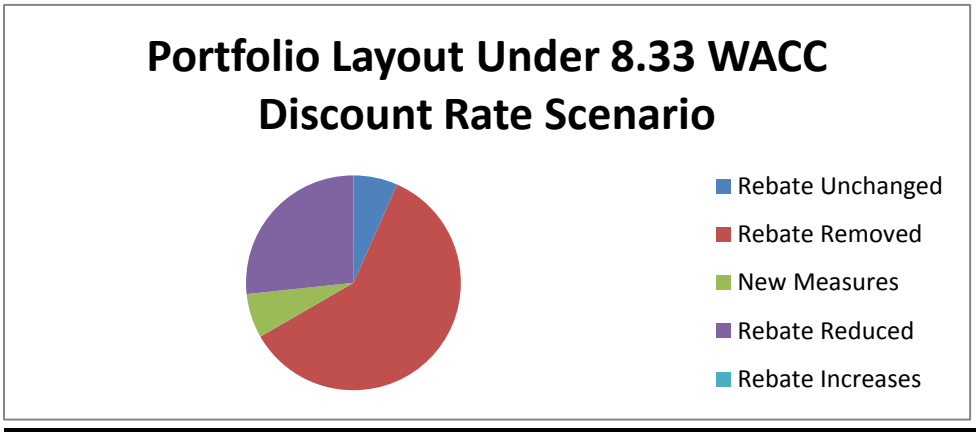
As a final note, therm savings targets were based from the TEAPOT tool and will be used for the purposes of IRP and Conservation Plan development. However for the

purposes of program development, we have narrowed the target to 138k therms (closer to 25% of Achievable base), reflecting a number within approximate range of our 2013 achievement. This was built this way in order to ensure any program portfolio built is not set up for failure if it cannot attain an unrealistic model-created target. Additional savings achieved beyond this figure will make the conservation programs even more cost effective, maximizing the value of participation for the Company and Ratepayers.

TEAPOT- generated targets will be acknowledged in the IRP and conservation plan as *aspirational* targets and those we will aggressively strive towards throughout the year. However, the programs will be built in a way that ensures cost-effectiveness can be maintained even if we fall short of that target.

Now that we have reviewed Residential program budgets and targets, here are the results of the Best Possible Outcomes under the 4.17% and 8.33% discount rate scenarios for our Residential Program.

Figure 6 - 8



The above chart provides a high-level overview of the portfolio spread available to our customers under an optimized program planning scenario where we set rebate levels at as close to .30 of cost as possible in order to maintain attractive incentives.

Measures remained in the portfolio if they were able to maintain a benefit cost ratio of over 1 at a measure level, and a loaded levelized cost of under $0.41 per therm at the portfolio level under the following conditions:

(a) under the full spread of anticipated residential program expenses;
(b) under a target based from prior year achievements;
(c) Under an incentive level within reach of 30% of incremental costs, per Nexant guidance as reasonable threshold for encouraging update of conservation measure.

For the most part, outcomes were positive with only one measure removed from the portfolio due to strains to cost-effective under the current lowered cost of natural gas. The efficiency levels for two measures — .64 water heaters and 90% efficient furnaces were adjusted upwardly to .67 and 95% respectively, in order to reflect the market, and set the conservation bar higher for our customers to encourage deeper energy savings. Four measures remained unchanged from the current tariff. Three new measures were added, and three rebates were upwardly adjusted due to their extreme cost-effectiveness and in order to help them reach a threshold closer to .30 of measure cost. Five measures experienced downward adjustments in order to balance the portfolio and maintain cost effectiveness overall, but careful attention was paid to ensure the rebates were not reduced to levels that would make them unattractive to customers and thus become purposeless as incentives towards positive conservation behavior.

Figure 6 – 9

The above chart provides a high-level overview of the portfolio spread available to our customers under the Best Possible Outcome program planning scenario under the constraints of the 8.33% WACC discount rate, with rebate levels remaining set at as close to .30 of cost as possible in order to maintain attractive incentives.

Measures remained in the portfolio if they were able to maintain a cost benefit ratio of over 1 at a measure level, and a loaded levelized cost of under $0.41 per therm at the portfolio level under the following conditions:

(a) under the full spread of anticipated residential program expenses;
(b) under a target based from prior year achievements;
(c) Under an incentive level within reach of 30% of incremental costs, per Nexant guidance as reasonable threshold for encouraging update of conservation measure.

Under this scenario, nine rebates needed to be removed since incentive levels and

administrative costs could not be balanced to adequately preserve them and still keep other more cost effective measures remaining in the portfolio. One new measure was added, and one remained unchanged. Four additional measures were decreased but careful attention was paid to ensure the rebates were not reduced to levels that would make them unattractive to customers and thus become purposeless as incentives towards positive conservation behavior. Under this scenario, no measure increases were viable since the portfolio was extremely tight and maintenance of cost-effectiveness precarious.

Again, it is important to emphasize that the Company ran multiple portfolio scenarios under the 8.33% WACC discount rate and the portfolio listing was the most viable, inclusive option available under these circumstances. Based on the reduced offerings the Company strongly recommended moving forward with a portfolio that utilizes the previously accepted 4.17% long term discount rate.

Commercial/Industrial Scenarios

The Nexant potential assessment and TEAPOT modeling tool have allowed the Company to identify viable measures for inclusion in a modified Commercial/Industrial Conservation Program portfolio. The purpose of this exercise was to design a program able to withstand fluctuations in avoided gas costs and maximize the spread of cost-effective and worthy measures for inclusion in the CNGC Conservation Incentive Program.

Savings levels were based from the TEAPOT model. The outcomes were developed by running multiple portfolio scenarios carved out from the master list of measures. Carve-out was based from Nexant's screened achievable cost-effectiveness, with a secondary review of this measure sub-set by the C&I program delivery team. The portfolio was screened in both TEAPOT and in the Company's internal valuation tool. For the purposes of program planning, a viable measure set was defined as one composed of measures identified by Nexant and the Company as viable through its initial measure screen *and* remained viable under the company's best estimates of program expenses and predicted energy savings.

It is important to note the screen conducted with the TEAPOT tool and internal valuation mechanism for the Commercial/Industrial sector was performed **strictly to assess viable prescriptive measures and potential**. TEAPOT can only provide estimated achievable potential based on known measures. However, program experience has clearly demonstrated the prescriptive portion of savings from the CNGC Conservation Program is fairly consistent, with an average of 65% of therm savings coming from custom projects. Therefore the prescriptive portfolio is assumed to represent 35% of total program savings.

All measures identified as viable under Nexant from an Achievable Potential Standpoint were screened under the TRC and UCT utilizing the 8.33% WACC discount rate recommended for commercial programs through UG-121207 policy statement for program planning. An additional screen was run under the Company's 4.17% long term discount rate. This was performed in the Company's standard program planning and cost-effectiveness assessment tool.

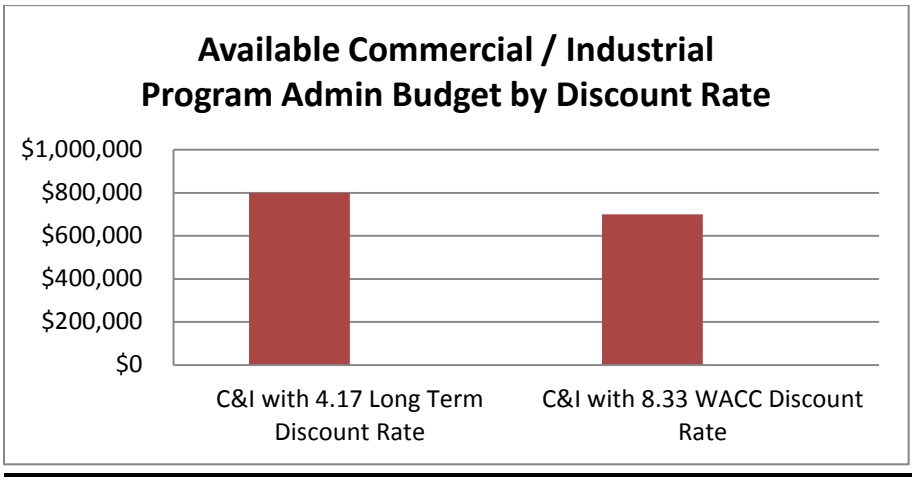
Incentive levels had been set to one third of incremental costs as determined by Nexant or ground-level programmatic data. Keeping all incentives in the 30-33% range allowed us to clearly synchronize program offerings with the TEAPOT model which begins a base scenario of Achievable 1 at an assumption of a minimal viable rebate level of 33% of incremental costs, in order to avoid free ridership, or vestigial offerings.

Measures remained in the portfolio if they were able to maintain a benefit cost ratio of over 1 at a measure level, and a loaded levelized cost of less than $0.41 per therm at the portfolio level under the following conditions:

(a) under the full spread of anticipated C&I program expenses;

(b) under a combined prescriptive + customer C&I target developed via TEAPOT (35% of total program savings) + additional proportion of custom savings (assumed at 65% of total C&I program savings). With the exception of the WACC scenario which assumed a greater dependence on C&I (75% C&I/25% prescriptive)

(c) Under an incentive level at least 30% of incremental costs, per Nexant guidance as minimal threshold for encouraging update of conservation measure.



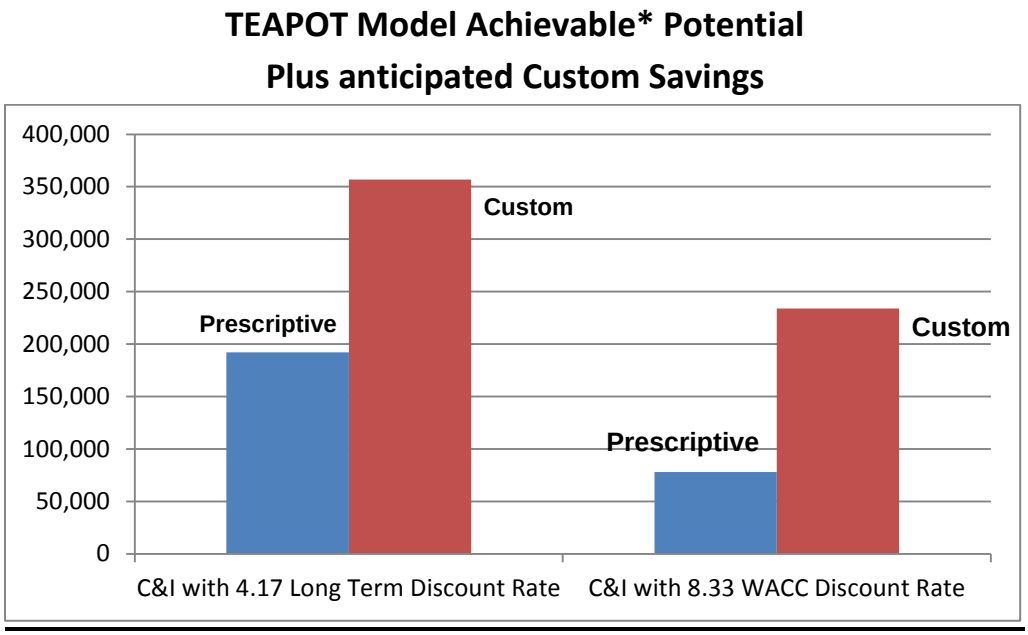
Cascade strives towards aggressive conservation achievements, but at the program development phase, it is essential that we balance optimism and realism. Program developers must set an administrative budget in order to plan and operate programs. This budget must ensure an acceptable ratio of costs balanced with therm savings achievements. Since therm savings offset the costs of administrative investment, the greater the achievement, the more cost-effective our programs. If the budget or therm savings upon which the portfolio is built are unrealistic, we risk developing a scale-dependent portfolio doomed to failure because we designed a program dependent on the savings levels we *hoped* we would achieve, based on abstract modeling, and not based on prior year accomplishments and ground level understanding.

As with the Residential program, the Company analyzed the Best Possible Outcomes for a portfolio designed under the parameters of the WUTC policy statement. The portfolios were optimized for rebate level, budget and measure mix. The following table

demonstrates the maximum viable budget under both a 4.17% Long Term and 8.33% WACC discount rate scenario. For the development of the CIP C&I portfolio, program costs were assumed at the fully budgeted amount for program development contractor, plus an additional buffer for internal administrative expenses and staff time. If at all possible, costs are managed at a level lower than this estimate, but significant cut-backs would require further aggressive administrative restructuring, and therefore would be imprudent to base from a more aspirational budget for the purposes of program planning.

Estimated administrative costs were assumed to be approximately $800k, reflecting the estimated expense of the Lockheed Martin program delivery contract plus a buffer for CNGC staff time and expenses. However, they were lowered to $700k under the WACC out of necessity.

Figure 6 - 10



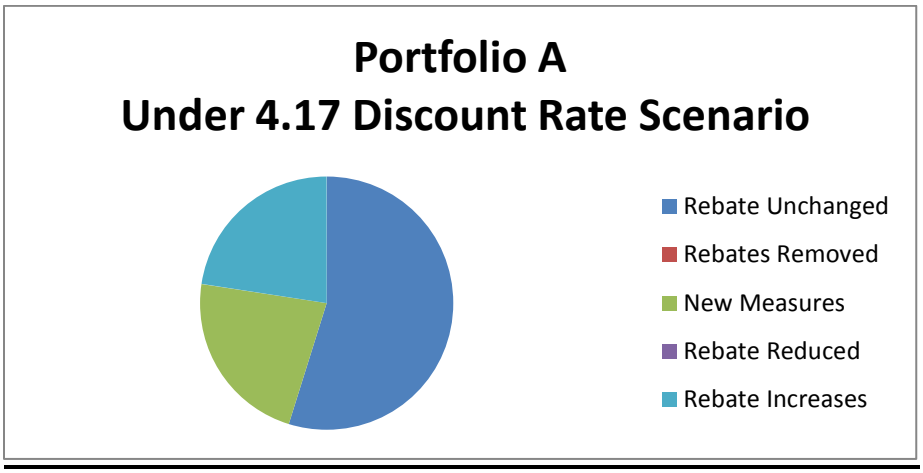
The appropriate budget levels described previously were entered into the cost-effectiveness calculation tool. These costs were balanced against the targets and portfolio offerings available under the respective discount rate scenarios.

Budgets must balance out with a realistic, proportionate level of therm savings. The table below shows the anticipated level of Achievable Potential modeled from TEAPOT. Total achievable therm savings for the Company's modified C&I programs were based from the TEAPOT tool in combination with a best estimate based on previous accomplishments and real experience with program implementation.

All targets and costs utilized in the internal valuation tool reflect the total assumed achievement and expenditure associated with the full program *including* the custom component, which was assumed at 65% of the total achieved savings for the year. However, under WACC scenario, we built in a 75% dependence on custom to

compensate for plummeting cost effectiveness for prescriptive measures.

Figure 6 - 11



***For program planning Achievable Potential means the likelihood of measure adoption under realistic market and societal conditions in the CNGC service territory. However, Achievable Potential should not be confused with Program Potential, which is influenced by Regulatory Policy and company budgets/tariffs. Cascade aggressively strives towards Achievable Potential, but builds programs against the threshold of lower more Program-realistic targets in order to ensure maintained cost effectiveness.**

Under the Long Term discount rate scenario, total Achievable Potential was approximately 192,091 therms saved from prescriptive measures in an inclusive portfolio, with an additional 356,740 therms achieved through custom incentives. The WACC scenario offered an Achievable Potential threshold of 78,007 TEAPOT-identified therms, and an additional estimate of 234,021 therms saved through custom projects. The prescriptive savings were lower since most prescriptive measures were designed for commercial facilities, and the deepest (but least predictable) savings come from our core industrial customers who gravitate towards custom projects. Industrial measures are harder to standardize since there are a wide range of facility types, processes, and needs to be addressed for these customers.

That said, Achievable Potential identified through TEAPOT may still be overly inclusive as it does not reflect factors such as internal budgeting to meet cost-effectiveness thresholds and external policy impacts.

Thus, while the therm savings identified through TEAPOT (and through traditional custom-to-prescriptive ratios) will be used in the IRP as our aggressive aspirational targets that we strive towards, for the sake of portfolio development, we have adjusted targets to 75% in the 4.17% scenario to set a more realistic minimal threshold that must be met in order for the programs to remain cost-effective. To do otherwise would risk designing a program that buckles under the weight of its own administrative and rebate costs unless an overly optimistic level of savings were achieved.

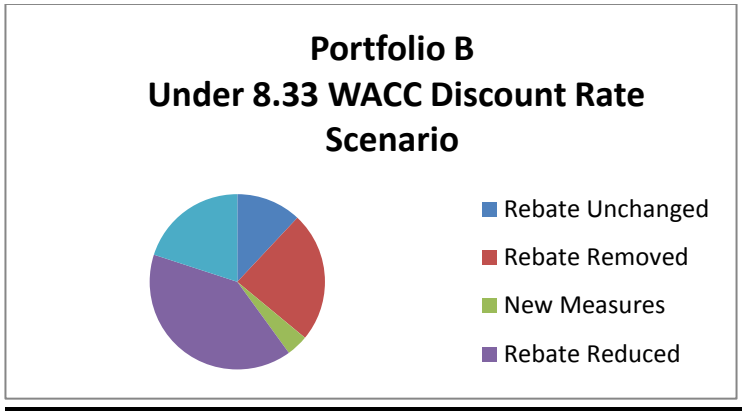


Figure 6 -12

The chart above provides a visualization of the optimized portfolio of measures developed from the TEAPOT model and screened against the avoided gas costs outlined in our most recently acknowledged Integrated Resources Plan. It is important to recognize the key variable driving the differences between the first and second pie chart is the discount rate.

Under the Long Term discount rate scenario, the Company was able to maintain a robust portfolio of prescriptive conservation incentives, retaining 17 measures at their current levels, and increasing the rebate level for 7 measures without negatively impacting program cost-effectiveness. In addition, 7 new measures were added to the list of prescriptive rebates, opening up expanded conservation opportunities. These measures were identified in the Nexant study and by our program delivery team as having a high-likelihood of adaptation if incentives were provided to drive purchase behavior.

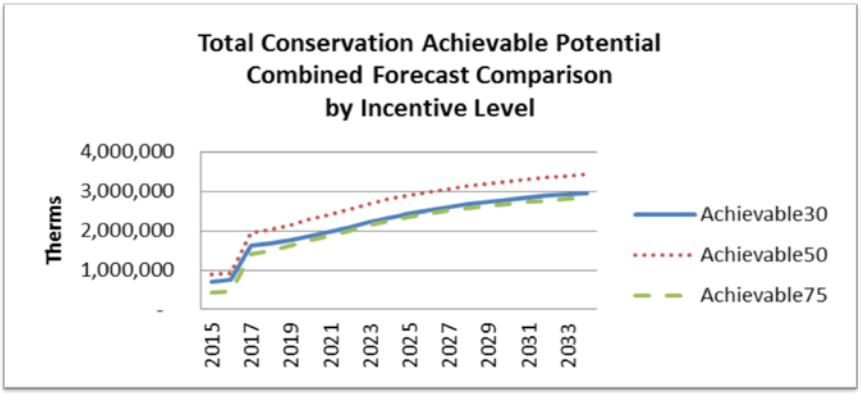

Figure 6 -13

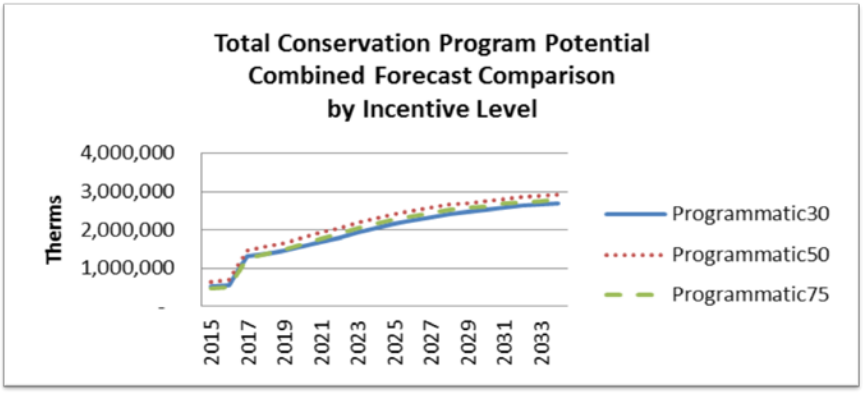

Utilizing the 8.33% WACC discount rate artificially diminishes the perceived value/cost effectiveness of commercial gas conservation measures. The same portfolio that maintained a levelized cost at less than .31 under the long-term discount rate, crumbles under the WACC—all other factors being identical. Therefore, as the previous charts demonstrate, budgets were reduced out of necessity to lower the levelized cost of the portfolio.

Under the WACC scenario, 10 rebates were reduced, 6 removed, and 3 remained unchanged. Five measures were increased and 1 new measure was added.

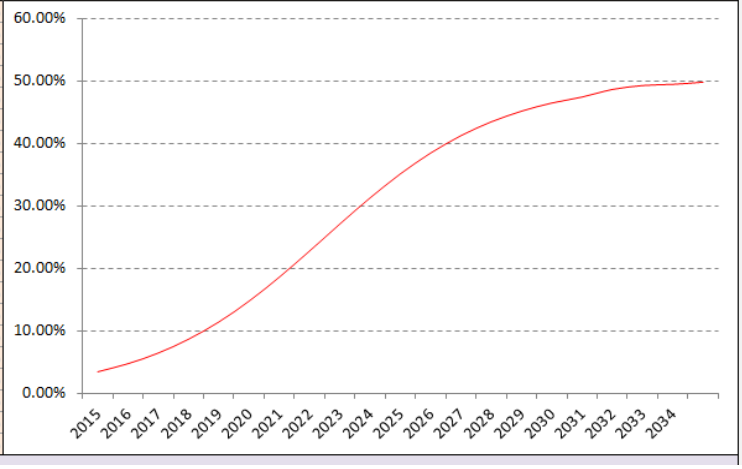
Effect on 30% Current Portfolio Measures		-4%	-17%

***NOTE:**

"Nexant Measures" refers to the list of potential measures reviewed in the Nexant Conservation Potential Study, provided in Appendix B of Volume III, available in Appendix D of the 2014 IRP.

"Cascade Portfolio Measures" refers to the present portfolio of measures being offered. The current portfolio aims to operate at or near the 30% incentive level.

The cost effective measures by incentive levels reflect the total number of measures passing cost effectiveness (greater than or equal to 0.90) out of the total number of measures, either included in the Nexant study or under the program's current portfolio offerings.



The "Effect on 30% Current Portfolio Measures" rows show the decreases, as a percentage, of cost-effective measures that would be able to be offered if the incentive level changed.

This page does not include Low Income.

Adoption Curve for Each Achievable Scenario and Incentive Level

1 INTRODUCTION

1.1 OVERVIEW

Cascade Natural Gas Corporation ("Cascade") has offered energy efficiency programs to its customers since the 1990s with expanded programs beginning in 2008. In light of significant changes to codes, costs, technologies, and gas prices that have taken effect in the past four years, Cascade has contracted with Nexant, Inc. ("Nexant") to perform a comprehensive assessment of the technical and achievable natural gas conservation potential within Cascade's Washington service territory for residential, commercial and industrial sectors. This assessment references Cascade's potential assessment conducted in 2006 by the Energy Trust of Oregon, which in turn was refined in 2009 to include Cascade's Washington conservation potential. The assessment conducted in 2006 and refined in 2009 included all of the Cascade Natural Gas service territory in Washington and Oregon. This assessment does not directly build on those reports; and thus represents a new assessment of Cascade's energy efficiency potential. This assessment stands apart from previous studies as a potential assessment for Cascade Natural Gas Washington State service territory only. The findings of this assessment will help inform the development of Cascade's Integrated Resource Planning (IRP) process as well as provide guidance for future program planning and development efforts. In addition to providing potential assessment, Cascade also requested Nexant evaluate energy savings associated with measures installed by participants in Cascade's Conservation Incentive Program during 2011/12.

This report presents results of the technical, economic, and achievable potential for natural gas energy efficiency savings in Cascade's Washington service territory over the next 21 years (2014-2035). Program potential was not included in the study scope, but could be developed by Cascade using the findings of this study and based on regulatory/budgetary parameters, cost-effective thresholds, policy considerations, and decisions on which subset of cost-effective measures to offer to customers going forward. Nexant assessed therm savings realized through Cascade's program to-date, researched natural gas energy efficiency measures to estimate measure-specific savings, costs and lifetimes, and conducted a detailed bottom-up assessment of the Cascade market to provide a credible and transparent estimation of the technical and achievable energy efficiency potential.

1.2 STUDY GOALS

The primary goal of this assessment was to develop a comprehensive assessment of technical and achievable potential for natural gas energy efficiency within Cascade's Washington service territory for customers on Rate Schedules 503, 504, 505, 511, 570 & 577 (residential, commercial and non-transport sales industrial customers). This objective analysis illustrates the remaining savings potential by sector, segment and end use as a means to inform future program design given the declining cost of natural gas. The study also integrated a detailed evaluation and measure savings review of Cascade's conservation portfolio. Key objectives of this study include:

- Provide credible and transparent estimation of the technical and achievable energy efficiency potential by year over the next 21 (2014-2034) years within Cascade's Washington service territory;
- Assess and validate therm savings associated with key measures that qualified for, and received, a conservation incentive in the 2012 program year, and apply findings to determine realistic therm savings potential in Cascade's Washington Service area;
- Provide a user friendly, executable dynamic model that will support the potential assessment and allow for testing of sensitivity of all model inputs and assumptions;
- Develop a final report including summary data tables and graphs reporting incremental and cumulative potential by year from 2014 through 2034.

1.3 Definitions of Potential

This study estimated energy efficiency savings developed into three types of potential: technical potential, economic potential, and achievable potential. Market penetration rates associated with each potential were estimated and included in this assessment. While technical and economic potential are both theoretical limits to efficiency savings, achievable potential embodies a set of assumptions about the decisions consumers make regarding the efficiency of the equipment they purchase. Relevant factors to Cascade's stimulus program were included in the Achievable Potential to simulate a realistic estimate of real-life conditions. Program potential (i.e. the subset of achievable potential attainable given constraints on program budget and implemented measures) is not presented in this report. Volume II, Section 2, details each potential definition.

1.4 Cost Effectiveness Screening

Industry standard cost effectiveness tests were performed to gauge the economic merits of the portfolio. Each test compares the benefits of the energy efficiency metric to their costs defined in terms of net present value of future cash flows. The definitions for the two standard tests used in this analysis are described below.

Total Resource Cost test (TRC). The benefits in this test are the lifetime avoided energy costs and avoided capacity costs. The costs in this test are the incremental measure costs plus all administrative costs spent by the program administrator.

Utility Cost Test (UCT). The benefits in this test are the lifetime avoided energy costs and avoided capacity costs, the same as the TRC benefits. The costs in this test are the program administrator's incentive costs and administrative costs.

Detailed findings are presented in this report using the UCT as the cost-effectiveness screen for economic and achievable potential. As is shown in **Section 6** and **Section 7**, total natural gas savings potential is considerably higher using the UCT when compared with the TRC. This occurs because the

UCT allows more measures to pass the cost-effectiveness threshold of 0.90[1] when compared to the TRC (because it considers only the incentivized portion of a measure's incremental cost). To illustrate this effect, **Table 1-1** below summarizes the number of measures evaluated and the number of measures to pass the UCT and TRC cost-effectiveness test under the base-case scenario of Cascade's current avoided costs, and an incentive rate of 30%.

Table 1-1: Summary of count of measures passing each cost test

	Total Measures	*Passing Measures*	
		TRC	*UCT*
Total All Sectors	***143***	***51***	***96***
Residential Sector	*46*	*16*	*36*
Commercial Sector	*63*	*31*	*47*
Industrial Sector	*34*	*4*	*13*

1.5 Report Organization

This report is organized into three volumes as follows:

- **Volume I: Executive Summary** provides an overview of initial findings from the potential study and outlines the remainder of the report. This document represents Volume 1: Executive Summary.
- **Volume II: Report** provides detailed explanation of methodology, results and findings.
- **Volume III: Appendices** provide detailed tables of data and assumptions utilized in the analyses summarized in this assessment.

2 Analytical Approach

Energy efficiency potential studies involve a number of analytical steps to produce estimates of each type of energy efficiency potential: technical, economic, and achievable. This study utilizes Nexant's in-house developed Microsoft Excel-based modeling tool, TEA-POT (Technical/Economic/Achievable Potential). This modeling tool is built on a platform that provides the ability to run multiple scenarios and re-calculate potential savings based on variable inputs such as sales/load forecasts, natural gas

[1] A cost-effectiveness threshold of 0.90 was used to account for the non-quantifiable environmental benefits of reduced natural gas consumption. This approach aligns with that used by many utilities in the Pacific Northwest.

prices, discount rates, and actual program savings. This model provides Cascade with the utmost transparency into the assumptions and calculations for estimating market potential. TEA-POT has been consistently upgraded and refined over the past several years, with the most recent upgrade occurring in 2012. The major analytical steps are summarized below and specific changes in methodology from one sector to another have been noted throughout this section. The major analytical steps utilized in both the potential study and measure savings review are explained throughout **Volume II, Section 2**.

3 Measure Savings Review Findings

The goal of the measure savings review was to provide a high level assessment of Cascade's process for collecting, organizing program participant data and estimating the associated savings for four key measures in the time period June 1, 2011 – May 31, 2012. This was broken up into three tasks: 1) a desk review of program applications, 2) a telephone call to program participants to verify measure installation and key savings metrics, and 3) a billing analysis of a statistical sample of installed furnace, boiler and water heater installed measures. The findings of these assessments are provided below.

3.1 Desk & Telephone Review Findings

The telephone review verified all participation data and **no errors were found** in the reviewed measures. One of the key findings of the measure savings review is regarding Cascade's methodology for estimating natural gas savings. While utilizing a deemed savings value approach for each measure can be a cost-effective and appropriate approach to estimating savings, it can over or underestimate actual savings.

With the data provided in this analysis – specifically measure savings algorithms used in the potential assessment – Cascade will have the option to refine projected savings estimates with increased specificity by calculating premise-specific natural gas savings for each installed measure. While Cascade is already collecting some of the key savings parameters on its participant application forms (such as house square footage and efficiency of installed measure), Nexant recommends including some additional parameters on the application forms to enable premise-specific calculation estimates of natural gas savings. The following desk review findings may have an impact on reporting of savings:

1. The Cascade participant database documented the efficiency of the replacement measure as the incentivized amount (such as a 0.62 EF water heater), whereas often the efficiency of the installed measure as listed on the application was greater than the incentivized efficiency level. That is, while the application form always listed the actual efficiency of the installed equipment (e.g. EF=0.67), the efficiency of that particular measure would be set to a default value (e.g. EF=0.62) in the Cascade participant database. This implies deemed values were used to project savings, as opposed to premise-specific values, which were often more efficient than the incentivized efficiency level. This practice would conservatively estimate savings. Recording the

actual efficiency value of installed equipment, as opposed to the incentivized efficiency value, would be less conservative but could increase the accuracy of projections and data analysis.

2. The efficiency level of original equipment was not always recorded on the application form, nor whether or not the original equipment was replaced due to failure or for another reason prior to the end of expected equipment life. Savings calculations are dependent upon the efficiency of the base equipment, as well as whether or not the customer replaced the equipment early or upon burn-out. Nexant recommends collecting data on these two factors in the rebate application, and tracking them in the participant database, for inclusion in savings calculations (see **Section** Error! Reference source not found. below).
3. The cost category in the customer database varied in inclusions per measure. Categories included equipment, labor, old equipment disposal, and/or additional work performed. Standardized entries of "equipment costs" and "labor costs", in addition to "extraneous costs" will ensure accurate comparison of measure and installation costs.
4. While Cascade collects participant square footage for its weatherization measures, importing commercial participant facility square footage information into the participant database will facilitate comparative analysis between commercial customers, as facility sizes and types can vary dramatically in the commercial sector.

3.2 Billing Analysis Findings

In an effort to estimate realized savings associated with Cascade's program offerings, Nexant conducted a billing analysis for four key residential and commercial measure offerings. The measures are residential high efficiency furnaces and hot water heaters, and commercial/industrial high efficiency furnaces and boilers. Savings from the final qualified accounts assessed in the billing analysis were compared to estimates from Cascade's deemed measure savings. The findings of this analysis are summarized in **Table 3-1** below.

Table 3-1: Total Participant vs. Billing Analysis Subsample Summary

Source	Metric	Residential		Commercial[2]	
		DHW	Furnace	Furnace	Boiler
Cascade Participant Database	Participants	83	833	18 (Census)	23 (Census)
	Equipment Eff. Installed	65%	90%	Assumed 91%	Assumed 90%
	Cascade Deemed Savings (Therms per Measure)	24	86	272	2644
Qualified Billing Analysis Participants	# of samples	50	53	8	5[3]
	Confidence / Precision	90/8	90/11	90/20	90/30
	Avg. Equipment Eff. Installed	67%	95%	95%	91%
	Average Savings (Therms per Measure)	33	111	349[4]	1566
Actual as a % of Deemed Savings		**138%**	**129%**	**128%**	**59%**

4 Market Segmentation Findings

An important first step in calculating Cascade's energy efficiency potential estimates is to establish baseline energy usage characteristics and disaggregate the market by sector, segment, and end use. The findings of this section represent the control totals to which all energy usage is calibrated in the base year of the study and then forecasted. Further details and assumptions are described in **Volume, 2, Section 4**. Below is a summary of findings.

Total natural gas consumption by eligible residential, commercial and industrial customers for 2012 in Cascade's Washington service territory was 12,256,153 dekatherms[5]. **Table 4-1** shows the overview of

[2] While some commercial participant numbers are too low to obtain statistical accuracy on the results, this is a census of the installed measures therefore this is a summary of the entire sample size for the commercial sector.

[3] This small sample resulted in a 90/30 confidence precision, which decreases the ability to make meaningful conclusions about savings projections for commercial boilers

[4] Premise savings were divided by number of installed units to develop a therms saved per installed unit value. The three other measures were not standardized by installed units and the therms saved values are per premise.

natural gas sales and premises by sector for Cascade in calendar year 2012. While the industrial sales number totals 2,651,868 dekatherms, this number includes only non-transport industrial gas customers and represents only 4% of total industrial natural gas sales.

Table 4-1: Cascade 2012 Natural Gas Consumption & Premise Counts by Sector

Sector	2012 Sales (annual dekatherms)	Premise Count
Residential	11,203,608	171,991
Commercial	7,873,584	23,609
Industrial	2,651,868	10,639
Total	12,256,153	206,239

4.1 RESIDENTIAL SECTOR

Table 4-2 shows the breakdown of energy consumption and building stock by residential segment. Single family homes dominate consumption with an 86% share, with multi-family dwellings at 14% of total residential consumption. Manufactured home (such as mobile home) dwellings comprise less than 1% of total residential consumption.

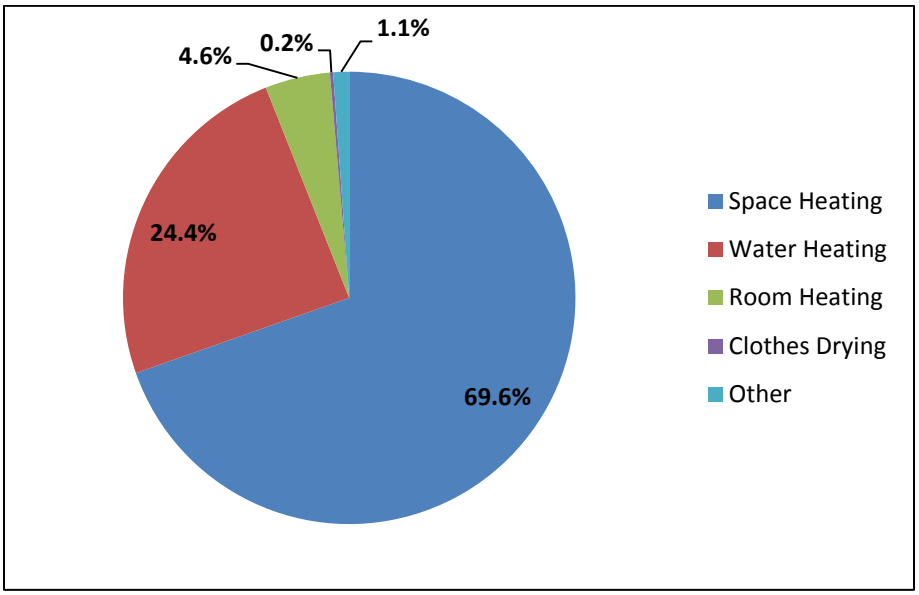

Table 4-2: Residential 2012Natural Gas Consumption & Premise Counts by Segment

Sector	Energy Consumption (annual therms)	Energy Use Share	No. of Premises	Energy Use per Premise (dth)
Single Family	9,657,510	86.2%	143,058	67.5
Multifamily	1,523,691	13.6%	28,542	53.4
Manufactured	11,204	0.1%	391	28.7
Total	11,203,608	100%	171,991	65.1

Nexant further disaggregated Cascade's residential load by end use. **Figure 4-1** shows the distribution of natural gas consumption by end use for all residential households in Cascade's territory.

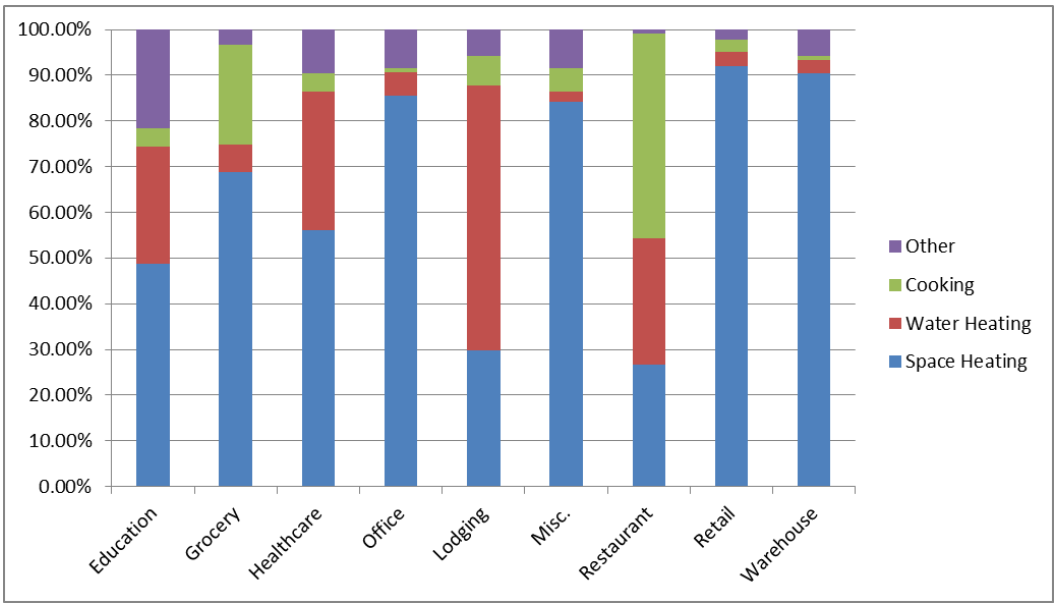
[5] Note: Nexant utilized the definition of premise for this study which removes non-building customer accounts, and other miscellaneous loads from its findings. The number of premises, therefore, and the associated natural gas consumption is less than the number of accounts and top-line natural gas sales that Cascade utilizes in its IRP documents. Furthermore, the number of eligible industrial premises and sales is significantly less due to the large share of transport sales – which were removed because they are ineligible for energy efficiency programs.

Figure 4-1: 2012 Residential Natural Gas Consumption by End Use[6]

4.2 COMMERCIAL SECTOR

Table 4-3 shows the distribution of consumption by commercial segment for all eligible premises. The office and retail segments represent the largest share of consumption at 29.6% and 24.2% respectively.

Table 4-3: Commercial 2012 Natural Gas Consumption & Premise Counts by Segment



Segment	Energy Consumption (annual dth)	Energy Use Share	No. of Premises	Energy Use per Premise (dth)
Education	1,191,963	15.1%	994	1,199
Grocery	590,930	7.5%	1,020	579
Healthcare	312,585	4.0%	512	611
Office	2,329,730	29.6%	8,401	277
Lodging	304,013	3.9%	266	1,143
Misc.	386,424	4.9%	2,470	156
Restaurant	650,618	8.3%	1,318	494
Retail	1,904,289	24.2%	7,152	266
Warehouse	203,032	2.6%	936	217
Total	**7,873,584**	**100.0%**	**23,069**	341

Nexant further disaggregated Cascade's commercial load by end use. **Figure 4-2** shows the distribution of natural gas consumption by end use by segment. Space heating represents the largest share for most

[6] Space Heating refers to central heating equipment end uses, such as furnaces and boilers. Room Heating refers to gas hearths / fireplaces.

segments at 71.9% on average; however certain segments such as lodging and restaurants have a higher share of water heating and cooking load respectively.

Figure 4-2: Commercial 2012 Natural Gas Consumption Shares by Segment, by End Use

4.3 INDUSTRIAL SECTOR

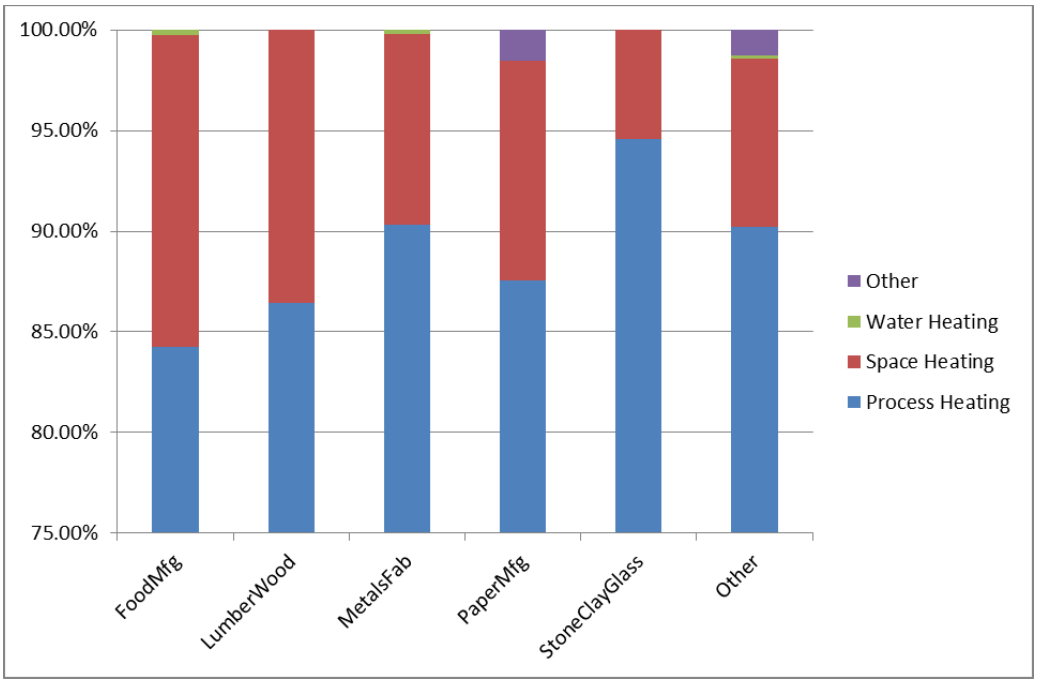


Table 4-4 shows the distribution of consumption by industrial segment for all eligible premises. The food manufacturing segment represents the largest share of energy use at 28.3%, with paper manufacturing representing the smallest share at 2.6% of consumption.

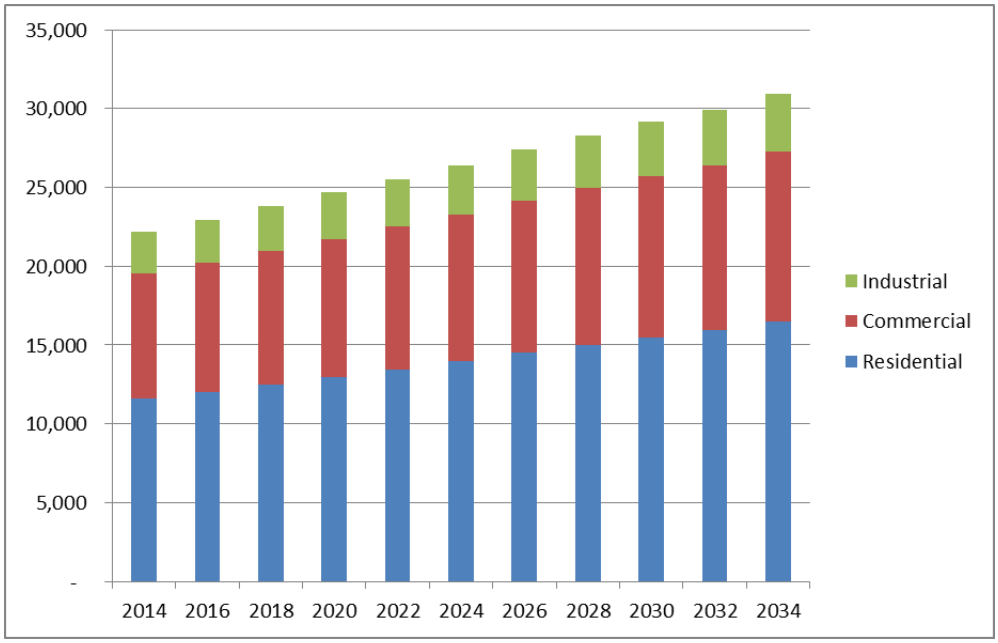
Table 4-4: Industrial 2012 Natural Gas Consumption & Premise Counts by Segment

Segment	Energy Consumption (annual dth)	Energy Use Share	No. of Premises	Energy Use per Premise (dth)
Food Manufacturing	749,223	28.3%	465	1,611
Lumber, Wood Products	90,689	3.4%	340	267
Primary Metals Manufacturing	509,712	19.2%	1,081	472
Paper Manufacturing	69,240	2.6%	62	1,117
Stone, Clay, Glass Production	276,950	10.4%	446	621
Other	956,055	36.1%	8,245	116
Total	**2,651,868**	**100.0%**	**10,639**	**249**

Nexant further disaggregated Cascade's industrial load by end use. **Figure 4-3** shows the distribution of natural gas consumption by segment by end use. Process heating represents the largest share of end use consumption across all segments at 87.1% on average.

Figure 4-3: 2012 Industrial Natural Gas Consumption by Segment, by End Use



5 BASELINE FORECAST DISAGGREGATION

Table 5-1 and **Figure 5-1** summarize the baseline natural gas sales forecast by sector of eligible DSM sales for Cascade's Washington service territory.

Table 5-1: Natural Gas Consumption by Sector, by Year ('000 dth)

Sector	2014	2016	2018	2020	2022	2024	2026	2028	2030	2032	2034

6 PORTFOLIO ENERGY EFFICIENCY POTENTIAL

This section provides an overview of the findings for the entire portfolio of natural gas customers in Cascade's Washington service territory. Natural gas energy efficiency findings for technical, economic and achievable potential are presented in two parts. At the beginning of each section, detailed findings are presented for the "base-case" technical, economic, and achievable scenarios. Where findings are broken out by segment (building type) or end use, they are done so under the achievable base case scenario (for appropriate numbering see Error! Reference source not found.). All base case scenarios were run under the following main assumptions:

- Measure cost effectiveness screen: Utility Cost Test (UCT)
- Incentive percentage of incremental cost (for achievable scenarios): 30%, 50% or 75%
- Avoided Costs: Current avoided costs as provided in Appendix H of Cascade's 2012 IRP
- Discount Rate: 8.55%

Findings are then presented under each cost-effectiveness test (UCT vs. TRC). Additional summary findings on each of the 66 scenarios conducted for this study can be found in **Volume 2, Section 6 and Section 7.**

6.1 BASE CASE PORTFOLIO FINDINGS

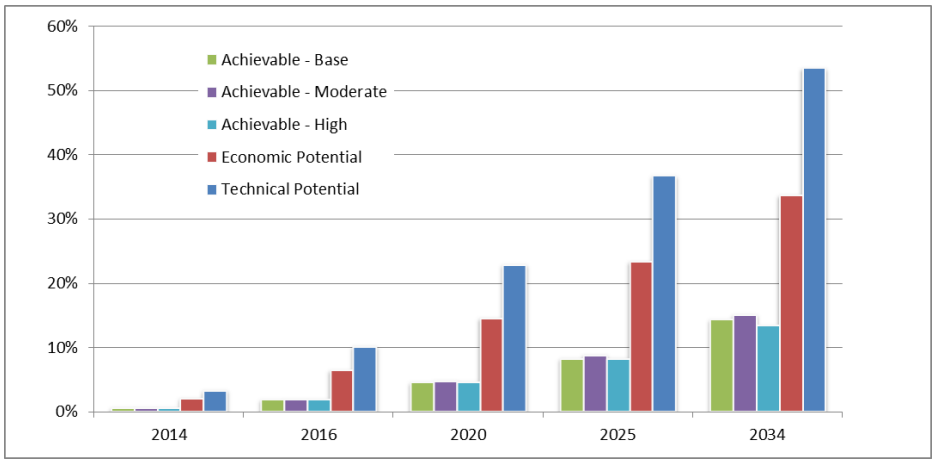
Table 6-1 and

Figure 6-1 present the estimated technical, economic and achievable savings potential for Cascade's Washington service territory under the Utility Cost Test. First year (2014) natural gas conservation achievable base potential under the UCT screen for all sectors is 139,859 dth, representing 0.63% of baseline sales. It should also be noted that the achievable base savings potential is slightly greater than the achievable moderate savings potential (even though the moderate has a more aggressive adoption curve). This occurs because the measure cost used in the cost-effectiveness test under the achievable moderate scenario (50% of incremental cost) compared to the achievable moderate scenario (30% of incremental) causes more measures to fail cost-effectiveness. The fewer measures passing cost effectiveness has a greater impact on potential than the increased adoption of those measures. **Figure 6-2** shows the changes in Cascade's baseline sales forecast under each of the base case potential scenarios, screened with the UCT.

Table 6-1: Portfolio Energy Efficiency Potential Savings by Base Case Scenario under UCT Screen

	2014	2016	2020	2025	2034
Baseline Sales Forecast (dth)	22,191,016	22,948,017	24,688,061	26,974,698	30,927,487
Cumulative Savings (dth)					
Technical Potential	744,155	2,337,526	5,667,873	9,931,037	16,585,195
Economic Potential	476,641	1,494,793	3,606,967	6,314,915	10,434,394
Achievable - Base	139,859	437,581	1,130,474	2,243,553	4,448,248
Achievable - Moderate	137,844	441,098	1,180,749	2,384,769	4,677,603
Achievable - High	141,599	446,575	1,153,137	2,239,052	4,160,771
Energy Savings (% of baseline sales)					
Technical Potential	3.35%	10.19%	22.96%	36.82%	53.63%
Economic Potential	2.15%	6.51%	14.61%	23.41%	33.74%
Achievable - Base	0.63%	1.91%	4.58%	8.32%	14.38%
Achievable - Moderate	0.62%	1.92%	4.78%	8.84%	15.12%
Achievable - High	0.64%	1.95%	4.67%	8.30%	13.45%

Figure 6-1: Portfolio Energy Efficiency Potential Savings (% Sales) by Base Case Scenario under UCT Screen



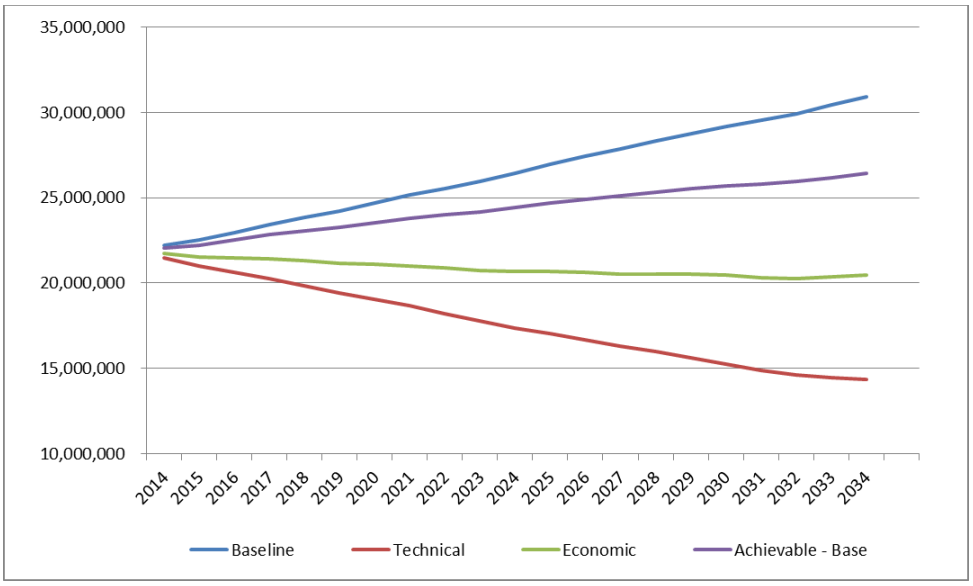


Figure 6-2: 21-year Portfolio Sales Forecast (dth) by Base Case Scenario under UCT Screen

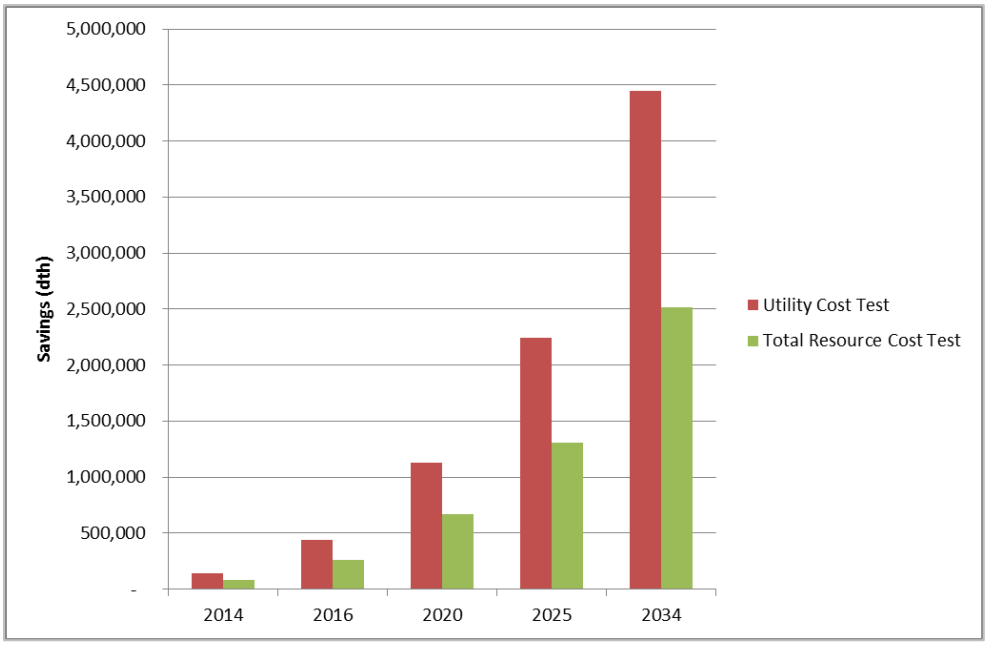

6.2 PORTFOLIO FINDINGS BY COST-EFFECTIVENESS TEST

Table 6-2 and **Figure 6-3** below illustrates the differences in cumulative savings potential based on whether the UCT or TRC test is used to screen measure cost effectiveness. As can be seen there is approximately 40% more savings potential under the achievable base scenario in 2014 under the UCT screen (139,859dth) compared to the TRC screen (83,674 dth). This occurs because the UCT only considers the incentivized portion of the measure cost, thus allowing more measures to pass cost-effectiveness when compared with the TRC screen. It can also be seen that unlike the UCT findings, savings potential increases from achievable base to achievable moderate under the TRC screen because the measure cost is the full incremental cost under all scenarios so the same number of measures are considered under each scenario.

Table 6-2: Portfolio Savings Potential by Base-Case Scenario, by Cost-Effectiveness Screen

	2014	2016	2020	2025	2034

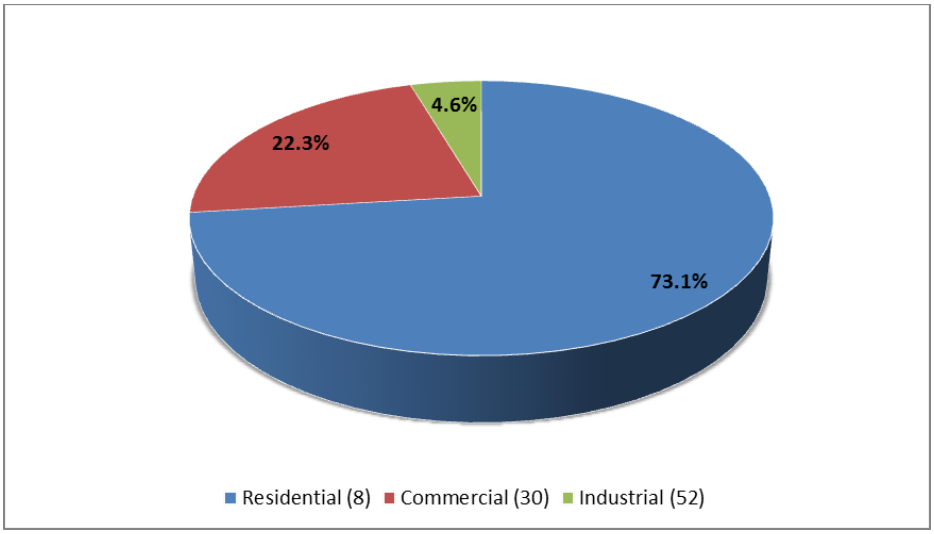

Figure 6-3: Portfolio Achievable Base Potential by Cost-Effectiveness Screen

7 ACHIEVABLE POTENTIAL BY SECTOR

Figure 7-1 shows the distribution of savings by sector for the achievable base scenario. Residential shows the largest potential at 73% of the total, with Commercial representing 22% and Industrial just under 5%.

Figure 7-1: 2014 Achievable Base Savings Potential by Sector under UCT Screen

7.1 Residential Potential Findings

7.1.1 Base Case Residential Findings

Table 7-1 and Figure 7-2 present the estimated cumulative technical, economic and achievable savings potential for the residential sector in Cascade's Washington service territory under the Utility Cost Test (UCT). Cascade's 2014 achievable-base savings potential is estimated at 102,231 dekatherms, reaching 3.1M dekatherms in 2034, representing 0.9% and 18.9% of current year sales respectively.

Table 7-1 Residential Cumulative Natural Gas Savings Potential by Base Case Scenario under the UCT

Figure 7-2: Residential Energy Efficiency Potential Savings (% of Sales) by Base Case Scenario (UCT)

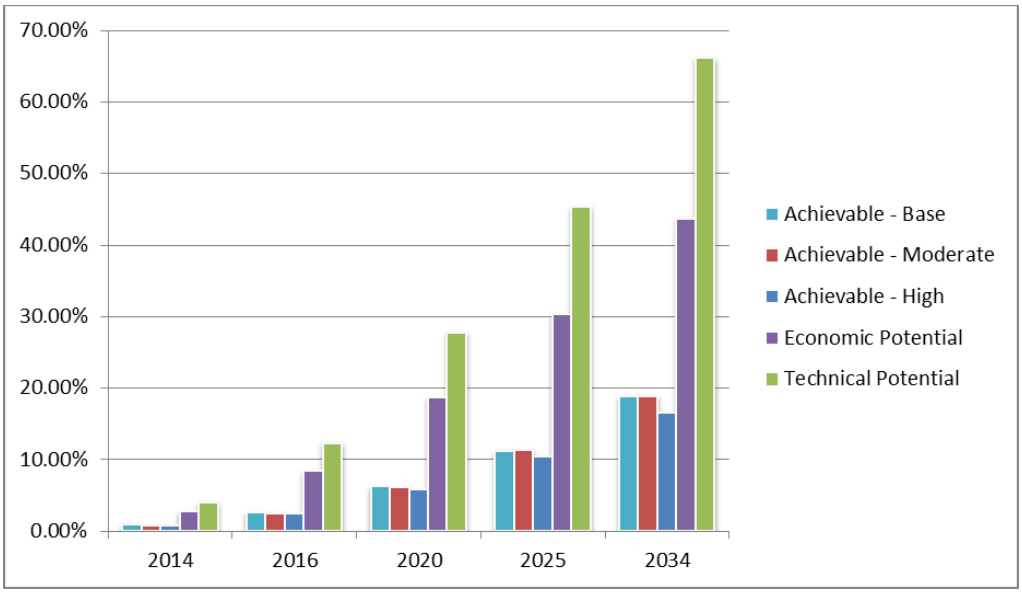

Table 7-2 shows the achievable savings potential when screened at various levelized cost/therm under the UCT test. Given its current program funding threshold of $0.42/levelized cost per therm, Cascade could potentially realize 73,677 dth of savings in 2014 were it to implement all cost-effective residential measures[7].

Table 7-2: 2014 Residential Achievable Potential (dth) Screened by Levelized Cost ($/therm) under UCT

	Screened at Levelized Cost of:						
	$0.12	$0.22	$0.32	$0.42	$0.53	$0.64	$0.75

Figure 7-3 and **Table 7-3** summarizes the savings potential in the residential sector under the achievable-base scenario by segment and by end use. The single family segment shows the most potential for savings both on a total therms basis, and as a percentage of segment sales, while the space heating end use represents the largest share of end use savings at approximately 62% of total savings.

[7] This estimate also precludes other program potential constraints such as available budget, realization of administrative costs, regulatory considerations, among others.

7.1.2 Residential Findings by Cost-Effectiveness Screen

Table 7-4 below illustrates the differences in cumulative savings potential based on whether the UCT or TRC test is used to screen measure cost effectiveness. There is more achievable potential under the UCT test due to its more favorable cost-effectiveness screening methodology with achievable base savings of 102,231 dekatherms in 2014 (compared to 58,075 dekatherms under the TRC). For the Economic and Achievable Base scenarios UCT savings are higher than TRC savings by about 40%. UCT is also higher than TRC in the Achievable Moderate scenario by about 20%, whereas in the Achievable High scenario TRC savings are greater than UCT by about 5%.

Table 7-4: Residential Savings Potential by Base-Case Scenario, by Cost-Effectiveness Screen

7.2 COMMERCIAL POTENTIAL FINDINGS

7.2.1 Base Case Commercial Findings

Table 7-5 and
Figure 7-4 present the estimated technical, economic and achievable savings potential for the commercial sector in Cascade's Washington service territory under the Utility Cost Test. 2014 savings potential in the commercial sector under the achievable base scenario is 31.229 dth, representing 0.39% of current year sales. Under a higher incentive rate of 75%, the 2014 savings potential in the commercial sector under the achievable high scenario increases to 37,461 dth, representing 0.47% of sales.

Figure 7-5 and **Table 7-7** show the achievable base potential by commercial segment by end use. Achievable base savings is fairly evenly distributed among the various segments with the most residing in education (25%) and the least in warehouses (0.9%). Again, these savings potential align closely with baseline sales. The majority of 2014 savings also reside in space heating (51%) and water heating (45%) across all segments. However, some segments such as restaurants see a higher share of savings potential in the cooking end use (4.3%).

7.2.2 Commercial Findings by Cost Effectiveness Screen

As noted above, Nexant examined savings potential under both the TRC and UCT screen to comply with WUTC's October 9, 2013 Policy Statement regarding cost screening. **Table 7-8** below illustrates the differences in cumulative savings potential based on whether the UCT or TRC test is used to screen measure cost effectiveness. . Similar to the residential sector, significantly more savings potential is realized under the UCT screen with 31,228 dth in 2014 compared to 20,408 dth under the TRC screen.

Table 7-8: Commercial Savings Potential by Scenario, by Cost-Effectiveness Screen (dth)

	2014	2016	2020	2025	2034

7.3 Industrial Potential Findings

7.3.1 Base Case Industrial Findings

Table 7-9, and
Figure 7-6 present the estimated technical, economic and achievable savings potential for the industrial sector in Cascade's Washington service territory under the Utility Cost Test. Cumulative savings by the

year 2034 are projected at 20% of baseline sales for Technical Potential, and this savings potential reduces to 4.8% over the 20 year study horizon for the Achievable Base scenario. As is the case with each sector, the Achievable scenario's projected savings are not necessarily linear with the 'base', 'moderate', and 'high' designations.

Table 7-9: Industrial Energy Efficiency Potential Savings by Base Case Scenario (UCT)

	2014	2016	2020	2025	2034
Baseline Sales Forecast (dth)	2,663,312	2,749,499	2,945,178	3,203,435	3,629,550

Figure 7-7 and

Table 7-11 below summarize the cumulative industrial savings potential by segment by end use. By segment under the achievable base savings scenario, Food Manufacturing and the "Other"[8] category are projected to make up roughly 33% each of total potential savings, while Metals Fabrication makes up the third largest potential savings at 19.5% of the total potential. Process Heating End Use represents the majority of the savings opportunity in all industrial segments. No water heating or "other" end use measures passed cost-effectiveness, and therefore have no achievable potential in the industrial sector.

Figure 7-7: 2014 Achievable Base Savings Potential by Industrial Segment (UCT)

[8] The "Other" industrial segment includes various industries including textiles, petroleum and allied products, printing, chemicals and allied products, leather manufacturing, electronic manufacturing, forestry, among other many other industrial industry facility types.

Table 7-11: 2014 Achievable Base Savings by Industrial Segment, by End Use (UCT)

7.3.2 Industrial Findings by Cost Effectiveness Test

Table 7-12 below illustrates the differences in cumulative savings potential based on whether the UCT or TRC test is used to screen measure cost effectiveness. As with the other sectors, UCT potential is consistently larger than TRC potential by amounts varying from 8%-37% higher, with 21 year UCT savings ranging from 175,531 dth under the Achievable Base scenario, to 225,057 dth under the Achievable moderate scenario.

Table 7-12: Industrial Savings Potential by Scenario, by Cost-Effectiveness Screen

	2014	2016	2020	2025	2034

8 CONCLUSIONS

The results of this study reveal that considerable natural gas energy efficiency opportunities exist for Cascade Natural Gas Corporation in its Washington service territory, despite recent declines in the cost of natural gas, the savings achieved to-date by Cascade's DSM programs, and increasing building standards due to the 2012 Washington State Energy Codes for buildings. Our analysis shows that 137,844 dth of natural gas savings are achievable in 2014 across all sectors when measures are screened using the UCT, increasing to 4.5M dth of cumulative natural gas savings by 2034. These findings should be viewed with the following considerations in mind:

- The natural gas savings potential highlighted in this report does not reflect "program potential", but rather achievable potential which assumes all cost-effective measures are pursued and implemented.
- The achievable potential findings also assume no limitations on program spending to achieve all cost-effective measure savings.
- Administrative costs were not included when screening measures for cost-effectiveness.
- The approach of using the UCT as the cost-effectiveness screen departs from prior potential studies conducted for Cascade. Prior studies for Cascade utilized the TRC cost-effectiveness screen which typically results in less saving potential when compared to the UCT. Nexant has run various scenarios to illustrate the difference in savings potential under both the UCT and TRC cost-effectiveness screen.
- The measure costs utilized for the purposes of the potential assessment are lower resolution than those that would be available by the company for program planning. For program planning purposes the costs may be refined by the company to better reflect costs in their specific service territory.
- This report (**Volume I**) provides summary findings of the base-case and cost-effectiveness screen scenarios. Detailed cumulative natural gas savings potential by sector, by segment, by end use and by year are presented for all 66 scenarios modeled by Nexant in **Vol. III, Appendix B**.

1 INTRODUCTION

1.1 OVERVIEW

Cascade Natural Gas Corporation ("Cascade") has offered energy efficiency programs to its customers since the 1990s with expanded programs beginning in 2008. In light of significant changes to codes, costs, technologies, and gas prices that have taken effect in the past four years, Cascade has contracted with Nexant, Inc. ("Nexant") to perform a comprehensive assessment of the technical and achievable natural gas conservation potential within Cascade's Washington service territory for residential, commercial and industrial sectors. This assessment references Cascade's potential assessment conducted in 2006 by the Energy Trust of Oregon, which in turn was refined in 2009 to include Cascade's Washington conservation potential. The assessment conducted in 2006 and refined in 2009 included all of the Cascade Natural Gas service territory in Washington and Oregon. This assessment does not directly build on those reports; and thus represents a new assessment of Cascade's energy efficiency potential. This assessment stands apart from previous studies as a potential assessment for Cascade Natural Gas Washington State service territory only. The findings of this assessment will help inform the development of Cascade's Integrated Resource Planning (IRP) process as well as provide guidance for future program planning and development efforts. In addition to providing potential assessment, Cascade also requested Nexant evaluate energy savings associated with measures installed by participants in Cascade's Conservation Incentive Program during 2011/12.

This report presents results of the technical, economic, and achievable potential for natural gas energy efficiency savings in Cascade's Washington service territory over the next 21 years (2014-2035). Program potential was not included in the study scope, but could be developed by Cascade using the findings of this study and based on regulatory/budgetary parameters, cost-effective thresholds, policy considerations, and decisions on which subset of cost-effective measures to offer to customers going forward. Nexant assessed therm savings realized through Cascade's program to-date, researched natural gas energy efficiency measures to estimate measure-specific savings, costs and lifetimes, and conducted a detailed bottom-up assessment of the Cascade market to provide a credible and transparent estimation of the technical and achievable energy efficiency potential.

1.2 STUDY GOALS

The primary goal of this assessment was to develop a comprehensive assessment of technical and achievable potential for natural gas energy efficiency within Cascade's Washington service territory for customers on Rate Schedules 503, 504, 505, 511, 570 & 577 (residential, commercial and non-transport sales industrial customers). This objective analysis illustrates the remaining savings potential by sector, segment and end use as a means to inform future program design given the declining cost of natural gas. The study also integrated a detailed evaluation and measure savings review of Cascade's conservation portfolio. Key objectives of this study include:

- Provide credible and transparent estimation of the technical and achievable energy efficiency potential by year over the next 21 (2014-2034) years within Cascade's Washington service territory;
- Assess and validate therm savings associated with key measures that qualified for, and received, a conservation incentive in the 2012 program year, and apply findings to determine realistic therm savings potential in Cascade's Washington Service area;
- Provide a user friendly, executable dynamic model that will support the potential assessment and allow for testing of sensitivity of all model inputs and assumptions;
- Develop a final report including summary data tables and graphs reporting incremental and cumulative potential by year from 2014 through 2034.

1.3 REPORT ORGANIZATION

This report is presented in three volumes as outlined below. This document represents **Volume 2: Assessment of Achievable Potential and Program Evaluation.**

- Volume 1: Executive Summary
- Volume 2: Assessment of Achievable Potential and Program Evaluation
- Volume 3: Detailed Appendices

2 METHODOLOGY

Energy efficiency potential studies involve a number of analytical steps to produce estimates of each type of energy efficiency potential: technical, economic, and achievable. This study utilizes Nexant's in-house developed Microsoft Excel-based modeling tool, TEA-POT (**T**echnical/**E**conomic/**A**chievable **Pot**ential). This modeling tool is built on a platform that provides the ability to run multiple scenarios and re-calculate potential savings based on variable inputs such as sales/load forecasts, natural gas prices, discount rates, and actual program savings. This model provides Cascade with the utmost transparency into the assumptions and calculations for estimating market potential. TEA-POT has been consistently upgraded and refined over the past several years, with the most recent upgrade occurring in 2012. The major analytical steps are summarized below and specific changes in methodology from one sector to another have been noted throughout this section.

2.1 MEASURE SAVINGS REVIEW

A thorough review of Cascade's past evaluated therm savings associated with its DSM programs not only provided critical feedback to Cascade DSM program managers, but also helped provide important baseline savings and participation data that informed both remaining potential as well as the market adoption curves discussed in **Section 2.2.5.4**. Nexant developed a three-pronged approach to review the energy savings for Cascade's current portfolio of natural gas measures for the 2011/2012 program year: 1) A detailed desk review of submitted application forms, 2) Telephone surveys to verify proper measure documentation, installation and savings parameters, and 3) Billing analysis to evaluate pre and post installation energy consumption for relevant measures. The approach is outlined below.

2.1.1 Sample Selection

As a first step in evaluating Cascade's program, Nexant reviewed Cascade's DSM residential and commercial/industrial participation database to design a cost effective sample frame that would provide statistically meaningful findings. The sample was divided into a desk/telephone review sample frame and a billing analysis sample frame for both the residential and commercial sector. Program participants from the period June 1, 2011 through May 31, 2012 were identified as the eligible sample population[1].

The desk/telephone review sample was drawn from all measure categories within each sector. The number of sample points for each stratum is illustrated in **Table 2-1** below along with the estimated confidence/precision of Nexant's findings, assuming a coefficient of variance (Cv) of 0.5 and the available population during the evaluation period. Within each substratum of participants (e.g. residential furnace participants), accounts were selected using a simple random sampling method, except for the

[1] This guaranteed that Nexant has one full year of billing data available pre and post measure installation for the billing analysis discussed in Section 3.1.3.

commercial furnace and boiler participants where all (i.e. census) of the eligible participants were chosen from the evaluation time period.

Table 2-1: Sample Frame for Telephone/Desk Review

Sector	Cascade Sampling Approach	Sample Points	Confidence / Precision[2]	Measure Type
Residential	Desk Reviews	31	90/15	All
	Telephone Reviews	18	90/20	All
Commercial	Desk Reviews	27	90/8	All
	Telephone Reviews	19	90/11	All

2.1.2 Verifying Proper Measure Documentation

As a means to provide additional validity into the saving values reported by Cascade, Nexant conducted a spot-check desk review of a statistical sample of the completed projects in 2012 to ensure the savings methodologies were consistently applied and key parameters were correctly recorded into Cascade's participant database. In total 58 projects were randomly selected for desk review. A sub-sample of 37 participants was then called and a telephone survey conducted to verify installation and savings metrics.

The detailed review for the sample projects aimed to determine 1) if the data files of sampled projects are complete, well-documented, and adequate for calculation and reporting of the savings; and 2) whether the calculation methods used were correctly applied, appropriate, and accurate, and whether or not all necessary fields were properly populated.

Any inconsistencies found during this review are documented (see **Section 3:**

Measure Savings Review Findings). Based on these findings, recommendations are provided on changes to future program documentation approaches, if necessary.

[2] The confidence interval indicates a range within which one can be certain of the outcome. For example, using a 90/15 confidence/precision, indicates that 90% of the time, the results would occur within 15% of the reported value. While a higher 'confidence' infers higher actual confidence in the result, a lower 'precision' infers higher confidence.

2.1.3 Billing Analysis

The billing analysis assessed Furnace and Domestic Hot Water measure installations for residential participants and Furnace and Boiler measure installations for commercial/industrial participants[3]. The actual number of sample points for each stratum is shown in **Table 2-2** along with the estimated confidence/precision, assuming a coefficient of variance (Cv) of 0.5 and the given sample population during the evaluation period. Within each substratum of participants (e.g. residential furnace participants), accounts were selected using a simple random sampling method, except for the commercial furnace and boiler participants where all of the eligible participants were chosen from the evaluation time period.

Table 2-2: Sample Frame for Billing Analysis

Sector	Sample Points	Confidence / Precision	Measure Type
Residential	50	90/8	Water Heater
	53	90/11	Furnace
Commercial	8	90/20	Furnace
	5	90/30	Boiler

Nexant conducted a regression analysis of a sample of 116 projects to evaluate pre- and post-installation energy consumption using customer billing data from the period June 1, 2010 through May 31, 2013. Participants were initially screened to ensure 12 months of consistent billing data and occupancy prior to and after the measure was installed. For example, if there was a change in occupancy during the analysis period, Nexant removed that account from the analysis. For accounts where the billing data looked unusual compared to predictions, Nexant contacted the participants to ask a series of adjusted baseline questions. These questions aimed to determine if there were any notable changes to the baseline inputs for a given measure. For example, a change in the number of occupants[4] or the installation of additional major efficiency measures would deem that customer ineligible for the billing analysis. While Nexant initially targeted a census (i.e. all) commercial participants that received a rebate for a furnace or boiler in the study period, only 13 of the 39 participants were deemed eligible for the evaluation due to reasons listed above.

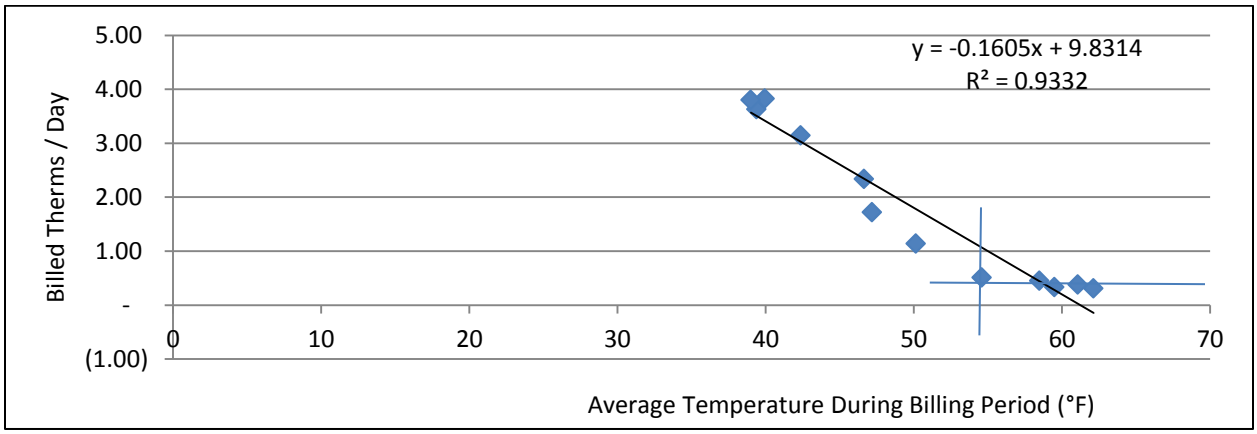
[3] These measure categories were chosen for the billing analysis not only given their high impact on portfolio savings, but also because they are the most appropriate measures for this type of analysis.

[4] With a different number of people in the household, various occupancy factors such as the amount of water consumed would change by an unknown amount, making the regressions analysis unreliable in predicting energy savings.

Due to limitations in data reporting, all measures were assumed to be replacements when the equipment reached the end of its useful life[5], with the baseline condition considered to be a new standard efficiency measure (2009 WA Code, **Table 2-3**). Measure efficiency inputs were pulled from available data provided in the rebate application form.

Table 2-3: Billing Analysis Baseline Efficiency Assumptions

Sector	Measure Type	Assumed Baseline Efficiency
Residential	Water Heater	58%
	Furnace	80%
Commercial	Furnace	78%
	Boiler	80%



The following method was used to analyze each participant's billing data: Collect gas usage and meter read dates:

1. Collect gas usage and meter read dates.
2. Conduct initial screen to determine the appropriate billing history (12 months pre- and post-retrofit).
3. Determine climate zone specific heating degree days (HDDs) and reference heating temperature as applicable to each utility bill.
    (1) Heating degree days were calculated in the conventional manner. For each day in the observation period (i.e., billing period), the average daily temperature is first computed as the average between the minimum and maximum temperatures over the 24 hours of that day. The number of degree days for a specific day is the difference between the temperature chosen as the reference and the observed mean temperature. For heating, if the mean temperature is higher than the reference temperature, HDD is zero. The HDD for each day is summed across the number of days in the observation period to form the variable in **Equation 2-1**. Typical Mean Year (TMY) temperature values were used for projections.
    (2) As applied in a statistically based analytical framework, the reference temperature (Trc) is defined as the temperature that maximized the explanatory power of the model above (i.e., minimizes sum of squared residuals). Physically, Trc approximates the outdoor temperature above which the heating system must operate to maintain a constant indoor air temperature (D. Belzer, 2007). In this approach, the measure of degree days varies by household, derived from the pattern of actual consumption

[5] A reasonable assumption given that virtually all residential measure adoptions are completed at the end of the equipment's useful life.

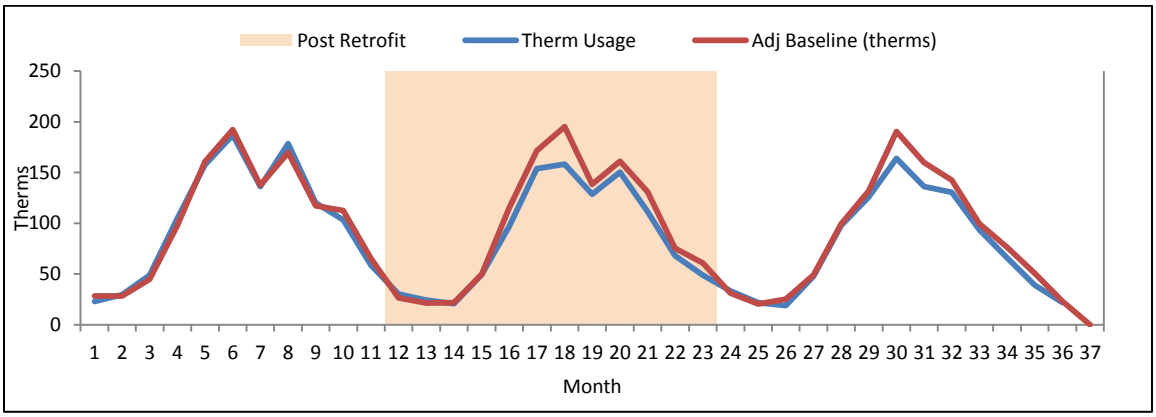
rather than being based on some fixed temperature (e.g., 65°F, as a commonly published value)[6]. **Figure 2-1** below demonstrates the x-axis temperature values begin leveling out at the building-specific balance temperature (see blue crosshairs), which is 54° in this instance.

Figure 2-1: Illustration of Project-Specific HDD Threshold

4. Use linear regression of gas usage vs. HDDs to determine the heating load of each residence. The model is formulated as outlined in the equation below:

Equation 2-1: Billing Analysis Linear Regression Formula

$E=a+b\text{HDD}(T_{rc})+e$ where:



i. E= Energy consumption
ii. *a,b* = regression-model coefficients
iii. HDD = Heating Degree Days
iv. T_{rc}=reference temperature for heating
v. e=error term

In this equation, the *b* coefficient indicates the magnitude of the response of heating energy to changes in outside temperature. It incorporates both the thermal integrity of the structure as well as the efficiency of the heating equipment. Energy consumption for non-space conditioning (base level consumption) is represented by coefficient *a*. If monthly data is used in the equation, then *a* would represent average monthly non-space conditioning energy use. For homes using natural gas for space and water heating, this base-level use primarily results from water heating and cooking.

[6] This premise-specific approach was used for the billing analysis only. For the measure research component of the market potential study, Nexant utilized a fixed temperature of 65°F when estimating therm savings for weather-dependent residential measures. The fixed 65°F building balance temperature aligns with Cascade's IRP methodology.

Following this initial screen, a linear regression of the billing data was compared to projected therms consumption for the account. Should the r^2 values of this linear regression be less than 0.80, the account behavior was considered anomalous and disqualified from the final summary. **Figure 2-2** shows a sample output of the actual and adjusted energy consumption of one of the project analyzed, with an R^2 value of 0.987.

Figure 2-2: Sample Modeled Baseline and Adjusted Energy Consumption.

4. Calculate baseline gas consumption using a ratio of code efficiency to installed efficiency (as described in the rebate application).
5. Verified savings = Baseline gas consumption – Post-retrofit gas consumption.

The final step in the billing analysis compared average determined savings values to Cascade's reported savings values. This data is reported in **Section 3:**

Measure Savings Review Findings**.**

2.2 Energy Efficiency Potential Methodology

The energy efficiency potential in the Cascade's territory can be characterized by levels of opportunity. The ceiling or theoretical maximum is based on commercialized and emerging technologies and behavior measures, whereas the realistic savings that may be achieved through DSM programs reflects real world market constraints such as cost-benefit considerations, market barriers such as regional

economic conditions and customer perspectives, and finally budget and planning constraints. This analysis defines these levels of energy efficiency potential according to the Environmental Protection Agency's (EPA) National Action Plan for Energy Efficiency (NAPEE) [7] as illustrated in **Table 2-4**.

Table 2-4: Energy Efficiency Potential

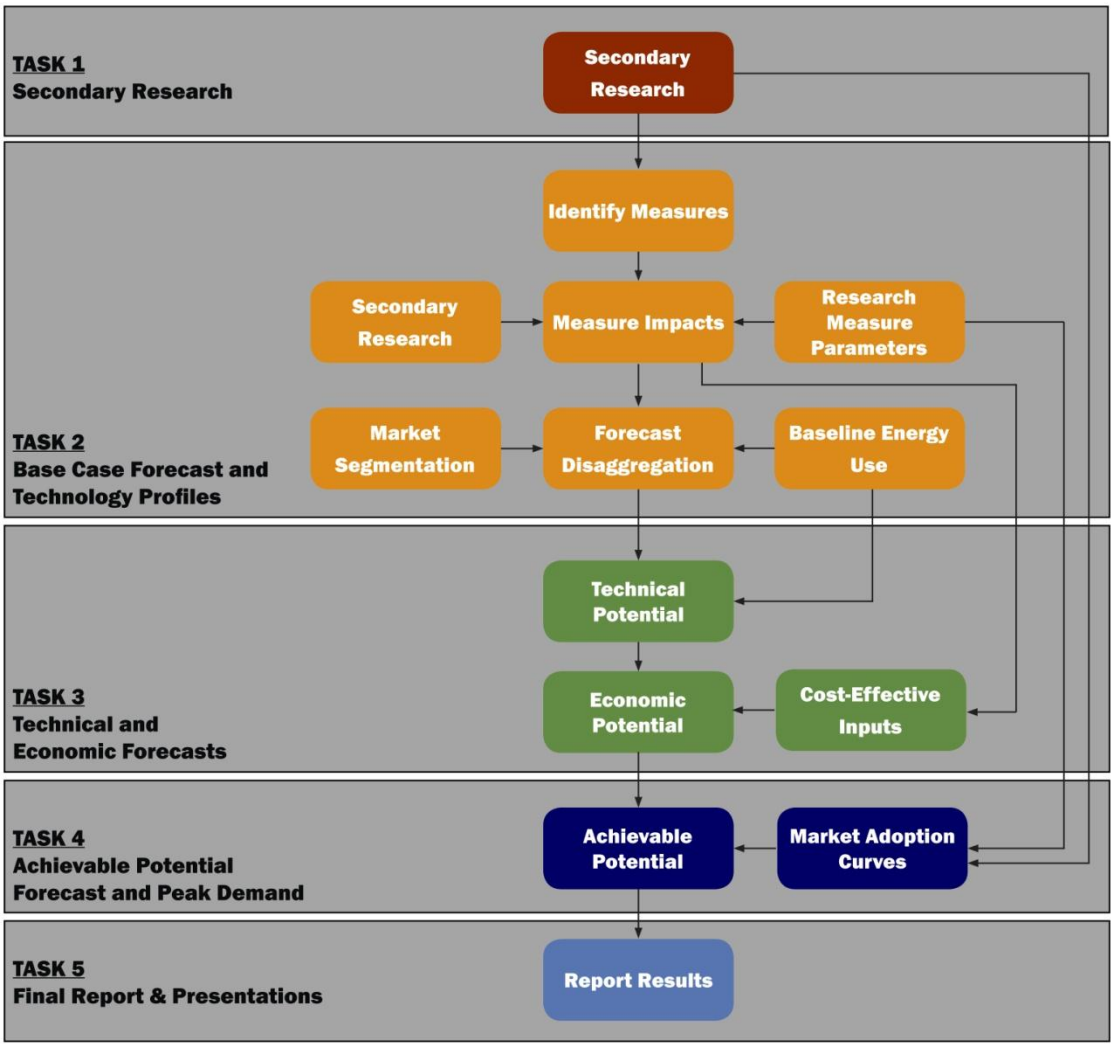
EPA – National Guide for Resource Planning

- **Technical Potential** is the theoretical maximum amount of energy and capacity that could be displaced by efficiency, regardless of cost and other barriers that may prevent the installation or adoption of an energy-efficiency measure. Technical potential is only constrained by factors such as technical feasibility and applicability of measures.
- **Economic Potential** is the amount of energy and capacity that could be reduced by efficiency by measures that pass a cost-effectiveness test. It is at this screen, that utility discount rates and avoided costs are considered when valuing the costs and benefits of saved energy. The Total Resource Cost (TRC) Test estimates the measure costs to both the utility and customer, while the Utility Cost Test (UCT) estimates the measure costs to the utility. Like Technical Potential, Economic Potential is a theoretical number that assumes immediate implementation of efficiency measures, with no regard for the gradual "ramping up" process of real-life programs. Market barriers are ignored, and only the costs of the efficiency measures themselves are considered.
- **Achievable Potential** is the energy savings that can feasibly be achieved with cost-effective measures through program and policy interventions. For this analysis, Nexant assessed the achievable savings potential given various utility-provided incentive levels of an energy efficient measure's incremental cost. Real-world barriers are also taken into account, such as convincing end-users to adopt energy efficiency measures and the capability of programs and administrators to ramp up program activity over time. Taken together, the incentive level corresponds to a market adoption curve for all applicable measures.

[7] The EPA National Action Plan for Energy Efficiency: http://www.epa.gov/cleanenergy/documents/suca/napee_report.pdf

- **Program Potential** reflects the realistic quantity of energy savings the utility can realize through DSM programs during the horizon defined in the study. Savings delivered by program potential is often less than achievable potential, due to real-world constraints, such as program utility program budgets, cost-effectiveness thresholds, regulatory and policy statements, and decisions on which subset of cost-effective measures a utility ultimately decides to include in its portfolio.

The quantification of these four levels of energy efficiency potential is an iterative process reflecting assumptions on cost effectiveness that drill down the opportunity from the theoretical maximum to realistic program savings. This study explores technical, economic, and achievable conservation potential (program potential is not included in this assessment). That is, this study did not consider budget constraints nor did it consider the actual portfolio of measures offered through Cascade's DSM programs today or in the future. Achievable potential, therefore, reflects the savings potential given an unlimited utility budget to implement all cost-effective measures. It is from this upper-bound, from which Cascade can analyze the program potential given its limited resources to pay for and implement a sub-set of cost-effective measures. Data summarized in each section's supply curve (for example, see *Error! Reference source not found.* and **Table 7-3** for the residential sector), will help Cascade set its internal efficiency goals given the levelized cost of measure savings.



The California Standard Practice Manual[8]provides the methodology for estimating cost effectiveness of energy efficiency measures, bundles, programs or portfolios based on a series of tests representing the perspectives of the utility, customers, and stakeholders. In this potential study, individual measures were screened and bundles were analyzed for cost-effectiveness using the Total Resource Cost (TRC) and Utility Cost Test (UCT) from the Standard Practice Manual.

2.2.1 Quantifying Energy Efficiency Potential

A high level overview of the approach executed for the assessment of the energy saving potential for natural gas in Cascade's Washington service territory is illustrated in **Figure 2-3** and is further detailed throughout the remainder of this section.

[8] California Standard Practice Manual: http://www.energy.ca.gov/greenbuilding/documents/background/07-J_CPUC_STANDARD_PRACTICE_MANUAL.PDF

Figure 2-3: Approach to Work

2.2.2 End-Use Baseline Sales Forecast

A critical first step in estimating energy efficiency potential is establishing a realistic energy use baseline and end-use saturation numbers from which a 10-year "business as usual" forecast can be built upon. The approach described below outlines this process and is followed by a discussion of the approach to defining the existing energy savings baseline for energy-efficiency measures.

The team utilized a compiled database of information on utility loads and sales forecasts, market data (fuel shares, energy system saturations, and structural characteristics), end-uses (unit energy consumption (UEC), energy use intensities (EUI) and load shapes), technology shares, and measure characteristics (technologies, costs, life, and savings) from existing primary and secondary data sources. The data collection and mining effort involves a search of available secondary sources including:

- Data and policy statements directly applicable to Cascade's Washington service territory, including:
    - 2009 Cascade Gas energy-efficiency potential assessment
    - Cascade's 2012 IRP document
    - Cascade's program participation database
    - Washington Utilities and Transportation Commission's "Policy Statement on the Evaluation of the Cost-effectiveness of Natural Gas Conservation Programs (Docket UG-121207)
- Regional studies, including:
    - Northwest Energy Efficiency Alliance (NEEA) Residential Building Stock Assessment (RBSA)
    - NEEA Commercial Building Stock Assessment (CBSA)
- Washington-specific and pacific northwest sections of National studies, examples including:
    - Residential Energy Consumption Study (RECS, with household characteristics data tables)
    - Commercial Buildings Energy Consumption Study (CBECS)
    - Manufacturing Energy Consumption Study (MECS)
- Energy market characterization and energy-efficiency potential assessments conducted for other natural gas utilities, including:
    - NorthWestern Energy End-Use and Load Profile Study, 2009
    - Ontario Energy Board 2009 Measures and Assumptions for DSM planning
    - CA Database for Energy Efficient Resources (DEER)
    - Illinois Statewide Technical Reference Manual (TRM) 2013
    - Wisconsin Focus on Energy TRM 2012
    - Puget Sound Energy's 2013 IRP document

2.2.3 Load Disaggregation and Forecast Study

After the collection of applicable secondary data sources, the next step is to disaggregate the most recent year of completed sales (2012) into a baseline year. In this study, the team disaggregated end-use loads and technologies and applied them across the study horizon by:

- Determining energy consumption per customer class and segment in baseline year.
- Disaggregating customer class loads into end-use loads, such as space heating.
- Segmenting end-uses loads into technologies, such as furnaces.
- Analyzing and calibrating data to 2012.

- Forecasting the 21-year end-use energy consumption through 2034.

2.2.3.1 Determine Energy Consumption per Customer Class and Segment in Baseline Year

The first step in the forecast disaggregation is to analyze energy loads for the residential, commercial and industrial customer classes. Separate models were developed for the residential, commercial and industrial sector. Segmentation was developed per market segment as follows:

- ***Residential:*** Single-family, multi-family home, and manufactured home.
- ***Commercial:*** Education, Grocery, Healthcare, Office, Lodging, Restaurant, Retail, Warehouse, Misc.
- **Industrial:** Food Manufacturing, Lumber/Wood Products, Primary Metal Manufacturing & Fabrication, Paper Manufacturing, Stone/Clay/Glass Production, Misc.

2.2.3.2 End-Use Load Classification

The next step in the forecast disaggregation analysis is to establish the end-use loads within the residential, commercial and industrial market segments. A sample of the types of end-use loads to be analyzed is found in

Table 2-5**.**

Table 2-5: End-Use Loads by Sector

Residential	Commercial	Industrial
Space Heating	Space Heating	Space Heating
Water Heating	Water Heating	Water Heating
Cooking	Cooking	Process Heating
Room Heating (Gas Fireplace/Hearth)	Other	Other
Clothes Drying	-	-
Other	-	-

2.2.4 Measure List Research

Once the baseline forecast is disaggregated, the next step to assessing market potential was to accurately detail the universe of efficiency measures and their savings, costs and lifetimes. Measures that are currently implemented in Cascade's Gas programs, as well as those measures found in other adjacent utility DSM programs, received careful consideration since these measures have a historical record and vendors have proven processes for implementation. Additionally the Nexant team, through its previous assignments, compiled one of the most comprehensive sets of energy efficiency measures available today. The list of measures can be found in **Section 9.** This list includes measures from Cascade's current portfolio of programs, measures evaluated in the Cascade's 2009 potential study, the California Database for Energy Efficiency Resources (DEER), various technical reference manuals (TRMs),

like those used for the State of Illinois, Wisconsin and the province of Ontario, as well as other measures the Nexant team has characterized in similar studies. From these databases measures that are commonly available, based on well-understood technology, and applicable to the buildings and end-uses, were selected for the measure list. Consideration was also be given to measures that show promise for future viability but have not yet gained a foothold in the market.

Energy efficiency potential adoption in the marketplace can be captured over time through three principal processes:

- **Turnover:** Replacements are made normally in the market when a piece of equipment is at the end of its effective useful life (also referred to as "replace-on-burnout")
- **Early Retirement:** Replacements are made before the end of an equipment's expected useful life(also referred to as "retrofit").
- **New:** When a measures is installed in a newly constructed home or building.

Upon finalization of the energy efficiency measure list data on energy savings, costs, lifetime, and applicability was collected to determine potential measure impacts. This work was performed through a four step process outlined below.

Step 1: Define market classes for application of measures

In line with the disaggregated load forecast, the team defined the applicability of the appropriate fuel type, sectors, market segments, vintages, and end-uses to each of the measures. These classes are defined as follows:

- ***Customer Sectors:*** Residential, commercial and industrial.
- **Market Segments:**
  - *Residential:* Single-family, multi-family home, and manufactured home.
  - *Commercial:* Education, Grocery, Healthcare, Office, Lodging, Restaurant, Retail, Warehouse, Misc.
  - *Industrial:* Food Manufacturing, Lumber/Wood Products, Primary Metal Manufacturing & Fabrication, Paper Manufacturing, Stone/Clay/Glass Production, Misc.
- ***Measure Type:*** Equipment, Non-equipment [9]
- ***Vintages:*** Equipment – Turnover, Retrofit, New
  Non-equipment – Existing, New

[9] Equipment measures are units that actually consume natural gas, such as a furnace. Non-equipment measures do not consume natural gas directly, such as windows or insulation.

Step 2: Screen sectors, segments, and end-uses for eligibility

The Nexant team screened market segments and end-uses for applicability of specific energy efficient strategies. For example, certain commercial end-uses, such as cooking loads, may not be appropriate for segments such as offices and warehouses, and were analyzed only in limited market sectors.

Step 3: Develop base case impacts and costs

For each of the energy efficiency measures on the final list, base case equipment and practices was determined. A description of all base case equipment and practices was documented, along with a description of why that particular base case was the best representation. All base case assumptions and data, such as Washington state building codes and federal standards, were included. Base case assumptions included projected future shifts in the base, such as the upcoming 2015 Federal Standards' impact on water heater code minimums.

Step 4: Develop energy efficiency measure impacts and costs

A description of all energy efficiency (or "change case") measure equipment and practices were also developed. All measure energy savings assumptions and calculation parameters, such as equivalent full load hours (EFLH), were provided and documented for transparency. For each measure, energy savings were estimated as a percentage of base equipment and/or end-use consumption.

In addition to energy savings, incremental measure costs were collected from retailer research, RSMeans (a construction cost database) or calls to local contractors, when appropriate. It should be noted that the measure costs utilized for the purposes of this potential assessment reflect average installation costs across various implementation scenarios and therefore may be at a lower resolution than costs available to Cascade for program planning. For program planning purposes Cascade may opt to refine costs to better reflect costs in their specific service territory. Research was also performed to determine the measure life for each energy efficiency measure based on available datasets.

Limited non-energy benefits will also be assessed as part of the study in the context of both incremental costs and savings. Other measures, such as clothes washers and pre-rinse spray valves, offer water savings in addition to energy savings.

2.2.5 Estimating Energy Savings Potential and Determine Market Potential

Drawing on the previous data compilation, organization, and market analysis tasks, the estimation of market potential is conceptually a straightforward exercise.

2.2.5.1 Develop Baseline Forecast

The baseline forecast is created by combining all of the inputs compiled in prior tasks to obtain average consumption estimates by customer segment, construction vintage and end use, and summing these up to the sector level. The disaggregated forecast data provides the foundation. For example, in the residential sector, the general equation for the DSM baseline forecast is:

Equation 2-2: $$Forecast_{BL} = \sum_{i,j,t} HH_{i,t} \times EUS_{i,j,t} \times UEC_{i,j,t}$$

Where: $HH_{i,t}$ = the number of households of type *i* in year *t*

$EUS_{i,j,t}$ = the saturation of end use type *j* in household type *i* in year *t*

$UEC_{i,j,t}$ = the unit energy consumption of end use *j* in household type *i* in year *t*

2.2.5.2 Estimate Technical Potential

The measure-level inputs were used to estimate technical potential over the planning horizon. This is accomplished by creating an alternate forecast where consumption is reduced by the installation of all technically feasible measures. For technical potential, which represents substitution of all technically feasible measures at the end use level (and following the residential example above), the general equation is:

Equation 2-3: $$Forecast_{TP} = \sum_{i,j,t} HH_{i,t} \times EUS_{i,j,t} \times UEC_{i,j',t}$$

Where: $HH_{i,t}$ = the number of households of type *i* in year *t*

$EUS_{i,j,t}$ = the saturation of end use type *j* in household type *i* in year *t*

$UEC_{i,j',t}$ = the unit energy consumption of end use *j'* (the most efficient end use technology configuration) in household type *i* in year *t*

The technical potential for DSM is simply the difference between Equation 2-2 and Equation 2-3. Because measures anticipated to be installed in the absence of utility intervention are included in the baseline forecast in Equation 2-2 (and, thus, the technical potential forecast), savings due to already occurring conservation were removed from the technical potential estimates.

Addressing Naturally Occurring Energy Efficiency

As noted above, one of the first steps in the potential study is to disaggregate utility sales forecasts, as all estimates of potential are ultimately calibrated back to these forecasts. Therefore, getting the forecasts correct is critical. It is also in the sales forecasts where we incorporate naturally occurring adoption, which is the savings estimated to occur as a result of normal market forces. The analysis team worked with forecasters at Cascade Gas to understand how the baseline sales forecasts incorporate two known sources of naturally occurring adoption:

- Codes and standards
- Efficiency measure baseline penetration

By properly accounting for these factors the potential study estimates the net penetration rates, which represent the difference between the anticipated adoption rates of the efficiency measures after intervention and the "business as usual" adoption rates absent efficiency intervention.[10] This is true even in the technical and economic scenarios, where the efficiency-case penetration will approach 100 percent, and particularly important in the achievable potential analysis, where we estimate the percentage of eligible measures (and associated savings) that can be expected to occur net of baseline penetration rates (people who would buy the efficient technology in the absence of any program intervention).

2.2.5.3 Estimate Economic Potential

The next step is to create an alternative forecast of "economic" DSM potential (i.e., considering the most efficient measures that pass economic screening tests), specifically the Total Resource Cost (TRC) and Utility Cost Test (UCT)[11] were utilized to screen individual measures. Again following the residential example, the general equation is:

Equation 2-4:
$$Forecast_{EP} = \sum_{i,j,t} HH_{i,t} \times EUS_{i,j,t} \times UEC_{i,j",t}$$

Where: $HH_{i,t}$ = the number of households of type *i* in year *t*

$EUS_{i,j,t}$ = the saturation of end use type *j* in household type *i* in year *t*

$UEC_{i,j",t}$ = the unit energy consumption of end use *j"* (the most efficient end use technology configuration *that is also economic*) in household type *i* in year *t*

Similar to the calculation of technical potential, the economic potential for DSM is the difference between **Equation 2-2** and **Equation 2-4.**

Calculating Cost Effectiveness

Nexant determined measure cost-effectiveness using accepted industry-standard cost-effectiveness tests, described below, to gauge the economic merits of the portfolio. Each test compares the benefits of the energy efficiency measures to their costs using its own unique perspectives and definitions in terms of net present value of future cash flows. The two standard tests are:

- ***Total Resource Cost test (TRC).*** The benefits in this test are the lifetime avoided energy costs. The costs in this test are the incremental measure costs.

[10] As defined in the "Guide for Conducting Energy Efficiency Potential Studies: A Resource for the National Action Plan for Energy Efficiency (NAPEE)", November 2007.

[11] Utility Cost Test is also known as Program Administrator Cost (PAC) Test per the California Standard Practice Manual

- ***Utility Cost Test (UCT)***, also called the program administrator cost test (PACT).The benefits in this test are the lifetime avoided energy costs. The costs in this test are the utility's cost of providing the incentives for the measures.

Administrative costs were not included in either cost-effectiveness test, nor were capacity benefits. The cost component of the analysis consists of incremental measure costs and utility program costs. The research team utilized a cost-effectiveness screen of 0.90 to account for a 10% environmental benefit adder as is the general practice in the Pacific Northwest[12]. This taken directly from Docket UG-121207: "The Northwest Power act requires the Washington Utilities Transportation Commission (WUTC) to use a 10 percent adder. 16 U.S.C. § 839a(4)(D). The Energy Dependence Act, RCW 19.285.040(1), requires electric utilities to evaluate cost-effectiveness using the WUTC methodology, so electric utilities in Washington apply a 10 percent conservation adder to Total Resource Cost calculations. WUTC is not aware of an authority that currently allows the use of a 10 percent adder in the natural gas sector."

Nexant then produced estimates of levelized cost-of-conserved-energy (CCE) for each measure by integrating resource data (per-unit costs, savings, and measure life) with baseline building stock data (base-case fuel and end-use saturations, measure applicability factors, and current measure saturations) and baseline energy usage data. Cascade-specific data on avoided costs, distribution losses, discount rates[13], and inflation rates were incorporated for the economic and achievable potential assessments to perform a full cost-benefit analysis for every rate class, sector, customer segment, vintage, end use, and measure combination. These Cascade-specific data assumptions are detailed in **Volume III, Appendix B**.

2.2.5.4 Estimate Achievable Potential

The assessment of realistically achievable energy efficiency potential requires estimating, among other parameters, the rate at which cost-effective measures can be adopted over time. Because program implementation scenarios have a direct influence over such market penetration rates, calculating achievable potential typically incorporates individually developed sets of market penetration curves corresponding to implementation scenarios. These scenarios may be correlated to differing levels of urgency in program implementation, tolerance for rate impacts, macroeconomic conditions, or other situations.

There are important components in the determination of achievable potential:

- ***Customers' willingness to participate.*** The likelihood that customers will participate in energy efficiency programs is a function of several factors, most notably incentive level. Achievable potential was estimated for three different incentive-level scenarios (30%, 50%, and 75% of incremental cost) to examine the variance in expected savings.

[12] Nexant took care in not unilaterally screening out all measures with a TRC below 0.9, as some measures may be included as part of a cost-effective measure bundle.

[13] Cascade's weighted average cost of capital (WACC) of 8.55% was used for all measures in all sectors when screened under UCT, and the U.S. treasury note interest rate of 3.4% was used for residential measures when screened under the TRC.

- ***Uncertainty.*** Filing and planning requirements often necessitate a point-estimate of potential; however, this is not an accurate reflection of the reality of DSM programs. It is preferred to think of achievable potential as a range, or probability distribution, where the point-estimate is the most likely outcome. This distribution defines the lower and upper bounds of expected savings, as well as the most likely value.

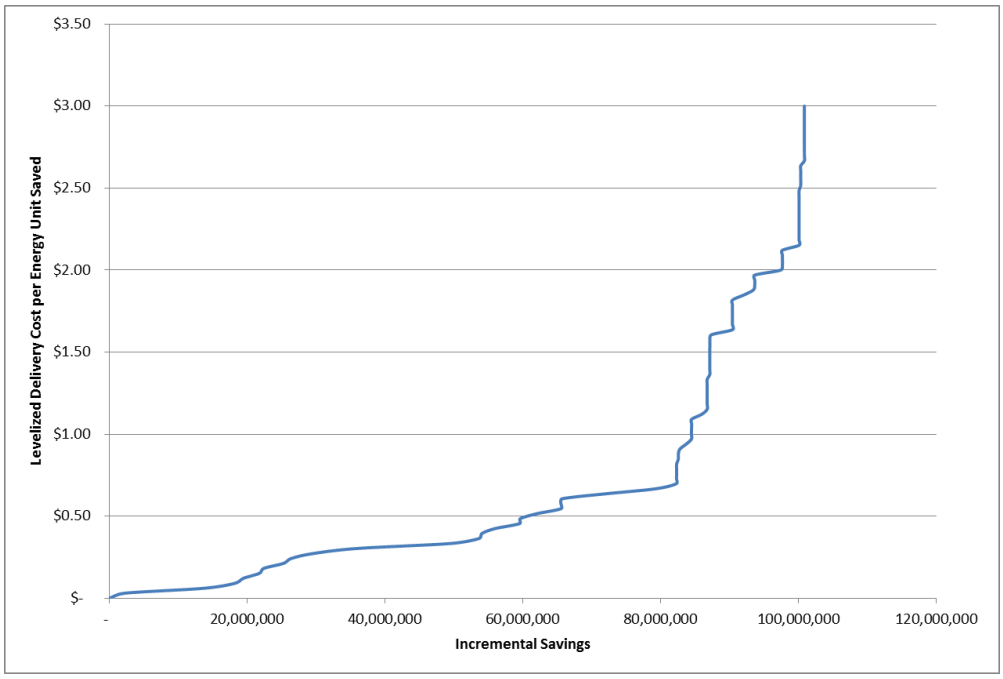
2.2.6 Scenarios Evaluated

This assessment of energy efficiency potential for Cascade's Washington service territory considered specific scenarios to understand how variation in several key input parameters would impact the assessment outcomes, including the following parameters:

- Cost-Benefit Test (TRC vs. UCT)
- Avoided Costs
- Incentive Level (30%, 50% and 75% of incremental cost)
- Discount Rate (Cascade's WACC of 8.55% for all measures in all sectors when screened under UCT, and the U.S. treasury note interest rate of 3.4% for residential measures when screened under the TRC)

Table 2-6 summarizes the 22 scenarios that were assessed per sector (66 total for residential, commercial and industrial) for this project.

Table 2-6: Scenarios addressed for each Sector



Potential Category	Scenario	Scenario # Res/Com/Ind	Avoided Costs	Incentivized %	Discount Rate	
					Residential	Comm./ Industrial
Base Case – Technical/Economic/Achievable Potential Scenarios under TRC						
Technical	Technical – Base	1 / 23 / 45	Current	n/a	3.40%	8.55%
Economic	Economic – Base	2 / 24 / 46	Current	n/a	3.40%	8.55%
Achievable Potential	Achievable – Base	3 / 25 / 47	Current	30%	3.40%	8.55%
	Achievable – Moderate	4 / 26 / 48	Current	50%	3.40%	8.55%
	Achievable – High	5 / 27 / 49	Current	75%	3.40%	8.55%
Base Case – Technical/Economic/Achievable Scenarios under UCT						
Technical	Technical – Base	6 / 28 / 50	Current	n/a	8.55%	8.55%
Economic	Economic – Base	7 / 29 / 51	Current	n/a	8.55%	8.55%
Achievable Potential	Achievable – Base	8 / 30 / 52	Current	30%	8.55%	8.55%
	Achievable – Moderate	9 / 31 / 53	Current	50%	8.55%	8.55%
	Achievable – High	10 / 32 / 54	Current	75%	8.55%	8.55%
Alternate Base Achievable Scenarios under TRC						
Achievable Potential	Achievable – Base	11 / 33 / 55	+25%	30%	3.40%	8.55%
	Achievable – Base	12 / 34 / 56	+50%	30%	3.40%	8.55%
	Achievable – Base	13 / 35 / 57	+100%	30%	3.40%	8.55%
	Achievable – Base	14 / 36 / 58	-25%	30%	3.40%	8.55%
	Achievable – Base	15 / 37 / 59	-50%	30%	3.40%	8.55%
	Achievable – Base	21 / 43 / 65	Current	30%	4.17%	4.17%
Alternate Base Achievable Scenarios under UCT						
Achievable Potential	Achievable – Base	16 / 38 / 60	+25%	30%	8.55%	8.55%
	Achievable – Base	17 / 39 / 61	+50%	30%	8.55%	8.55%
	Achievable – Base	18 / 40 / 62	+100%	30%	8.55%	8.55%
	Achievable – Base	19 / 41 / 63	-25%	30%	8.55%	8.55%
	Achievable – Base	20 / 42 / 64	-50%	30%	8.55%	8.55%
	Achievable – Base	22 / 44 / 66	Current	30%	4.17%	4.17%

2.2.7 Supply Curves

Finally, a supply curve was developed to show the amount of energy efficiency savings available at different cost levels. A supply curve typically consists of two axes; one that captures the cost per unit of saving a resource (e.g., dollars per lifetime therms saved) and another that shows the amount of savings

that could be achieved at each level of cost. The curve is typically built up across individual measures that are applied to specific base-case practices or technologies by market segment. Savings measures are sorted based on a metric of cost. Total savings available at various levels of cost are calculated incrementally with respect to measures that precede them. Supply curves typically, but not always, end up reflecting diminishing returns, i.e., costs increase rapidly and savings decrease significantly at the end of the curve. **Figure 2-4** shows a sample supply curve demonstrating this effect.

Figure 2-4: Sample Supply Curve

3 MEASURE SAVINGS REVIEW FINDINGS

The goal of the measure savings review was to provide a high level assessment of Cascade's process for collecting, organizing program participant data and estimating the associated savings for four key measures in the time period June 1, 2011 – May 31, 2012. This was broken up into three tasks: 1) a desk review of program applications, 2) a telephone call to program participants to verify measure installation and key savings metrics, and 3) a billing analysis of a statistical sample of installed furnace, boiler and water heater installed measures. The findings of these two assessments are provided below.

3.1 DESK & TELEPHONE MEASURE REVIEW FINDINGS

The desk review compared the participant application to the Cascade participant database in an effort to determine the quality of Cascade's data collection processes and its ability to accurately estimate realized natural gas energy efficiency savings. **Table 3-1** summarizes the actual number of desk and telephone reviews completed.

Table 3-1: Desk and Telephone Review Sample Completion

CASCADE Sampling Approach	Residential Sector			Commercial Sector		
	Sample Points	Confidence/ Precision	Measure Type	Sample Points	Confidence/ Precision	Measure Type
Desk Reviews	31	90/15	All	27	90/8	All
Telephone Reviews	18	90/20	All	19	90/11	All

One of the key findings of the measure savings review is regarding Cascade's methodology for estimating natural gas savings. While utilizing a deemed savings value approach for each measure can be a cost-effective and appropriate approach to estimating savings, it can over or underestimate actual savings. With the data provided in this analysis – specifically measure savings algorithms used in the potential assessment – Cascade will have the option to refine projected savings estimates with increased specificity by calculating premise-specific natural gas savings for each installed measure. While Cascade is already collecting some of the key savings parameters on its participant application forms (such as house square footage and efficiency of installed measure), Nexant recommends including some additional parameters on the application forms to enable premise-specific calculation estimates of natural gas savings. The following desk review findings may have an impact on reporting of savings:

1. The Cascade participant database documented the efficiency of the replacement measure as the incentivized amount (such as a 0.62 EF water heater), whereas often the efficiency of the installed measure as listed on the application was greater than the incentivized efficiency level. That is, while the application form always listed the actual efficiency of the installed equipment

(e.g. EF=0.67), the efficiency of that particular measure would be set to a default value (e.g. EF=0.62) in the Cascade participant database. This implies deemed values were used to project savings, as opposed to premise-specific values, which were often more efficient than the incentivized efficiency level. This practice would conservatively estimate savings. Recording the actual efficiency value of installed equipment, as opposed to the incentivized efficiency value, would be less conservative but could increase the accuracy of projections and data analysis.

2. The efficiency level of original equipment was not always recorded on the application form, nor whether or not the original equipment was replaced due to failure or for another reason prior to the end of expected equipment life. Savings calculations are dependent upon the efficiency of the base equipment, as well as whether or not the customer replaced the equipment early or upon burn-out. Nexant recommends collecting data on these two factors in the rebate application, and tracking them in the participant database, for inclusion in savings calculations (see **Section 3.1.1** below).
3. The cost category in the customer database varied in inclusions per measure. Categories included equipment, labor, old equipment disposal, and/or additional work performed. Standardized entries of "equipment costs" and "labor costs", in addition to "extraneous costs" will ensure accurate comparison of measure and installation costs.
4. While Cascade collects participant square footage for its weatherization measures, importing commercial participant facility square footage information for all measures into the participant database will facilitate comparative analysis between commercial customers, as facility sizes and types can vary dramatically in the commercial sector.

The telephone review verified all participation data and **no errors were found** in the reviewed measures. Additional useful information not requested in the rebate application was gleaned from customers during the telephone review, including:

- **39% of commercial rebate customers were new construction**. Savings algorithms change depending on the age of the installed equipment and the assumed base case. New construction base case is code, but for other circumstances the base case may be an existing unit.
- **11% of commercial rebate customers replaced equipment prior to burn-out**. To be as accurate as possible, equipment replaced prior to burn-out is typically compared to a base-case of the prior unit, not code.
- **24% of residential customers installed multiple gas efficiency measures at once**. As multiple efficiency measures would affect projected savings, this is important information to document for inclusion in analysis.
- **6% of residential customers installed an additional gas efficiency measure** after receiving the rebate for the initial gas efficiency measure. Again, installing additional measures might also impact savings and alter the results of savings calculations for previously installed measures.

3.1.1 Measure Savings Algorithms

As noted above, reporting measure savings on a project-specific basis can significantly increase accuracy. The suggested algorithms below were derived from various Technical Reference Manuals (TRMs) from around the U.S. and were utilized in the potential assessment to estimate savings for applicable measures. The same algorithms can be used by Cascade when estimating project-specific measure savings.

Equation 3-1: Furnace Measure Algorithm[14]

$$\Delta \text{ Therms} = (FLHheat * (Capacity/AFUEbase - Capacity/AFUEee)) / (100{,}000Btu/therm)*DF$$

- Assumptions:
  - FLHheat = Full Load Heating Hours
  - Capacity = Furnace Capacity
  - AFUE = Furnace Efficiency
  - DF = EFLH derate factor (engineering adjustment to account for equipment oversizing)

Equation 3-2: Duct Sealing Algorithm[15]

$$\Delta\text{Therms} = ((DEafter – DEbefore)/ DEafter)) * FLHheat * Capacity) / (100{,}000Btu/therm) / \eta Heat$$

- Assumptions:
  - DE = Duct system distribution efficiency
  - FLHheat = Full Load Heating Hours
  - Capacity = Furnace Capacity
  - ηHeat = Average net heating system efficiency (Equipment Efficiency * Distribution Efficiency)

Equation 3-3: Insulation Measure Algorithm[15]

$$\Delta\text{Therms} = (((1/R_old - 1/R_new)*A_insulated*(1-F/2))*24*HDD)/(\eta Heat*100{,}000 \text{ Btu/therm})$$

- Assumptions:
  - R = insulation R-value
  - A = insulated area
  - F = framing factor to account for area of framing
  - HDD = Heating Degree Days
  - ηHeat = Average net heating system efficiency (Equipment Efficiency * Distribution Efficiency)

Equation 3-4: Water Heater Measure Algorithm[16]

$$\Delta\text{Therms} = W*ECw*\Delta T*(1/EFbase-1/EFeff)*(100{,}000 \text{ Btu/therm})$$

- Assumptions:

[14] Based on the Delaware TRM algorithm (Opinion Dynamics Corporation, 2012)

[15] Based on the Illinois TRM algorithm (State of Illinois, 2012)

[16] Based on Ontario Energy Board algorithm (Navigant Consulting, 2009)

- W = daily household hot water use (gallons)
- ECw = Energy content of water, 8.33 Btu/gallon-°F
- ΔT = Average water heater set point temperature minus incoming water temperature (assumed to be mean ground temperature below frost line)
- EF = water heater efficiency factor

Equation 3-5: Water Flow Restriction Devices Algorithms[16]

Step 1. Calculate Water Consumption Savings

Water Consumption (W) = FuPpl*365*Fp*(Flbase-Fleff/Flbase)*DR

Step 2. Calculate Therms Savings

Therm Consumption = W*8.33*(ΔT)*(1/EF)/100,000 Btu/therm

- Assumptions:
  - FuPpl = Faucet use per capita per day
  - Fp = faucet water consumption as % of total water consumption
  - Fl = Flow rate (gpm)
  - Dr = % water that goes down drain
  - W = Water Savings (gallons)
  - ECw = Energy content of water, 8.33 Btu/gallon-°F
  - ΔT = Average water heater set point temperature minus incoming water temperature (assumed to be mean ground temperature below frost line)
    EF = water heater efficiency factor

3.2 BILLING ANALYSIS FINDINGS

In an effort to estimate realized savings associated with Cascade's program offerings, Nexant conducted a billing analysis for four key residential and commercial measure offerings. The measures are residential high efficiency furnaces and hot water heaters, and commercial/industrial high efficiency furnaces and boilers. Savings from the final qualified accounts assessed in the billing analysis were compared to estimates from Cascade's deemed measure savings. The findings of this analysis are summarized in **Table 3-2** below.

Table 3-2: Total Participant vs. Billing Analysis Subsample Summary

Source	Metric	Residential		Commercial[17]	
		DHW	Furnace	Furnace	Boiler
Cascade Participant Database	Participants	83	833	18 (Census)	23 (Census)
	Equipment Eff. Installed	65%	90%	Assumed 91%	Assumed 90%
	Average Savings (Therms per Measure)	24	86	272	2644
Qualified Billing Analysis Participants	# of participants	50	53	8	5
	Confidence / Precision	90/8	90/11	90/20	90/30
	Avg. Equipment Eff. Installed	67%	95%	95%	91%
	Average Savings (Therms per Measure)	33	111	349[18]	1566
Actual Savings vs. Projected		**39%**	**29%**	**28%**	**-41%**

Nexant found that, on average, actual natural gas savings as assessed from the billing analysis were higher than the estimates provided through Cascade's deemed measures savings. The residential billing analysis of water heater retrofit savings was 39% greater than Cascade projections. This variance is in line with comments from Cascade staff indicating its deemed savings are intentionally conservative estimates. It should be noted that the average projected installed efficiency value of the water heaters used by Cascade was 65%; while actual installed average water efficiency rating was 67%, with several water heaters having efficiency ratings of greater than 90%. This reinforces the need to collect actual installed efficiency values of equipment as discussed in **Section 2.1.2.**

Residential furnace savings were 30% greater than projected. Similar to water heaters, it appears Cascade is using a base level equipment efficiency value of 90% in savings projections, whereas the actual average efficiency of new furnaces installed was 95%. The larger actual savings versus projected likely reflects this conservative assumption.

[17] While some commercial participant numbers are too low to obtain statistical accuracy on the results, this is a census of the installed measures therefore this is a summary of the entire sample size for the commercial sector.

[18] Premise savings were divided by number of installed units to develop a therms saved per installed unit value. The three other measures were not standardized by installed units and the therms saved values are per premise.

Commercial furnace savings were calculated on a per-furnace, per-premise basis, as the number of furnaces installed varied per premise (from 1 to 8 furnaces in the subsample). Nexant billing analysis savings results averaged 28% greater than projected by Cascade's deemed savings estimates. Again, average efficiency values were 95% and it appears Cascade calculations were using the incentivized 91% efficiency value in their assumptions. This conservative assumption and the small sample size could account for the variance.

Commercial boiler savings were 40% less than projected. Several boiler measures didn't qualify for billing analysis due to either billing history disqualifications (such as not having 12 months of utility billing history before and after the installation, or a change in tenants during the required 24 month spread) or excessive variance in consumption behavior from model prediction, creating a small qualified sample size of 5 premises. This small number resulted in a 90/30 confidence precision, which decreases the ability to make meaningful conclusions about savings projections.

4 Market Segmentation Findings

An important first step in calculating Cascade's energy efficiency potential estimates is to establish baseline energy usage characteristics and disaggregate the market by sector, segment, and end use. The findings of this section represent the control totals to which all energy usage is calibrated in the base year of the study and then forecasted. Furthermore, the market segmentation findings provide the foundation of the forecast disaggregation (as described in **Section 5**) which identifies the allocated shares of natural gas sales upon which each energy efficiency measure savings values are applied to.

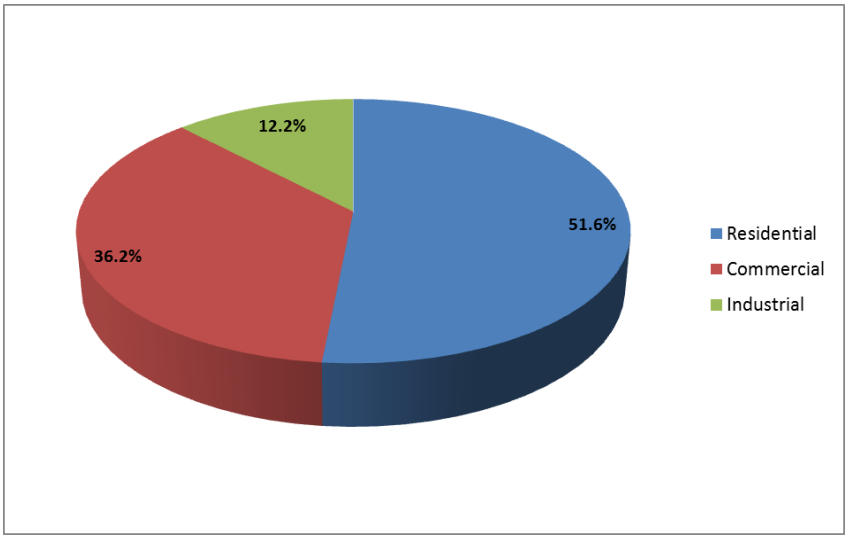
This section summarizes the market segmentation findings from Nexant's review of 2012 energy (therms) consumption by residential, commercial, and industrial Cascade customers, using the 2012 customer billing database received from Cascade. Residential customer accounts were categorized based on the given premise type. Commercial and Industrial customer accounts were first categorized by the customer class and premise type, then further refined as follows:

- An initial screen based on the standard industrial classification (SIC) code provided in the database.
- Additional analysis was performed to verify, and in many cases, correct the mapping. For example, roughly 18,000 accounts (or 52% of the records) with no SIC code or a code that mapped to an incorrect category were manually reassigned based on other database fields including customer name, premise type, and premise address.
- Only accounts with the following rate codes are included in the below summary: 504, 505, 511, 570, and 577.

Because this analysis presents findings on building premises, findings presented below do not include transmission, substation, telecommunication, or utility rate classes. Finally, consumption thresholds

(Residential: 50 therms, Commercial: 100 therms, Industrial 100 therms) were developed. Consumers below this threshold were assumed to be non-premises (i.e. not eligible for energy efficiency measures) and removed from the summary below. The average premise consumption values (therms per year) for each sector were compared to EIA data for the State of Washington, and found to be in reasonable agreement. Through analysis of Cascade's customer billing data and secondary research, Nexant was able to break out the energy usage by sector, segment and end use.

4.1 2012 Natural Gas Sales Summary



Total natural gas consumption by eligible residential, commercial and industrial customers for 2012 in Cascade's Washington service territory was 14,642,834 dekatherms[19]. **Table 4-1** and **Figure 4-1** show the overview of natural gas sales and premises by sector for Cascade in calendar year 2012. While the industrial sales number totals 2,651,868 dekatherms, this number includes only non-transport industrial gas customers and represents only 4% of total industrial natural gas sales.

Table 4-1: Cascade 2012 Natural Gas Consumption & Premise Counts by Sector

Sector	2012 Sales (annual dekatherms)	Premise Count
Residential	11,203,608	171,991
Commercial	7,873,584	23,609
Industrial	2,651,868	10,639
Total	12,256,153	206,239

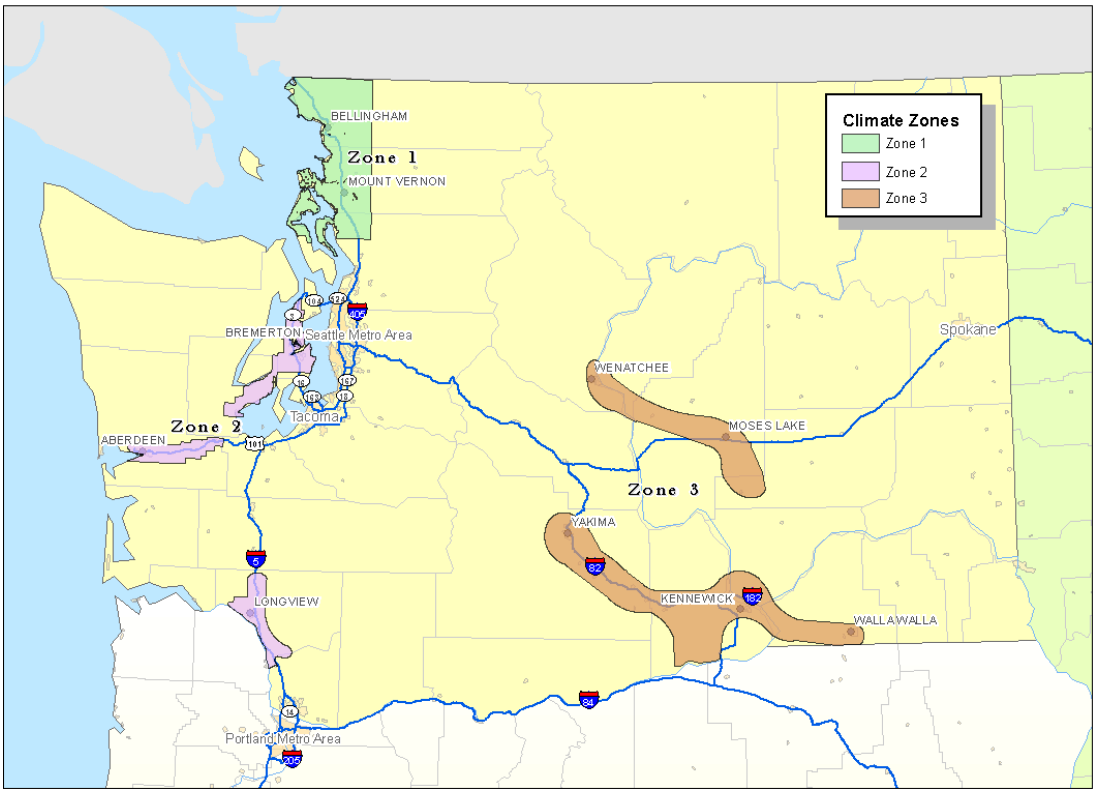
[19] Note: Nexant utilized the definition of premise for this study which removes non-building customer accounts, and other miscellaneous loads from its findings. The number of premises, therefore, and the associated natural gas consumption is less than the number of accounts and top-line natural gas sales that Cascade utilizes in its IRP documents. Furthermore, the number of eligible industrial premises and sales is significantly less due to the large share of transport sales – which were removed because they are ineligible for energy efficiency programs.

Figure 4-1: 2012 Natural Gas Consumption by Sector

4.2 Residential Sector Natural Gas Consumption

Table 4-2 shows the breakdown of energy consumption and building stock by residential segment. Single family homes dominate consumption with an 86% share, with multi-family dwellings at 14% of total residential consumption. Manufactured home (such as mobile home) dwellings comprise less than 1% of total residential consumption.

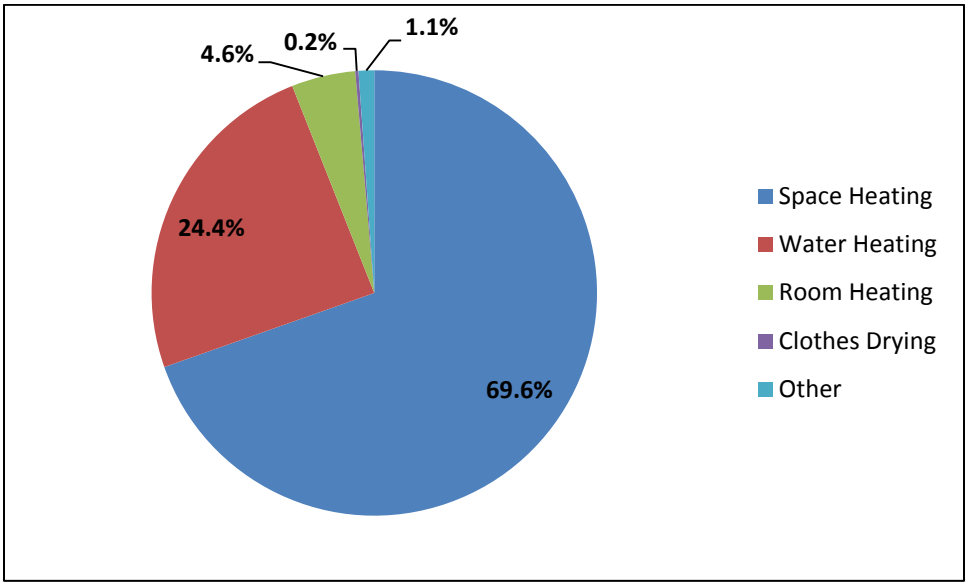
Table 4-2: Residential 2012Natural Gas Consumption & Premise Counts by Segment



Sector	Energy Consumption (annual therms)	Energy Use Share	No. of Premises	Energy Use per Premise (dth)
Single Family	9,657,510	86.2%	143,058	67.5
Multifamily	1,523,691	13.6%	28,542	53.4
Manufactured	11,204	0.1%	391	28.7
Total	11,203,608	100%	171,991	65.1

For the residential sector, Nexant also assessed energy efficiency potential by climate zone, and thus it was necessary to parse out energy consumption for each of the three climate zones in Cascade's service territory. The residential natural gas consumption by climate zone is presented in **Table 4-3 and Figure 4-2** shows a map of Cascade's Washington service territory broken out by these climate zones. Climate Zone 2 represents nearly half of all residential energy consumption (47%).

Table 4-3: Residential 2012 Natural Gas Consumption & Premise Counts by Climate Zone



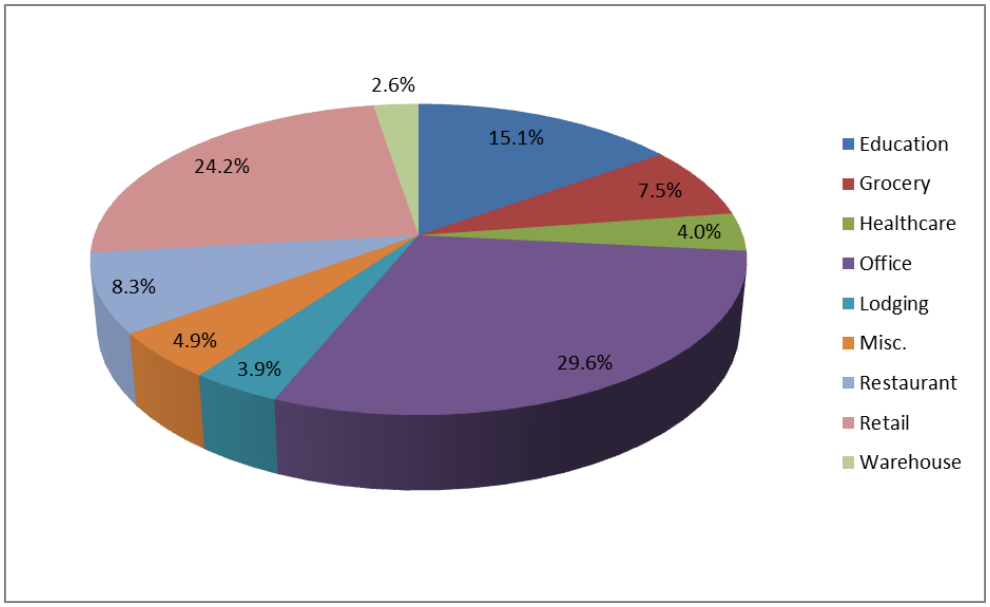
Climate Zone	Energy Consumption (annual therms)	Energy Use Share	No. of Premises	Energy Use per Premise (dth)
Climate Zone 1	2,912,938	26.0%	40,996	71.1
Climate Zone 2	5,265,696	47.0%	72,241	72.9
Climate Zone 3	3,024,974	27.0%	58,754	51.5
Total	**11,203,608**	**100%**	**171,991**	**65.1**

Figure 4-2: Climate Zone Map of Cascade's Washington Service Territory

Nexant further disaggregated Cascade's residential load by end use. **Figure 4-3** shows the distribution of natural gas consumption by end use for all residential households in Cascade's territory.

Figure 4-3: 2012 Residential Natural Gas Consumption by End Use*

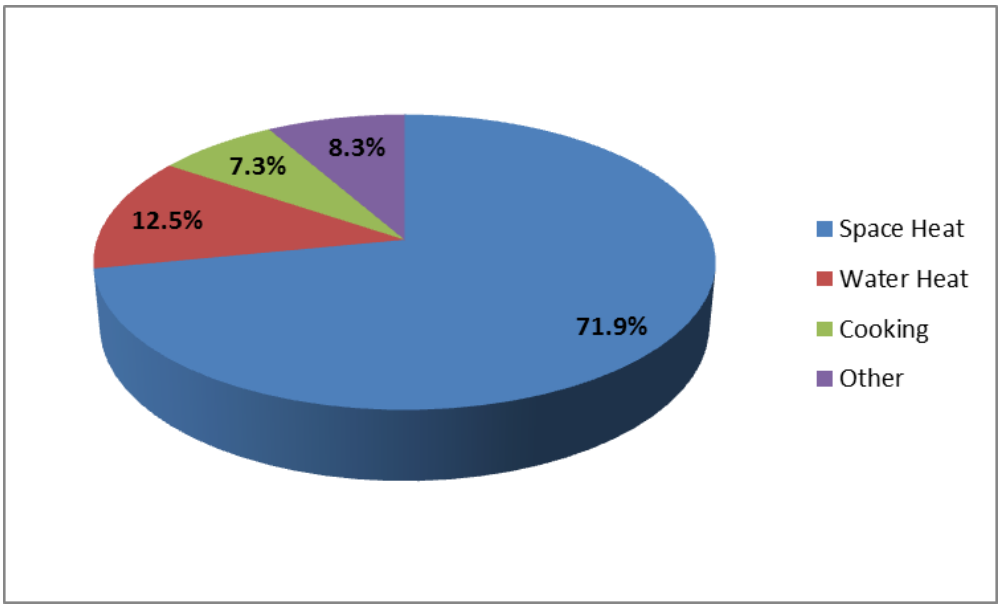
*Space Heating refers to central heating equipment end uses, such as furnaces and boilers. Room Heating refers to gas hearths / fireplaces.



4.3 Commercial Sector Natural Gas Consumption

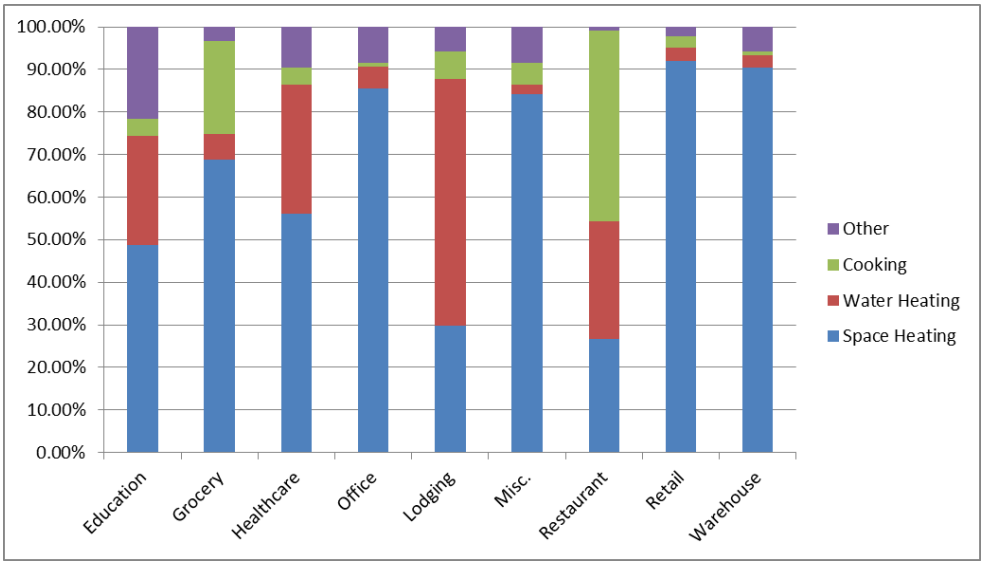
Table 4-4 and **Figure 4-4** show the distribution of consumption by commercial segment for all eligible premises. The office and retail segments represent the largest share of consumption at 29.6% and 24.2% respectively.

Table 4-4: Commercial 2012 Natural Gas Consumption & Premise Counts by Segment



Segment	Energy Consumption (annual dth)	Energy Use Share	No. of Premises	Energy Use per Premise (dth)
Education	1,191,963	15.1%	994	1,199
Grocery	590,930	7.5%	1,020	579
Healthcare	312,585	4.0%	512	611
Office	2,329,730	29.6%	8,401	277
Lodging	304,013	3.9%	266	1,143
Misc.	386,424	4.9%	2,470	156
Restaurant	650,618	8.3%	1,318	494
Retail	1,904,289	24.2%	7,152	266
Warehouse	203,032	2.6%	936	217
Total	**7,873,584**	**100.0%**	**23,069**	341

Figure 4-4: Commercial 2012 Natural Gas Consumption by Segment

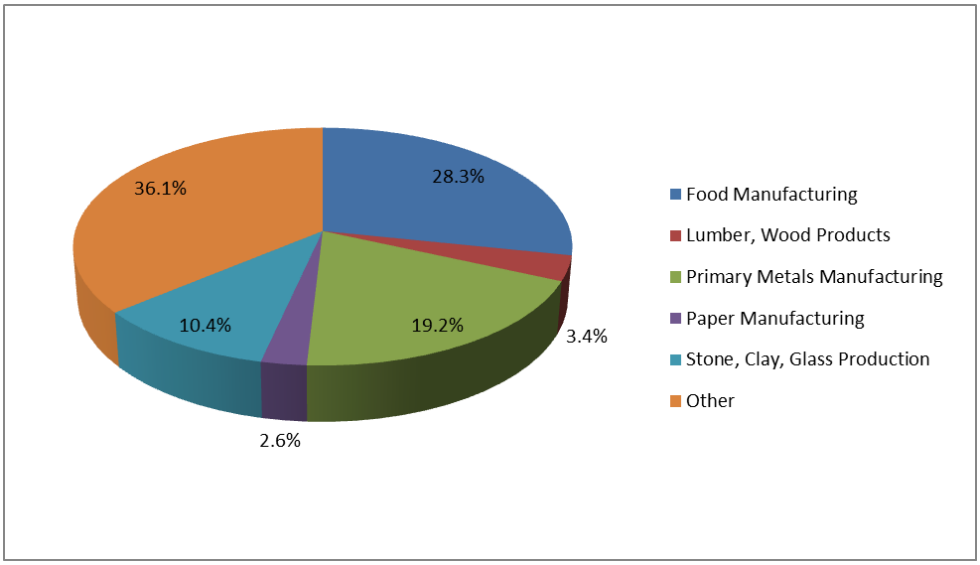


Nexant further disaggregated Cascade's commercial load by end use. **Figure 4-5** and **Figure 4-6** show the distribution of natural gas consumption by end use for all commercial premises and each segment respectively. Space heating represents the largest share at 71.9% of all consumption.

Figure 4-5: Commercial 2012 Natural Gas Consumption by End Use*

***Space Heating refers to central heating equipment end uses, such as furnaces and boilers. Room Heating refers to gas hearths / fireplaces.**

Figure 4-6: Commercial 2012 Natural Gas Consumption Shares by Segment, by End Use



4.4 INDUSTRIAL SECTOR NATURAL GAS CONSUMPTION

Table 4-5 and Figure 4-7 show the distribution of consumption by industrial segment for all eligible premises. The food manufacturing segment represents the largest share of energy use at 28.3%, with paper manufacturing representing the smallest share at 2.6% of consumption.

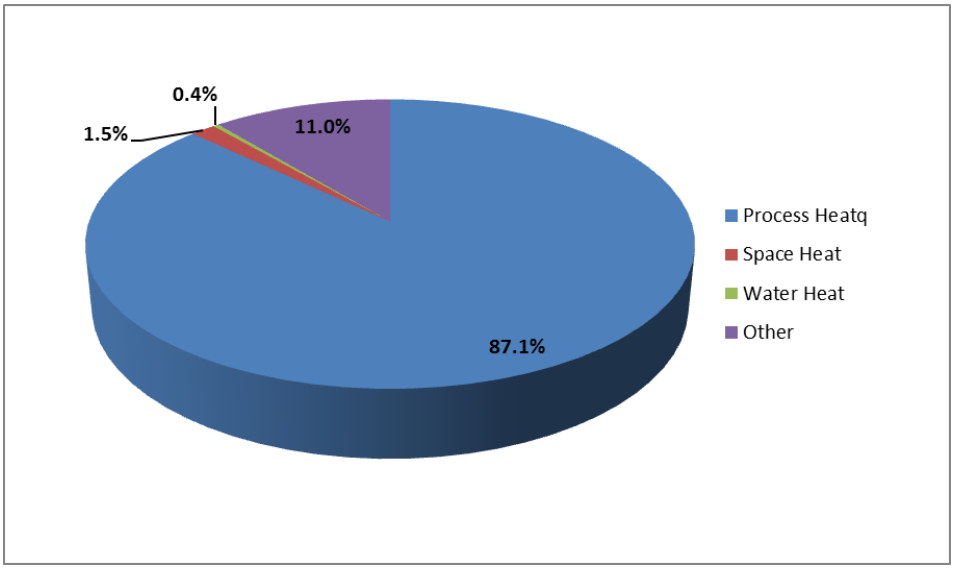
Table 4-5: Industrial 2012 Natural Gas Consumption & Premise Counts by Segment

Segment	Energy Consumption (annual dth)	Energy Use Share	No. of Premises	Energy Use per Premise (dth)
Food Manufacturing	749,223	28.3%	465	1,611
Lumber, Wood Products	90,689	3.4%	340	267
Primary Metals Manufacturing	509,712	19.2%	1,081	472
Paper Manufacturing	69,240	2.6%	62	1,117
Stone, Clay, Glass Production	276,950	10.4%	446	621
Other	956,055	36.1%	8,245	116
Total	**2,651,868**	**100.0%**	**10,639**	**249**

Figure 4-7: Industrial 2012 Natural Gas Consumption by Segment

Nexant further disaggregated Cascade's industrial load by end use. **Figure 4-8 and Figure 4-9** show the distribution of natural gas consumption by end use for all industrial premises and each segment respectively. Process heating represents the largest share of end use consumption at 87.1% across all segments.

Figure 4-8: 2012 Industrial Natural Gas Consumption by End Use



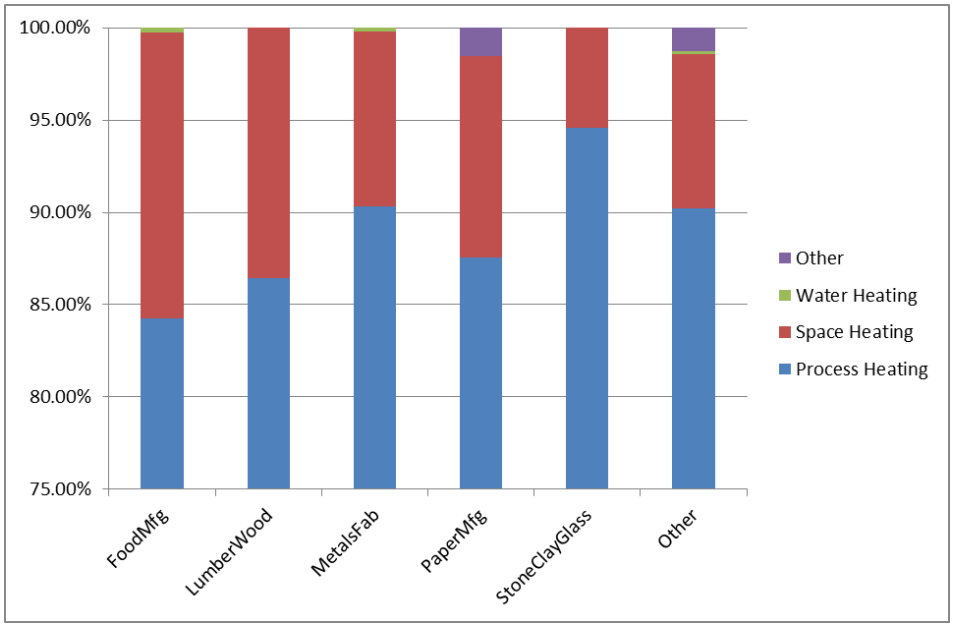


Figure 4-9: 2012 Industrial Natural Gas Consumption by Segment, by End Use

5 BASELINE FORECAST DISAGGREGATION

This section summarizes the baseline forecast disaggregation results in which the market segmentation findings as illustrated in **Section 4** are applied to the baseline natural gas forecast submitted by Cascade. This disaggregated baseline forecast, then, serves as the foundation upon which measure savings shares are applied to the applicable sector, segment, and end use[20].

5.1 BASELINE FORECAST DISAGGREGATION SUMMARY

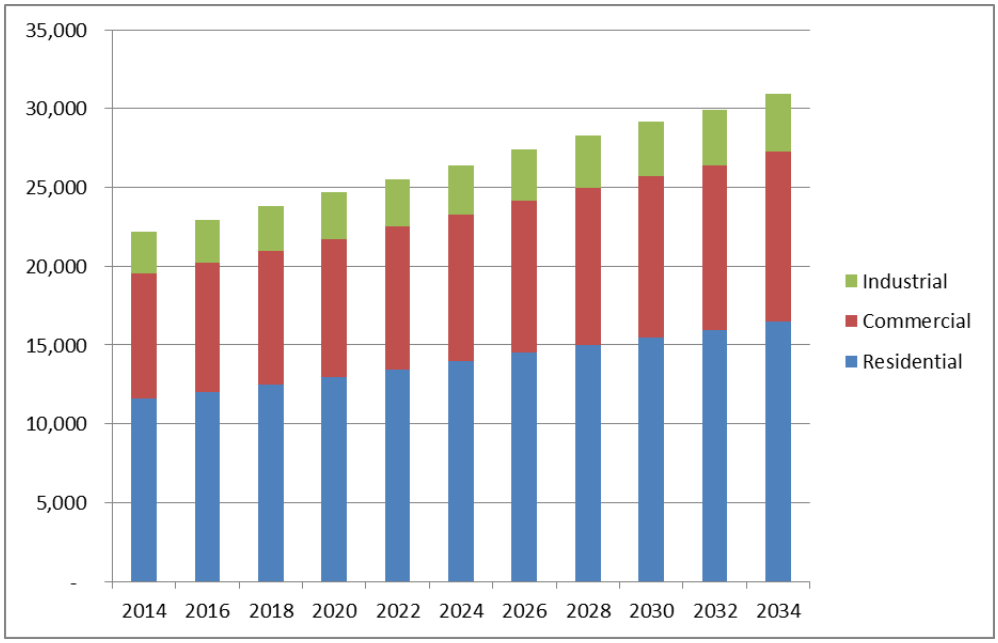

Table 5-1 and **Figure 5-1** summarize the baseline natural gas sales forecast of eligible DSM sales by sector for Cascade's Washington service territory.

[20] The forecast was further disaggregated by equipment type in the TEA-POT model; however, that level of resolution is not included in this report.

Table 5-1: Natural Gas Consumption by Sector, by Year ('000 dth)

Sector	2014	2016	2018	2020	2022	2024	2026	2028	2030	2032	2034
Residential	11,609	12,023	12,508	12,986	13,454	13,951	14,505	15,001	15,475	15,935	16,506

Figure 5-4: Industrial Natural Gas Baseline Forecast by End Use by Year (dth)

6 PORTFOLIO ENERGY EFFICIENCY POTENTIAL

This section provides an overview of the findings for the entire portfolio of natural gas customers in Cascade's Washington service territory. Natural gas energy efficiency findings for technical, economic and achievable potential are presented in two parts. At the beginning of each section, detailed findings are presented for the "base-case" technical, economic, and achievable scenarios. Where findings are broken out by segment (building type) or end use, they are done so under the achievable base case scenario (for appropriate numbering see **Table 2-6**). All base case scenarios were run under the following main assumptions:

- Measure cost effectiveness screen: Utility Cost Test (UCT)
- Incentive percentage of incremental cost (for achievable scenarios): 30%, 50% or 75%
- Avoided Costs: Current avoided costs as provided in Appendix H of Cascade's 2012 IRP
- Discount Rate: 8.55%

Summary findings are then presented for various achievable potential scenarios given variations in 1) measure screening approach (based on cost-effectiveness test), 2) avoided costs, and 3) discount rate. Again, **Table 2-6** above illustrates the 22 scenarios (per sector) Nexant examined under the utility cost test (UCT) and TRC for each sector – residential, commercial and industrial (for a total of 66 scenarios for the three sectors presented). Detailed summary tables for savings potential for all scenarios are provided in **Volume III, Appendix C**.

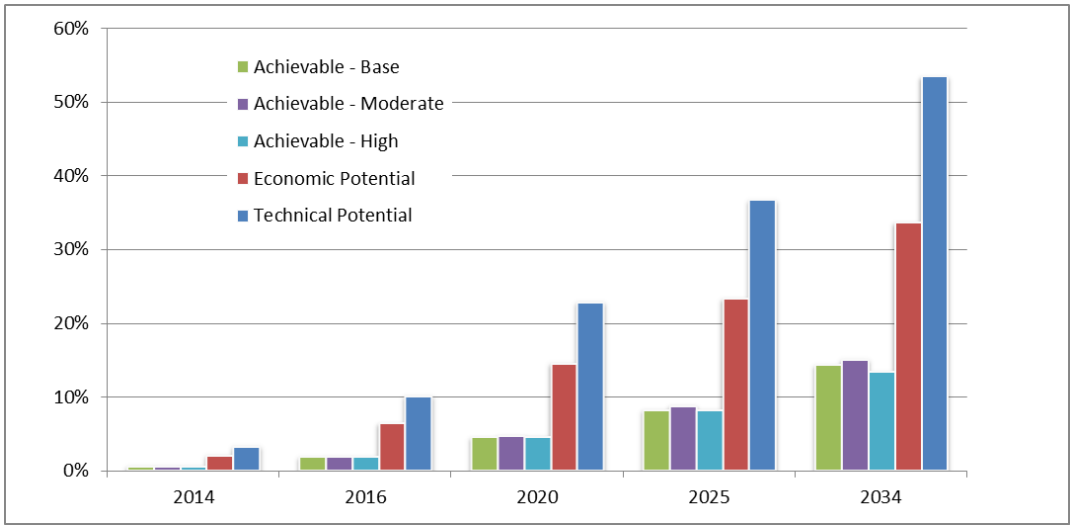
6.1 Base Case Technical/Economic/Achievable Potential Findings

Table 6-1 and **Figure 6-1** present the estimated technical, economic and achievable savings potential for Cascade's Washington service territory under the Utility Cost Test. First year (2014) natural gas conservation achievable base potential under the UCT screen for all sectors is 139,859 dth, representing 0.63% of baseline sales. It should also be noted that the achievable base savings potential is slightly greater than the achievable moderate savings potential (even though the moderate has a more aggressive adoption curve). This occurs because the measure cost used in the cost-effectiveness test under the achievable moderate scenario (50% of incremental cost) compared to the achievable moderate scenario (30% of incremental) causes more measures to fail cost-effectiveness. The fewer measures passing cost effectiveness has a greater impact on potential than the increased adoption of those measures. **Figure 6-2** shows the changes in Cascade's baseline sales forecast under each of the base case potential scenarios, screened with the UCT.

Table 6-1: Portfolio Energy Efficiency Potential Savings by Base Case Scenario under UCT Screen

	2014	2016	2020	2025	2034
Baseline Sales Forecast (dth)	22,191,016	22,948,017	24,688,061	26,974,698	30,927,487
Cumulative Savings (dth)					
Technical Potential	744,155	2,337,526	5,667,873	9,931,037	16,585,195
Economic Potential	476,641	1,494,793	3,606,967	6,314,915	10,434,394
Achievable - Base	139,859	437,581	1,130,474	2,243,553	4,448,248
Achievable - Moderate	137,844	441,098	1,180,749	2,384,769	4,677,603
Achievable - High	141,599	446,575	1,153,137	2,239,052	4,160,771
Energy Savings (% of baseline sales)					
Technical Potential	3.35%	10.19%	22.96%	36.82%	53.63%
Economic Potential	2.15%	6.51%	14.61%	23.41%	33.74%
Achievable - Base	0.63%	1.91%	4.58%	8.32%	14.38%
Achievable - Moderate	0.62%	1.92%	4.78%	8.84%	15.12%
Achievable - High	0.64%	1.95%	4.67%	8.30%	13.45%

Figure 6-1: Portfolio Energy Efficiency Potential Savings (% Sales) by Base Case Scenario under UCT Screen



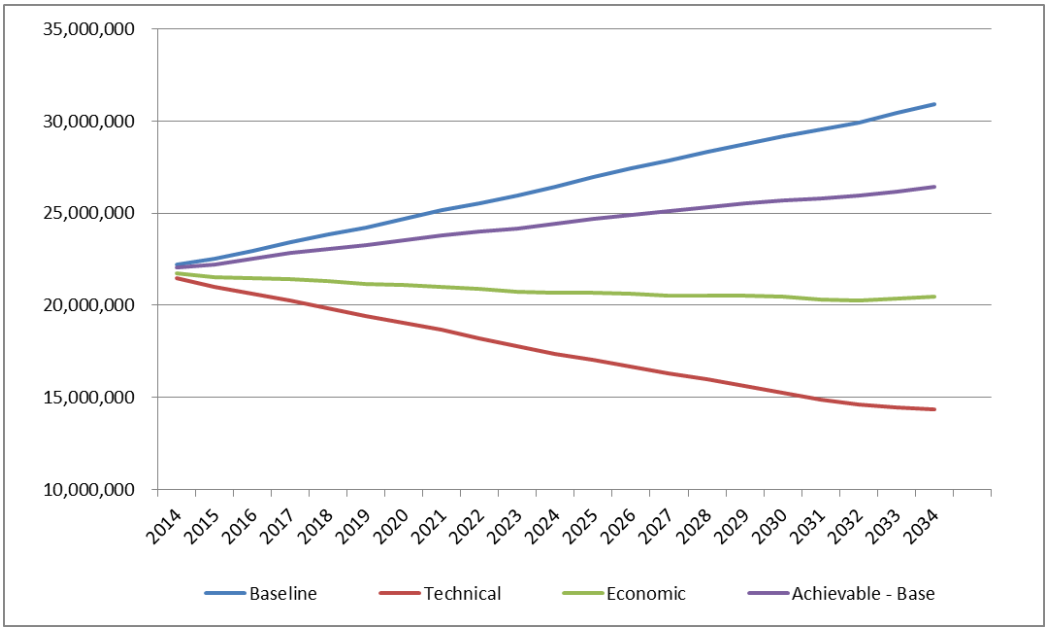


Figure 6-2: 21-year Portfolio Sales Forecast (dth) by Base Case Scenario under UCT Screen

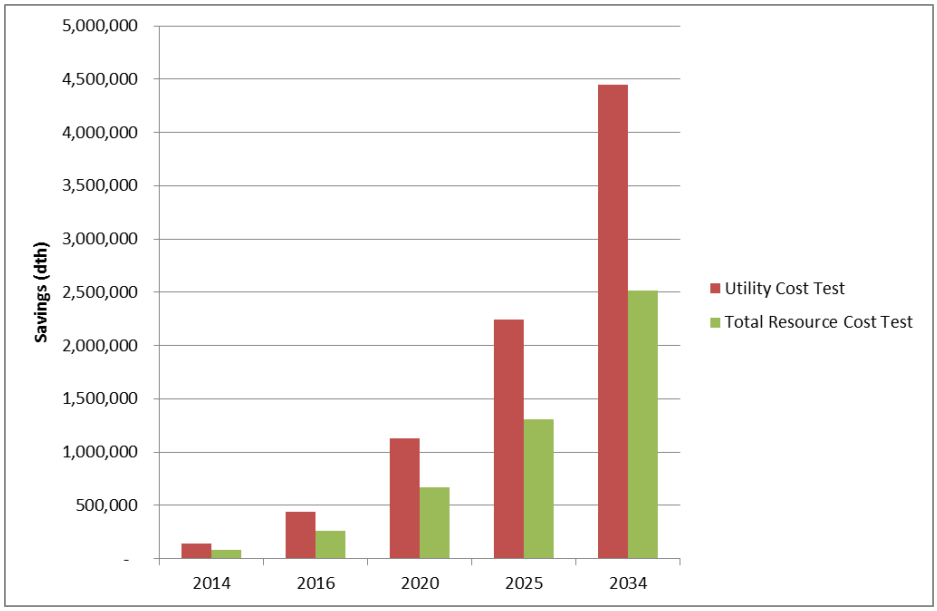
6.2 Alternate Achievable Base Potential Findings

With the decrease in the cost of natural gas there is additional scrutiny over the cost-effectiveness of natural gas efficiency measures. There are several commonly used methodologies available to utilities to estimate cost effectiveness including the utility cost test and total resource cost test. The



Washington Utilities and Transportation Commission's October 9, 2013 Policy Statement states the WUTC is "…unwilling to allow utilities to end natural gas conservation programs as a result of an unbalanced or incomplete TRC analysis…Accordingly, the UCT is an acceptable option when a properly balanced TRC is not available."[21]. To address this policy statement, Nexant examined savings potential under both screens. **Table 6-2** and **Figure 6-3** below illustrates the differences in cumulative savings potential based on whether the UCT or TRC test is used to screen measure cost effectiveness. As can be seen there is approximately 40% more savings potential under the achievable base scenario in 2014 under the UCT screen (139,859dth) compared to the TRC screen (83,674 dth). This occurs because the UCT only considers the incentivized portion of the measure cost, thus allowing more measures to pass cost-effectiveness when compared with the TRC screen. It can also be seen that unlike the UCT findings, savings potential increases from achievable base to achievable moderate because the measure cost is the full incremental cost under all scenarios so the same number of measures are considered under each scenario.

Table 6-2: Portfolio Savings Potential by Base-Case Scenario, by Cost-Effectiveness Screen

	2014	2016	2020	2025	2034
Cumulative Savings (dth) based on UCT Screen					
Technical Potential (6+28+50)	744,155	2,337,526	5,667,873	9,931,037	16,585,195
Economic Potential (7+29+51)	476,641	1,494,793	3,606,967	6,314,915	10,434,394

Figure 6-3: Portfolio Achievable Base Savings Potential by Base-Case Scenario, by Cost-Effectiveness Screen

As mentioned above, recent volatility in the price of natural gas is having a significant impact on the cost-effectiveness of many natural gas efficiency measures. The avoided cost of procuring and delivering natural gas (calculated as a benefit in the cost-effectiveness screen) is directly related to this volatility. Thus, Nexant also assessed differences in 2014 achievable base portfolio savings potential given variations in avoided costs under both the UCT and TRC test (**Table 6-3**). These scenarios illustrate the sensitivity of total savings potential given uncertainty in the forecasted cost of natural gas (thus the avoided costs) for Cascade.

Table 6-3: 2014 Portfolio Achievable Base Potential by Cost Effectiveness Test, by Avoided Cost Scenario

Scenario (UCT #'s / TRC #'s)	Cumulative Savings by UCT Screen (dth)	Cumulative Savings by TRC Screen (dth)
Achievable Base Avoided Costs (8+30+52 / 3+25+47)	139,859	83,674
Avoided Costs +25% (16+38+60 / 11+33+55)	147,672	90,458
Avoided Costs +50% (17+39+61 / 12+34+56)	151,415	113,293
Avoided Costs +75% (18+40+62 / 13+35+57)	152,696	133,288
Avoided Costs -25% (19+41+63 / 14+36+58)	128,080	74,383
Avoided Costs -50% (20+42+64 / 15+37+59)	89,785	65,239

Finally, **Table 6-4** and **Table 6-5** summarize the differences in achievable base savings potential over time given variations in the corporate discount rate used by Cascade. Nexant used Cascade's weighted average cost of capital of 8.55% to screen measures as the base-case assumption for all scenarios under

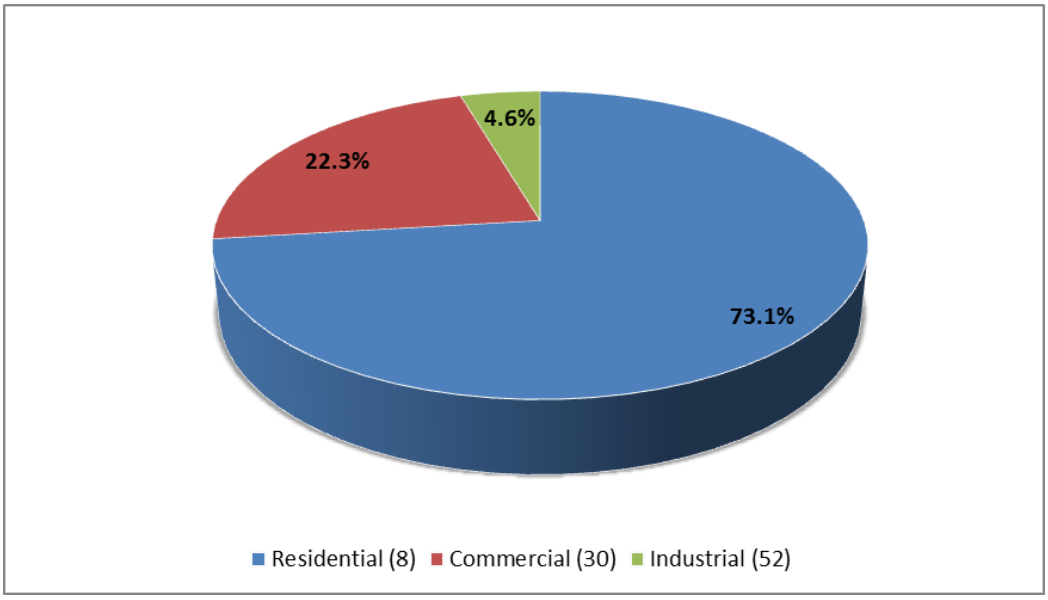
the UCT screen (a 3.4% discount rate was used for the residential TRC screen). An alternate discount rate of 4.17% (Cascade's long term discount rate utilized for DSM planning and program reporting) was used to assess impact on savings potential as illustrated below.

Table 6-4: Portfolio Achievable Base Savings Potential (dth) by Discount Rate under UCT Screen

Scenario	2014	2016	2020	2025	2034
Base Case Discount Rate of 8.55% (Scenario #'s 8+30+52)	139,859	437,581	1,130,474	1,968,116	4,448,248
Discount Rate of 4.17% (Scenario #'s 22+44+66)	147,918	462,390	1,192,431	2,053,210	4,672,363

Table 6-5: Portfolio Achievable Base Savings Potential (dth) by Discount Rate under TRC Screen

Scenario	2014	2016	2020	2025	2034
Base Case Discount Rate of 3.4% (res), 8.55% (C&I) (Scenario #'s 3+25+47)	83,674	261,580	668,838	1,310,576	2,512,861
Discount Rate of 4.17% (Scenario #'s 21+43+65)	85,424	266,665	680,809	1,335,733	2,573,978



7 ACHIEVABLE POTENTIAL BY SECTOR

Table 7-1 presents the cumulative estimated energy efficiency achievable savings potential for the residential, commercial and industrial sectors under the UCT cost-effectiveness screen. As noted earlier, achievable potential decreases from the achievable base to the achievable high scenario. This occurs because under the UCT cost-effectiveness screen, the utility incurs a higher proportion of the measure's incremental cost in the achievable high scenario (75% incentive) as compared to the achievable base scenario (30% incentive). This increase in the cost to the utility is causing more measures to fail the cost-effective screen, which is outweighing the increased adoption of the measures which do pass. **Figure 7-1** shows the same distribution of savings by sector for the achievable base scenario. Residential shows the largest potential at 73% of the total, with Commercial representing 22% and Industrial just under 5%.

Table 7-1: Cumulative Natural Gas Savings Potential by Achievable Scenario, by Sector (UCT) [22]

	2014	2016	2020	2025	2034
Achievable - Base Cumulative Savings (dth)					
Residential (8)	102,231	318,717	809,252	1,601,762	3,115,143
Commercial (30)	31,228	99,116	272,356	547,792	1,157,574
Industrial (52)	6,400	19,748	48,866	93,998	175,531
Achievable - Moderate Cumulative Savings (dth)					
Residential (4)	74,639	237,393	616,349	1,253,558	2,419,570
Commercial (26)	26,581	84,226	227,098	413,413	754,225
Industrial (48)	6,508	19,868	48,343	87,540	147,284
Achievable - Aggressive Cumulative Savings (dth)					
Residential (5)	98,949	313,235	801,824	1,596,849	2,992,451
Commercial (27)	35,136	110,840	294,314	521,315	915,961
Industrial (49)	8,671	26,461	64,305	116,170	194,724

Figure 7-1: 2014 Achievable Base Savings Potential by Sector under UCT Screen

[22] The scenario number is listed in parenthesis for reference to **Table 2-6**

7.1 Residential Energy Efficiency Potential Findings

Sector specific findings for the residential sector are presented below. Similar to the portfolio section, detailed findings are presented first for the base-case technical, economic and achievable-base potential scenarios. It should be noted that all findings in the base-case scenario are run under the UCT cost effectiveness screen and the following main assumptions:

- Cost Effectiveness Screen: UCT
- Incentive Level: 30% (Achievable Base), then 50% and 75%
- Avoided Costs: Current
- Discount Rate: 8.55%[23]

Summary findings are then presented for the alternate achievable-base potential scenarios given changes in cost-effectiveness screen, avoided cost and discount rate.

7.1.1 Base Case Technical/Economic/Achievable Savings Potential Findings

Table 7-2 and Figure 7-2 present the estimated cumulative technical, economic and achievable savings potential for the residential sector in Cascade's Washington service territory under the Utility Cost Test (UCT). Cascade's 2014 achievable-base savings potential is estimated at 102,231 dekatherms, reaching 3.1M dekatherms in 2034, representing 0.9% and 18.9% of current year sales respectively.

Table 7-2 Residential Cumulative Natural Gas Savings Potential by Base Case Scenario under the UCT

	2014	2016	2020	2025	2034
Baseline Sales Forecast (dth)	11,608,614	12,023,160	12,985,691	14,246,171	16,505,838
Cumulative Savings (dth)					
Technical Potential	463,954	1,483,179	3,607,978	6,460,296	10,928,515
Economic Potential	317,391	1,008,519	2,431,359	4,323,971	7,216,991
Achievable - Base	102,231	318,717	809,252	1,601,762	3,115,143
Achievable - Moderate	94,517	302,284	795,012	1,613,675	3,120,243
Achievable - High	94,522	297,154	749,820	1,479,572	2,735,363
Energy Savings (% of baseline sales)					
Technical Potential	4.00%	12.34%	27.78%	45.35%	66.21%
Economic Potential	2.73%	8.39%	18.72%	30.35%	43.72%
Achievable - Base	0.88%	2.65%	6.23%	11.24%	18.87%
Achievable - Moderate	0.81%	2.51%	6.12%	11.33%	18.90%
Achievable - High	0.81%	2.47%	5.77%	10.39%	16.57%

[23] While a 8.55% discount rate is used for all the base-case scenarios under the UCT, a 3.4% discount rate was used when screening residential measures under the TRC. Moreover, a scenario was also run to assess residential potential using a 4.17% discount rate.

Figure 7-2: Residential Energy Efficiency Potential Savings (% of Sales) by Base Case Scenario (UCT)

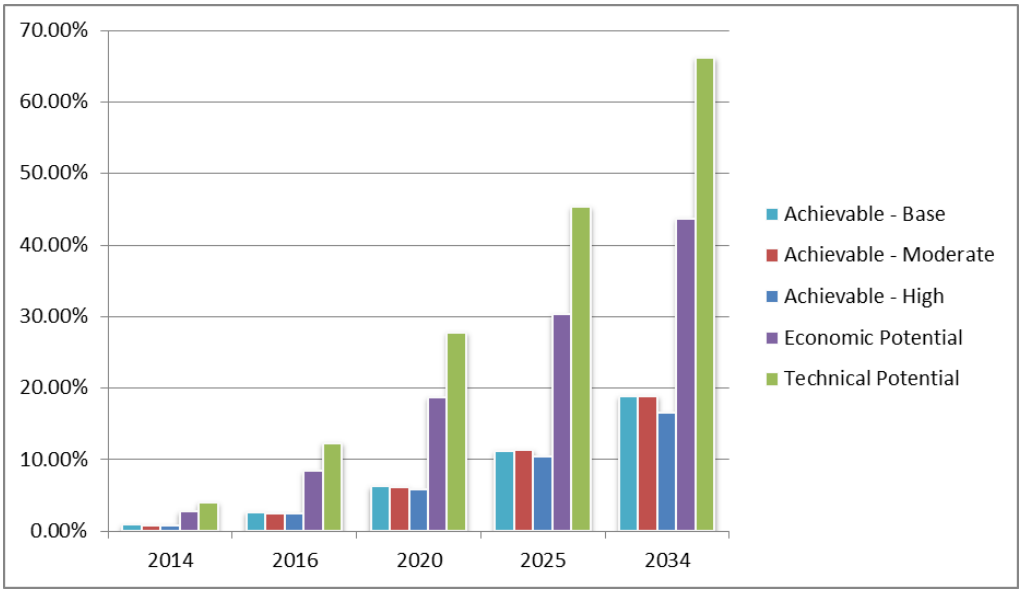


Figure 7-3 illustrates the technical savings potential in the residential sector along various points along the supply curve. These findings suggest that Cascade can obtain a large share of the total residential energy savings (81.5M therms) at a screened levelized cost of $0.75 or less with diminishing savings returns thereafter. **Table 7-3** shows the achievable savings potential when screened at various levelized cost/therm under the UCT test. Given its current program funding threshold of $0.42/levelized cost per therm, Cascade could potentially realize 73,677 dth of savings in 2014 were it to implement all cost-effective residential measures.

Figure 7-3: Residential Technical Potential Supply Curve under UCT

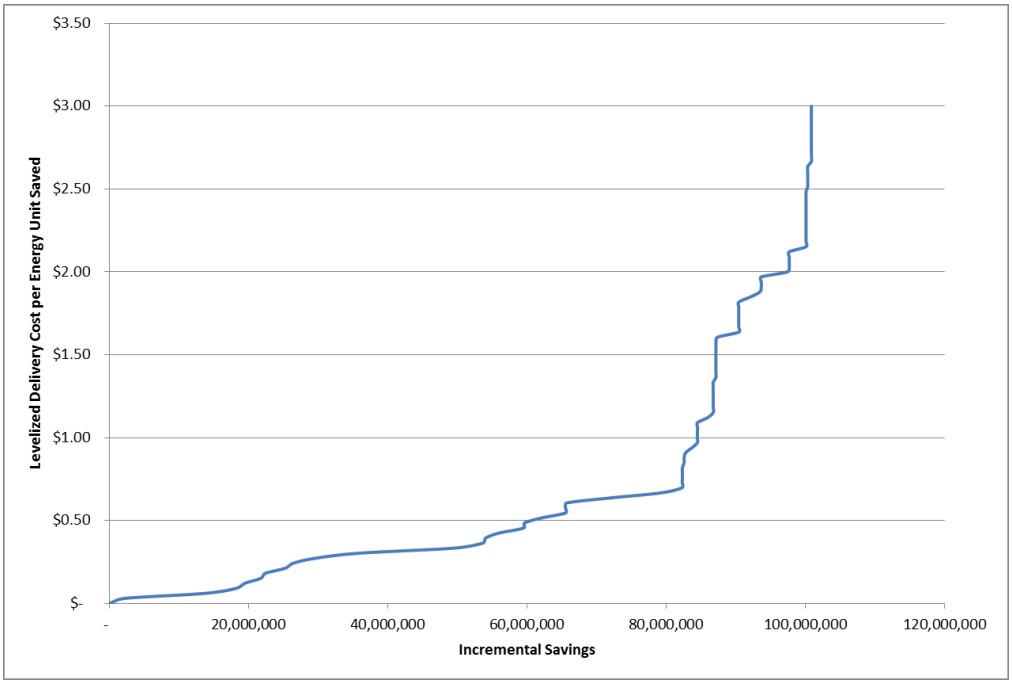

Table 7-3 2014 Residential Achievable Potential (dth) Screened by Levelized Cost ($/therm) under UCT

	Screened at Levelized Cost of:						
	$0.12	$0.22	$0.32	$0.42	$0.53	$0.64	$0.75

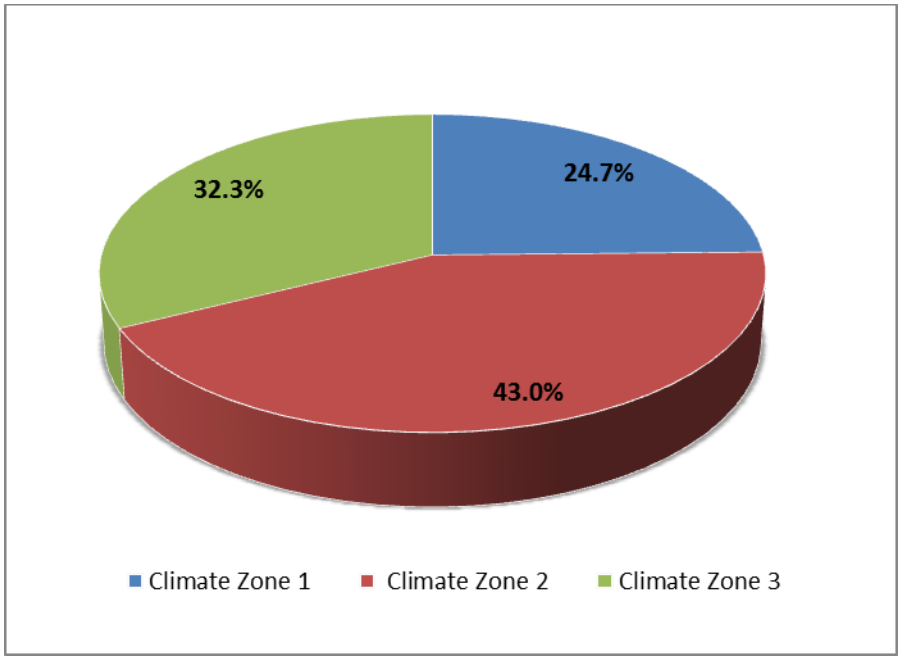
Clothes Drying	-	-	-	-	-	-	-
Other	-	-	-	-	-	-	-
TOTAL	**46,462**	**55,215**	**60,514**	**73,677**	**84,840**	**101,169**	**102,229**



7.1.1.1 Residential Savings Potential by Climate Zone

Table 7-4 and **Figure 7-4** below summarize the cumulative residential savings potential by scenario and by segment. Climate Zone 2 demonstrates the most savings potential at 43% of the total (in line with total sales), followed by Climate Zone 3 (32%) then Climate Zone 1 (25%). These findings generally align with the baseline sales forecast in each climate zone (i.e. the more sales, the more savings potential); however, it can be seen that as a percentage of sales the most potential resides in climate zone 3 (0.93% of sales for the achievable base scenario).

Table 7-4: Residential 2014 Cumulative Natural Gas Savings by Climate Zone by Base Case Scenario (UCT)

	1	2	3	TOTAL
Baseline Sales Forecast (dth)	2,970,456	5,087,390	3,550,768	**11,608,614**

Figure 7-4: Residential 2014 Achievable Base Savings Potential by Climate Zone (UCT)

7.1.1.2 Residential Savings Potential by Segment

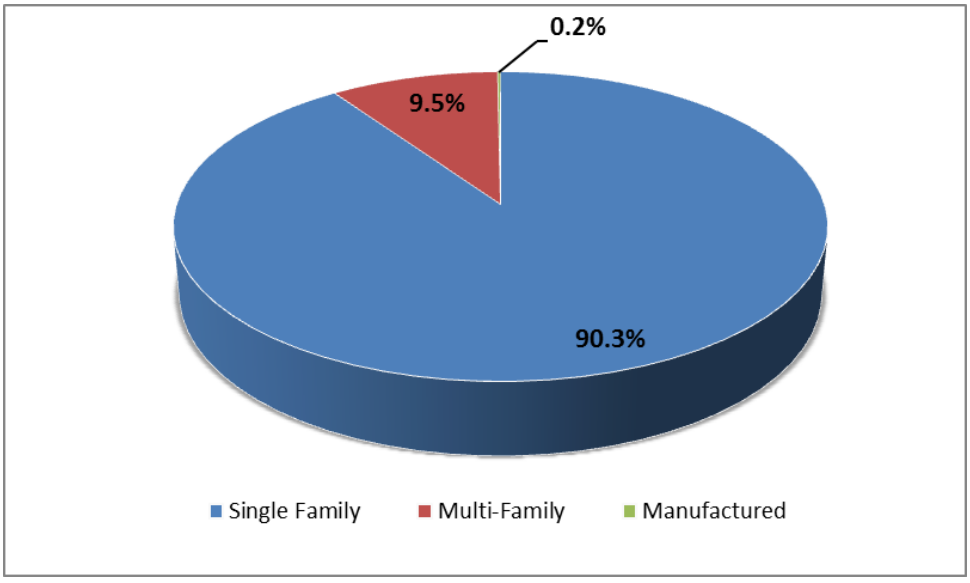

Table 7-5 and **Figure 7-5** below summarize the cumulative residential base-case savings potential by scenario and by segment. The single family segment shows the most potential for savings both on a total therms basis, and as a percentage of segment sales. As shown in

, manufactured homes represent the smallest share of savings, at 0.2% of the residential sector. Again, these savings percentage align largely with the baseline sales forecast in each segment, as shown earlier in **Table 4-2** (manufactured homes represent 0.1% of the energy consumption of the residential sector).

Table 7-5: Residential 2014 Base Case Savings Potential by Residential Segment by Scenario (UCT)

	Single Family	Multi-Family	Manufactured	TOTAL
Baseline Forecast (dth)	9,851,460	1,736,502	20,651	**11,608,614**
Energy Savings (dth)

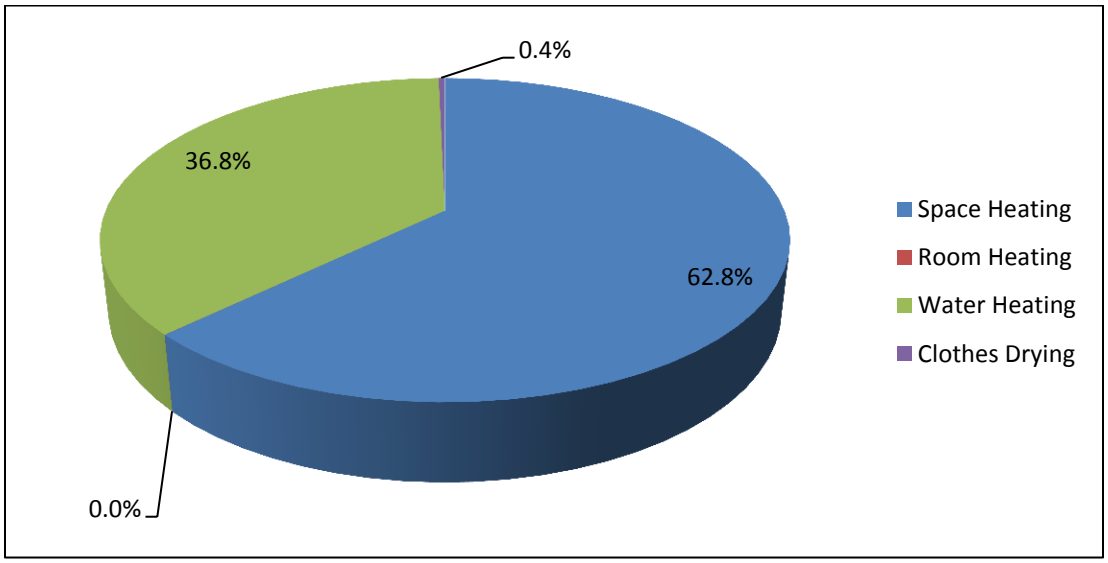
Figure 7-5: Residential 2014 Achievable Base Potential Savings by Segment (UCT)



7.1.1.3 Residential Savings Potential by End Use

Table 7-6 summarizes the savings potential in the residential sector under the achievable-base scenario by segment and by end use, while **Figure 7-6** illustrates the 2014 achievable savings potential by residential end use. Space heating represents the largest share of saving potential across all segments at 62.8%, followed by water heating at 36.8%. Room heating and clothes drying make up the remainder.

Table 7-6: Residential 2014 Cumulative Achievable Base Savings by Segment, by End Use (UCT)

	Single Family		Multi-Family		Manufactured		TOTAL
End Use	Dekatherms	% of Total	Dekatherms	% of Total	Dekatherms	% of Total	
Space Heating	228,139	62.8%	26,924	61.9%	409	61.1%	**255,472**
Room Heating	50	0.01%	14	0.03%	0	0.01%	**64**
Water Heating	133,727	36.8%	16,398	37.7%	259	38.6%	**150,384**
Clothes Drying	1,266	0.35%	178	0.41%	1	0.22%	**1,445**
% of Sales		**3.7%**		**2.5%**		**3.2%**	**3.5%**

Figure 7-6: Residential 2014 Achievable Base Potential Savings by End Use (UCT)

7.1.2 Alternate Achievable Savings Potential Findings

As described in **Section 6.2 Alternate Achievable Base Potential Findings**, Nexant complied with the Washington Utilities and Transportation Commission's October 9, 2013 Policy Statement addressing cost-effectiveness by examining savings potential under both the TRC and UCT screen. **Table 7-7** below

illustrates the differences in cumulative savings potential based on whether the UCT or TRC test is used to screen measure cost effectiveness. There is more achievable potential under the UCT test due to its more favorable cost-effectiveness screening methodology with achievable base savings of 102,231 dekatherms in 2014 (compared to 58,075 dekatherms under the TRC). As noted earlier, achievable potential decreases from the achievable base to the achievable high scenario because under the UCT test, fewer measures are passing the achievable high cost effectiveness screen (utility pays a 75% incentive) than compared with the achievable base scenario (utility pays 30% incentive). This increase in the cost to the utility is causing more measures to fail the cost-effective screen, which is outweighing the increased adoption of the measures which do pass. For the Economic and Achievable Base scenarios UCT savings are higher than TRC savings by about 40%. UCT is also higher than TRC in the Achievable Moderate scenario by about 20%, whereas in the Achievable High scenario TRC savings are greater than UCT by about 5%.

Table 7-7: Residential Savings Potential by Base-Case Scenario, by Cost-Effectiveness Screen

	2014	2016	2020	2025	2034
Cumulative Savings (dth) based on UCT Screen					
Technical Potential	463,954	1,483,179	3,607,978	6,460,296	10,928,515
Economic Potential	317,391	1,008,519	2,431,359	4,323,971	7,216,991
Achievable - Base	102,231	318,717	809,252	1,601,762	3,115,143
Achievable - Moderate	94,517	302,284	795,012	1,613,675	3,120,243
Achievable - High	94,522	297,154	749,820	1,479,572	2,735,363
Cumulative Savings (dth) based on TRC Screen					
Technical Potential	463,954	1,483,179	3,607,978	6,460,296	10,928,515
Economic Potential	192,917	622,511	1,498,814	2,686,147	4,412,650
Achievable - Base	58,075	181,825	461,307	934,496	1,824,239
Achievable - Moderate	74,639	237,393	616,349	1,253,558	2,419,570
Achievable - High	98,949	313,235	801,824	1,596,849	2,992,451

The next scenarios illustrate the sensitivity of total savings potential given uncertainty in the forecasted cost of natural gas (thus the avoided costs) for Cascade. **Table 7-8** compares 2014 savings results of the UCT test vs. the TRC under various avoided cost scenarios. UCT savings are greatest by roughly 40% over TRC under the following scenarios: Current Avoided Costs, Avoided Costs +25%, and Avoided Costs -25%. However, the savings potential under the UCT is only 4% greater than the TRC when Avoided Costs are increased by +100%.

Table 7-8: Residential 2014 Achievable Base Potential by Cost Effectiveness Test, by Avoided Cost Scenario

Scenario (30% Incentive)	Cumulative 2-yr Savings by UCT Screen (dth)	Cumulative 2-yr Savings by TRC Screen (dth)	Difference in Therms (UCT-TRC)
Current Avoided Costs (8, 3)	102,231	58,075	44,156
Avoided Costs +25% (16, 11)	105,136	63,345	41,790
Avoided Costs +50% (17, 12)	105,137	84,542	20,595
Avoided Costs +100% (18, 13	105,446	101,683	3,763
Avoided Costs -25% (19, 14)	93,769	54,914	38,855
Avoided Costs -50% (20, 15)	59,157	48,260	10,897

Table 7-9 summarizes the differences in achievable base savings potential given variations in the corporate discount rate used by Cascade under the UCT and TRC screen respectively. Nexant used Cascade's weighted average cost of capital of 8.55% to screen residential measures as the base-case assumption under the UCT screen, and 3.4% under the TRC screen. An alternate discount rate of 4.17% was used to assess impact on savings potential for both cost-effectiveness screens. Using a 4.17% discount rate increases 2014 potential by 3% under the UCT, while it reduces potential by 1.7% under the TRC.

Table 7-9: Residential Achievable Base Savings Potential by Discount Rate under UCT and TRC Screen (dth)

Scenario	2014	2016	2020	2025	2034
UCT Screen					
Base Case Discount Rate of 8.55% (8)	102,231	318,717	809,252	1,601,762	3,115,143
Discount Rate of 4.17% (22)	105,301	328,232	833,403	1,648,602	3,212,676
TRC Screen					
Base Case Discount Rate of 3.4% (3)	58,075	181,825	461,307	934,496	1,824,239
Discount Rate of 4.17% (21)	57,088	177,597	442,776	878,733	1,669,872

7.1.3 Residential Achievable Potential Benefits & Costs

Table 7-10 and **Table 7-11** summarize benefit-cost ratios associated with the achievable potential scenarios given variations in avoided costs screened under the UCT and TRC respectively. The residential sector UCT ratio ranges from 2.01 to 4.35 depending on the avoided costs, while the TRC benefits range from $1,612,661 to $15,815,917, with costs ranging from $758,517 to $7,376,411. The TRC ratio ranges from 1.92 to 2.81 depending on avoided cost. Again, the UCT screen considers less costs (especially under lower incentive rates as is the case with the base case scenario assumption of 30% incentive rates), and thus has a more favorable benefit cost ration when compared to the TRC test (which considers the full incremental cost of each measure).

Table 7-10: Residential 2014 UCT Ratios for Achievable Potential by Avoided Cost Scenario

Scenario	UCT Benefits	UCT Costs	UCT Ratio
Base Avoided Costs (8)	$ 5,208,577	$ 2,219,358	2.35
Avoided Costs +25% (16)	$ 6,730,392	$ 2,457,045	2.74
Avoided Costs +50% (17)	$ 8,076,595	$ 2,457,161	3.29
Avoided Costs +100% (18)	$ 10,798,665	$ 2,483,598	4.35
Avoided Costs -25% (19)	$ 3,484,687	$ 1,733,075	2.01
Avoided Costs -50% (20)	$ 1,411,965	$ 469,090	3.01

Table 7-11: Residential 2014 TRC Ratios for Achievable Potential by Avoided Cost Scenario

Scenario	TRC Benefits	TRC Costs	TRC Ratio
Base Avoided Costs (3)	$ 4,136,066	$ 1,470,327	2.81
Avoided Costs +25% (11)	$ 5,886,079	$ 2,204,442	2.67
Avoided Costs +50% (12)	$ 9,984,223	$ 5,195,834	1.92
Avoided Costs +100% (13)	$ 15,815,917	$ 7,376,411	2.14
Avoided Costs -25% (14)	$ 2,846,545	$ 1,148,480	2.48
Avoided Costs -50% (15)	$ 1,612,661	$ 758,517	2.13

Finally, **Table 7-12** summarizes the total acquisition costs ($/therm saved) to achieve the residential savings associated with each achievable scenario under the UCT and TRC cost tests, respectively. Acquisition cost per therm saved range from $1.30 to $2.17 under the UCT and $2.06 to $2.62 under the TRC.

Table 7-12: Residential 2014 Acquisition Costs for Achievable Potential Scenarios (UCT and TRC)

Scenario	UCT Costs	Savings (therms	Acquisition Cost
Achievable Base	$ 2,219,358	1,022,309	$ 2.17
Achievable Moderate	$ 1,809,078	945,173	$ 1.91
Achievable Aggressive	$ 1,231,523	945,219	$ 1.30
Scenario	TRC Costs	Savings (therms	Acquisition Cost
Achievable Base	$ 1,470,327	580,753	$ 2.53
Achievable Moderate	$ 1,959,148	746,388	$ 2.62
Achievable Aggressive	$ 2,037,064	989,486	$ 2.06

7.2 COMMERCIAL ENERGY EFFICIENCY POTENTIAL

Sector specific findings for the commercial sector are provided below. Similar to the portfolio and residential section, findings are presented first for the base-case technical, economic and achievable

potential; and then for the alternate achievable potential scenarios given changes in cost-effectiveness screen, avoided cost and discount rate.

7.2.1 Base Case Technical/Economic/Achievable Savings Potential Findings

Table 7-13 and **Figure 7-7** present the estimated technical, economic and achievable savings potential for the commercial sector in Cascade's Washington service territory under the Utility Cost Test. 2014 savings potential in the commercial sector under the achievable base scenario is 31,229 dth, representing 0.39% of current year sales. Under a higher incentive rate of 75%, the 2014 savings potential in the commercial sector under the achievable high scenario increases to 37,461 dth, representing 0.47% of sales.

Table 7-13: Commercial Energy Efficiency Potential by Scenario under UCT Screen (dth)

	2014	2016	2020	2025	2034
Baseline Sales Forecast (dth)	7,919,090	8,175,358	8,757,191	9,525,092	10,792,100
Cumulative Savings (dth)					
Technical Potential (28)	245,635	749,691	1,811,603	1,811,603	4,919,046
Economic Potential (29)	138,153	422,290	1,023,921	1,023,921	2,774,773
Achievable - Base (30)	31,228	99,116	272,356	272,356	1,157,574
Achievable - Moderate (31)	35,705	115,110	324,650	324,650	1,332,303

Achievable - Base	0.39%	1.21%	3.11%	2.86%	10.73%
Achievable - Moderate	0.45%	1.41%	3.71%	3.41%	12.35%
Achievable - High	0.47%	1.47%	3.79%	3.49%	11.25%

Figure 7-7: Commercial Energy Efficiency Potential by Scenario under Utility Cost Test

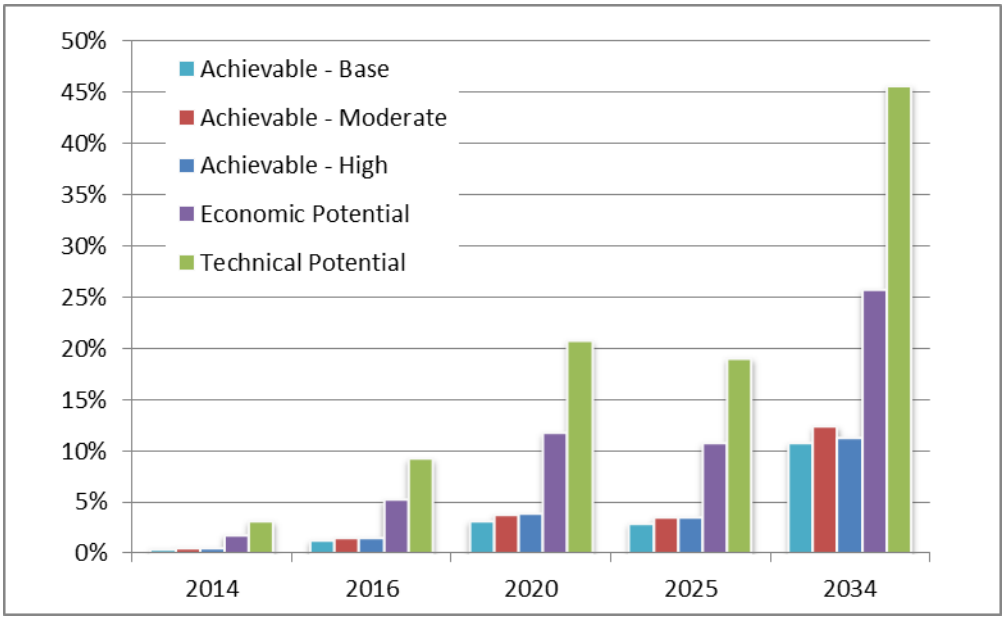

Figure 7-8 illustrates the 2014 technical savings potential supply curve. These findings suggest that Cascade can obtain a large share of the total commercial energy savings (29,131 dth) at a screened levelized cost of $0.65/therm or less with diminishing savings returns thereafter. **Table 7-14** shows the achievable base savings when screened at various levelized cost/therm under the UCT test. Given its current program threshold of $0.42/levelized cost per therm, it's possible to achieve 27,201 dth in the commercial sector assuming all cost effective measures are pursued.

Figure 7-8: Commercial Technical Potential Supply Curve under UCT

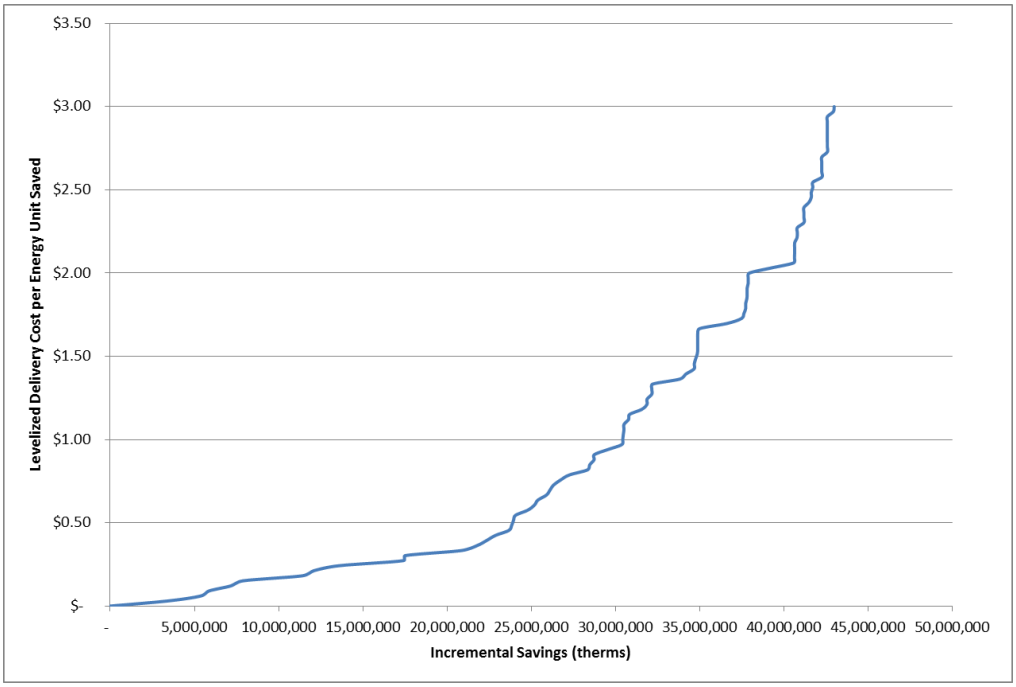

Table 7-14: Commercial 2014 Achievable Potential (dth) Screened by Levelized Cost ($/therm) under UCT

	Screened at Levelized Cost of:

7.2.1.1 Commercial Savings Potential by Segment

Table 7-15 below summarizes the cumulative Commercial savings potential by scenario and by segment. Achievable base savings is fairly evenly distributed among the various segments with the most residing in education (25%) and the least in warehouses (0.9%). Again, these savings potential align closely with baseline sales. However, when viewed as a percentage of sales basis, the lodging segment has the highest savings potential at 1.25% of segment sales.

Table 7-15: 2014 Commercial Savings Potential by Scenario, by Segment (UCT)

	Education	Grocery	Healthcare	Office	Lodging	Misc.	Restaurant	Retail	Warehouse	TOTAL
Baseline Forecast (dth)	1,198,852	594,346	314,392	2,343,195	305,770	388,657	654,378	1,915,295	204,206	**7,919,090**

Figure 7-9: 2014 Achievable Base Savings Potential by Commercial Segment (UCT)

7.2.1.2 Commercial Savings Potential by End Use

Figure 7-10 illustrates the savings potential in the commercial sector under the achievable-base scenario by segment and by end use. **Table 7-16** shows the 2014 achievable savings potential by commercial end use. The majority of savings reside in space heating (51%) and water heating (45%) across all segments. However, some segments such as restaurants see a higher share of savings potential in the cooking end use (4.3%).

Figure 7-10: Commercial 2014 Achievable Base Savings Potential by Commercial End Use (UCT)

7.2.2 Alternate Achievable Savings Potential Findings

As described in **Section 6.2**, Nexant examined savings potential under both the TRC and UCT screen to comply with WUTC's October 9, 2013 Policy Statement regarding cost screening. **Table 7-17** below illustrates the differences in cumulative savings potential based on whether the UCT or TRC test is used to screen measure cost effectiveness. Similar to the residential sector, significantly more savings potential is realized under the UCT screen with 31,228 dth in 2014 compared to 20,408 dth under the TRC screen.

Table 7-17: Commercial Savings Potential by Scenario, by Cost-Effectiveness Screen (dth)

	2014	2016	2020	2025	2034
Cumulative Savings (dth) based on UCT Screen					
Technical Potential (28)	245,635	749,691	1,811,603	1,811,603	4,919,046
Economic Potential (29)	138,153	422,290	1,023,921	1,023,921	2,774,773
Achievable - Base (30)	31,228	99,116	272,356	272,356	1,157,574
Achievable - Moderate (31)	35,705	115,110	324,650	324,650	1,332,303
Achievable - High (32)	37,461	120,085	332,083	332,083	1,214,167
Cumulative Savings (dth) based on TRC Screen					
Technical Potential (23)	245,635	749,691	1,811,603	3,036,629	4,919,046
Economic Potential (24)	74,703	227,948	552,393	881,742	1,300,918
Achievable - Base (25)	20,408	63,925	169,113	306,647	571,900
Achievable - Moderate (26)	26,581	84,226	227,098	413,413	754,225
Achievable - High (27)	35,136	110,840	294,314	521,315	915,961

Nexant also assessed differences in 2014 achievable base savings potential given variations in avoided costs under both the UCT and TRC test (**Table 7-18)**. These scenarios illustrate the sensitivity of total savings potential given uncertainty in the forecasted cost of natural gas (thus the avoided costs) for Cascade.

Table 7-18: Commercial 2014 Achievable Base Potential by Cost Effectiveness Test, by Avoided Cost Scenario

Scenario (UCT #/ TRC #)	2014 Savings by UCT Screen (dth)	2014 Savings by TRC Screen (dth)	Difference in dth (UCT-TRC)
Current Avoided Costs/30% (30/25)	31,228	20,408	10,820
Avoided Costs +25% (38/33)	35,868	21,355	14,513
Avoided Costs +50% (39/34)	39,503	22,993	16,510
Avoided Costs +75% (40/35)	40,410	25,843	14,567
Avoided Costs -25% (41/36)	28,308	14,279	14,030
Avoided Costs -50% (42/37)	24,870	11,789	13,081

Table 7-19 summarizes the differences in achievable base savings potential given variations in the corporate discount rate used by Cascade under the UCT and TRC screen respectively. Per the recommendations provided by the Washington Utilities and Transportation Commission in the October 9, 2013 Policy Statement, Nexant used Cascade's weighted average cost of capital of 8.55% to screen measures as the base-case assumption for all scenarios. An alternate discount rate of 4.17% was used to assess impact on savings potential. Potential increases by approximately 16% and 11% when going from the 8.55% to 4.17% discount rate under the UCT and TRC screen, respectively.

Table 7-19: Commercial Achievable Base Savings Potential by Discount Rate (UCT and TRC)

Scenario	2014	2016	2020	2025	2034
UCT Screen					
Base Case Discount Rate of 8.55% (30)	31,228	99,116	272,356	547,792	1,157,574
Discount Rate of 4.17% (44)	36,139	114,173	309,589	309,589	1,282,239
TRC Screen					
Base Case Discount Rate of 8.55% (25)	20,408	63,925	169,113	306,647	571,900
Discount Rate of 4.17% (43)	22,578	71,513	195,457	380,152	777,474

7.2.3 Commercial Achievable Potential Benefits & Costs

Table 7-20 and **Table 7-21** summarize the associated cost-benefit ratios associated with the achievable potential scenarios given variations in avoided costs screened under the UCT and TRC respectively.

Table 7-20: Commercial 2014 UCT Achievable Potential Ratios by Avoided Cost Scenario

Scenario	UCT Benefits	UCT Costs	UCT Ratio
Base Avoided Costs (30)	$ 1,337,436	$ 533,881	2.5
Avoided Costs +25% (38)	$ 1,968,539	$ 837,284	2.4
Avoided Costs +50% (39)	$ 2,635,439	$ 1,119,598	2.4
Avoided Costs +75% (40)	$ 3,169,520	$ 1,217,843	2.6
Avoided Costs -25% (41)	$ 876,628	$ 363,912	2.4
Avoided Costs -50% (42)	$ 489,934	$ 239,557	2.0

Table 7-21: Commercial 2014 TRC Achievable Potential Ratios by Avoided Cost Scenario

Scenario	TRC Benefits	TRC Costs	TRC Ratio
Base Avoided Costs (25)	$ 722,400	$ 392,424	1.8
Avoided Costs +25% (33)	$ 966,385	$ 455,139	2.1
Avoided Costs +50% (34)	$ 1,304,296	$ 607,203	2.1
Avoided Costs +75% (35)	$ 1,802,684	$ 892,712	2.0
Avoided Costs -25% (36)	$ 352,790	$ 144,440	2.4
Avoided Costs -50% (37)	$ 176,746	$ 61,968	2.9

Finally, **Table 7-22** and **Table 7-23** summarize the total costs projected to be paid by Cascade to achieve the savings associated with the achievable base, moderate, and aggressive scenarios for 2014 and the associated savings under the UCT and TRC costs tests, respectively. The acquisition costs ($/therm-saved) under each scenario are also presented. The acquisition costs under the UCT range from $1.37 to $1.93/therm-saved. While the acquisition costs are slightly higher under the TRC screen, ranging from $1.52 to $1.95/therm-saved.

Table 7-22: Commercial 2014 Acquisition Costs for Achievable Potential Scenarios (UCT)

Scenario	UCT Costs	Savings (therms)	Acquisition Cost ($/therm)
Achievable Base (30)	$ 533,880.91	312,284	$ 1.71
Achievable Moderate (31)	$ 690,255.13	357,052	$ 1.93
Achievable Aggressive (32)	$ 513,840.96	374,614	$ 1.37

Table 7-23: Commercial 2014 Acquisition Costs for Achievable Potential Scenarios (TRC)

Scenario	TRC Costs	Savings (therms)	Acquisition Cost ($/therm)
Achievable Base (25)	$ 392,424.31	204,080	$ 1.92
Achievable Moderate (26)	$ 517,628.38	265,814	$ 1.95
Achievable Aggressive (27)	$ 535,150.01	351,358	$ 1.52

7.3 Industrial Energy Efficiency Potential

Sector specific findings for the industrial sector are provided below. Similar to the portfolio section, findings are presented first for the base-case technical, economic and achievable potential; and then for the alternate achievable potential scenarios given changes in cost-effectiveness screen, avoided cost and discount rate.

7.3.1 Base Case Technical/Economic/Achievable Savings Potential Findings

Table 7-24, and **Figure 7-11** present the estimated technical, economic and achievable savings potential for the industrial sector in Cascade's Washington's service territory under the Utility Cost Test. Cumulative savings by the year 2034 are projected at 20% of baseline sales for Technical Potential, and this savings potential reduces to 4.8% over the 20 year study horizon for the Achievable Base scenario. As is the case with each sector, the Achievable scenario's projected savings are not necessarily linear with the 'base', 'moderate', and 'high' designations.

Table 7-24: Industrial Energy Efficiency Potential Savings by Base Case Scenario (UCT)

	2014	2016	2020	2025	2034
Baseline Sales Forecast (dth)	2,663,312	2,749,499	2,945,178	3,203,435	3,629,550
Cumulative Savings (dth)					
Technical Potential	34,565	104,656	248,293	434,112	737,634
Economic Potential	21,097	63,985	151,686	268,511	442,629
Achievable - Base	6,400	19,748	48,866	93,998	175,531
Achievable - Moderate	7,621	23,704	61,087	120,160	225,057
Achievable - High	9,616	29,337	71,234	128,528	211,241

Achievable - Moderate	0.29%	0.86%	2.07%	3.75%	6.20%
Achievable - High	0.36%	1.07%	2.42%	4.01%	5.82%

Figure 7-11: Industrial Energy Efficiency Potential Savings (% Sales) by Base Case Scenario (UCT)

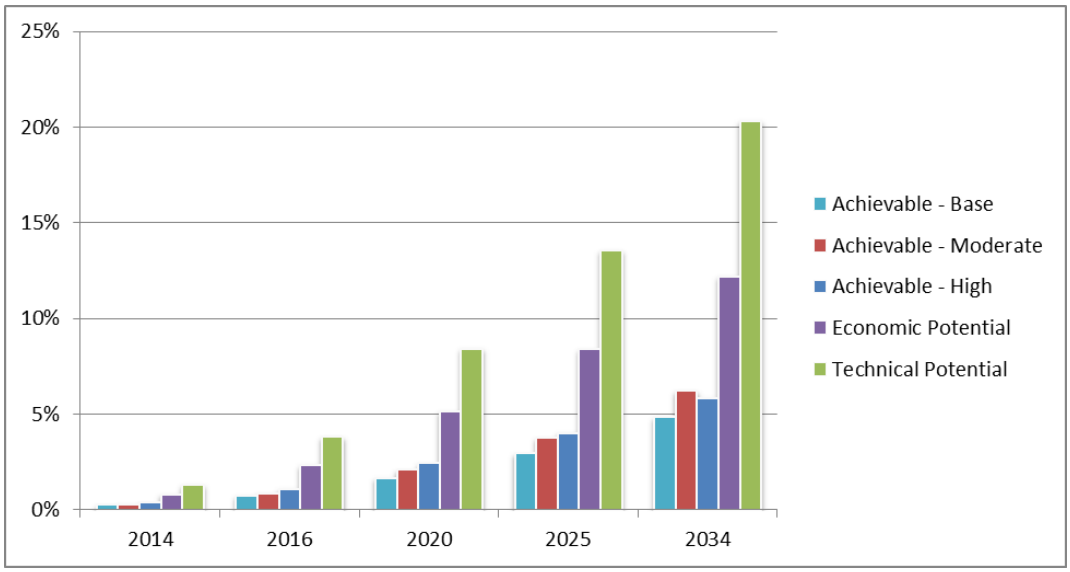

Figure 7-12 illustrates the achievable savings potential along various points of the industrial technical potential supply curve. These findings suggest that Cascade can obtain a large share of the total industrial energy savings (170,554 dekatherms) at a screened levelized cost of $0.42/therm or less with diminishing savings returns thereafter. **Table 7-25** shows the achievable base savings potential when screened at various levelized cost/therm under the UCT test. When screened at Cascade's current levelized cost threshold of $0.42/therm, it's possible to achieve up to 170,554 dth in the industrial market assuming all cost-effective measures are pursued.

Figure 7-12: Industrial Technical Potential Supply Curve under UCT

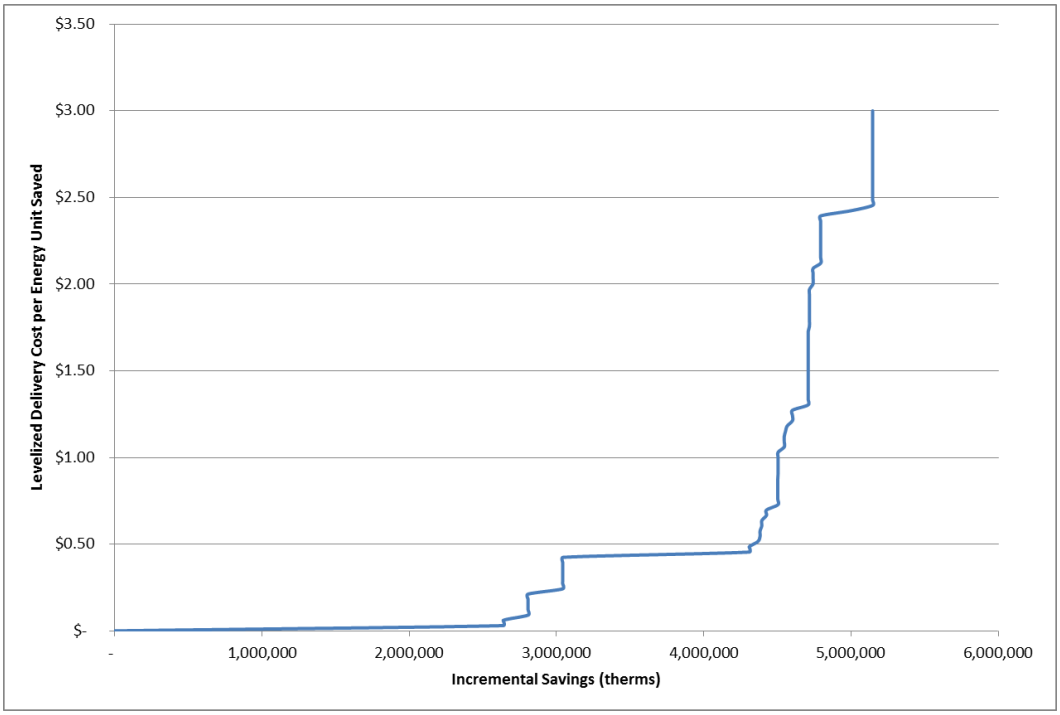

Table 7-25: Industrial 2014 Achievable Potential (dth) Screened by Levelized Cost ($/therm) under UCT

	Screened at Levelized Cost of:

7.3.1.1 Industrial Savings Potential by Segment

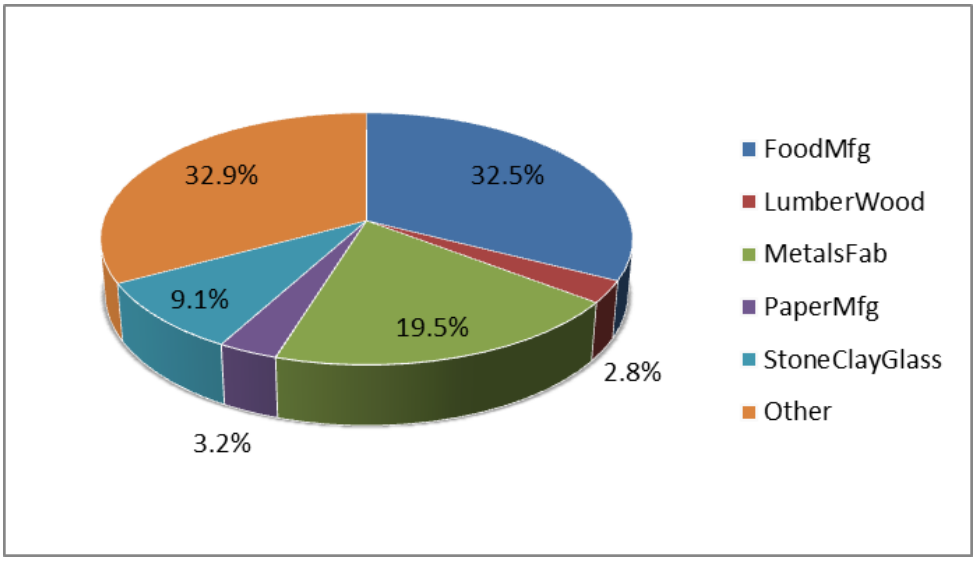

Table 7-26 and Figure 7-13 below summarize the cumulative industrial savings potential by scenario and by segment. As a percent of baseline sales, the Achievable Base potential scenario represents 0.24% of baseline sales. By segment under the achievable base savings scenario, Food Manufacturing and the "Other" category[24] are projected to make up roughly 33% each of total potential savings, while Metals Fabrication makes up the third largest potential savings at 19.5% of the total potential.

[24] The "Other" industrial segment includes various industries including textiles, petroleum and allied products, printing, chemicals and allied products, leather manufacturing, electronic manufacturing, forestry, among other many other industrial industry types.

Table 7-26: 2014 Base Case Savings Potential by Scenario by Industrial Segment

	FoodMfg	LumberWood	MetalsFab	PaperMfg	StoneClayGlass	Other	TOTAL

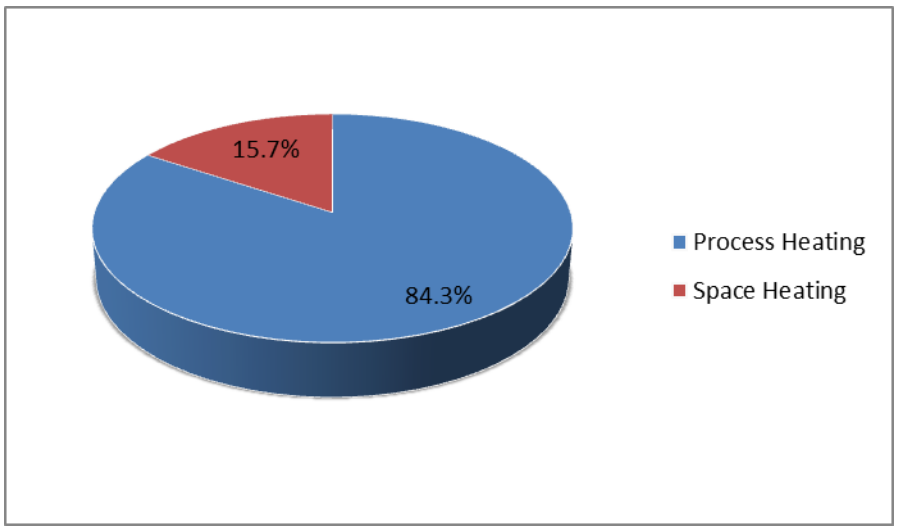
Figure 7-13: 2014 Achievable Base Savings Potential by Industrial Segment (UCT)



7.3.1.2 Industrial Savings Potential by End Use

Table 7-27 summarizes the savings potential in the industrial sector under the achievable-base scenario by segment and by end use. Process Heating End Use represents the majority of the savings opportunity in all industrial segments. No water heating or "other" end use measures passed cost-effectiveness, and therefore have no achievable potential in the industrial sector. **Figure 7-14** shows the 2014 achievable savings potential by industrial end use with process heat representing 84.3% of savings potential across all segments.

Table 7-27: 2014 Achievable Base Savings by Industrial Segment, by End Use (UCT)

	FoodMfg		LumberWood		MetalsFab		PaperMfg		StoneClayGlass		Other		TOTAL

Figure 7-14: Achievable Base Savings Potential by Industrial End Use (UCT)

7.3.2 Alternate Achievable Savings Potential Findings

As described in **Section 6.2**, Nexant examined savings potential under both the TRC and UCT screen to comply with WUTC's October 9, 2013 Policy Statement regarding cost screening. **Table 7-28** below illustrates the differences in cumulative savings potential based on whether the UCT or TRC test is used to screen measure cost effectiveness. As with the other sectors, UCT potential is consistently larger than TRC potential by amounts varying from 8%-37% higher, with 21 year UCT savings ranging from 175,531 dth under the Achievable Base scenario, to 225,057 dth under the Achievable moderate scenario. 21-year TRC savings range from 116,722 dth under the Achievable Base scenario, to 147,284 dth under the Achievable moderate scenario.

Table 7-28: Industrial Savings Potential by Scenario, by Cost-Effectiveness Screen

	2014	2016	2020	2025	2034
Cumulative Savings (dth) based on UCT Screen					
Technical Potential (50)	34,565	104,656	248,293	434,112	737,634
Economic Potential (51)	21,097	63,985	151,686	268,511	442,629
Achievable - Base (52)	6,400	19,748	48,866	93,998	175,531
Achievable - Moderate (53)	7,621	23,704	61,087	120,160	225,057
Achievable - High (54)	9,616	29,337	71,234	128,528	211,241
Cumulative Savings (dth) based on TRC Screen					
Technical Potential (45)	34,565	104,656	248,293	434,112	737,634
Economic Potential (46)	13,042	39,667	95,583	170,485	280,638
Achievable - Base (47)	5,191	15,830	38,418	69,433	116,722
Achievable - Moderate (48)	6,508	19,868	48,343	87,540	147,284
Achievable - High (49)	8,671	26,461	64,305	116,170	194,724

Nexant also assessed differences in 2014 savings potential given variations in avoided costs under both the UCT and TRC test (**Table 7-29**). These scenarios illustrate the sensitivity of total savings potential given uncertainty in the forecasted cost of natural gas (thus the avoided costs) for Cascade. While savings potential increases when avoided costs are increased (given increases in the price of natural gas), the increase is smaller under the UCT when compared to the TRC scenarios.

Table 7-29: Industrial 2014 Achievable Base Potential by Cost Effectiveness Test, by Avoided Cost

Scenario (UCT #/ TRC #)	2014 Savings by UCT Screen (dth)	2014 Savings by TRC Screen (dth)	Difference in Therms (UCT-TRC)
Current Avoided Costs/30% (52/47)	6,400	5,191	1,209
Avoided Costs +25% (60/55)	6,668	5,758	911
Avoided Costs +50% (61/56)	6,775	5,758	1,017
Avoided Costs +75% (62/57)	6,840	5,762	1,079
Avoided Costs -25% (63/58)	6,003	5,191	813
Avoided Costs -50% (64/59)	5,758	5,191	567

Table 7-30 summarizes the differences in achievable base savings potential given variations in the corporate discount rate used by Cascade under the UCT and TRC screen respectively. Per the recommendations provided by the Washington Utilities and Transportation Commission in the October 9, 2013 Policy Statement, Nexant used Cascade's weighted average cost of capital of 8.55% to screen measures as the base-case assumption for all scenarios. An alternate discount rate of 4.17% was used to assess impact on savings potential. Savings potential is slightly higher under the 4.17% discount rate, with the difference between savings on an annual basis under the UCT screen varying by less than 1%,

whereas the difference is greater under the TRC screen, with savings hovering near 10% greater for the 4.17% discount rate than the 8.55%.

Table 7-30: Industrial Achievable Base Savings Potential by Discount Rate by Cost Effectiveness Screen

Scenario	2014	2016	2020	2025	2034
UCT Screen					
Base Case Discount Rate of 8.55% (52)	6,400	19,748	48,866	93,998	175,531
Discount Rate of 4.17% (66)	6,478	19,985	49,439	95,020	177,448
TRC Screen					
Base Case Discount Rate of 8.55% (47)	5,191	15,830	38,418	69,433	116,722
Discount Rate of 4.17% (65)	5,758	17,555	42,576	76,848	126,632

7.3.3 Industrial Achievable Potential Benefits & Costs

Table 7-31 and **Table 7-32** summarize the associated cost-benefit ratios of the industrial achievable potential scenarios given variations in avoided costs screened under the UCT and TRC respectively. With avoided costs ranging from 50% below base to 75% above base, the UCT Ratio ranges from 9.2 to 10.1, while the TRC Ratio ranges from 5.8 to 11.5. The cost-benefit ratios are higher in the industrial sector because those measures that passed where non-equipment measures and had a very favorable cost-benefit ratio.

Table 7-31: Industrial 2014 UCT Ratios for Achievable Potential Base Scenario

Scenario	UCT Benefits	UCT Costs	UCT Ratio
Base Avoided Costs (52)	$ 319,626	$ 31,919	10.0
Avoided Costs +25% (60)	$ 409,242	$ 41,869	9.8
Avoided Costs +50% (61)	$ 500,729	$ 51,765	9.7
Avoided Costs +75% (62)	$ 591,179	$ 58,677	10.1
Avoided Costs -25% (63)	$ 234,858	$ 25,615	9.2
Avoided Costs -50% (64)	$ 149,435	$ 15,909	9.4

Table 7-32: Industrial 2014 TRC Ratios for Achievable Potential Base Scenario

Scenario	TRC Benefits	TRC Costs	TRC Ratio
Base Avoided Costs (47)	$ 274,201	$ 23,834	11.5
Avoided Costs +25% (55)	$ 373,588	$ 53,031	7.0
Avoided Costs +50% (56)	$ 448,306	$ 53,031	8.5
Avoided Costs +75% (57)	$ 523,460	$ 53,510	9.8
Avoided Costs -25% (58)	$ 205,649	$ 23,833	8.6
Avoided Costs -50% (59)	$ 137,100	$ 23,833	5.8

Table 7-34 and Table 7-34 summarize the total costs projected to be paid by Cascade to achieve the savings associated with achievable base, moderate and aggressive scenarios in 2014 under the TRC and UCT scenarios, respectively. The acquisition costs[25] ($/therm-saved) under each scenario are also presented. UCT savings range from 63,997 therms to 96,158 and with acquisition costs ranging from $0.50 – $0.76 $/therm; while TRC savings range from 51,906 to 86,710 therms and acquisition costs range from $0.35 - $0.46 $/therm.

Table 7-33: Industrial 2014 Acquisition Costs for Achievable Potential Scenarios (UCT)

Scenario	UCT Costs	Savings (therms)	Acquisition Cost ($/therm)
Achievable Base (52)	$ 31,919.00	63,997	$ 0.50
Achievable Moderate (53)	$ 57,973.89	76,212	$ 0.76
Achievable Aggressive (54)	$ 50,161.41	96,158	$ 0.52

Table 7-34: Industrial 2 Acquisition Costs for Achievable Potential Scenarios (TRC)

Scenario	TRC Costs	Savings (therms)	Acquisition Cost ($/therm)
Achievable Base (47)	$ 23,834.07	51,906	$ 0.46
Achievable Moderate (48)	$ 30,152.38	65,081	$ 0.46
Achievable Aggressive (49)	$ 30,385.36	86,710	$ 0.35

[25] Acquisition costs in this study do not include administrative expenses.

8 CONCLUSIONS

The results of this study reveal that considerable natural gas energy efficiency opportunities exist for Cascade Natural Gas Corporation in its Washington service territory, despite recent declines in the cost of natural gas, the savings achieved to-date by Cascade's DSM programs, and increasing building standards due to the 2012 Washington State Energy Codes for buildings. Our analysis shows that 137,844 dth of natural gas savings are achievable in 2014 across all sectors when measures are screened using the UCT, increasing to 4.5M dth of cumulative natural gas savings by 2034. These findings should be viewed with the following considerations in mind:

- The natural gas savings potential highlighted in this report does not reflect "program potential", but rather achievable potential which assumes all cost-effective measures are pursued and implemented.
- The achievable potential findings also assume no limitations on program spending to achieve all cost-effective measure savings.
- Administrative costs were not included when screen measures for cost-effectiveness.
- The approach of using the UCT as the cost-effectiveness screen departs from prior potential studies conducted for Cascade. Prior studies for Cascade utilized the TRC cost-effectiveness screen which typically results in less saving potential when compared to the UCT. Nexant has run various scenarios to illustrate the difference in savings potential under both the UCT and TRC cost-effectiveness screen.
- The measure costs utilized for the purposes of the potential assessment are lower resolution than those that would be available by the company for program planning. For program planning purposes the costs may be refined by the company to better reflect costs in their specific service territory.
- This report (**Volume II**) provides summary findings on each of the 66 scenarios modeled under this research. Detailed cumulative natural gas savings potential by sector, by segment, by end use and by year are presented for all 66 scenarios modeled by Nexant in **Vol. III, Appendix B**.

9 ENERGY EFFICIENCY MEASURES EXAMINED

9.1 MEASURES EXAMINED

Nexant examined a total of 190 measures for all sectors combined. 39 residential measures were included in this study. For the non-residential sector, there were 134 total measures included in the potential energy savings analysis. Of these 134 measures, 36 were considered in the industrial model and 63 were included in the commercial model. Therefore the total number of measures included in the model is 125, yet many measures had overlap between different sectors and segments and therefore may appear in the summary as one measure. **Table 9-1** through **Table 9-3** provides a brief description of the types of measures included for each end use in the residential, commercial and industrial model respectively. The list of measures was developed based on a review of Cascade's current measure offerings, measures examined in the 2009 Potential Assessment for Cascade, and measures included in other contemporary natural gas potential assessments, along with individual measures recommended by either Nexant or Cascade staff.

Table 9-1: Summary of Residential Measures

End Use	Measure Type	Measure Name

9.2 MEASURE DEFINITIONS

The following section provides summary definitions of each of the measures evaluated as part of this potential assessment. Measures are organized by sector, by end use.

9.2.1 Residential

9.2.1.1 Space Heating

Air sealing: This measure creates pressure boundaries in the shell of the home and reduces air leaks through strategic use and application of air-sealing materials which prevent air movement and subsequent heat loss.

Attic/ceiling insulation: Insulation is added to the attic/ceiling as a thermal boundary. insulating the attic includes air sealing. The following iterations were included in this analysis: R-0 to R-49 assumed no prior attic/ceiling insulation. R-11 to R-49 assumed an existing R-11 level of insulation. R-19 to R-49 assumed the prior insulated condition to be R-19.

Basement Floor insulation & Crawlspace insulation - R-30 or higher: R-30 insulation is added to the basement or crawlspace floor.

Boiler controls: Boiler reset controls capable of resetting boiler supply water temperature in an inverse linear fashion with outdoor air temperature.

Boiler repair/maintenance: This measure pertains to boiler diagnostic testing, repair, and tune-up which ensures the boiler will run smoothly and efficiently.

Built Green Home: Many features of a built green home are environmental-impact related, but not necessarily energy related. Therefore a base Energy Star Home Efficiency was assumed (R-44 insulation vs. R-38 base, 92 AFUE furnace vs. 78 AFUE base, 62 EF water heater vs. 57 EF base, and ACH reduction from 7.08 (base) to 4.6. In addition to these Energy Star Home efficiency measures, the following were

added for the Built Green Home energy savings algorithms: Duct insulation to R-11 vs. R-6.8 base, R-26 wall insulation vs. R-13 base, upgrade to energy star clothes washer and dishwasher.

Condensing Boiler: This measure pertains to the installation of a condensing boiler that has a high efficiency (typically greater than 90%) which is achieved by using the waste heat in the flue gases to pre-heat the cold water entering the boiler.

Duct Sealing: This measure is associated with performing duct sealing using mastic sealant or metal tape to the distribution system of homes with either central air conditioning using a ducted system. This measure prevents heat loss through leaky duct work.

Entryway door: Installation of an entryway door that has a lower U-value than the Washington Code specifications. Lower U-value correlates with better insulation capabilities which prevent heat loss.

Exterior wall R-0 to Blow-in R-13 insulation: Blow-in cellulose insulation is usually applied to exterior walls, or walls that provide a thermal barrier inside the home. Since walls in most homes represent more exterior surface area than the floors or ceilings, they present more opportunity to lose and gain heat.

Furnace repair/maintenance: Repair or replace any deteriorating components to ensure furnace runs efficiently.

Heat recovery ventilator: Installation of an Energy Star qualified air to air heat recovery ventilator; the counter-flow provides improved climate control, while saving energy through reduction of heating (and cooling) requirements by mixing outbound air with inbound air.

High Efficiency Boiler: This measure involves installation of a high efficiency or condensing boiler that improves efficiency by recovering "waste heat" which usually exits a house from the flue of a conventional boiler. It does this by condensing the water vapor produced in the combustion process and using the heat from this condensation thereby extracting more usable heat for use in the building

High efficiency Combination Domestic Hot Water and Hydronic Space Heating System using pre-approved Tankless Water Heater: Hydronic systems transfer heat through thermal radiation, thereby reducing air temperature stratification. Thermal heat heats the objects in the home which is more efficient than heating the air in the home.

High efficiency furnace 90%+ AFUE: High efficiency furnace features may include improved heat exchangers and modulating multi-stage burners. Washington State Energy Code efficiencies are AFUE 80 for equipment that meets code, and 76 AFUE for stock equipment. Two measure iterations were run in this analysis: a 90% efficiency furnace and a 95% efficient furnace.

High Efficiency Pool/Spa heating boilers: Installation of a high efficiency or condensing boiler that improves efficiency by recovering "waste heat" that usually exits the facility from the flue of a

conventional boiler. These boilers function by condensing the water vapor produced in the combustion process and using the heat from this condensation. Baseline efficiencies are 80% for equipment that meets code, and 75% for stock equipment.

Insulation, basement side wall: Add R-13 insulation to the basement or crawlspace side wall.

Programmable Thermostat: This measure characterizes the household energy savings from the installation of a new or reprogramming of an existing programmable thermostat for reduced heating energy consumption through temperature set-back (while unoccupied or during reduced demand times).

Slab insulation R-0 to R-5 (4 ft.): Installing R-5 insulation value of a depth of 4 ft. down on the perimeter to an existing slab with no additional insulation.

Window treatments: Glazing installed onto the window resulting in a U-value of 0.44.

Window upgrade U<0.3: Upgrading windows resulting in a U-value less than or equal to 0.30. This measure reduces the heat transfer through the windows.

9.2.1.2 Water Heating

Condensing Domestic Hot Water: Unlike a regular gas water heater, a condensing DHW unit captures the combustion gas and utilizes the residual heat in the combustion gas to heat the water in the storage tank. A gas condensing water heater is designed with greater surface area flue. The heat and combustion gases have much farther to travel before they exit the water tank, so more heat is transferred to the water in the tank. Energy Factor (EF) typically > 0.80. Measure replaces stock EF 0.54 water heater or EF 0.62 water heater that meets Washington State Energy Code.

Condensing High Efficiency Natural Gas Tankless Water Heater: This unit achieves savings by eliminating standby losses in stand-alone or tank-type water heaters and through higher efficiency than baseline storage hot water heaters. Minimum efficiency for the Tankless Water Heater is generally 0.80. Measure replaces stock EF 0.54 water heater or EF 0.62 water heater that meets code.

Conventional High Efficiency Natural Gas Water Heater: This measure characterizes the purchase and installation of a new efficient gas-fired water heater, in place of a code or existing residential unit. Natural gas savings are generated from the higher efficiency (EF>0.62) water heater. Measure replaces stock EF 0.54 water heater or code EF 0.62 water heater.

Drain water heat recovery: 80%–90% of the energy used to heat water in a home goes down the drain with used hot water. Drain-water heat recovery systems reduce the amount of energy needed for water heating by capturing heat from the used water to preheat cold water entering the water heater or going to other water fixtures.

ENERGY STAR dishwasher: An Energy Star certified dishwasher uses less water per cycle which correlates to therms saved per year through reduced water heat.

Hot water pipe insulation: Adding insulation to both the hot and cold domestic hot water pipes. Insulating helps reduce standby losses. Default savings are provided per 3 feet of length and are appropriate up to 6 feet of the hot water pipe and 3 feet of the cold. Existing pipes are assumed to be un-insulated (R-0).

Hot water temperature setback: The thermostat setting of a hot water tank is lowered to 120 degrees. The baseline condition is a hot water tank with a thermostat setting that is higher than 120 degrees, typically systems with settings of 130 degrees or higher.

Low Flow Faucet aerators*:* Installation of a low flow faucet aerator in a household kitchen or bath faucet fixture. Gas savings are generated from a maximum flow rate of 1.5 compared to a standard 2.2 gpm faucet.

Low Flow Showerheads: Installation of a low flow showerhead in a single or multi-family household. Gas savings are generated from a maximum flow rate of 2.0 gpm compared to a standard 2.5 gpm showerhead

Solar Hot Water Heater: This measure assumes that a gas water heater is replaced with a solar water heater with backup, reducing the water heating load by about 60%. Solar water heating system includes a storage tank and solar collector. Replaces stock EF 0.54 water heater.

9.2.1.3 Room Heating

High efficiency Natural Gas Hearth +80% AFUE: Efficient alternative to a masonry fireplace via reduced air infiltration by removing the fireplace, and adding an 80%+ efficiency appliance. Overall space heating reduction is the result.

High efficiency Natural Gas Hearth +70% FE (Fireplace Efficiency)**:** Efficiency alternative to masonry fireplace by reducing air infiltration by removing the fireplace and replacing it with a 70%+ efficiency appliance. Overall space heating reduction is the result.

9.2.1.4 Clothes Drying

High efficiency clothes washer: Efficient clothes washers use one-third the water of standard clothes washers. Efficient clothes washers also shorten drying time due to high speed spin cycles, which reduce the water content of washed clothes.

9.2.1.5 Others

ENERGY STAR Certified Home + U.30 Window Glazing: A home can earn the ENERGY STAR certificate by completing the following: thermal enclosure system, high efficiency heating and cooling system, ,energy-efficient lighting and appliances, and U 0.30 glazing.

ENERGY STAR Plus Certified Home (Gas, with or without AC): ENERGY STAR Certified Home + U.30 Glazing (as above), with the following added efficiency alternates: R-44 Ceiling Insulation, 92 AFUE furnace, 0.62 EF water heater, <0.46 Air Changes per Hour.

Home Performance with ENERGY STAR: Completion of three measures listed below triggers a cash incentive:

Shell: Attic, Floor or Wall Insulation

Sealing: PECS, Duct Sealing and Insulation, Whole House Air Sealing

Water Heat: High-Efficiency Water Heat

Space Heat: High-Efficiency Furnace, HE Boilers, Combination Hydronic Heat or Fuel Conversion

9.2.2 Commercial

9.2.2.1 Space Heating

Boiler Economizer: Economizers are heat exchange devices that heat fluids, (usually water), up to, but not normally beyond the boiling point of the fluid. Economizers are so named because they can make use of the enthalpy in fluid streams that are hot, but not hot enough to be used in a boiler, thereby recovering more useful enthalpy and improving the boiler's efficiency.

Boiler pipe insulation: Insulate Boiler Pipes, 2" diameter with 1" R-4 insulation or better. Savings compared to a standard un-insulated boiler pipe.

Boiler repair/maintenance: This measure pertains to boiler diagnostic testing, repair, and tune-up to improve boiler operational efficiency.

Boiler Steam Trap - min. 300 kBtu in, pressure of 7 psig: Replacement of a leaking steam trap. A proper working trap keeps steam lines free of condensate. Condensate can cause damage to valves, piping, and equipment, reducing operational efficiency and equipment life.

Boiler vent damper - min. 1000 kBtu input: A vent damper prevents conditioned air from being pulled into the flue (exiting the building) when the heating appliance is not running. When there's a demand for heat and the furnace or boiler starts to run, the damper opens to improve draw.

Demand-controlled ventilation: Installation of a demand controlled ventilation system to adjust outside air quantities in response to measured CO_2 levels. Conventional ventilation supply ventilated air based

on assumed, rather than actual, occupancy. This often results in over-ventilation, wasting both money and energy. Demand-controlled ventilation monitors conditions in every zone, and then delivers the required ventilation where it is needed.

Direct fired radiant heating: This measure involves the installation of a low intensity gas-fired radiant heater. It is more efficient than baseboard heating and usually more efficient than forced-air heating because it eliminates duct losses.

Duct sealing & insulation: This measure prevents air leaks through duct work via duct sealing, by using a sealant such as mastic or metal tape, or replacing the air distribution with a new system entirely. This applies only to facilities with a ducted heating system.

***Energy management system optimization*:** Energy management system optimization involves using system appropriate automation hardware and software to detect and identify opportunities for savings and implement catered solutions.

Floor Insulation: R-30 insulation is added to the basement or crawlspace floor. Assumed base-case minimum of R-4.94.

Gas Engine-drive Heat Pumps: This measure provides space heating and cooling using an advanced natural gas engine in place of an electric motor. Variable –speed engine controls allow the GHP to closely follow the load and maintain efficiency. Heat recovery from engine cooling jacket and exhaust supplements the GHP output during heating mode. (Electric heat pumps require inefficient resistant heating to supplement the heat pump output at low outdoor temperatures).

***Heat Exchanger*:** Traditional systems that condition air use the air only once, and then exhaust it. Much of this energy can be recovered by installing heat-recovery coils in the exhaust air handlers. This heat exchanger can precondition the outside air coming into the building, recovering energy without risking contamination.

High efficiency condensing boiler - Min. 90% therm. Eff. & 300 kBtu input: Installing a new high efficiency, gas-fired condensing boiler in a commercial location. Gas savings achieved through the utilization of a sealed combustion chamber and multiple heat exchangers that remove a significant portion of the waste heat from flue gasses. Because multiple heat exchangers are used to remove waste heat from the escaping flue gasses, some of the flue gasses condense and must be drained. Baseline efficiencies are 80% for equipment that meets code, and 75% for stock equipment.

High efficiency condensing furnace - min. 91% AFUE: The installation of a new high efficiency, gas-fired condensing furnace in a commercial location. Savings achieved through the utilization of a sealed, super insulated combustion chamber, more efficient burners, and multiple heat exchangers that remove a significant portion of waste heat from flue gasses. This system produces condensate which must be drained. The base case is a standard furnace with AFUE of 78.

High efficiency condensing unit heater - min 92% AFUE: This measure applies to a gas fired condensing unit heater installed in a commercial application. A heat exchanger is attached to the condensing unit heater to capture heat and vapor from the exhaust gases. That heat, instead of being flushed outside, is turned back into useable heat circulating inside the heated space. Baseline equipment is a new unit heater meeting 2012 WA energy code minimum efficiency.

High efficiency non-condensing unit heater - min 86% AFUE: This measure applies to a gas fired non-condensing unit heater installed in a commercial application. Hot gases generated from combustion of hydrogen are directly vented to the outside. Baseline equipment is a new unit heater meeting 2012 WA energy code minimum efficiency.

HVAC controls: The installation of the following: Programmable Thermostats, Energy Management Systems or Direct Digital Control systems. These options enable more efficient control of the HVAC system.

HVAC system commissioning: HVAC System Commissioning is a systematic, documented process that includes inspection and testing conducted to confirm that the buildings systems are being operated and maintained in conformance with the design intent. Buildings that are not properly commissioned can suffer from high energy costs, poor indoor air quality, poor system control, and many other mechanical problems.

Power Burner: This measure involves a condensing, integrated water heater/boiler with an AFUE of $\geq$ 90%, with Power Burner. Baseline equipment is condensing, integrated water heater/boiler with an AFUE of $\geq$ 90%, with standard atmospheric burner.

Roof insulation (retrofit only) - Tier 1: Min R-30: Addition of roof insulation to minimum R-30 to replace existing insulation that is less than R-11.

Roof insulation (retrofit only) - Tier 2: Min R-45: Addition of roof insulation to minimum R-45 to replace existing insulation that is less than R-11.

Solar Wall: Installation of solar wall which captures solar heat to pre-warm air for space heating. The solar heat cuts down on the amount of natural gas needed for space heating.

Steam System Efficiency Improvements: This measure includes assessing and adding or replacing main line air vents. Assess and replace radiator vents. Upgrade boiler control system to averaging system with indoor and outdoor sensors.

Variable Volume Air System: A mechanical HVAC system responsible for serving multiple zones which control the temperature in a zone by regulating the quantity of warm or cooled air supplied. The fan capacity has variable-speed drives, which reduces energy consumption versus constant volume systems.

Wall insulation (retrofit only) - Tier 1: Min R-11: Installation of exterior wall Insulation that is greater than R-11 to replace existing insulation that is less than R-4.

Wall insulation (retrofit only) - Tier 2: Min R-19: Installation of exterior wall Insulation that is greater than R-19 to replace existing insulation that is less than R-4.

Waste Water Heat Exchanger: A waste water heat exchanger recovers waste heat by pre-warming incoming water with the waste water in a separately contained unit which prohibits contamination while allowing heat transfer.

Windows- add argon to vinyl Low-E: This measure involves adding vinyl low-E Glass and Argon gas between layers of window glass for superior thermal efficiency. Baseline equipment is a vinyl-framed window with low-E glass installed, no argon fill.

Windows- Add Low E and Argon to vinyl tint: Same as the measure above except the windows are tinted. Baseline is vinyl framed-tinted window with argon gas fill, but not Low-E.

Windows- Add Low E to vinyl tint: addition of low-e glass to vinyl tint windows. Baseline is vinyl-framed, tinted window with (not low-E).

Windows- non-tinted AL code to class 36: Improvements of window to AL code class 36. Baseline equipment is an aluminum-framed non-tinted code window.

Windows- non-tinted AL code to class 40: Improvements of window to AL code class 40. Baseline equipment is an aluminum-framed non-tinted code window.

Windows- non-tinted AL code to class 45: Improvements of window to AL code class 45. Baseline equipment is an aluminum-framed non-tinted code window.

Windows- tinted AL code to class 36: Improvements of window to AL code class 36. Baseline equipment is an aluminum-framed tinted code window.

Windows- tinted AL code to class 40: Improvements of window to AL code class 40. Baseline equipment is an aluminum-framed tinted code window.

9.2.2.2 Water Heating

Combination HVAC/hot water delivery: new high efficiency condensing boiler for water and space heating to replace existing standard boiler with thermal efficiency 75% for existing, plus >75,000 BTU gas water heater EF 0.80.

Domestic hot water - condensing tank - min 91% efficiency: Unlike a regular gas water heater, the condensing DHW captures the combustion gas and utilizes the captured gas to heat the water in the

storage tank. A gas condensing water heater has its flue designed with greater surface area. The heat and combustion gases have much farther to travel before they exit the water tank, so more heat is transferred to the water in the tank. Typically EF > 0.80. Measure replaces stock EF 0.54 water heater or code EF 0.62 water heater.

Domestic hot water tankless water heater ENERGY STAR EF 0.82 efficiency: This measure achieves savings by eliminating the standby losses that occur in stand-alone or tank-type water heaters. Efficiency for the Tankless Water Heater is generally EF > 0.80. Measure replaces stock EF 0.54 water heater or code EF 0.62 water.

Drainwater heat recovery: Drain-water heat recovery systems reduce the amount of energy needed for water heating by capturing the heat from used drainwater and using it to preheat cold water entering the water heater or going to other water fixtures.

ENERGY STAR Door Type Dishwasher Low Temp Gas: Replace a standard door-type energy star dishwasher with a low temperature door-type single tank energy star dishwasher. Significant reduction in water heating cost. Water use for the efficient equipment is 1.18 gallons/rack compared to a conventional 2.1 gallons/rack.

Faucet aerators: Install low flow faucet aerators. New installation flow rate assumptions are≤ 1.5 gpm for bathrooms, and ≤ 2.2 GPM for kitchens. Stock equipment flow rate assumption is 3.0 gpm.

High efficiency commercial gas clothes washer 1.8 MEF: Installation of high efficiency commercial gas clothes washer, 2.2 MEF, and 3.3-4.3 cubic feet capacity. Measure replaces standard commercial gas clothes washer 1.6 MEF.

High efficiency water heater: This measure characterizes the purchase and installation of a new efficient gas-fired water heater, in place of an existing commercial unit. Natural gas savings are generated from the higher efficiency (EF > 0.62) water heater. Measure replaces stock EF 0.54 water heater or code EF 0.62 water heater.

Hot water pipe insulation: Adding insulation to both the hot and cold water pipes. Insulating helps reduce standby losses. Default savings are provided per 3 feet of length and are appropriate up to 6 feet of the hot water pipe and 3 feet of the cold water pipe. Existing pipes are assumed to be un-insulated (R-0).

Hot water temperature reset: The thermostat setting of a hot water tank is lowered to 120 degrees. The baseline condition is a hot water tank with a thermostat setting that is higher than 120 degrees, typically systems with settings of 130 degrees or higher.

Low-flow Pre-Rinse Spray Valve: Installation of low flow pre rinse spray valve, < 1.06 gpm, clean ability performance of <26 seconds per plate. The baseline equipment efficiency value for code is 1.6 gpm, stock is 1.9 gpm.

Low-flow showerheads: Installation of a low flow showerhead ≤ 2.0 gpm in a commercial setting. Replaces stock showerhead with 3.0 gpm flow rate.

Motion Faucet Controls: Installation of a motion controlled faucet with an average assumed flow duration of 12 seconds versus a standard faucet with an assumed average flow duration of 15 seconds.

Multi-Tank Conveyor Low Temp Dishwasher: Installation of a low-temperature multi-tank conveyor dishwasher to replace a standard multi-tank conveyor dishwasher. Water use for the efficient equipment is 0.54 gallons/rack compared to a conventional 1.04 gallons/rack.

Ozone injection laundry systems: Installation of washing machine with ozone injection system, allowing use of cold water. Baseline equipment is a standard washing machine without ozone injection. This measure saves the amount of energy required to heat water for a standard laundry system.

Pool cover: This measure involves a standard thermal pool cover which should have a minimum insulation value of R-12 to meet code requirement. Baseline equipment is a pool without cover. This measure reduces wasted heat when the pool is not occupied.

Pool/Spa solar heat: This measure assumes that a gas water heater is replaced with a solar water heater with backup. Solar water heating system includes a solar collector, the pool or spa is the storage. Measure replaces stock EF 0.54 water heater or code EF 0.62 water heater.

Solar Hot Water Heater: This measure assumes that a gas water heater is replaced with a solar water heater with backup. Solar water heating system includes a storage tank and solar collector. Measure replaces stock EF 0.54 water heater or code EF 0.62 water heater.

Storage Water Heater: Installation of a water heater with heating capacity > 75,000 Btuh, thermal efficiency (TE) ≥ 88% to replace baseline equipment with TE ≥ 80%.

9.2.2.3 Cooking

Combination Oven: Installation of combination convection with steam oven with cooking efficiency ≥ 38% and a convection mode cooking efficiency ≥ 44% to replace a standard combination convection and steam oven. Baseline model has a gas cooking energy efficiency of 35%.

Conveyor Oven: Installation of natural gas conveyor oven with a tested baking energy efficiency > 42% to replace existing deck oven.

ENERGY STAR Convection Oven: Installation of an energy star convection oven with cooking efficiency ≥ 44% to replace a natural gas convection oven that is not ENERGY STAR certified. Baseline efficiencies are 30% for equipment that meets code, and 25% for stock equipment.

ENERGY STAR Gas Fryer: Installation of a natural gas fired ENERGY STAR fryer with cooking energy efficiency of 50% to replace a natural gas fryer that is not ENERGY STAR certified. Baseline efficiencies are 35% for equipment that meets code, and 30% for stock equipment.

ENERGY STAR Griddle: Installation of a natural gas fired ENERGY STAR griddle with cooking energy efficiency of 38% to replace a natural gas fryer that is not ENERGY STAR certified with 32% efficiency.

High efficiency steam cooker: Installation of an ENERGY STAR® qualified gas steam cooker with 38% minimum cooking energy efficiency at heavy load (potato) cooking capacity to replace non-ENERGY STAR® commercial steamer. Baseline efficiencies are 18% for equipment that meets code, and 15% for stock equipment.

9.2.3 Industrial

9.2.3.1 Process Heating

Efficient Boiler: Upgrading boiler to higher efficiency model of AFUE >=90%, Standard boiler has no upgrades.

Efficient Burners: The boiler burner combines fuel and air in proper proportions for combustion and enables the fuel-air mixture to burn stably to give a specified flame size and shape. Efficient burners are designed to maximize combustion efficiency while minimizing the release of emissions.

Efficient Process Furnace: An industrial process furnace provides heat for a process, or can serve as a reactor to provide the heat of a reaction. Efficient process heaters reduce the energy consumption required to complete these results via 1) controlling the air-fuel ratio, 2) enhancing heat transfer within the furnace, 3) containing heat within the furnace by reducing leakage, 4) recovering waste heat, and 5) using sensors and controls to optimize the four previous process areas.

Improved process heating control: Improved process heating control measures improve the fuel/air mixture for optimum combustion of input fuels. Baseline equipment is standard process heating controls.

Process Heating O&M: Improve efficiency through maintaining optimum flame temperatures, monitoring levels of oxygen in flue gas, etc. Base-case involves no operations and maintenance measures.

9.2.3.2 Space Heating

Boiler repair/maintenance: Boiler diagnostic testing, repair, and tune-up. Base-case involves an existing boiler without diagnostic testing, repair, or tune-up for the prior two years.

Boiler Steam Trap - min. 300 kBtu in, pressure of 7 psig: Replacement of a leaking stream trap. A proper working trap keeps steam lines free of condensate. Condensate can cause damage to valves, piping, and equipment, reducing efficiency and equipment life.

Boiler vent damper - min. 1000 kBtu input: Installation of a vent damper to a boiler or furnace is an easy way to cut energy losses. The damper prevents conditioned air exfiltration via the flue when the heating appliance is not running.

Demand-controlled ventilation: Installation of a demand controlled ventilation system to adjust outside air quantities in response to measured CO_2 levels. Conventional ventilation supply ventilates air based on assumed, rather than actual, occupancy. This often results in over-ventilation. Demand-controlled ventilation monitors conditions in every zone, and then delivers the required ventilation where it is needed.

Direct fired radiant heating: This measure involves the installation of a low intensity gas fired radiant heater. It is more efficient than baseboard heating and usually more efficient than forced-air heating via eliminating duct losses.

Duct sealing: This measure prevents air leaks through duct work via duct sealing, either using a sealant such as mastic or metal tape, or replacing the air distribution with a new system entirely. This applies only to facilities with a ducted heating system.

***Energy management system optimization*:** Energy management system optimization involves using system appropriate automation hardware and software to detect and identify opportunities for savings and implement catered solutions.

Heat Exchanger: A heat exchanger recovers waste heat by pre-warming incoming medium with the waste exhaust medium in a separately contained unit which prohibits contamination while allowing heat transfer.

High efficiency condensing boiler - Min. 90% therm. Eff. & 300 kBtu input: This measure involves installation of a high efficiency or condensing boiler that improves efficiency by recovering “waste heat” that usually exits from the flue of a conventional boiler. Alternatively, the measure unit re-uses the heat from condensation. Baseline efficiencies are 80% for equipment that meets code, and 75% for stock equipment.

High efficiency condensing furnace - min. 91% AFUE: The installation of a new high efficiency, gas-fired condensing furnace in a commercial location. Savings achieved through the utilization of a sealed, super

insulated combustion chamber, more efficient burners, and multiple heat exchangers that remove a significant portion of the waste heat from the flue gasses. Because multiple heat exchangers are used to remove waste heat from the escaping flue gasses, some of the flue gasses condense and must be drained. This measure replaces a standard furnace with AFUE of 78.

High efficiency condensing unit heater - min 92% AFUE: This measure applies to a gas fired condensing unit heater installed in a commercial application. A heat exchanger is attached to the condensing unit heater to capture heat and vapor from the exhaust gases. That heat, instead of being flushed outside, is turned back into useable heat circulating inside the heated space. Baseline equipment is a new unit heater meeting 2012 WA energy code minimum efficiency.

High efficiency non-condensing unit heater - min 86% AFUE: This measure applies to a gas fired non-condensing unit heater installed in a commercial application. Hot gases generated from combustion of hydrogen are directly vented to the outside. There is no condensate. Baseline equipment is a new unit heater meeting 2012 WA energy code minimum efficiency.

HVAC controls: The installation of the following: Programmable Thermostats, EMS or DDS systems. These systems enable more efficient control of the HVAC system.

HVAC system commissioning: HVAC System Commissioning is a systematic, documented process that includes inspection and testing conducted to confirm that a buildings system are capable of being operated and maintained in conformance with the design intent. Buildings that are not properly commissioned can suffer from high energy costs, poor indoor air quality, poor system control, and many other mechanical problems.

Refrigeration system superheat recovery HVAC: Heat released from the refrigerant is recovered from the compressor and is used to pre-heat HVAC feeds.

Roof insulation (retrofit only) - Tier 1: Min R-30: Addition of roof insulation to minimum R-30 to replace existing insulation that is less than R-11.

Roof insulation (retrofit only) - Tier 2: Min R-45: Addition of roof insulation to minimum R-45 to replace existing insulation that is less than R-11.

Space Heating O&M: Improve efficiency through maintaining optimum flame temperatures, monitoring levels of oxygen in flue gas, boiler insulation, waste heat recover, burner efficiency improvements, etc. Base case involves no operations and maintenance measures.

Steam System Efficiency Improvements: This measure includes assessing and adding or replacing main line air and radiator vents, and upgrading the boiler control system to averaging system with indoor and outdoor sensors. The damper opens to improve draw.

Wall insulation (retrofit only) - Tier 1: Min R-11: Installation of exterior wall Insulation that is greater than R-11 to replace existing insulation that is less than R-4.

Wall insulation (retrofit only) - Tier 2: Min R-19: Installation of exterior wall Insulation that is greater than R-19 to replace existing insulation that is less than R-4.

Waste Water Heat Exchanger: A waste water heat exchanger recovers waste heat by pre-warming incoming water with the waste water in a separately contained unit which prohibits contamination while allowing heat transfer.

Windows- add argon to vinyl Low-E: This measure involves adding vinyl low-E Glass and Argon gas between layers of window glass for superior thermal efficiency. Baseline equipment is a vinyl-framed window with low-E glass installed, no argon fill.

Windows- Add Low E and Argon to vinyl tint: Same as the measure above except the windows are tinted. Baseline is vinyl framed-tinted window with argon gas fill, but not Low-E.

Windows- Add Low E to vinyl tint: addition of low-e glass to vinyl tint windows. Baseline is vinyl-framed, tinted window (not low-E).

Windows- non-tinted AL code to class 36: Improvements of window to AL code class 36. Baseline equipment is an aluminum-framed non-tinted code window.

Windows- non-tinted AL code to class 40: Improvements of window to AL code class 40. Baseline equipment is an aluminum-framed non-tinted code window.

Windows- non-tinted AL code to class 45: Improvements of window to AL code class 45. Baseline equipment is an aluminum-framed non-tinted code window.

Windows- tinted AL code to class 36: Improvements of window to AL code class 36. Baseline equipment is an aluminum-framed tinted code window.

Windows- tinted AL code to class 40: Improvements of window to AL code class 40. Baseline equipment is an aluminum-framed tinted code window.

9.2.3.3 Water Heating

Refrigeration system superheat recovery: A superheat recovery system recovers concentrated high temperature heat from compressor condenser discharge and pumps the recovered heat into a hot water tank to save on water heating energy.

APPENDIX B DETAILED MEASURE ASSUMPTIONS B-1

APPENDIX C DETAILED FINDINGS BY SCENARIO C-1

- **Annual Avoided Energy Costs (Current):**

Year	Avoided Cost ($)	Year	Avoided Cost ($)
2014	$0.460	**2029**	$0.720
2015	$0.510	**2030**	$0.750
2016	$0.510	**2031**	$0.800
2017	$0.510	**2032**	$0.820
2018	$0.520	**2033**	$0.840
2019	$0.550	**2034**	$0.860
2020	$0.560	**2035**	$0.880
2021	$0.570	**2036**	$0.900
2022	$0.620	**2037**	$0.930
2023	$0.630	**2038**	$0.950
2024	$0.650	**2039**	$0.980
2025	$0.650	**2040**	$1.000
2026	$0.690	**2041**	$1.030
2027	$0.720	**2042**	$1.050
2028	$0.730	**2043**	$1.080

- **Avoided Capacity Costs**: n/a
- **Inflation Rate:** 2.60%
- **Discount Rate (s):** Commercial and Industrial: 8.55% UCT and TRC
  Residential: 3.4% TRC, 8.55% UCT
- **Distribution Loss Rate:** 0.1959%

Appendix B Detailed Measure Assumptions

Details on each of the residential, commercial and industrial measures researched with savings, costs and EULs for all measure permutations are presented below. While Nexant modeled energy savings potential at the premise (i.e. building) level, measure savings (therms) and costs are presented at both the premise as well as the incremental unit level to aid with program planning. Measures in the tables below are organized by sector – residential, commercial, then industrial. Within each sector, measures are sorted alphabetically first by end use, then measure name, then segment, and finally vintage. Definitions for each vintage category are provided below:

- **Turnover:** A measure is installed at the end of existing equipment's expected useful life (EUL). In other words, the existing measure is replaced on burn-out. For this measure vintage, measure savings are calculated compared to code (where applicable). Costs are calculated as the incremental cost over the code minimum cost.

- **New:** A measure is installed as a new building is constructed. For this measure vintage, measure savings are calculated compared to code (where applicable). Costs are calculated as the incremental cost over the code minimum cost.

- **Early Retirement**: A measure is installed before the end of the existing equipment's expected useful life (EUL). In other words, the customer replaces the equipment while it's still operational. For this measure vintage, measure savings are calculated compared to the existing equipment or non-equipment baseline energy consumption (generally lower than code). Costs are estimated as the full cost of the installed measure.

It should be noted that the measure costs utilized for the purposes of this potential assessment reflect average installation costs across various implementation scenarios and therefore may be at a lower resolution than costs available to Cascade for program planning. For program planning purposes Cascade may opt to refine costs to better reflect costs in their specific service territory.

B.1 Residential Sector Measures

								Per Premise Values			Per Unit Values		
Measure Name	Sector	Vintage	Segment	Climate Zone	End Use	EUL (yrs)	Energy Savings (%)	Unit	Energy Savings (therms)	Incre-mental Cost ($)	Unit	Savings UEC (Thm/Unit) calculated	Incremental Cost ($/Unit)
Residential Clothes Washer	Residential	Early Retirement	Mfg_CZ1	1	Clothes Drying	11.0	55.0%	per premise	6	$1,056	per unit	6	$1,056
Residential Clothes Washer	Residential	Turnover	Mfg_CZ1	1	Clothes Drying	11.0	55.0%	per premise	6	$396	per unit	6	$396
Residential Clothes Washer	Residential	Early Retirement	Mfg_CZ2	2	Clothes Drying	11.0	55.0%	per premise	6	$1,056	per unit	6	$1,056

Appendix C Detailed Findings by Scenario

Detailed natural gas energy efficiency cumulative savings for each of the 22 scenarios run for each sector (66 scenarios total) are presented below. Within each scenario table, natural gas savings are presented by segment, by end use and by year. Values presented in each year represent the cumulative savings to each given year. Each of the scenarios addressed in this study are summarized in the table below.

Potential Category	Scenario	Scenario # Res/Com/Ind	Avoided Costs	Incentivized %	Discount Rate	
					Residential	Comm./ Industrial
Base Case – Technical/Economic/Achievable Potential Scenarios under TRC						
Technical	Technical – Base	1 / 23 / 45	Current	n/a	3.40%	8.55%
Economic	Economic – Base	2 / 24 / 46	Current	n/a	3.40%	8.55%
Achievable Potential	Achievable – Base	3 / 25 / 47	Current	30%	3.40%	8.55%
	Achievable – Moderate	4 / 26 / 48	Current	50%	3.40%	8.55%
	Achievable – High	5 / 27 / 49	Current	75%	3.40%	8.55%
Base Case – Technical/Economic/Achievable Scenarios under UCT						
Technical	Technical – Base	6 / 28 / 50	Current	n/a	8.55%	8.55%
Economic	Economic – Base	7 / 29 / 51	Current	n/a	8.55%	8.55%
Achievable Potential	Achievable – Base	8 / 30 / 52	Current	30%	8.55%	8.55%
	Achievable – Moderate	9 / 31 / 53	Current	50%	8.55%	8.55%
	Achievable – High	10 / 32 / 54	Current	75%	8.55%	8.55%
Alternate Base Achievable Scenarios under TRC						
Achievable Potential	Achievable – Base	11 / 33 / 55	+25%	30%	3.40%	8.55%
	Achievable – Base	12 / 34 / 56	+50%	30%	3.40%	8.55%
