**UE 180/UE 181/UE 184**

**STAFF DIRECT TESTIMONY OF**

**Thomas D. Morgan  
Bryan Conway**

**In the Matter of  
PORTLAND GENERAL ELECTRIC COMPANY  
Request for a General Rate Revision (UE 180),  
2007 Resource Valuation Mechanism (UE 181),  
And  
Request for a General Revision relating to the  
Port Westward Plant (UE 184).**

**August 14, 2006**

CASE: UE 180/UE 181/UE 184  
WITNESS: Thomas D. Morgan

**PUBLIC UTILITY COMMISSION  
OF  
OREGON**

**STAFF EXHIBIT 1000**

**Direct Testimony**

**August 14, 2006**

**Introduction**

1  
2 **Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

3 A. My name is Thomas D. Morgan and my business address is 550 Capitol Street  
4 NE, Salem, Oregon 97301-2551.<sup>1</sup>

5 **Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?**

6 A. I am employed as a Financial Economist by the Public Utility Commission of  
7 Oregon ("Commission") in the Finance/Policy Analysis Division. I have been  
8 employed by the Commission since August 2001 (excluding July through  
9 December 2005.)

10 **Q. HAVE YOU PREPARED ANY EXHIBITS?**

11 A. Yes. My Witness Qualifications Statement is included as Staff/1001. The  
12 results of my analyses are included as Staff/1002. I have also prepared an  
13 Appendix marked as Staff/1003, which includes 443 pages of additional  
14 testimony and supporting reports.

15 **Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?**

16 A. The purpose of my testimony is to develop the cost of capital estimates for the  
17 rate-regulated property operated by Portland General Electric (PGE or  
18 Company.) In addition, I provide Staff's recommended capital structure for the  
19 Company.

20 **Q. WHAT IS YOUR RECOMMENDED RETURN ON EQUITY?**

21 A. I recommend that the Commission adopt a 9.30 percent return on equity.

22 **Q. HOW DID YOU DEVELOP YOUR RECOMMENDED RETURN ON EQUITY?**

23 A. My recommendation is based upon review of single and multi-stage discounted  
24 cash flow ("DCF") model results and sensitivity analyses. The use of DCF

---

<sup>1</sup> My telephone number is (503) 378-4629 and my e-mail address is thomas.d.morgan@state.or.us.

1 models is consistent with Commission's most recent return on equity decisions  
2 in Dockets UE 115<sup>2</sup> and UE 116.<sup>3</sup> I detail the underlying theory of the DCF  
3 model beginning at Staff/1003, Morgan/44.

4 **Q. DOES YOUR DCF ANALYSIS ALSO PRODUCE A RANGE OF**  
5 **COST OF EQUITY ESTIMATES?**

6 A. Yes. The following table illustrates the range of results produced by the DCF  
7 models:

8 **Table 1 – Cost of Equity Summary Results**

	<b>Range of Results</b>
Single-stage DCF	8.7 percent to 9.6 percent
2-stage 150-year DCF	7.9 percent to 9.6 percent
3-Stage 40-year DCF	8.5 percent to 9.6 percent

9  
10 Consistent with the Commission's internal operating guidelines, this  
11 range provides the Commission with information related to the upper and lower  
12 ends of a reasonable cost of equity estimate.

13 **Q. PLEASE SUMMARIZE YOUR COST OF EQUITY RECOMMENDATION?**

14 A. I recommend a cost of equity of 9.30 percent. The range of my cost of equity  
15 estimates is 9.0 to 9.50 percent. The range produced by the models is wider  
16 than my recommended range. This is due to the sensitivity analyses that  
17 include assumptions of growth rates that are higher than my range of  
18 recommended rates.

19 **Q. WHAT IS STAFF'S RECOMMENDED OVERALL ROR FOR THE**  
20 **COMPANY?**

<sup>2</sup> Order 01-777, August, 2001. <http://apps.puc.state.or.us/orders/2001ords/01-777.pdf>

<sup>3</sup> Order 01-787, September, 2001. <http://apps.puc.state.or.us/orders/2001ords/01-787.pdf>

1 A. Staff Witness Conway's testimony regarding recommendations for the  
2 embedded costs of long-term debt and preferred stock will be filed at a later  
3 date. In his testimony, he will summarize Staff's recommended overall ROR.

4 **Q. WHY DID YOU APPLY THE DCF MODELS TO A SAMPLE OF COMPANIES**  
5 **RATHER THAN TO COMPANY ITSELF?**

6 A. I applied the DCF models to a representative sample of companies because,  
7 although the Company is now publicly-traded, the short time that it has been  
8 traded precludes consistent market data to perform the same multi-stage DCF  
9 modeling. However, I could provide the results of a single-stage model using  
10 the company's current stock price, coupled with its own stated long-term growth  
11 goals. I explain the derivation of the single-stage DCF model further in my  
12 testimony.

13 PGE published an Investor Fact Sheet in May 2006<sup>4</sup> in which it  
14 indicated an annual dividend of \$0.90 per share. Coupled with the current  
15 share price, as of August 8, 2006, of \$25.13 (reported on CNN.com<sup>5</sup>) the  
16 dividend yield is 3.58 percent. PGE has indicated that its earnings growth  
17 target is between four and five percent. Adding this range of growth to the  
18 dividend yield results in an expected return on equity of 7.58 percent to 8.58  
19 percent.

20 The high-end of the results of this analysis are consistent with the low-  
21 end of my recommended range, which was based on my analysis using a  
22 sample of comparable companies.

23 **Q. WHAT SAMPLE OF COMPANIES DID YOU ADOPT TO DETERMINE THE**  
24 **COST OF EQUITY?**

---

4 <http://files.shareholder.com/downloads/POR/28476830x0x40727/42EBD67C-4652-4E6B-8713-A6A961E4BBF4/factsheet.pdf>

5 <http://money.cnn.com/quote/quote.html?symb=POR>

1 A. My sample selection includes fourteen companies.<sup>6</sup> I limited my selection to  
2 companies covered by Value Line. I considered the overall contribution to  
3 earnings (profitability) and the underlying asset base of the companies in  
4 addition to revenues. Because revenues are only one financial metric,  
5 consideration of additional financial metrics - profitability and the asset base -  
6 provide a representative sample.

7 Therefore, my primary selection process was to exclude companies  
8 that have a large amount of revenues, assets, or earnings focused on  
9 unregulated operations. In addition, I selected companies that were rated BBB  
10 or better by Standard & Poor's. Because the financial metrics used to select  
11 companies are not static, the final selection process required final judgment  
12 pertaining to the anticipated future state of the companies' business.

13 My sample selection is significantly different than the Company's.  
14 PGE uses three different samples of companies in the electric utility industry.<sup>7</sup>  
15 Although I did not create analyses using the samples selected by PGE, it is  
16 likely that the results of a DCF analysis would be largely independent of the  
17 sample used in the models. Instead, the main driver of the differences in DCF  
18 results are related to the input assumptions related to growth rates, which will  
19 be discussed later in my testimony.

---

<sup>6</sup> The company name and ticker symbol (in parenthesis) of my sample companies are as follows: Alliant Energy (LNT); American Electric Power (AEP); Consolidated Edison, Inc. (ED); Empire District Electric Co. (EDE); Energy East Corporation (EAS); IDACORP, Inc. (IDA); MGE Energy (MGEE); NSTAR (NST); OGE Energy (OGE); Progress Energy (PGN); Southern Co. (SO); Wisconsin Energy (WES); WPS Resources (WPS); Xcel Energy, Inc. (XEL).

<sup>7</sup> First, the Company uses a "Combined Sample" of Companies from the S&P Utility Index and Moody's Utility Index. The Company filters the companies into a 17-company sample. Second, the Company uses a "PGE Comparable" sample that is comprised of nine companies. PGE's final sample is based on the 14-company cohort group of companies relied on in the 2005, UE 170 (PacifiCorp) rate case.

1 **Q. IS THE APPROPRIATE COST OF EQUITY LINKED TO THE CAPITAL**  
2 **STRUCTURE?**

3 A. Yes. The cost of equity is inextricably linked to the capital structure. For  
4 example, if PGE employs less debt and more equity in its capital structure than  
5 the sample companies used in the DCF models, all else being equal, PGE is a  
6 less risky investment than suggested by the model. Accordingly, PGE would  
7 require a lower return than that indicated by models analyzing companies with  
8 a capital structure with more debt and less equity. Over the past few years,  
9 while the industry has reduced its overall levels of debt, PGE has increased its  
10 levels of equity even more than the industry sample. All else equal, this would  
11 have the impact of reducing the riskiness of the firms, and therefore, their costs  
12 of equity, with PGE having less risk than the overall industry sample.

13 My recommended return on equity is based upon the average capital  
14 level of equity of the sample of comparable companies used in the DCF  
15 models. If we were to assume a higher level of equity in the capital structure  
16 than the comparable companies, as the Company does, the DCF results are  
17 inaccurate. The results would be inaccurate because the DCF models return  
18 on equity is based upon the capital structure of the sample selection and does  
19 not take into account that a more equity-rich capital structure would lower risk  
20 and, therefore, reduce the investors required rate of return.

21 The Company's proposed cost of equity is not reasonable based on its  
22 proposed capital structure. The Company has not shown how it adjusted its  
23 sample cost of equity to reflect the high level of equity it has maintained.  
24 Assuming a capital structure that is different than the Company's actual capital  
25 structure does not impact the ability of the Company to manage its capital  
26 structure. Rather, it simply recognizes that the DCF results related to return on

1 equity are a reflection of the capital structure of the sample selection or  
2 comparable companies.

3 **Q. HAS THE COMMISSION RECOGNIZED THIS COST OF EQUITY AND**  
4 **CAPITAL STRUCTURE RELATIONSHIP IN THE PAST?**

5 A. Yes. In Order No. 01-777 at 36, the Commission stated:

6  
7 “It is well understood by finance practitioners and theoreticians  
8 that the cost of equity drops as the percentage of common  
9 equity in the capital structure increases. Because the average  
10 amount of common equity in the capital structure of the  
11 comparable group of electric companies was 45.14 percent  
12 compared to 52.16 percent for PGE, it necessarily follows that  
13 PGE has a lower cost of equity. PGE’s capital structure is  
14 therefore less risky, and its cost of common equity should be  
15 adjusted accordingly.”

16 **Q. IS THE APPROPRIATE LONG-TERM GROWTH RATE AN IMPORTANT**  
17 **ISSUE IN THIS DOCKET?**

18 A. Yes, the disparity between the cost of equity estimates provided by Company  
19 and staff is largely due to differences in the long-term growth rates used in the  
20 DCF models. My long-term growth rates (I recommend 4.0 to 5.0 percent) are  
21 based upon analysis and review of growth rates in the regulated utility industry,  
22 financial analysts’ estimates of future growth, and sustainable growth rates  
23 estimates.

24 In contrast, the Company’s long-term growth rates are based on a  
25 forecast of GDP growth and on a 40-year average calculation of historical GDP  
26 growth. The forecast average is 5.01 percent and the historic average is 6.76  
27 percent. PGE’s forecast average is at the high-end of the 4.0 to 5.0 percent

1 growth estimate I recommend. PGE's historic GDP growth calculation is  
2 almost two hundred basis points higher than the forecasted data. For reasons  
3 discussed in more detail below, PGE's historic calculation reflects a rate that  
4 should not be used as a proxy for future growth in the regulated utility industry.  
5 Accordingly, the Commission should reject the results of PGE's DCF model  
6 that rely on historic GDP growth calculation, because these results are  
7 predicated on the use of an unreasonable long-term growth rate.

8 **Q. WHAT ARE THE METHODS YOU USED TO ESTIMATE LONG-TERM**  
9 **GROWTH?**

10 A. My growth rate analysis is supported by using separate supporting methods  
11 and available market expectations. Specifically, I considered the following:

- 12 1. Market Consensus Growth Rates (Financial Analysts' Forecasts);
- 13 2. Sustainable Growth; and,
- 14 3. Historical Utility Growth Rates.

15 **Q. WHAT INPUTS ARE REQUIRED FOR A SINGLE-STAGE DCF MODEL?**

16 A. The single-stage DCF model, which is also know as a perpetuity model,  
17 requires a dividend growth estimate, current stock price, and an initial dividend.

18 **Q. HOW ARE YOUR MULTI-STAGE DCF MODELS DIFFERENT THAN THE**  
19 **SINGLE-STAGE DCF MODEL?**

20 A. A multi-stage DCF model also requires a current stock price and initial dividend  
21 but separates dividend growth into two or more stages. While a single-stage  
22 model assumes that growth is steady and stable, the multi-stage models allow  
23 the growth rate to change over a period of time before making the final (also  
24 called "terminal" or "horizon") constant growth rate assumption.

25 **Q. WHAT MULTI-STAGE DCF MODELS DID YOU EMPLOY?**

1 A. I used a two-stage DCF model that uses the current dividend yields and Value  
2 Line's Investment Survey ("Value Line") estimates of growth for the next few  
3 years and applied long-term growth forecasts for the remainder of 150 years.

4 I also utilized the three-stage DCF model that the Commission has  
5 relied on in the last two contested cases in which parties litigated the return on  
6 equity, UE 115 and UE 116. This model has three-stages over a 40-year  
7 period. In the first stage, estimates from Value Line are used. The second  
8 stage uses implicit growth rates from two primary input assumptions. The third  
9 stage is the "reversionary" stage where an explicit estimation of the stock price  
10 is produced at year 40.

11 **Q. WHAT DID YOU USE FOR THE CURRENT STOCK PRICE IN YOUR DCF**  
12 **MODELS?**

13 A. I used the current stock price ( $P_0$ ) from Microsoft Network Money as of August  
14 8, 2006.<sup>8</sup> The most current spot prices are the correct prices to use for  $P_0$   
15 because, based upon the efficient market hypothesis, current spot prices  
16 include all current and past information.

17 **Q. WHAT DID YOU USE FOR THE INITIAL DIVIDEND,  $D_1$ , IN YOUR DCF**  
18 **MODELS?**

19 A. I used the estimates of  $D_1$  (the expected dividend per share over the next  
20 twelve months) from the July 21, 2006, Value Line Summary and Index.

21 **Q. DO YOU AND THE COMPANY AGREE ON THE GROWTH RATES TO BE**  
22 **USED OVER THE NEXT FEW YEARS?**

23 A. Yes, we generally agree on the growth rates that should be applied in the near  
24 term. We disagree, however, regarding the perpetual, long-term growth rate to  
25 be used in the DCF models.

---

<sup>8</sup> <http://moneycentral.msn.com/investor/home.asp>: Supplied by Standard & Poor's ComStock, Inc.

1 **Q. WHAT IS THE APPROPRIATE PERPETUAL, LONG-TERM GROWTH RATE**  
2 **TO BE USED IN THE DCF MODELS?**

3 A. I conclude that the appropriate growth rate ranges from 4.0 to no more than 5.0  
4 percent. My perpetual growth rate analysis is supported by separate methods  
5 and available market expectations.  
6

7 **Market Consensus (Analyst) Growth Rates**

8 **Q. EXPLAIN HOW YOU USED THE MARKET CONCENSUS (ANALYST)**  
9 **GROWTH RATE METHOD.**

10 A. I began by reviewing the actual growth rates achieved by the comparable  
11 companies. Then, I considered current forecasts of growth, including changes  
12 in dividend payout ratios. In order to estimate reasonable future growth rates, I  
13 reviewed estimates from the following five major financial analysis services:  
14 Kiplinger's; Firstcall; Zack's; Reuters; and Value Line. Using the analysts'  
15 minimum and maximum estimates of 3.8 to 5.3 percent, I created a sensitivity  
16 analysis in the single and two-stage DCF models. In Staff/1002, Morgan/16, I  
17 provide a table illustrating analysts' future growth estimates. In the three-stage  
18 model, I also provide a sensitivity analysis with implicit growth rates that range  
19 up to five percent.

20 **Q. HOW DID YOU ESTIMATE DIVIDEND GROWTH?**

21 A. Consistent with Staff's past approach to the DCF method, I viewed past  
22 dividend growth as one potential indicator of the marginal investor's  
23 expectations of future growth. I analyzed the historical dividend growth of the  
24 comparable companies by looking at both the arithmetic and geometric  
25 averages.<sup>9</sup>

---

<sup>9</sup> A discussion of geometric and arithmetic averages can be found at Staff/1003, Morgan/27.

1           In addition, I considered the historic growth rate in both earnings per  
2 share and book value. Over time, a convergence among these two measures  
3 is expected. For a more detailed explanation of the convergence issue, please  
4 see Staff/1003, Morgan/51.

5 **Q. IS IT APPROPRIATE TO CONSIDER ANALYSTS' FORECASTS OF**  
6 **GROWTH WITHIN THE DCF MODEL?**

7 A. Yes. While the Company and I both incorporate analysts' forecasts, they are  
8 not generally supportable assumptions for perpetual growth. Because analyst  
9 estimates are explicitly designed to cover a more limited amount of time, I do  
10 not rely on them exclusively. Also, analysts may expect higher than  
11 sustainable growth rates at times, such as during a recession or major industry  
12 restructuring. Thus, such estimates should not necessarily be used for the  
13 indefinite future. Nonetheless, in the broad prospective they provide relevant  
14 information to consider in conducting a DCF analysis.

15 **Q. HAS THIS ISSUE BEEN DISCUSSED IN SCHOLARLY ARTICLES?**

16 A. Yes. A recent publication, entitled "Prophets and Profits," written by McKinsey  
17 & Company concluded that analysts tend to provide inflated (as much as 20  
18 percent higher for five year forecasts) growth estimates. A copy of the  
19 publication can be found at Staff/1003, Morgan/319. Another article from the  
20 Journal of Finance, entitled "The Level & Persistence of Growth Rates,"  
21 indicates that, while analyst forecasts are not appropriate for perpetual use,  
22 they are useful when combined with historic results and reasonable future  
23 expectations. The article also explains that actual growth results have  
24 generally been lower, on average, than expected from analyst long-term  
25 forecasts. A copy of this article can be found at Staff/1003, Morgan/323.

1 **Q. WHAT DO YOU CONCLUDE THE MARKET EXPECTS FOR GROWTH**  
2 **RATES?**

3 A. I conclude that all the actual growth rates and analysts' forecasts for the next  
4 five years provide significant support for a growth rate of less than five percent.  
5 These growth rates are in line with the Company's own analysts' estimates. In  
6 fact, to the extent the Company's DCF models do not rely on historic long-term  
7 average GDP growth, the DCF results generated by the Company are largely  
8 consistent with my results. It is only where the Company relies on long-term  
9 average GDP growth that our results diverge.

10  
11 **Sustainable Growth**

12 **Q. PLEASE DESCRIBE THE SUSTAINABLE GROWTH METHOD.**

13 A. The sustainable growth method is a minor variation of the "retention growth"  
14 method. The retention growth is calculated by taking the product of the  
15 percentage of retained earnings and the rate of return on book equity. The  
16 percentage of earnings retained (b), multiplied by the rate of return on equity  
17 (ROE), creates a long-horizon future growth estimate (g) [ $g = b \times \text{ROE}$ ]. PGE  
18 uses a similar method to calculate its long-term growth estimates.

19 The retention growth rate provides a useful check on the supportability  
20 of growth rates because it requires an explicit expectation regarding the  
21 sustainability of both ROEs and reinvestment rates (or, as the complementary  
22 factor, dividend payouts). The combination of retention rates and ROEs  
23 necessary to produce a particular growth rate can be determined.

24 The sustainable growth rate can be estimated by the "b x ROE" formula  
25 described above. A variation on the model, designed with the assumption of

1 on-going debt issuances to maintain a “balanced” capital structure while  
2 reinvesting a portion of the earnings (“plowback”) is described below:

30

### The Sustainable Growth Rate

- The sustainable growth rate tells us how much the firm can grow by using internally generated funds and issuing debt to maintain a constant debt ratio.

$$\begin{aligned} \text{Sustainable Growth Rate} &= \frac{\text{ROE} \times b}{1 - \text{ROE} \times b} \\ &= \frac{.2517 \times .6037}{1 - .2517 \times .6037} = .1792 \\ &= 17.92\% \end{aligned}$$

McGraw-Hill/Irwin  
Reserved

© 2001 The McGraw-Hill Companies All Rights Reserved

3 Using this formula and assuming: (1) the highest estimate that is  
4 expected as a long-run ROE for electric utilities of 11.0 to 12.0 percent, and (2)  
5 a reasonable long-run expectation of dividend reinvestment of 30 to 40 percent,  
6 results in a growth estimate of 3.3 to 5.0 percent. As a sensitivity analysis, we  
7 might assume a 10 percent ROE and a 30 percent retention, which would result  
8 in a growth indication of just less than 3.10 percent. The following table  
9 presents a summary of the calculations described above:

**SUSTAINABLE GROWTH RATE**

ROE	Dividend Payout, “d”	Retention Rate “b” = (1-“d”)	ROE x “b”	[1- ROE x “b”]	Expected Growth
<b>10.00%</b>	<b>70%</b>	<b>30%</b>	3.00%	97.00%	<b>3.09%</b>
<b>10.50%</b>	<b>70%</b>	<b>30%</b>	3.15%	96.85%	<b>3.25%</b>
<b>11.00%</b>	<b>65%</b>	<b>40%</b>	4.40%	95.60%	<b>4.60%</b>
<b>12.00%</b>	<b>60%</b>	<b>40%</b>	4.80%	95.20%	<b>5.04%</b>

1 **Q. DO YOU HAVE ANYTHING ELSE TO ADD?**

2 A. Yes. The expectations of Value Line for “earned” ROEs are readily available  
3 and are closer to the credible long-run estimates for the earnings that might be  
4 expected to accrue to the companies within the industry. Using Value Line’s  
5 estimate of future “earned” ROEs at about 11 percent, along with a 40 percent  
6 retention rate, provides a growth rate estimate of 4.4 percent. This forecasted  
7 growth rate is more reasonable than the Company’s because it is based upon  
8 the future expectations for the specific industry. It takes into account the  
9 expected level of earnings retention as well as expected long-run returns on  
10 equity for the overall industry. The ROE that is forecast by Value Line includes  
11 the contribution to earnings from activities other than the returns generated  
12 from rate-regulated assets.

13  
14 **Historic Utility Growth Rates**

15 **Q. IS THERE HISTORIC INFORMATION AVAILABLE REGARDING THE**  
16 **ACTUAL GROWTH RATES OF THE COMPARABLE COMPANIES?**

17 A. Yes. Over the past fifteen years, the comparable electric companies have  
18 achieved a median growth in book value, earnings per share, and dividends of  
19 less than 3.0 percent.

20 **Q. SHOULD THE COMMISSION GIVE ANY WEIGHT TO THE HISTORIC**  
21 **GROWTH IN THIS CASE?**

22 A. Yes. Because there is no evidence that this historic period was the result of  
23 unfair earnings performance, it could provide guidance judging future growth  
24 expectations. The historic dividend growth reflects the comparable companies’  
25 economic performance and dividend policies. If historic dividend growth is

1 relatively stable, one would assume that the historic dividend growth would  
2 continue all else being equal.

3 The comparable companies' historic growth, coupled with Value Line's  
4 forecasts of 4.17 percent average growth in earnings over the next five-year  
5 period, supports an expected long-term growth rate somewhere in the range of  
6 3.0 to 4.5 percent. A factor that would tend to place greater reliance on the  
7 higher-end of the range, however, relates to changes in the dividend retentions.  
8 As more earnings are withheld and reinvested in a company, the growth rate  
9 would increase, all else equal.

10 **Q. IF THE DCF MODELS USE DIVIDEND GROWTH, WHY WOULD ONE**  
11 **CONSIDER GROWTH IN BOOK VALUE OR GROWTH IN EARNINGS?**

12 A. Over the long run, there can be no growth in dividends per share without  
13 growth in earnings per share unless companies have higher payout ratios.  
14 Both earnings and dividend expectations have a significant influence on the  
15 market prices. By considering earnings growth rates in the DCF analysis, a link  
16 is provided between investors' market appreciation expectations and the  
17 growth rate component of the DCF models. Over the long run, a convergence  
18 among these measures of growth is to be expected.

19 **Q. DO YOU HAVE ADDITIONAL INFORMATION ON THE HISTORIC GROWTH**  
20 **RATES FROM THE COHORT SAMPLE YOU HAVE SELECTED?**

21 A. Yes, based upon Value Line's most current data, the following tables detail  
22 historic growth in cash flow, earnings per share, dividends, and book value.  
23 The last table provides Value Line's forecasts for these same financial metrics.

24 From this data, the growth rates over the past five and ten year periods  
25 have averaged less than four percent.

**Q. PLEASE SUMMARIZE THE COMPANY'S RECOMMENDATIONS.**

A. At UE 180/PGE/1100, Hager-Valach/3, the Company recommends:

- A capital structure of 43.75 percent long-term debt, 0.29 percent preferred stock, and 55.96 percent common equity.
- A cost of preferred stock of 8.43 percent.
- A cost of equity of 10.75 percent.
- A rate of return of 8.97 percent.

**Q. PLEASE SUMMARIZE THE COMPANY'S COST OF EQUITY RANGE.**

A. In PGE's electronic workpapers, titled "DCF\_Elec.xls", the company provides the following table indicating the results of its analysis:

1

combined	PGE comparables	UE170 rebut	
9.25%	8.46%	8.43%	BRVS
9.27%	8.99%	9.31%	GDP Trend
10.77%	10.50%	10.81%	GDP Hist

2

The first row reflects the name associated with the sample of companies that

3

PGE uses in its DCF. The last column represents the method PGE used in

4

estimating long-term growth. Omitting the historic GDP growth rate

5

calculations (the bottom row,) the range of ROE estimates is 8.43 percent to

6

9.31 percent.

7

**Q. SHOULD THE COMMISSION GIVE THE COMPANY'S 10.75 PERCENT**

8

**RECOMMENDED RETURN ON EQUITY ANY WEIGHT?**

9

A. No. The high-end of the Company's analysis presumes a growth rate that is

10

greater than the company or the electric industry has experienced on average.

11

The high growth rate estimate is based on historic growth in nominal GDP and

12

disregards analyst estimates, sustainable growth rate calculations, and historic

13

growth rates. In addition, the Company's own presentations to the financial

14

community indicate that its long-term goal is to generate four to five percent

15

growth in earnings per share. See Staff/1003 Morgan/440.

16

**Q. WHICH DCF MODELS ARE USED BY THE COMPANY?**

17

A. The Company uses only one version of the DCF model; a two-stage growth

18

model. The Company applies this model to three samples of integrated electric

19

companies.

20

**Q. WOULD YOU PLEASE DESCRIBE THE TWO-STAGE DCF MODEL USED**

21

**BY THE COMPANY?**

22

A. Yes. The Company uses a two-stage DCF model with three different growth

23

rate assumptions. All three growth rate formulations appear to rely on the

24

closing share price from December 2005.

1 **Q. WERE YOU ABLE TO DETERMINE HOW THE COMPANY PERFORMED ITS**  
2 **ANALYSIS?**

3 A. Not entirely. The Company did not include clear descriptions of its process, nor  
4 its assumptions, in its testimony or workpapers. However, after reviewing the  
5 workpapers, I discovered that the DCF model appears to employ the expected  
6 dividend over the ensuing 12 months and forecast an additional three years of  
7 growth based on the forecasts provided by Value Line. The Company appears  
8 to have mislabeled some of its headings within its electronic workpapers. For  
9 example, the first year of two models (“BR+VS” and “GDP Historical”) is labeled  
10 “2005” and another model (GDP Trend) is labeled “D1” with the second year  
11 labeled “2005”. The second-stage extends 247 years, using explicit forecasts  
12 of perpetual growth.

13 **Q. HOW DOES THE COMPANY ESTIMATE PERPETUAL GROWTH?**

14 A. The Company estimates long-term growth three different ways. First, it  
15 calculates a “sustainable growth” rate using a retention forecast and forecast of  
16 ROE. In addition, it calculates an additional “vs” term. The Company also uses  
17 an historic calculation of GDP growth, and a forecast of GDP growth, as two  
18 alternative proxies for second-stage growth.

19 **Q. PLEASE DESCRIBE THE FIRST TECHNIQUE.**

20 A. The first technique is in many ways similar to the sustainable growth formula on  
21 which I relied. As I discussed previously, the sustainable growth rate relies  
22 upon the ability of retained earnings to grow the future earnings of the  
23 company. This earnings growth depends upon normalized ex-ante earnings  
24 (e.g. forward-looking expectations). The “r” variable represents the long-run  
25 anticipated ROE and is applied by multiplying it with the ratio of the long run  
26 forecast of retained earnings. The Company’s model assumes that Value

1 Line's forecasted ROE and forecasted retention ratio is appropriate. Because  
2 the final indication of growth appears reasonable, this method of estimating  
3 growth could be supported. However, the ROE that should be used in the  
4 calculation should be considered the "steady-state" ROE that could be earned  
5 into perpetuity. The ROE at any single point in time is not necessarily the  
6 correct figure to use.

7 **Q. PLEASE DESCRIBE THE OTHER TECHNIQUES.**

8 A. The Company also uses two calculations of GDP growth, historic and  
9 forecasted, seeming to imply that long run nominal GDP growth is a useful  
10 estimate of perpetual or terminal growth in any DCF model. I discuss GDP  
11 growth rates starting at Staff/1003, Morgan/18.

12 To calculate its forecast of GDP growth, which the Company identifies  
13 as "Average of 20-year growth rate for GDP, the Company relies on published  
14 forecasts of GDP growth.<sup>10</sup> The calculation is the average of two sources.  
15 The calculation is based on a geometric, or compounded, rate of growth over  
16 the respective periods. One estimate is a 25-year forecast from Global Insight  
17 (5.49 percent), and the other estimate is a 50-year forecast from the Social  
18 Security Administration (4.53 percent.) The average of the 25-year and 50-  
19 year estimates is 5.01 percent.

20 To determine historic GDP growth, the Company calculates average  
21 historic GDP growth over the time period from 1963 through 2003. It calculates  
22 the year-over-year growth over each period and takes the arithmetic, or simple  
23 average, of four different periods: the entire 40-year period (7.497 percent), the

---

<sup>10</sup> The Company identifies two independent sources of forecast data that are readily available. While I do not support the use of GDP growth as a proxy for long-term utility growth, considering these readily available projections of GDP growth rates produce results similar to the highest analyst forecast for the industry, overall, and is consistent with the high-end of my growth rate recommendations.

1 past 30-year period (7.583 percent), the past 20-year period (6.286 percent)  
2 and the past 10-year period (5.663 percent). The Company then takes the  
3 average of these four periods (6.757 percent) as the perpetual growth rate for  
4 its sample of companies.

5 The Company did not explain why this approach should be relied upon,  
6 and only provided a spreadsheet that provides some data relative to GDP for  
7 the period from 1963 through 2003.<sup>11</sup> The table and the calculation method,  
8 however, are problematic. The results imply that the annual average of the  
9 nominal growth rates for four overlapping periods provides a reasonable  
10 forecast for the future. The Company did not discuss why it uses an average of  
11 annual growth rates rather than using a consistent compounding calculation, as  
12 PGE used for the forecast data.

13 The following table identifies the four periods that are calculated and  
14 the overall average of each period. Notably, this method gives a large amount  
15 of weight to high inflationary periods (1970-1985).

16 **PGE's Historic GDP Growth Calculations**

10-year nominal average	5.663%
20-year nominal average	6.286%
30-year nominal average	7.583%
40-year nominal average	7.497%
<b>Four-period Simple Average</b>	<b>6.757%</b>

17  
18 The following table corrects the calculations to reflect the results of  
19 compounding, resulting in a four-period average of 6.40 percent, about 35  
20 basis points lower than the Company's figures.

<sup>11</sup> The Company identifies the source as: [www.bea.doc.gov](http://www.bea.doc.gov): Nominal GDP (seasonally adjusted, annual).

1

**Compounded Historic GDP Growth Calculations**

10-year nominal average	5.154%
20-year nominal average	5.839%
30-year nominal average	7.159%
40-year nominal average	7.466%
<b>Four-period Geometric Average</b>	<b>6.404%</b>

2

3 **Q. ARE THERE OTHER METHODS FOR CALCULATING LONG-TERM GDP**  
4 **GROWTH?**

5 A. Yes. The impact of inflation can be removed from the historic data. Since  
6 inflation rates have been declining over the historic period, it is reasonable to  
7 remove inflation and simply consider real growth rates rather than nominal  
8 growth rates. Then, forward-looking forecasts for inflation can be directly  
9 applied to the historic results to reflect a reasonable forward-looking estimate of  
10 nominal GDP growth.

11 In my recently-published testimony from PacifiCorp's rate-case, I  
12 provided geometric-average calculations based on historic GDP growth using  
13 data that included 2004. See UE 179 Staff/1000 Morgan/19. The following  
14 table removes the impact of inflation and provides an average rate of real  
15 growth of 2.65 percent. If we assume that inflation is 2.5 percent, the long-run  
16 expectation of nominal growth is still 5.15 percent. This is more in-line with the  
17 forecast GDP data on which the Company relies.

18

1

**Staff's Historic GDP Growth Calculations**

Period	GDP Growth	Inflation	Real Growth
10-year nominal average	5.20%	2.50%	2.70%
20-year nominal average	5.60%	3.00%	2.60%
30-year nominal average	7.10%	4.60%	2.50%
40-year nominal average	7.50%	4.70%	2.80%
<b>Four-period Geometric Average</b>	6.35%	3.70%	2.65%

2

The calculation of historic GDP growth, when used for forecasting, should explicitly consider future inflation, and is better than a calculation of historic nominal growth.

3

4

5

**Q. DO YOU AGREE WITH THE COMPANY'S ASSUMPTION THAT GDP GROWTH IS THE CORRECT LONG-TERM PROXY FOR UTILITY-SPECIFIC COMPANIES?**

6

7

8

A. No. There is no support that correlates the growth in public utilities with growth in "average" or "normal" companies, which would be the implication if GDP were the proper proxy for growth rate in the DCF model. Rather, public utilities are less risky than the average company due to regulation. In addition, they also pay out a higher portion of their earnings in dividends, which tempers their growth rate potential downward from that of the overall economy. The economy-wide growth rate is an inappropriate proxy in earnings per share growth rates. Some sectors are expected to grow faster than the economy, such as those that do not pay dividends, while others sectors, such as regulated utilities that pay out large portions of their earnings as dividends are expected to grow a slower rate.

9

11

12

13

14

15

16

17

18

19

**Q. WHAT IS THE TARGET GROWTH RATE FOR PORTLAND GENERAL ELECTRIC?**

20

1 A. Based on information provided to potential investors, PGE estimates a long-  
2 term goal for earnings growth of four to five percent. See Staff/1003  
3 Morgan/440.

4 **Q. DO YOU RECOMMEND THAT THE COMMISSION ADOPT THE**  
5 **COMPANY'S DCF RESULTS?**

6 A. No. However, putting aside the company's DCF results that rely on the historic  
7 GDP growth estimate, the results of the remaining DCF models appear to be  
8 within a reasonable range and are consistent with the results of my analysis.

9 **Q. WHAT OTHER MODELS DOES THE COMPANY PROPOSE?**

10 A. The Company's witness, Mr. Hager, employs a risk positioning model.

11 **Q. PLEASE DESCRIBE MR. HAGER'S RISK-PREMIUM MODEL.**

12 A. Mr. Hager's risk premium model is utility debt + risk premium. The model  
13 appears to be unique to Mr. Hager and to my knowledge has not been  
14 subjected to peer-review. His model purports to relate Authorized Equity Rates  
15 of Return from 1984-2005 to some average interest rate for bonds as reported  
16 by Moody's Investors Service, as well as Treasury rates. Over the period  
17 included in the model, the allowed returns ranged from a high of 17.38 percent  
18 to a low of 9.5 percent.

19 **Q. DO YOU BELIEVE THAT THIS IS AN APPROPRIATE APPROACH?**

20 A. No, I do not. First, the ROE is only one component involved in establishing an  
21 overall revenue requirement. Requesting the Commission to base its ROE  
22 decision on ROEs of other jurisdictions is equivalent to taking one cost element  
23 in isolation out of another states' rates and putting it into Oregon rates. Mr.  
24 Hager's model likely omits important variables, such as capital structure,  
25 whether there are any rate base disallowances, inflation rates. Additionally,  
26 risk premium models typically require the use of future expected returns.

1 Authorized ROEs for a company are not the same as the actual returns  
2 required by investors. If the Authorized ROE is higher (or lower) than the  
3 required return at any given time, then the price of the company shares will  
4 increase (decrease) until the required return is in equilibrium. Using authorized  
5 returns as a surrogate for expected returns is not necessarily the best proxy.  
6 Another concern is that in published risk-premium literature, the analyses  
7 generally use a simple difference and do not rely on regression analysis.  
8 Finally, there is a lot of evidence that risk premiums may be time-varying, so  
9 developing an average over a specific certain period may not be appropriate.

10 Other than the issues pertaining to the model's development, the  
11 Company's reasoning is circular. An author of a text focusing on the utility  
12 industry has stated: "It would be hopelessly circular to set a fair return based  
13 on the past actions of other regulators, much like observing a series of  
14 duplicate images in multiple mirrors." For example, if all regulators adopted this  
15 practice then no Commission would be free to update ROE and their decisions  
16 would always be based upon outdated information.

17 Finally, it is notable that this model includes data spanning a period  
18 when interest rates were the highest in history. If the model were applied using  
19 current and forecast data, it would likely indicate a lagging effect and  
20 demonstrate that the average ROE is lower than indicated in Mr. Hager's  
21 regression analysis.

22 **Q. HAS THE COMMISSION DISCUSSED THE USE OF THESE MODELS IN**  
23 **THE PAST?**

24 A. Yes, the Commission rejected similar models in the past. In UE 116, the  
25 Commission stated that:

26

1 Capital market conditions, not regulatory decisions, determine  
2 a utility's cost of equity. While we agree that regulatory  
3 agencies generally make every effort to capture those market  
4 conditions, a review of past decisions cannot replace an  
5 independent analysis of current market conditions and how  
6 they affect the particular utility. Moreover, ROE  
7 determinations are made not just in the traditional rate cases,  
8 but also in a range of other proceedings, such as industry  
9 restructuring plans, merger approval cases, or performance-  
10 based regulatory plans. Thus, the ROE awards may have  
11 been based, in part, on other unknown parameters relevant in  
12 that particular docket.

13 The Commission correctly rejected the generic analysis of determining  
14 ROE based upon other state commission rulings and they should again reject  
15 the Company's request to establish circular ROE decisions that do not consider  
16 current market conditions.

17 **Q. DO YOU HAVE ANY FURTHER COMMENTS REGARDING THIS RISK-**  
18 **POSITIONING MODEL?**

19 Yes. First, the model suggests that interest rates experienced in the early  
20 1980's are going to re-occur in the future. The interest rates during the early  
21 1980's were extremely high. This is clearly problematic considering that  
22 interest rates are, and are expected to remain, at much lower levels than much  
23 of the period analyzed by this model. Since there is evidence that the risk  
24 premium varies with interest rates, using a period that contains wide variations  
25 in interest rates may weaken the results of the analysis. Further, because  
26 common stocks are considered very long term investments, longer periods are  
27 preferable when estimating historic return data.

1                   Second, because there are no other independent variables in PGE  
2 witness Hager's model, it assumes that the "average" cost of debt in a wide-  
3 range of companies is the other relevant variable that affects allowed rates of  
4 return. As mentioned above, the model does not consider other issues that  
5 may be directly relevant such as leverage, overall rate base, performance-  
6 based regulation or other regulatory approaches. The Company should  
7 consider the requirements of the Modern Portfolio Theory, which identifies non-  
8 diversifiable risk as the pertinent risk for which equity investors are  
9 compensated.

10 **Q. ARE THERE ANY OTHER CONCERNS THAT STAFF WOULD LIKE TO**  
11 **ADDRESS REGARDING THE COMPANY'S RISK-POSITIONING**  
12 **REGRESSION ANALYSIS?**

13 A. Yes. Mr. Conway will discuss the econometric analysis in his testimony,  
14 Staff/1200.

15 **Q. ARE THERE MACROECONOMIC FACTORS, OTHER THAN CHANGES IN**  
16 **INTEREST RATES,<sup>12</sup> THAT WERE OMITTED IN THE COMPANY'S ANALYSIS?**

17 A. Yes. The Company failed to discuss the implications of the tax cut program  
18 enacted in 2003. The tax changes lowered dividend taxes, which is especially  
19 relevant for public utilities, which generally pay a large amount of dividends.  
20 With this reduction, the equity investor would be expected to bid up the price,  
21 all else being equal. This change would be expected to significantly contribute  
22 to the price of shares in high-dividend paying companies; thereby, reducing the  
23 required rate of return.

---

<sup>12</sup> Expected changes in interest rates are included in my analysis. For more information on interest rates, please refer to Staff/1003, Morgan/3.

- 1 A. The following table provides a range of results, indicating the cost of equity that  
2 could be generated in the 3-stage, 40-year DCF.

3 **SENSITIVITY ANALYSIS, EXPECTED COST OF EQUITY**

<b>Growth Rate</b>	3.50%	4.00%	4.50%	5.00%	5.50%
<b>Cost of Equity</b>	7.27%	8.06%	8.83%	9.60%	10.35%

- 4 **Q. WHAT IS THE PERCENTAGE OF EQUITY YOU PROPOSE FOR THE**  
5 **CAPITAL STRUCTURE?**

- 6 A. I propose a capital structure that includes 48.50 percent equity and 51.50  
7 percent debt. This is consistent with the amount of equity included in the  
8 sample of companies from which I derived my cost of equity recommendation.  
9 Consistent with Staff/1100, Conway/2-3, I have not included a component for  
10 preferred equity in the capital structure.

- 11 **Q. DOES THIS CONCLUDE YOUR TESTIMONY?**

- 12 A. Yes.

### WITNESS QUALIFICATIONS STATEMENT

NAME: Thomas D. Morgan

EMPLOYER: Public Utility Commission of Oregon

TITLE: Senior Financial Economist, Economic & Policy Analysis

ADDRESS: 550 Capitol St NE Suite 215, Salem, Oregon 97301-2551.

EDUCATION: Bachelor of Science in Business Administration, Finance; 1993, University of Oregon, Eugene, Oregon *summa cum laude*. I am enrolled in Master of Science in Finance program through the University of Leicester (UK).

#### RELEVANT WORK EXPERIENCE:

Since August 2001, I have been employed by the Public Utility Commission of Oregon as a financial analyst in the Economic Research & Financial/Policy Analysis Division. Current responsibilities include conducting research and providing technical support for cost of equity issues for electric, telecommunications, and gas utilities.

From October 1997 to August 2001, I worked for the Oregon Department of Revenue as a Senior Appraiser Analyst in the Utility Program, Valuation Section of the Property Tax Division. Duties included appraising a variety of public utility and transportation properties. The valuation process included developing cost of capital studies for use in the discounting of cash flows in the Income Capitalization Approach to value. Duties included valuation of the property owned by gas, electric, telecommunication and airline companies.

I am a certified general property appraiser and have been involved in the valuation of commercial properties since 1993.

Internal Rate of Return 9.29%

Source:

- [A] First Stage is average from Value Line. Second stage is prior years' book value plus value from Col. [6].
- [B] First Stage is (Col. [4]-Col.[3])/Col.[4]. First year of second stage computed by 1-dividends/earnings; subsequent years use the same retention rate.
- [C] First Stage is from Value Line. First year of second stage determined by Terminal Retention rate and ROE.
- [D] First Stage is from Value Line. Second stage is average of current and prior year's value from Col. [1] x Col. [9].
- [E] Col. [4] - Col. [3]
- [F] Col. [1] x Col. [10]
- [G] Col. [4] - Col. [3]
- [H] Staff/1002 Morgan/10 (Schedule 7)
- [I] First stage is Col. [4]/Ave. of Current and prior year's Col. [1]. Second stage is input.
- [J] Input is "negative" Col. [7] for year of purchase, "positive" Col. [7] for year of sale.
- [K] Col. [3]
- [L] Col. [10] + Col. [11]

CASE: UE 180/UE 181/UE 184  
WITNESS: Bryan Conway

**PUBLIC UTILITY COMMISSION  
OF  
OREGON**

**STAFF EXHIBIT 1100**

**Direct Testimony**

**August 14, 2006**

1

2

**Embedded Cost of Preferred Stock**

3

**Q. WHAT IS PGE'S RECOMMENDED COST OF PREFERRED STOCK?**

4

A. In Exhibit PGE/1100, Hager-Valach/3, PGE's proposed embedded cost of

5

preferred stock is 8.43%.

6

**Q. HOW DID PGE ARRIVE AT THE 8.43% FIGURE?**

7

A. PGE first determined the cost of money for its preferred stock issuance.

8

The cost of money for each preferred stock series was then multiplied by

9

the principal amount outstanding for each issue to yield the annualized

10

cost. Because the preferred stock has a sinking fund requirement, PGE

11

used the average month-end balance for its preferred stock. The effective

12

interest rate represents the internal rate of return of the cash flows

13

associated with the preferred stock over the test period.

14

**Q. WHAT IS STAFF'S RECOMMENDED COST OF PREFERRED STOCK?**

15

A. I recommend the Commission remove the costs of PGE's preferred stock

16

due to the mandatory sinking fund payment due June 2007.

17

**Q. PLEASE EXPLAIN HOW YOU ACCOUNTED FOR THE MANDATORY**

18

**SINKING FUND PAYMENT DUE JUNE 2007.**

19

A. As of June 2007, PGE will no longer have any preferred stock in its capital

20

structure. In order to set rates that best represent the costs of preferred

21

stock going forward, I used the preferred stock balance at July 1, 2007,

22

which is the midpoint of the test year.

23

**Q. WHY IS THIS ADJUSTMENT APPROPRIATE?**

1 A. Accounting for the June 2007 payment helps ensure that the cost of  
2 preferred stock is most reflective of rates on a going forward basis.  
3 Because the preferred stock has a mandatory redemption, it is known and  
4 measurable change and should be considered when establishing rates  
5 going forward.

6

7

**PGE's Risk Positioning Model**

8

**Q. PLEASE DESCRIBE PGE'S RISK POSITIONING MODEL (RPM).**

9

A. PGE uses regression analysis as one of its methods of estimating its  
10 required return on equity. Specifically, PGE regresses differences  
11 between historic cost of equity decisions from regulatory agencies across  
12 the United States, and a lagged treasury or corporate bond rate against  
13 the same lagged treasury or corporate bond rate. (See PGE's Cost of  
14 Capital Work Papers pages 132 and 133 attached as Staff/1102,  
15 Conway/1-2.) Staff Witness Thomas D. Morgan also discusses the model  
16 at Staff/1000, Morgan/23-26.

17

**Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY ON PGE'S RPM?**

18

A. My testimony focuses on econometric issues surrounding PGE's  
19 application of its RPM. More specifically, I address problems with PGE's  
20 regression analysis.

21

**Q. WHAT IS THE DIFFERENCE BETWEEN MR. MORGAN'S TESTIMONY  
22 ON PGE'S RPM AND YOUR TESTIMONY ON PGE'S RPM?**

1 A. Mr. Morgan's testimony focuses on the theoretical pitfalls of using an RPM  
2 that is based on historic authorized costs of equity from around the nation.  
3 My testimony addresses errors PGE made in its application of its RPM.

4 **Q. WHAT CONCERNS DID YOU IDENTIFY WITH PGE'S APPLICATION**  
5 **OF ITS RPM?**

6 A. I have two major concerns with PGE's RPM. First, PGE's RPM appears  
7 to be misspecified. By misspecified, I mean PGE's model appears to lack  
8 relevant explanatory variables. Second, the RPM's statistically significant  
9 results are likely fallacious due to the circular logic used by PGE when it  
10 set up its regression analysis. I also have three additional concerns of  
11 lesser magnitude. First, PGE did not perform basic statistical tests to  
12 check for problems present in either cross-sectional or time series  
13 analysis. Second, the analysis PGE relied upon to determine the lag it  
14 would assume for Treasury rates was not reproducible and likely not  
15 correctly done. Third, the data relied upon by PGE's contains errors and  
16 is not consistent with PGE's testimony.

17 **Q. PLEASE DISCUSS YOUR FIRST MAJOR CONCERN THAT PGE'S**  
18 **RPM IS MISSPECIFIED.**

19 A. PGE testifies that there are numerous risks or factors that need to be  
20 considered by this Commission in determining PGE's specific required  
21 return on equity. For example, PGE discusses Ballot Measure 9, SB 408,  
22 a "new wholesale power environment," hydro risks, etc. (See generally,  
23 PGE/1100, Hager-Valach/18 through Hager-Valach/21.) PGE further

1 states that “[c]onceptually, the required return to induce an investor to  
2 purchase any security investment is:  $k=r+pi+i+b+f+l$ .” (See PGE/1100,  
3 Hager-Valach/21, lines 11-12.)

4 However, PGE’s model to predict or forecast the correct authorized  
5 return using its RPM looks at only the nominal interest rate ( $r+pi$ ). By  
6 excluding relevant variables such as expected growth rates, inflation, or  
7 other non-diversifiable risks, PGE’s RPM model likely is misspecified.

8 **Q. WHAT IS THE IMPACT OF A MISSPECIFIED MODEL?**

9 A. The impact depends on the nature of the misspecification. In PGE’s case,  
10 its RPM appears to omit relevant variables.

11 **Q. WHAT IS THE IMPACT OF OMITTING RELEVANT VARIABLES FROM**  
12 **A REGRESSION EQUATION?**

13 A. Generally, this is known as omitted variable bias. The following excerpt  
14 from A Guide to Econometrics (Peter Kennedy, 2<sup>nd</sup> Edition, pg. 69) states,

15 (i) Omission of a relevant independent variable

16  
17 (a) In general, the OLS estimates of the coefficients of the remaining  
18 variables are biased. If by luck...the observations on the omitted  
19 variables(s) are uncorrelated in the sample with the observations on the  
20 other independent variables (i.e., if the omitted variable is orthogonal to  
21 the included variables), the slope coefficients will be unbiased; the  
22 intercept estimate will retain its bias unless the mean of the observations  
23 on the omitted variable is zero.

24  
25 (b) The estimator of the variance-covariance matrix of  $B^{ols}$  is biased  
26 upward, causing inferences concerning these parameters to be  
27 inaccurate. This is the case even if the omitted variable is orthogonal to  
28 the others.

29 **Q. PGE STATES THAT ITS RPM “ASSUMES THAT NON-STIPULATED**  
30 **ROE DECISIONS BY REGULATORY BODIES, ON AVERAGE SINCE**

1           **1983, PROVIDE UNBIASED ESTIMATES OF THE COST OF EQUITY**  
2           **FOR ELECTRIC UTILITIES.” ARE YOU ARGUING THAT THE**  
3           **VARIOUS COMMISSION DECISIONS WERE BIASED?**

4           A.    No. My arguments do not depend on the accuracy of the various  
5           regulatory decisions. I conclude that the coefficient PGE relies upon to  
6           estimate its implied RROE from the risk-positioning model is likely biased  
7           independent of the accuracy of the regulatory decisions. Should the  
8           decisions or a subset of the regulatory decisions prove to be biased, that  
9           would also likely add another source of error to PGE’s analysis.

10          **Q.    PLEASE DISCUSS YOUR SECOND MAJOR CONCERN THAT THE**  
11          **STATISTICAL RESULTS OF PGE’S RPM ARE FALLACIOUS.**

12          A.    PGE’s model subtracts either a Treasury rate or a corporate rate from the  
13          Commission authorized decision and then regresses that difference on the  
14          same Treasury or corporate rate. Mathematically this can be expressed  
15          as the following:  $(AROE_{i,t} - T_{i,t-1}) = \alpha + \beta * T_{i,t-1} + \varepsilon$ . Because the term  
16           $T_{i,t-1}$  is on both sides of the equation, the results are a “finding” that the  
17          interest rate that was subtracted from the authorized cost of equity helps  
18          explain the difference between the authorized cost of equity and that same  
19          interest rate. This circular reasoning results in statistical tests that appear  
20          to show a high degree of statistical significance.

21          **Q.    CAN YOU PROVIDE AN EXAMPLE OF HOW THIS CIRCULAR LOGIC**  
22          **CAN PRODUCE STATISTICALLY SIGNIFICANT RESULTS?**

1 A. Yes. To illustrate the problem I have been discussing, I replicated PGE's  
2 regression analysis substituting samples of 50 randomly generated  
3 numbers as replacements for authorized ROEs and interest rates (either  
4 Treasuries or cost of debt). I conducted this exercise ten times refreshing  
5 the random variables for each regression run. The results of my analysis  
6 show that when running PGE's regression using fictitious and randomly  
7 generated regulatory decisions and interest rates, I obtain highly  
8 significant results in all ten trial runs. The *t*-statistic and R-squared results  
9 are shown in Table 1. The full results of this analysis are attached as  
10 Staff/1102, Conway/3-14.

11 Table 1:

Trial	Multiple R-Squared	T-statistic
1	75%	-7.97
2	82%	-10.05
3	74%	-7.53
4	64%	-5.83
5	69%	-6.68
6	67%	-6.23
7	74%	-7.53
8	69%	-6.58
9	76%	-8.18
10	68%	-6.45

12  
13 **Q. PLEASE EXPLAIN IN LAYMAN'S TERMS WHAT YOU MEAN BY**  
14 **"HIGHLY SIGNIFICANT RESULTS."**

1 A. The R-squared and  $t$ -statistic are commonly reported statistics. The R-  
2 squared gives the analyst an idea of how much of the variation in the  
3 dependent variable is being explained by the independent variable(s).  
4 The  $t$ -statistic roughly represents how confident the analyst can be that the  
5 coefficient on the independent variable is not zero. I refer to these results  
6 as highly significant since it is fairly standard to accept a  $t$ -statistic of 2 (in  
7 absolute value) as significant.

8 **Q. WHAT DO YOU CONCLUDE ABOUT PGE'S RPM BASED ON YOUR**  
9 **TEN TRIALS USING RANDOMLY GENERATED NUMBERS?**

10 A. The statistical results from PGE's RPM should not be relied upon since  
11 they are most likely the result of how PGE set up its regression analysis  
12 and do not represent sound econometric analysis.

13 **Q. DO ALL OF PGE'S DIFFERENT RISK-POSITIONING MODELS**  
14 **SUFFER FROM THE SAME CIRCULAR LOGIC?**

15 A. Yes. I discovered the flawed logic while reviewing PGE's SAS program  
16 included with its work papers. PGE's testimony provides an inaccurate  
17 description of its RPM but PGE corrected its testimony in response to Staff  
18 Data Requests Nos. 83 and 88. PGE's responses are attached as  
19 Staff/1102, Conway/15-16.

20 **Q. PLEASE EXPLAIN YOUR CONCERN REGARDING PGE NOT**  
21 **PERFORMING ANY BASIC STATISTICAL TESTS ON ITS RPM.**

22 A. Putting aside the issue regarding how PGE set up its RPM, it is troubling  
23 that no basic statistical tests were run by PGE to check for common

1 problems. PGE's responses to Staff's data requests state that PGE did  
2 not run statistical tests to check for problems common in cross-sectional  
3 analysis. Additionally, PGE's responses to Staff's data requests regarding  
4 statistical tests to check for problems common to time series analysis  
5 state that the statistical tests common to time series were not run because  
6 "...the data used was a pooled cross-sectional sample and not just a time  
7 series." (See PGE's responses to Staff data requests 85 and 206  
8 attached as Exhibit Staff/1102, Pages 17-18.)

9 **Q. WHAT IS THE DIFFERENCE BETWEEN CROSS-SECTIONAL DATA**  
10 **AND TIME SERIES DATA?**

11 A. Cross-sectional data is data that spans across several entities or items in  
12 the same time period such as price of gasoline from multiple gas stations  
13 in Salem on July 27, 2006. Time series refers to data that is viewed  
14 across time for the same entity or item (e.g., the price of gasoline at the  
15 State Street ARCO from June 1, 2006, through July 1, 2006.)

16 **Q. CAN A DATA SET BE BOTH CROSS-SECTIONAL AND TIME SERIES?**

17 A. Yes. This is commonly referred to as "panel data."

18 **Q. DOES IT MAKE SENSE TO APPLY EITHER CROSS-SECTIONAL OR**  
19 **TIME SERIES TESTS TO PANEL DATA?**

20 A. Yes. The fact that you have pooled data does not negate issues  
21 surrounding either cross-sectional or time series data sets. The following  
22 quote from "Econometric Models & Economic Forecasts" by Robert S.  
23 Pindyck & Daniel L. Rubinfeld pg. 223-224 makes this clear.

1           “The process of combining cross-section and time-series data is called  
2           *pooling*. Cross-section parameters may shift over time, in which case  
3           pooling is not the appropriate procedure. Alternatively, there may be  
4           time-series-related explanatory variables such as expectations, prices,  
5           and interest rates which could be included in a pooled model. In either  
6           case, the necessity of combining time series and cross-section  
7           variables adds a new dimension of difficulty to the problem of model  
8           specification, because the disturbance term is likely to consist of time-  
9           series-related disturbances, cross-section disturbances, and a  
10          combination of both.”  
11

12           **Q.     PLEASE DISCUSS YOUR CONCERNS REGARDING PGE’S CHOICE**  
13           **OF USING A ONE-MONTH AND AN EIGHT-MONTH LAG IN ITS RPM.**

14           A.     PGE was unable to produce any analysis to justify the use of a lag or any  
15           analysis specific to its choice of a 1- or 8-month lag. (See PGE’s  
16           response to Staff data request 91 attached as Staff/1102, Conway/19.)  
17           Because PGE’s analysis cannot be replicated, it should not be given any  
18           weight.

19           **Q.     WAS PGE ABLE TO EXPLAIN IN GENERAL TERMS HOW THEY**  
20           **CONDUCTED THE ANALYSIS TO DETERMINE THE OPTIMAL LAG?**

21           A.     Yes. In response to Staff Data Request 202, PGE explained that they use  
22           R-squared, *t*-tests, and F-tests to determine the optimal lag. (See PGE’s  
23           response to Staff’s data request 202 attached as Staff/1102, Conway/20.)

24           **Q.     DOES THIS RESPONSE ALLEVIATE ANY OF YOUR CONCERNS**  
25           **ABOUT PGE BEING UNABLE TO REPRODUCE THE ANALYSIS USED**  
26           **TO DETERMINE THE OPTIMAL LAG?**

1 A. No, however it does raise some additional concerns. PGE reliance on  
2 both the  $t$ -test and the F-test for its RPM seems to indicate a  
3 misunderstanding of statistical analysis.

4 **Q. PLEASE EXPLAIN.**

5 A. There are two issues.

6 The first is a technical point. For a univariate regression such as PGE's  
7 RPM, the F-test and the T-test provide identical results. The tests are  
8 purely duplicative because the t-test is run to test the hypothesis that an  
9 individual coefficient is equal to zero. The F-test is run to test the  
10 hypothesis that all of the coefficients are zero. In the case of the RPM,  
11 there is only one coefficient (on the interest rate); therefore the tests are  
12 functionally identical.

13 The second is a methodological concern. T-tests and F-tests are  
14 meant to report on how confident the researcher can be that the  
15 coefficient or a group of coefficients are not equal to zero. However, a  
16 model should not merely be developed from the results of these tests. A  
17 model should be developed from a sound, defensible theory that  
18 describes a causal relationship between several variables.

19 **Q. DO YOU HAVE CONCERNS ABOUT PGE'S USE OF R-SQUARED FOR**  
20 **DETERMINING THE APPROPRIATE LAG?**

21 A. Yes, while it may be intuitively compelling to use the R-squared to assist in  
22 model selection, it is not generally the best tool. The R-squared is  
23 backward looking and helps one to understand how much of the "history"

1 or variation of the dependent variable the model can explain. A more  
2 pertinent question for this model is how well the model can predict a future  
3 authorized return on equity given current interest rates.

4 **Q. DID PGE CONDUCT ANY TESTS OF THE RPM'S PREDICTIVE**  
5 **POWER?**

6 A. No. See PGE's response to Staff Data Requests Nos. 209 and 210  
7 attached as Staff/1102, Conway/21-22.

8 **Q. DO YOU HAVE ANY SUPPORT FOR YOUR ASSERTION THAT PGE**  
9 **MAY NOT HAVE PERFORMED APPROPRIATE SPECIFICATION**  
10 **TESTS?**

11 A. Yes. From A Guide to Econometrics (Peter Kennedy, 2<sup>nd</sup> Edition, pg. 76):

12 "Using techniques that adopt specifications on the basis of searches  
13 for high  $R^2$  or high  $t$  values, is called data-mining, fishing, grubbing or  
14 number-crunching. This methodology is described eloquently by Coase:  
15 'if you torture the data long enough, Nature will confess.' In reference to  
16 this unjustified (but unfortunately typical) means of specifying relations,  
17 Leamer (1983a) is moved to comment: '[t]here are two things you are  
18 better off not watching in the making: sausages and econometric  
19 estimates.'

20  
21 Peach and Webb (1983) fabricated 50 macroeconomic models at  
22 random and discovered that the majority of these models exhibited very  
23 high  $R^2$  and  $t$  statistics. This casts considerable doubt on the practice of  
24 using a high  $R^2$  or high  $t$  values to defend a specification, and suggests  
25 that practitioners should utilize some of the more relevant specification  
26 testing methods explicated in this chapter."  
27

28 **Q. PLEASE EXPLAIN THE CONCERNS YOU HAVE WITH THE**  
29 **UNDERLYING DATA PGE RELIED UPON FOR ITS RPM.**

30 A. PGE states that it used the cost of equity decisions it could find for the  
31 period January 1983 through the time it published its testimony. PGE then

1 excluded stipulated results. I conducted a cursory review of PGE's data  
2 set based on my experience at the Oregon Commission. From this  
3 review, I noted that PGE had not excluded PacifiCorp's stipulated cost of  
4 equity from UE 170 and PGE had excluded this Commission's decision on  
5 PGE's own cost of equity from Docket No. UE 115. Given the  
6 inaccuracies present in the data found while focusing solely on recent  
7 history in Oregon, it draws into question the accuracy of the entire data set  
8 and the results of the RPM.

9 **Q. WHAT DO YOU CONCLUDE REGARDING PGE'S APPLICATION OF**  
10 **ITS RPM MODEL?**

11 A. Even if there was support from a theoretical perspective for such a model,  
12 I conclude that PGE's application of its RPM is likely flawed from a  
13 statistical perspective and that the results are based on inaccurate data. I  
14 conclude that, even if the Commission determines a model similar to  
15 PGE's is theoretically feasible, PGE's specific RPM should be rejected.

16 **Q. DOES THIS CONCLUDE YOUR TESTIMONY?**

17 A. Yes.

CASE: UE 180/UE 181/UE 184  
WITNESS: Bryan Conway

**PUBLIC UTILITY COMMISSION  
OF  
OREGON**

**STAFF EXHIBIT 1101**

**Witness Qualification Statement**

**August 14, 2006**

WITNESS QUALIFICATION STATEMENT

NAME: Bryan A. Conway  
EMPLOYER: Public Utility Commission of Oregon  
TITLE: Program Manager, Economic & Policy Analysis Section  
ADDRESS: 550 Capitol Street NE Suite 215, Salem, Oregon 97301-2551.  
EDUCATION: B.S. University of Oregon, Eugene, Oregon  
Major: Economics; 1991  
M.S. Oregon State University, Corvallis, Oregon  
Major: Economics; 1994

In addition, I have completed all of the required and elective coursework for a Ph.D. in economics from Oregon State University. My fields of study were Industrial Organization and Applied Econometrics.

EXPERIENCE: Starting in October 1998, I have been employed by the Public Utility Commission of Oregon. I am currently the Program Manager of the Economic & Policy Analysis Section. My responsibilities include leading research and providing technical support on a wide range of policy issues for electric, telecommunications, and gas utilities. I have testified before the Commission on policy and technical issues in UG 132, UE 115, UE 116, UE 170, UE 179 and have been the Summary Staff Witness in UP 158, UP 168, UP 165/170, UX 27, UX 28, UM 967, UM 1041, UM 1045, UM 1121, UM 1206, and UM 1209.

From December 1994 to October 1998, I worked for the Oregon Employment Department as a Research Analyst in their Research Section. Duties included leading research projects on various policy issues involving labor economics and information systems.

OTHER EXPERIENCE: I am currently a faculty member of the University of Phoenix teaching economics.

From January 1998 through September 2000, I was a part time instructor at Linn-Benton Community College teaching principles of economics.

From July 1992 through June 1994, I was a graduate teaching assistant at Oregon State University teaching introductory principles of economics.

FROM: Patrick G. Hager  
Manager, Regulatory Affairs

**PORTLAND GENERAL ELECTRIC  
UE 180  
PGE Response to OPUC Data Request  
Dated March 28, 2006  
Question No. 083**

**Request:**

Regarding PGE/1100, Hager-Valach/31, lines 10-14, is it correct that PGE regressed the “authorized ROE in each of the 486 decisions against the yield on the appropriate long-term corporate bond for each company?” If yes, please identify which of the “model” commands in the “POOLED CROSS-SECTIONAL TIME-SERIES DATA” section of PGE/1100, Work Papers/133 corresponds to the regression described in PGE/1100, Hager-Valach/31, lines 10-14. Please also indicate which variable from the “model” commands is the “authorized ROE.”

**Response:**

No. The quote should read “regressed the *difference* between the authorized ROE and its most recent FMB yield to maturity against each individual utility’s corporate bond yield to maturity (*debtcost*) in each of the 486 decisions.”

The dependent variable in the equation is *riskprm*.

**PORTLAND GENERAL ELECTRIC  
UE 180  
PGE Response to OPUC Data Request  
Dated March 28, 2006  
Question No. 088**

**Request:**

Regarding PGE/1100, Hager-Valach/33, lines 6-12, is it correct that PGE regressed the “authorized ROE in each of the 486 decisions against the seven-year Treasury bond, lagged one month prior to the dates of the decisions?” If yes, please identify which of the “model” commands in the “POOLED CROSS-SECTIONAL TIME-SERIES DATA” section of PGE/1100, Work Papers/133 corresponds to the regression described in PGE/1100, Hager-Valach/33, lines 6-12. Please also indicate which variable from the “model” commands is the “authorized ROE.”

**Response:**

No. The quote should read “regressed the *difference* between the authorized ROE and the seven year treasury bond, lagged one month (*RPTR71 or RPTR78*) against each of the lagged seven year treasury bond (*YR71 or YR78*) in each of the 486 decisions.”

FROM: Patrick G. Hager  
Manager, Regulatory Affairs

**PORTLAND GENERAL ELECTRIC  
UE 180  
PGE Response to OPUC Data Request  
Dated March 28, 2006  
Question No. 085**

**Request:**

**Regarding PGE/1100, Hager-Valach/31, lines 10-14, did PGE run any tests to determine the level of integration between the "486 decisions" and the yield on the corporate bonds or the difference between the authorized ROE and the yield on corporate bonds and the yield on the corporate bonds? If yes, please identify each test and provide the results. If no, why not?**

**Response:**

PGE did not perform these tests since the data used was a pooled cross-sectional sample and not just a time series. While one could theoretically test for autocorrelation across each of the companies, the data are not sufficient in number or in sequence to allow for such a test. Decisions on authorized ROE for a utility do not occur monthly or even yearly. Sometimes, there are several years between decisions.

Manager, Regulatory Affairs

**PORTLAND GENERAL ELECTRIC  
UE 180  
PGE Response to OPUC Data Request  
Dated April 13, 2006  
Question No. 206**

**Request:**

**Regarding PGE's response to OPUC Staff Data Request 85 where PGE states "PGE did not perform these tests since the data used was a pooled cross-sectional sample and not just a time series." Were any tests run to determine if the cross-section parameters remained constant over time? If no, why not. If yes, please identify the statistical test run and provide the results.**

**Response:**

PGE originally tested the data set over different time periods but did not apply sophisticated tests for heteroskedasticity.

**PORTLAND GENERAL ELECTRIC  
UE 180  
PGE Response to OPUC Data Request  
Dated March 28, 2006  
Question No. 091**

**Request:**

**Regarding the regression analysis described at PGE/1100, Hager-Valach/33, lines 6-12, did PGE run any tests to determine the optimal lag? If yes, please identify the tests and provide the results. If no, why not?**

**Response:**

Previously we tested lags ranging from none to 10 months. The one month lag and eight month lag performed the best. This analysis was performed eight years ago (1998) and those results are no longer available.

Manager, Regulatory Affairs

**PORTLAND GENERAL ELECTRIC  
UE 180  
PGE Response to OPUC Data Request  
Dated April 13, 2006  
Question No. 202**

**Request:**

Regarding PGE's response to OPUC Staff Data Request 91, PGE states that "[t]he one month lag and eight month lag performed best." What test was conducted to determine which lag "performed" best? Please list the tests and describe how the best performing lags were chosen.

**Response:**

PGE tested the models by running separate regressions testing each of the potential lags. PGE then reviewed the results of each model, using the adjusted R-squared, t-tests, and F- values as well as appropriated coefficient signs, among others. Based on our judgment, we chose the 1- and 8-month lag models.
