Risk Identification: Risks are derived from various sources, some of which can be identified before a project starts, and some of which are surprises along the way. Many of these risks or sources are common across projects so the PM may start with NWN's common risks by project type. These tools can be leveraged as a starting place, but it is the job of the PM to coalesce common and unique risks that the project faces.

Risk identification should be conducted on an ongoing basis, but two points of the project are particularly important:

- During the Assess phase, leverage the assessment team to identify underlying risks with the chosen solution
- During the Planning phase, focus on what challenges might come up during execution; best practice is to hold a workshop with your project team to work through identification, evaluation and response plan

Risk Evaluation: As we document risk, we talk about its probability and its impact; this allows the project team to make thoughtful decisions about potential risks. To make this simple, we can use the following definitions to give a score for both probability and impact:

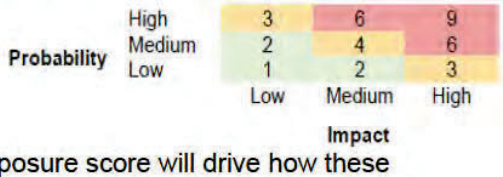
Probability of Risk Occurring

Level	Probability	Score
High	The risk is likely or certain to occur. Specifically, there is more than 75% chance that the risk occurs	3
Medium	There is some likelihood that the risk will occur. Specifically, there is between a 25% and 75% chance that the risk occurs	2
Low	It is not very likely that the risk will occur. Specifically, there is less than 25% chance that the risk occurs	1

Impact If the Risk Occurs

Level		Cost	Schedule	Scope	Quality	Score
High	If the risk occurs, it will have a severe impact on the ability to achieve the project's critical objectives	Cost increases would be beyond the total authorized spend, causing a change order	Key project event or milestone will be delayed by more than 3 months	Scope decrease would have significant impacts on key deliverables	Performance is degraded to the point that the project would not meet its objectives	3
Medium	If the risk occurs, it will somewhat impact the desired results either crippling a secondary objective or causing a critical outcome to be degraded	Cost increases would dip into contingency funds	Key milestone will be delayed	Scope decrease would impact some core objectives or key deliverables	Performance would be below goal and may have some impacts on project objectives that can be mitigated with work arounds	2
Low	If the risk occurs it will have little or no impact on the project's ability to achieve its objectives	Cost increases could be managed within the approved budget	No key milestones will be impacted	Scope decrease would not impact core objectives or key deliverables	Requires minor performance trades, but will not significantly inhibit project objectives	1

These numbers should then be evaluated to determine overall exposure, which will drive the project team's mitigation response:



Risk Response and Control

Risk response is perhaps the most important step in risk management; it is important to focus efforts and communications on the most important risks, with targeted and thoughtful mitigation strategies. The risk exposure score will drive how these are tackled.

Red Risk Exposure Mitigation Strategy: The mitigation strategy and execution should be assigned to a risk owner. The project team needs to work together to find outlets to avoid or temper the severity of the risk at hand. If the risk is accepted, it's critical that every stakeholder understand the consequences.

Request No.: UG 490 OPUC DR 411

What is the rate base total of IT&S expenses for each year from 2019 through the Test Year?

Response:

Rate base IT&S expenditures are found in the “Intangible” and “General” categories of utility plant in service. The Intangible designation is fully comprised of IT&S capital expenditures. IT&S expenditures within the General category are isolated to FERC accounts 391.2 Computers, 391.21 Computer Horizon, and 391.22 Computer Bloodhound.

Please see “UG 490 OPUC DR 411 Attachment 1.xlsx”.

Detail the payment terms for each of the contracts entered into for the IT&S projects included in Exh. 700. Include whether any prepayments were necessary for each project, if so, how much and when, the timeline of payments, and how many years this project is expected to provide benefits to customers and the Company.

Response:

NW Natural understands "payments terms" in this context to mean the condition triggering payment obligations for a contract. For each of the contracts entered into for the IT&S projects included in Exhibit 700, the payment terms were for 30 days after receiving an invoice (i.e., "Net 30").

Please see Confidential UG 490 OPUC DR 414 Attachment 1 for the requested information concerning those projects where prepayments were necessary.

Which IT&S projects are considered out of service in the Test Year but were previously included as capital projects?

a. Have these projects been moved into a regulatory asset account?

b. What amounts left are undepreciated? In other words, what are the remaining rate base amounts?

Response:

There are two IT&S projects that will be considered out of service at certain points during the Test Year but were previously included as capital projects. Those projects are:

UI Planner
Genesys

These projects are currently part of plant account 303.1-Computer Software.
The remaining rate base amounts as of 10/1/2023 are:

UI Planner - $331,789.40
Genesys - $3,404,683.86

Both IT&S projects are still in service today but are anticipated to be retired before the end of their original depreciable lives before or during the Test Year. Upon review, NW Natural did not include these projects in its forecasted retirements, and will update this in our Reply Testimony. These projects have not been moved into a regulatory asset. The Company uses the Group Depreciation Method which does not depreciate these assets individually, the total cost of the group is spread out over the useful life of the entire group. Through the depreciation study process the Company reassess the useful life and salvage value of the assets in each group, including retirements, and adjustments to depreciation rates may be made accordingly.

Please refer to the Company's response to UG 490 CUB DR 20 (due on March 22, 2024), which will provide more detailed information on the timing and estimated remaining balance on these two projects.

On NW Natural/100/Palfreyman-Kravitz/Page 16, in reference to "update[ing] its IT&S infrastructure, the Company states, "In this proceeding, NW Natural is seeking cost recovery of additional projects to further modernize its IT&S infrastructure and transition to cloud-based IT&S architecture. These upgrades are largely in response to cyber- security advancements, existing software reaching end of life and end of support, and developers exclusively providing cloud-based solutions." For the "existing software reaching end of life" please provide:

a. The in-service date of the software.
b. The useful life of the software when it was purchased and any changes to the useful life since then.
c. Any differences between the useful life and amortization period of the software if these periods ever differed.
d. The amount of money still in rate base for the software.
e. Any proposed changes to "d." in UG 490.
f. The Book Depreciation Reserve value of the software as of 10/1/2023.
g. The Future Accruals value of the software as of 10/1/2023.
h. A narrative explanation of how the software is still being used, if it is still being used, despite the addition/ transition to cloud-based software.

Response:

Please see "UG 490 CUB DR 20 Attachment 1" for subparts a-h. Upon review, NW Natural did not include these projects in its forecasted retirements and will update this in our Reply Testimony.

Request No.: UG 490 OPUC DR 424
Are contingency funds included in rate base or considered O&M expenses? Please point to where these are included in workpapers.

Response:

Contingency amounts may be included in forecasted project costs that are ultimately included in the forecasted rate base. There are no contingency funds included in O&M. The contingency funds, if included at the project level, would be embedded in individual capital project costs that are being closed and allocated to FERC accounts for rate base. There is no single place to point in a workpaper where contingency funds are layered into rate base; it would be embedded into the gross plant additions in UG 490 – Exh. 1713 – WP1 – Gross Plant and Accum Deprec – CONFIDENTIAL workpaper, Additions tab.

Have internal employees assisted in the implementation of any of the projects?
Response:

Yes, our internal employees play key roles in the implementation of all of our IT&S projects. Depending on the size and complexity of the project, internal staff may be involved in various capacities:

1. Subject Matter Experts (SMEs): Internal SMEs provide specialized knowledge and insights related to the project, guiding decisions, and offering expertise in specific areas such as software development, networking, cybersecurity, etc.

2. User Testing and Feedback: Internal employees may participate in user acceptance testing (UAT) to validate that the IT solution meets the organization's requirements and provides a satisfactory user experience.

3. Data Migration and Integration: Internal IT&S staff may assist in migrating data from existing systems to the new IT solution and integrating it with other systems within the organization.

4. Support and Maintenance: After implementation, internal IT&S support teams provide ongoing support and maintenance for the IT solution, addressing any issues that arise and ensuring smooth operation.

5. Documentation and Knowledge Transfer: Internal employees contribute to documenting processes, procedures, and best practices related to the IT project, facilitating knowledge transfer within the organization.

6. Vendor Management: Internal staff may interact with external vendors or consultants involved in the IT project, ensuring alignment with organizational goals, and overseeing contractual agreements.

By leveraging the skills and knowledge of internal employees, we optimize our resources, maintain institutional knowledge, and foster a sense of ownership and accountability throughout the IT project lifecycle.

Request No.: UG 490 OPUC DR 357

The Company describes its need for eight new Information Technology and Services FTEs in NW Natural/700, Downing/50-55. The Company states these positions are needed to adequately staff H2: Vista. While this project will not begin in 2024, the Company states the new positions are needed now for education and integration. When does the Company intend to fill these positions?

Response:

To clarify, only four out of the eight full-time equivalents (FTEs) listed in the NW Natural/700, Downing/50-55 testimony are essential to support Horizon 2: Vista (H2: Vista). The other four FTEs are needed to support NW Natural's SCADA telemetry systems, gas/pipeline control operations, and identity governance administration. (See NW Natural/700, Downing/53-55.)
With respect to the four FTEs necessary to support H2: Vista, the Company intends to immediately begin recruiting three of the four positions, and expects all four positions to be hired prior to the rate effective date (i.e., November 1, 2024), although the exact dates will depend on finding qualified candidates. As explained in NW Natural/700, Downing/51-52, filling these positions in a timely manner is crucial to effectively supporting NW Natural's ongoing CIS needs, while simultaneously allowing existing personnel to develop, test, and implement H2: Vista. NW Natural's legacy, 26-year-old CIS is highly complex, requiring substantial lead times of between 18-24 months for new personnel to be effectively educated and integrated. Robust training is essential to ensure that the legacy CIS continues to support reliable, seamless continuity of service for customers during the H2: Vista development and implementation. Given that NW Natural is already well into the planning stage of H2: Vista, including developing a comprehensive framing study, filling these four FTE positions quickly is imperative to ensure adequate capacity to advance the H2: Vista development and support the legacy CIS.

See UG 490 - Exh. 1400 - OM Model Workpaper_Non-Confidential, tab Dept Non-Payroll Forecast, and filtered by Test Year (TY) Adjustments (Highlighted in yellow) for FERC 921.

Cost Center	Cost Center	GL Accou	GL Account	FERC	I/O	Test Year	
10710	INFRASTRUCTURE-OFFIC	608100	TEST YEAR ADJUSTMENT - SUBCRIPTION SERVICES	921		$664,974	$586,028
10710	INFRASTRUCTURE-OFFIC	605600	TEST YEAR ADJUSTMENT - SOFTWARE MAINT	921		$4,846,188	$4,270,847
10710	INFRASTRUCTURE-OFFIC	605900	TEST YEAR ADJUSTMENT - HARDWARE MAINT	921		$214,517	$189,050
10710	INFRASTRUCTURE-OFFIC	606300	TEST YEAR ADJUSTMENT - CELLULAR PHONES	921		$238,493	$210,179
10710	INFRASTRUCTURE-OFFIC	602300	TEST YEAR ADJUSTMENT - RENTS AND LEASES	921		$32,518	$28,657
10818	REGULATORY AFFAIRS-O	605100	TEST YEAR ADJUSTMENT - PROFESSIONAL SERVICE	921		$153,196	$135,009
10831	LEGAL FEES-RATES-OFF	605000	TEST YEAR ADJUSTMENT - LEGAL FEES	921		$908.519	$800.659

a. Why are the TY totals for each month not referencing the IT&S TY Forecast tab, whereas rows for other cost centers reference different respective tabs? In other words, where are the numbers coming from that are in cells AV 2329 through BG 2329?

b. Why are professional services and legal fees included in FERC 921?

c. Were the amounts in (b) above discussed in Exh 1400.

Response:

a. Unlike the other adjustments in the workpaper where one line is adjusted to reflect higher or lower expense, IT&S expected increases from the Base Year to the Test Year are occurring across the entire IT&S organization on many different GL accounts and many different Cost Centers. IT&S forecasts a Test Year increase of $7,729,571 which included escalation. That can be found in the OM workpaper IT&S TY Forecast tab cell I92. The adjustments were hard coded each month in the model to get to the forecasted $7.7M.

This can be confirmed by going to the Dept Non-Payroll Forecast tab and filtering to the IT&S cost centers (10259-10282, 10705-10739 & 11128). The Base Year amounts can be added up using column BL which adds to $28,609,172. The Test Year amounts are in column BH which adds to $36,338,742, an increase of $7,729,571.

In hindsight, this adjustment could have been performed more clearly in the workpaper to make reviewing easier.

b. Professional services and legal fees are included in FERC 921 because they are estimated amounts to be incurred for prosecuting this case, i.e. “rate case expense”.

c. No, they were not discussed in Exh. 1400.

Why are the amounts the same in every month of the test year for the FERC 921 associated IT&S expenses? For example, cells AV 2329 through BG 2329 are $55,415 in each cell.

Response:

While the workpaper/model includes monthly amounts for gross up inflation, the IT&S adjustments were made with the intention to bring the Total 12-month Test Year amount in line with the forecasted increase. IT&S adjustments were made to increase the total IT&S Test Year amount by $7.7M. How the expenses were allocated to each month in the workpaper was not an emphasis, so the Company spread those expenses equally to each month.

Redacted Opening Testimony

April 18, 2024

Docket No: UG 490

Staff/1100
Kim/1

Q. Please state your name, occupation, and business address.

A. My name is Anna Kim. I am the Energy Costs Section Manager employed in the Rates, Safety and Utility Performance Program of the Public Utility Commission of Oregon (OPUC). My business address is 201 High Street SE, Suite 100, Salem, Oregon 97301.

Q. Please describe your educational background and work experience.

A. My witness qualifications statement is found in Exhibit Staff/1101.

Q. What is the purpose of your testimony?

A. The purpose of my testimony is to discuss long-term hedging policy and Schedule H, Large Volume Non-Residential High Pressure Gas Service Rider for Compressed Natural Gas service.

Q. Did you prepare any exhibits for this docket?

A. Yes. I prepared Exhibit Staff/1101, my witness qualifications statement, and Exhibit Staff/1102, a compilation of responses to data requests referenced in this testimony.

Q. How is your testimony organized?

A. My testimony is organized as follows:

Issue 1. Long-Term Hedging 2
Issue 2. Schedule H 8

Docket No: UG 490

Staff/1100
Kim/2

ISSUE 1. LONG-TERM HEDGING

Q. What is long-term hedging?

A. In this context, hedges are investments that are undertaken to limit risk from high gas prices. Short-term hedges are typically transactions that address the next heating season and medium-term hedges are typically transactions to hedge gas supply costs two and three years out. Long-term hedges are transactions (financial and physical) that hedge gas purchase costs more than three years in the future.[1]

Q. How does the Company recover the costs of long-term hedges?

A. NW Natural recovers costs of long-term hedges through its Purchased Gas Adjustment (PGA) Mechanism. The PGA is an automatic adjustment mechanism that allows NWN a to update rates to capture changes in its purchased gas costs on an annual basis without the need for a general rate review. The PGA includes both a forward-looking and backward-looking component. For the forward-looking component, the Commission allows NWN to reset rates annually with an updated forecast of purchased gas costs. For the backward component, NWN is allowed to defer the variance between forecasted and actual purchased gas costs and given the opportunity to recover that variance in future rates, subject to sharing, a prudence review, and a review of the Company's earnings during the deferral period.[2]

[1] LC 60 NW Natural 2014 IRP, p. 3.39.
[2] *In the Matter of the Public Utility Commission of Oregon Investigation into the Purchased Gas Adjustment (PGA) Mechanism Used by Oregon's three Local Distribution Companies*, UM 1286, Order No. 08-504 (October 21, 2008).

The purpose of the PGA is two-fold: (1) to allow the gas utilities to recover costs associated with the purchase and transportation of natural gas to its systems and (2) to provide an incentive (i.e., the sharing) to minimize the cost of natural gas purchases.

Q. Is long-term hedging specifically addressed in the PGA?

A. In a way. In 2015, the Commission opened an investigation into the long-term hedging policies of Oregon's three natural gas local distribution companies, docketed as UM 1720. Parties to that docket engaged in workshops to determine whether they could agree on guidelines for long-term hedging, but ultimately decided they could not due to the diversity of the available hedging instruments and optionality to the duration and timing of the hedges.[3] Instead, the parties agreed to a process that the gas companies could use to receive feedback from stakeholders regarding long-term hedges.[4] The parties proposed that this process be incorporated into the Commission's Natural Gas Portfolio Development Guidelines that gas utilities must follow in connection with making the Companies' PGA filings. The Commission subsequently adopted the parties' recommendation in Docket No. UM 1286.[5]

Q. Why is long-term hedging an issue in this proceeding?

A. In January 2024, the Company entered the long-term hedging review process as laid out in UM 1286 and the Natural Gas Portfolio Development Guidelines.

---

[3] *In the Matter of NW Natural Gas Company, dba NW Natural, Investigation into Long-Term Hedging Policy*, UM 1720, Order No. 18-019, pp. 1-2 (January 18, 2018).
[4] *Id.*
[5] UM 1286(4), supra, Order No. 18-144, App. A (May 1, 2018).

While engaging in this process, Staff identified opportunities to better align benefits of long-term hedges to the Company and to customers. Staff addresses this topic here to propose a change to how the costs of long-term hedges are recovered in NWN's annual PGA.[6]

Q. What is the review process for long-term natural gas hedging strategies for natural gas utilities?

A. If the utility identifies a long-term hedging strategy that it believes is in the interest of customers, the utility requests a meeting with stakeholders, including Staff, the Oregon Citizens' Utility Board, and the Association of Western Energy Consumers (formerly Northwest Industrial Gas Users).[7] In the meeting, the utility shares the proposal. Stakeholders have 30 days to provide a written response on whether they support the utility moving forward or if there are reservations and concerns. If any stakeholder believes the proposal needs further review by the Commission, said stakeholder would utilize the process outlined above to identify the appropriate forum for review.

Q. How often has this hedging review process been implemented by the Company?

A. Northwest Natural engaged this process for the first time in January 2024.

Q. When Staff engaged in this process, what did Staff find?

[6] NWN and the other natural gas companies in Oregon make their annual PGA filings on or around August 1 of each year.

[7] *In the Matter of the Public Utility of Oregon Investigation into the Purchased Gas Adjustment (PGA) Mechanism Used by Oregon's Three Local Distribution Companies*, UG 1286(4), Order No. 18-144, App. A, p. 3.

A. **[BEGIN CONFIDENTIAL]** [redacted] **[END CONFIDENTIAL]** The requirements for information shared in this process were vague as written. **[BEGIN CONFIDENTIAL]** [redacted] **[END CONFIDENTIAL]**

Q. What does Staff propose now?

A. Staff does not propose any change to the notice and meeting process utilities should use for proposing long-term hedging proposals adopted in Order No. 18-144. However, Staff proposes 90/10 sharing on costs of long-term hedges that exceed five percent of total gas purchases. Meaning, for any long-term hedge that exceeds the five percent of total gas cost threshold, NWN would only be allowed to include 90 percent of the cost in forecasted rates.

Q. Why is this appropriate?

A. In theory, a gas utility could use hedges to significantly limit the risk of non-recovery of actual purchased gas costs in the PGA. As noted above, the PGA allows the gas utility to recover the variance between its forecasted and actual gas prices, subject to sharing and an earnings and prudence review. If the

utility hedges all of its purchased gas, the utility's forecasted costs and actual costs would be the same and there would be no variance. Accordingly, the utility's recovery of its actual costs would not be subject to sharing or an earnings review.

The 90/10 sharing in the PGA is designed to incent the utility to minimize its purchased gas costs. Because the cost of long-term hedges will likely not vary between the forecasted and actual costs, there is no sharing of these costs. Accordingly, requiring the utility to absorb 10 percent of the cost of long-term hedging transactions will help ensure the Company acts in a manner that is in the best interests of both customers and the utility.

Q. Why does Staff only make this recommendation for hedging costs that exceed the five percent of total costs threshold?

A. Staff recommends a five percent of total purchase requirement as a "safe" limit that utilities could "lock in" long term prices as this is a small amount as a reasonable threshold before additional action. Amounts greater than this, however, should include a sharing component. The reason being that reducing price risks benefits both the Company and the customer. The Company benefits as it removes that amount of gas from having price risk ad subject to the PGA sharing. The alignment of incentives helps ensure the Company enters long-term hedging with careful analysis and is in the Company's best interest.

Docket No: UG 490

Staff/1100
Kim/7

Q. What would be the ratemaking treatment Staff proposes for any long-term hedge the Company enters into for those above the five percent of total retail load?

A. Staff proposes that long-term hedges above five percent of total retail load be presumed reasonable and prudent by evidence of the fact that the Company bears ten percent of the "above market" cost of the contract. The Company would continue to provide notice and hold a meeting with stakeholders.

Q. What do you mean by the "above market" cost of the contract?

A. There is a forward price curve for the natural gas market. To "lock in" those prices, presumably there would need to be a premium to pay. The premium would be deemed the above market cost.

Docket No: UG 490 Staff/1100
Kim/8

ISSUE 2. SCHEDULE H

Q. What is Schedule H?

A. Scheule H is the Large Volume Non-Residential High Pressure Gas Service Rider for Compressed Natural Gas service. There are currently two (2) customers on Schedule H. There was only one in 2019-2022.[8]

Q. Is Schedule H covered in this GRC?

A. No. Schedule H is removed from the revenue requirement model.[9]

Q. What is the Company proposing for Schedule H in this GRC?

A. The Company is updating Schedule H with new cost of capital components as well as capital investment cost and O&M assumptions for cost of service.[10] This is a standard update consistent with updates in the last GRC.[11]

Q. Where else does Staff review changes to Schedule H?

A. Updates are reviewed through advice filings. ADV 1472/Advice No. 22-23 is the last advice filing with changes to Schedule H. ADV 1472 extended the end date of this service until January 31, 2025.

Q. What did Staff conclude when reviewing Schedule H for ADV 1472?

A. In Staff's memo for the January 24, 2023, Public Meeting, Staff recommended approving the extension of this service. Staff found that the compressed natural gas fuel market has not appreciably changed since 2018. NW Natural is

8 NWN Response to Staff DR 219.
9 NWN/1700, Walker/17.

11 UE 435 NWN/1300, Walker/25.

providing a beneficial service to customers because it may not otherwise be available without the utility's involvement in the market.

Q. Have there been any changes to the market since?

A. Staff requested an update in DR 433. The Company has not seen any appreciable change in the compressed natural gas market since the last update filed in ADV 1472.

Q. Do you have any recommendations?

A. Not at this time.

Q. Does this conclude your testimony?

A. Yes.

a. Please list and discuss past Orders that relate to treatment and direction to parties.

Response:

The Company objects to this data request under OAR 860-001-0500, in that the information requested is not relevant to issues in a rate case. Notwithstanding this objection, the Company is aware of two Commission orders related to long term hedging: Order Nos. 18-019 and 18-144.

NW Natural®

Rates & Regulatory Affairs
UG 490
Request for a General Rate Revision
Data Request Response

Request No.: UG 490 OPUC DR 433

Please provide:

a. An update on the compressed natural gas market since the Company's last report in ADV 1472/Advice No. 22-23; and

b. A description of any notable changes to the CNG market, including number of public and private fueling stations.

Response:

For ease of reference, the Company provides its Schedule H – Large Volume Non-Residential High Pressure Gas Service (HPGS) Rider tariff extension request and market report in ADV 1472/Advice No. 22-23, dated December 15, 2022, as UG 490 OPUC DR 433 Attachment 1. The Company also provides Staff's report and recommendation in ADV 1472/Advice No. 22-23, dated January 13, 2023, as UG 490 OPUC DR 433 Attachment 2.

a. The Company finds that the Compressed Natural Gas ("CNG") market has not markedly changed since the Company's tariff extension request was filed and Staff's report was issued on December 15, 2022, and January 13, 2023, respectively. The Company did add one new customer to its Schedule H service in 2023 (City of Wilsonville). Further, the Company continues to engage with potential customers and industry partners that remain interested in moving diesel vehicle fleets to CNG. Diesel prices, while generally trending down after reaching a five-year high in 2022, remained volatile throughout 2023 and early 2024. The Company currently has three open inquiries to explore the feasibility of constructing CNG stations for service under Schedule H.

   The key difficulties potential developers have expressed in building CNG stations are lack of state incentives for a comprehensive network of stations and lack of commitment from fleet owners and operators. Companies with the capital to convert/purchase CNG fueled fleets that would make a CNG station economically viable are hesitant to invest in CNG vehicles because there is a sense of uncertainty about whether CNG will qualify under state clean fuels/carbon reduction programs in the near future. Companies with a nationwide presence are hesitant to convert their Oregon-based fleet to CNG as they prefer to use the same types of vehicles and

fuels in every state. Additionally, many smaller companies rent their fleets and even if they would prefer CNG, the fleet owner may not be incentivized or find it economically viable to offer CNG vehicles as an option.

The Company continues to find on-going interest in CNG within its service territory under current market conditions and despite the difficulties cited above. The Company finds that the conclusion from Staff's report is still valid, namely "…that NW Natural is providing a service [through the HPGS] that would not otherwise be available to customers without the utility's involvement in the market. [The] HPGS program provides a benefit to existing customers and a possible scenario can arise where if low CNG prices persist, diesel fleets can have incentives to convert to CNG thus further fueling CNG market development."[1] [2]

b. According to the US Department of Energy's Alternative Fuels Data Center, there are a total of three public and 10 private CNG fueling stations in Oregon as of March 2024. This count does not include the City of Wilsonville CNG fueling station. Additionally, there is one public liquified natural gas ("LNG") fueling station that sells renewable natural gas ("RNG").[3] In total, the Company finds there are 15 CNG and LNG fueling stations in Oregon. Staff's report identified 14 CNG stations as of 2023, which led Staff to conclude that this number indicated that the CNG market "has not changed appreciably" since 2018.[4]

[1] *See*: UG 490 OPUC DR 433 Attachment 2, page 6.
[2] For the US Department of Energy Alternative Fuel Price Report, see: Alternative Fuels Data Center: Fuel Prices (energy.gov). As of January 1, 2024 CNG averaged $2.95 per gasoline gallon equivalent ("GGE") while diesel averaged $3.51 per GGE.
[3] US Department of Energy Alternative Fuels Data Center, natural gas fueling station locations data can be accessed here: Alternative Fuels Data Center: Natural Gas Fueling Station Locations (energy.gov).

CASE: UG 490
WITNESS: CHARLES LOCKWOOD

PUBLIC UTILITY COMMISSION
OF
OREGON

STAFF EXHIBIT 1200

Opening Testimony
Uncollectible Accounts and
Schedule 330 Residential Bill Discount Program

April 18, 2024

Docket No: UG 490

Staff/1200
Lockwood/1

Q. Please state your name, occupation, and business address.

A. My name is Charles Lockwood. I am a Utility Analyst employed in the Utility Strategy and Integration Division of the Public Utility Commission of Oregon (OPUC). My business address is 201 High Street SE., Suite 100, Salem, Oregon 97301.

Q. Please describe your educational background and work experience.

A. My witness qualifications statement is found in Exhibit Staff/1201.

Q. What is the purpose of your testimony?

A. I provide background, analysis, and recommendations regarding the Company's Test Year amount for Uncollectible accounts and the Company's Schedule 330 Residential Bill Discount Program.

Q. Did you prepare any exhibits for this docket?

A. Yes. I prepared the following exhibits:

- Exhibit Staff/1202, NW Natural Response to DR 296.
- Exhibit Staff/1203, Staff Workpaper on Uncollectible accounts.
- Exhibit Staff/1204, NW Natural's Response to DR 318.

Q. How is your testimony organized?

A. My testimony is organized as follows:

Issue 1. Uncollectible Accounts 3
Issue 2. Residential Bill Discount Program 21
Summary of Staff Recommendations 29

Q. Could there be changes or updates to Staff's position and recommendations?

A. Yes. My testimony represents issues identified to date. My recommendations and issues may change when informed by new data and after reviewing testimony and analysis by other parties.

Docket No: UG 490

Staff/1200
Lockwood/3

ISSUE 1. UNCOLLECTIBLE ACCOUNTS

Q. Please provide a summary of the Commission's historical treatment of uncollectible accounts.

A. It is a long-standing policy of the Commission Staff to apply a three-year average methodology to determine the Test Year amount for uncollectible accounts for a utility's revenue requirement.[1] Commission Staff also examines other evidence to determine whether this approach results in a reasonable forecasted Test Year result. The amount included in a utility's revenue requirement for uncollectible accounts is revenue sensitive because it depends on the amount of forecasted revenue. That is, the total amount for uncollectible accounts included in the revenue requirement is a function of the Test Year revenue and the uncollectible rate.

Q. Describe the Company's proposal for Test Year uncollectible accounts.

A. The Company's Test Year forecast for uncollectible accounts is $4.49 million, which is approximately $3.8 million higher than the amount recorded in 2021 for uncollectible accounts of $690 thousand. The Company forecasts a Test Year uncollectible rate of 0.491, percent which is approximately five times the

[1] *See, e.g., In the Matter of Avista Corporation*, UG 246, Order No. 14-015 at 3 (January 21, 2014) and *In the Matter of Avista Corporation*, Docket UG 186, Order No. 09-422, Appendix A at 4 (October 26, 2009) (adopting stipulations for Avista general rate increase with uncollectible expense in revenue requirement based on three-year average); *but see In the Matter of Idaho Power Company*, UE 167, Order No. 05-871 (January 28, 2005) (adopting stipulation for Idaho Power Company general rate increase with uncollectible expense based on four-year average) and *In the Matter of Cascade Natural Gas Corporation*, UG 287, Order No. 15-412 (December 28, 2015) (adopting stipulation for Cascade Natural Gas general rate increase with uncollectible expense based on three-year average, removing an anomalous year).

Company's uncollectible rate of .097 percent from Northwest Natural's last GRC in Docket No. UG 435 in 2022.

Q. What uncollectible rate is obtained using the three-year average methodology described above?

A. The three-year average methodology produces an uncollectible rate of 0.182 percent.

Q. Does the Company use the three-year average methodology to derive its proposal for the Test Year uncollectible accounts?

A. No. The Company's proposed 2024-2025 amount for uncollectible accounts is calculated using an uncollectible rate that is forecasted using a combination of historical uncollectible rate trends, with adjustments for NW Natural's agreement to stop collecting residential customer deposits, changes to the collections and disconnection process adopted in the Division 21 rules, current macroeconomic factors such as inflation and higher interest rates, and federal regulation changes for collection agencies.[2]

Q. Please explain the Company's process for forecasting the 2024-2025 uncollectible rate.

A. The Company's starting point for the uncollectible rate forecast is the UG 435 approved uncollectible rate which is also the three-year average of the uncollectible rate between 2017-2020 (0.097 percent). The Company utilized this three-year historical average to avoid including months affected by the

[2] NW Natural/1300, Wilson-Sparley/5.

COVID-19 pandemic.[3] The Company then adds six distinct adjustments to the baseline uncollectible rate of 0.097 percent, all of which increase the uncollectible rate. The Company's adjustments are for:

- Weaker Economic Conditions
- Deposits No Longer Collected
- Division 21: Temperature/Weather/Wildfire/AQI/Shortened Day
- Division 21: Customer Notice Chance 15 to 20 Days
- Collection Agency Reduced Recoveries
- Discontinued Arrearage Management Program

Figure 1 provides an overview of the Company's proposed adjustments and the associated calculated adjustment amount to the baseline uncollectible rate.[4]

Figure 1. Proposed Uncollectible Rate Adjustments

Baseline Uncollectible Rate 2017-2019	0.097%
Weaker Economic Conditions	0.100%
Deposits No Longer Collected	0.137%
Division 21: Temperature/Weather/Wildfire/AQI/Shortened Day	0.029%
Division 21: Customer Notice Change 15 to 20 Days	0.007%
Collection Agency Reduced Recoveries	0.071%
Discontinued Arrearage Management Program	0.050%
	0.491%

Q. Please describe the Company's Economic Conditions Adjustment.

[3] NW Natural/1300, Wilson-Sparley/4.
[4] NW Natural/1300, Wilson-Sparley/12.

A. The Company states in testimony that "uncollectible expense typically increases during times of economic downturns."[5] To calculate how NW Natural's presumed current economic condition would impact the uncollectible expense Company averaged the uncollectible rates during previous technical economic recessions to arrive at 0.40 percent. The Company states the 0.40 percent is approximately 0.15 percentage points higher than the average uncollectible rate experienced in non-recessionary periods.[6]

However, given that the economy is weaker according to NW Natural but not in a technical recession today, the Company chose to use a 0.10 percent impact. While this is a decrease from the recession-based calculation of 0.15 percent, this is quite an increase for NW Natural's overall uncollectible rate. This increase alone more than doubles the Company's overall uncollectible rate of 0.097 percent to 0.197 percent.

FIGURE 2. NW NATURAL ECONOMIC CONDITION ANALYSIS

Methodology	Uncollectible Rate	Difference	Change From Currently Approved Rate
Non-Recessionary Periods	.25%	N/A	+0.153%
Technical Recession (2001-2002, 2007-2009)	.40%	+.15%	+0.303%

[5] Id.
[6] Id.

Adjustment Technical Recession	.35%	**+.10%**	+0.253%

The Company points to several indicators to justify to current macro-economic environment being weaker than in the pre-COVID-19 timeframe of 2017 through early 2020, when the Company last calculated the historical average uncollectible rate used in Docket No. UG 435. These indicators include:

- Interest rates increasing at the fastest rate in thirty-five years;
- The Personal Saving Rate decreasing from 6.4 percent in December 2019 to 3.4 percent in September 2023; and
- Increases in inflation rate, the consumer price index, and national delinquency rate on credit card loans.[7]

Overall, the Company argues that the risk of a recession remains elevated heading into 2024 and these factors create a weaker macroeconomic environment today compared to the Company's baseline period of 2017-2019.

Q. Does Staff agree with the Company's proposed Economic Conditions adjustment?

A. No. Staff believes that the Company fails to adequately justify the estimate of the economy's impact used in the calculation for the Weaker Economic Conditions adjustment. Staff is concerned with the use of the average uncollectible rate between 2001-2002 and 2007-2009 within the Company's

[7] NW Natural/1300, Wilson-Sparley/11, and Federal Reserve Economic Data.

calculations. NW Natural provides little to no substantive justification for their use of these time periods.

Staff believes the time periods selected by NW Natural represent too severe of an economic recession to be used by NW Natural in the calculation for this rate case. For example, the 2008 recession saw U.S. gross domestic product (GDP) decrease by 4.3 percent, making it the deepest recession since World War II.

Further, even if NW Natural can provide additional justification for the usage of these time periods, Staff remains concerned regarding the Company's downward rounding from the 0.15 percent difference in uncollectible rates during these technical economic recessions to calculate the 0.10 percent proposed. Staff feels that the methodology assumes conditions that raise the current uncollectible rate unrealistically, even with the slight downward adjustment. NW Natural notes the economy is weaker but is not in a technical recession today, therefore Staff is unclear if the 0.10 truly represents current economic conditions. Staff also did not find any further explanation from the Company regarding the calculation of the downward adjustment, as the Company's work papers do not provide reasoning.

Even with the Company applying a downward rounding adjustment of 0.05 percent, or one-third of the difference between total uncollectible rates during technical recessions and non-recessionary periods, Staff finds the use of these time periods improper and over states any needed adjustment. Staff

requires further information and justification from the Company regarding the overall calculation and downward adjustment made.

Q. Please describe the Company's Deposits No Longer Collected Adjustment.

A. The Company proposes to increase the uncollectible rate by 0.137 percent because the Company permanently stopped collecting deposits from residential customers because of the stipulation adopted in Docket No. UG 436 regarding NW Natural's Schedule R, Residential Arrearage Management Program.[8] The Company represents that the increase of 0.137 is reflective of the $600,000 NW Natural refunded on average in deposits on customers closing bills, given that $600,000 is 0.137 percent of the Company's annual residential gas revenues between 2017 and 2019. The Company states the $600,000 refunded on average assisted the customers and reduced potential write-offs, as when a customer closed their account, any deposit being held by the Company would be credited on the customer's closing bill. Because of this, the Company finds it is reasonable to expect that the lack of collected deposits will increase the uncollectible rate by 0.137 percent.

Q. Does Staff agree with the Company's proposed Deposit Adder adjustment?

A. No. The Company fails to provide any evidence that the end of deposits has led to an increase in uncollectible accounts to date. Staff finds the Company has not clearly articulated the relationship between not collecting deposits and

[8] NW Natural/1300, Wilson-Sparley/13.

an increase to the uncollectible accounts. Staff requests in the Company's Reply Testimony more information clarifying if the customers closing accounts were overdue on payments or if part of the $600,000 was being returned.

Additionally, the Company's deposit adder adjustment calculation assumes that the level of write-offs associated with residential deposits that occurred in 2017-2019 will remain constant and unchanged into the Test Year. The Company's calculation does not allow for any year-over-year variance and fails to consider that the end of deposits coupled with other measures targeted at alleviating residential customers' energy burden will lead to a lower overall level of write-offs for customers.

Q. Please describe the Company's Division 21: Temperature/Weather/Wildfire/AQI/Shortened Day Adjustment.

A. The Company states in testimony that the changes to the OAR Ch. 860, Div. 21 (Division 21) rules regarding shorter time frames for technicians to visit customers and collect payments and the new weather moratoriums will increase the uncollectible rate by 0.029 percent.[9]

Q. Please describe how NW Natural states the Division 21 Rule changes will affect the Company's uncollectible rate.

A. Prior to the Division 21 rule changes, NW Natural technicians would work until 4:00 PM, however, the new rule requires all technicians to stop field credit orders by 2:00 PM. The Company estimates this is a time reduction of

[9] NW Natural/1300, Wilson-Sparley/15.

25 percent, which equates to approximately 52 days a year lost as a result of this rule.[10]

In addition, there were two weather moratoriums updated by the Division 21 rule changes. First, the "cold weather moratorium prohibits the Company from disconnecting customers if the weather is or is forecasted to be less than thirty-two degrees or when there is a winter storm warning indicating weather conditions pose a threat to life or property."[11] NW Natural states this results in approximately twenty-eight days a year of inability to completely field credit orders in one or more of the areas within the Company's territory in 2022.

The second weather moratorium updated by the changes to the Division 21 rules prohibits technicians from completing field credit orders if the Air Quality Index (AQI) is 100 or above, resulting in approximately four days of inability to complete field credit orders in 2022.[12]

Overall, the Company is unable to complete credit field orders approximately eighty-four days per year.[13] The Company states "[t]he longer a customer is allowed to continue using gas service without payment, results in a higher bill and eventually leads to a higher uncollectible expense."[14] Therefore, using the 2022 net write-off rate and 2023 budgeted residential revenues, NW Natural found its daily net write-off is $3,723, meaning the total of incremental

[10] NW Natural/1300, Wilson-Sparley/14.
[11] Id.
[12] NW Natural/1300, Wilson-Sparley/14-15.
[13] Id.
[14] Id.

write-offs for the 84 day reduction would equate to $313 thousand or 0.029 percent of total 2023 budgeted revenues.[15]

Q. Does Staff agree with the Company's Division 21: Temperature/Weather/Wildfire/AQI/Shortened Day Adjustment?

A. No. The Company provides no data to validate the claim that these protections will increase the uncollectible rate. The Company's adjustment calculation broadly assumes that all customers will accrue balances uniformly and that these protections will have no effect on reducing overall disconnections. Staff finds this adjustment to be presumptuous and not backed by any evidence to date. Staff believes that the impacts of the rule change on the uncollectible rate is yet to be fully understood and therefore disagrees with the proposed adjustment. Staff requires further information in the Company's Reply Testimony illustrating how its calculations are "conservative"[16] and if the Company has any updated information on impacts of the rule changes it has seen since the rule changes were adopted.

Q. Please describe the Company's Division 21: Customer Notice Change 15 to 20 Days Adjustment.

A. The Company states in testimony that due to increased notice time for customers facing interruption of service and change in Company practice, NW Natural expects an increase of 0.007 percent in uncollectible expenses.[17]

---

15 Id.
16 Id.
17 NW Natural/1300, Wilson-Sparley/16.

To comply with the increased notice time of 15 to 20 days before interruption service in the most effective and efficient manner, the Company needed to remove its three-day call-ahead previously provided to customers.[18]

NW Natural states the Company historically received payment from 20 percent of customers it reached out to with the three-day call ahead. Therefore, to calculate the reduction in payments due to the removal of the three-day call ahead, the Company used the "September 2023 account balance aged 60+ days of $6.8 million and multiplied it by 20 percent to reach $1.4 million of accounts receivable that [the Company] would expect to collect from the three-day call ahead."[19] The Company then states it typically sees six (6) percent of accounts receivables turn into delinquent accounts that are deemed uncollectible, and therefore, written off, which equates to $81 thousand and represents 0.007 percent of the Company's 2023 budgeted total revenues.

Q. Does Staff agree with the Company's Division 21 Notice Division 21: Customer Notice Change 15 to 20 Days Adjustment?

A. No. It remains unclear to Staff why the Company is removing the three-day call-ahead due to the increased customer notice timeframe. Additionally, similarly to the Division 21 rule change adjustment, the Company does not provide any evidence that the updated rules have increased uncollectible expense to date. NW Natural fails to consider that the updated Division 21

[18] NW Natural/1300, Wilson-Sparley/15.
[19] NW Natural/1300, Wilson-Sparley/16.

rules were designed to offer greater protection to customers and ultimately help avoid further disconnections. The increased notice period may allow customers more time to make payments and ultimately avoid disconnection, thereby avoiding becoming uncollectible expense. Staff believes that the impacts of the rules change on the uncollectible rate is yet to be fully understood and therefore disagrees with the proposed adjustment.

Q. Please describe the Company's Collection Agency Reduced Recoveries Adjustment.

A. The Company states it has seen a decline in the number of recoveries received from collection agencies post-pandemic and requests an increase of 0.071 percent to the uncollectible expense.[20]

The Company notes recent changes to Consumer Financial Protection Bureau (CFPB) Regulation F (12 C.F.R. § 1006 and following), as a major factor in the decline of number of recoveries. Consumers now have more control over how collection agencies communicate with them and new restrictions on how agencies collect debts.

Overall, the Company has seen a decrease from recoveries in the years of 2014-2019, averaging 53 percent to 27 percent for 2022 and through October 2023.[21] The Company, therefore, applies the roughly 27 percent reduction in recoveries to its write offs, and proposes to increase the uncollectible rate by 0.071 percent.

[20] NW Natural/1300, Wilson-Sparley/17.
[21] NW Natural/1300, Wilson-Sparley/16-17.

Q. Does Staff agree with the Company's Collection Agency Reduced Recoveries Adjustment?

A. No. The Company's calculation uses just under two years of collection agency recovery rates to arrive at the recommended increase in the uncollectible rate. Staff believes that the focus on 2022 and 2023 recovery rates in this calculation is insufficient to justify the Company's proposed increase. Staff has examined the historic trend of recovery rates provided by the Company in Staff Data Request 296,[22] and while there is a decrease in 2022 and 2023, there is not a long enough time trend from which to infer that the recovery rate will not return to a historic baseline. Staff believes that there has not been adequate data to evaluate whether the new CFPB regulations will impact collection agency recovery rates at the same levels moving forward.

Q. Please describe the Company's adjustment for Discontinued Arrearage Management Program.

A. NW Natural states without the Arrearage Management Program (AMP), the Company projects an increase in the uncollectible rate of 0.05 percent.[23] Of the total write offs of $4.7 million between the months of May 2021 and December 2022, approximately $1.2 million were associated with accounts that had received AMP funds. By applying the post-pandemic collection agency rate of 27 percent, the Company calculates a new write off of $900 thousand, which equates to a 0.05 percent increase in the uncollectible rate.

22 Staff/1202, NW Natural Response to DR 296 (electronic spreadsheet).
23 NW Natural/1300, Wilson-Sparley/17.

Q. Does Staff agree with Company's adjustment for Discontinued Arrearage Management Program?

A. No. The Company argues that due to the expiration of the funds provided to customers through the Company's Arrearage Management Program (AMP) the uncollectible rate will increase. The Company's AMP was developed in response to the economic hardship faced by many individuals who lost the ability to pay their utility bills due to the COVID-19 pandemic. The AMP was meant as a temporary stopgap measure to alleviate arrears balances which increased during the pandemic. The expiration of the program does not necessarily indicate that the uncollectible rate will increase. The economic conditions that caused arrears to increase during the pandemic have subsided, and the Company's arrears remained cyclical in nature, shown in Figure 3.[24] Particularly, Figure 3 shows the Company's ninety-day arrears are declining significantly, while only the thirty-day arrears form the majority. Therefore, Staff believes that the Company has not provided sufficient evidence that the expiration of these programs will lead to an increase in uncollectible accounts.

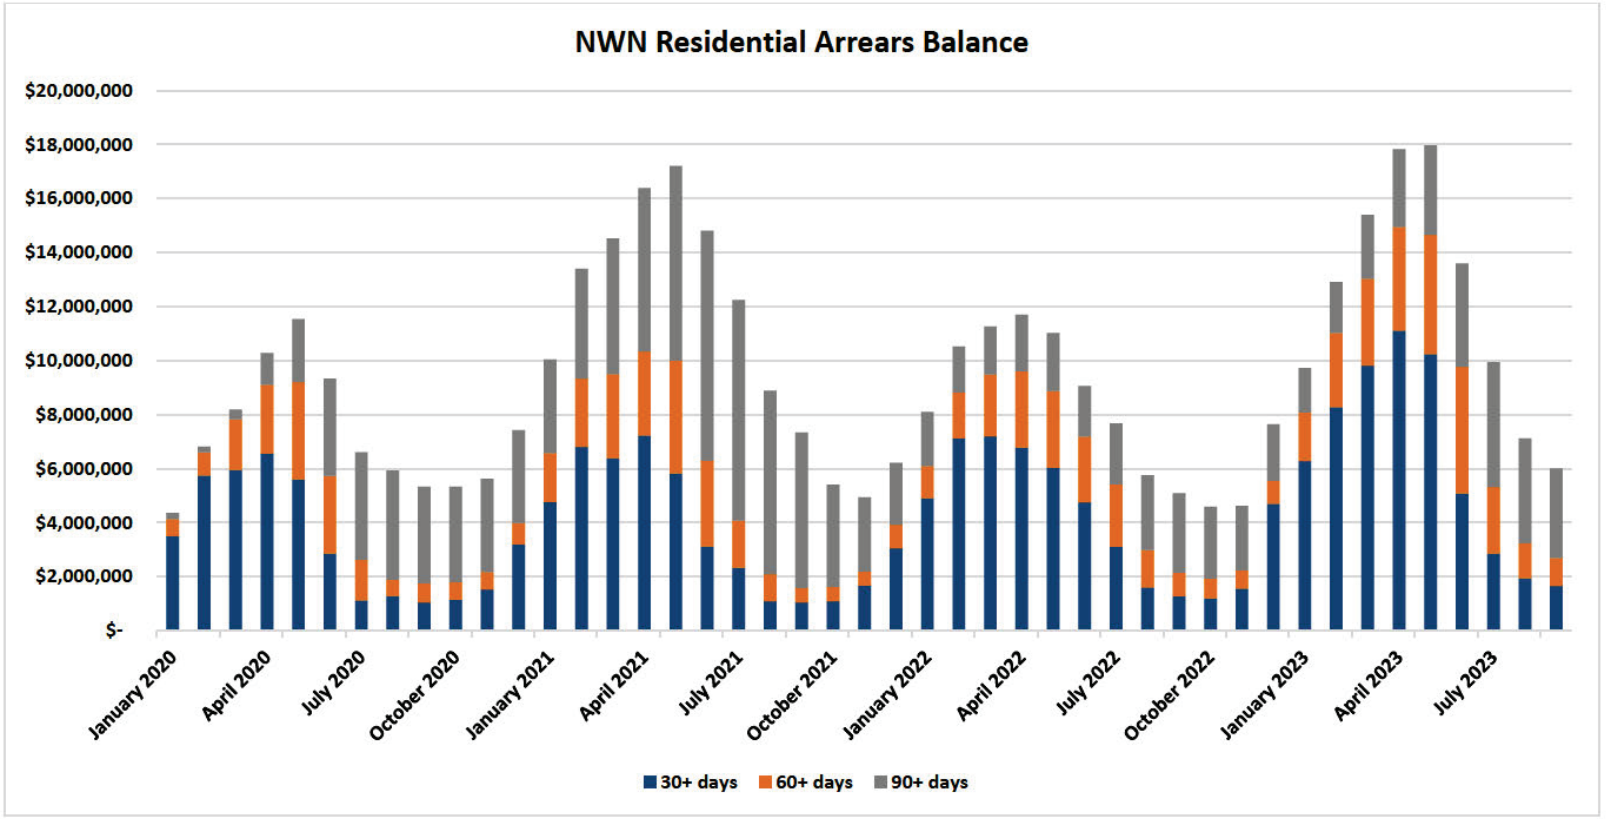
FIGURE 3. NW NATURAL RESIDENTIAL ARREARS BALANCE



Docket No: UG 490

Staff/1200
Lockwood/18

Q. Please summarize NW Natural's application of its Bill Discount Program in the Uncollectible Expense calculations.

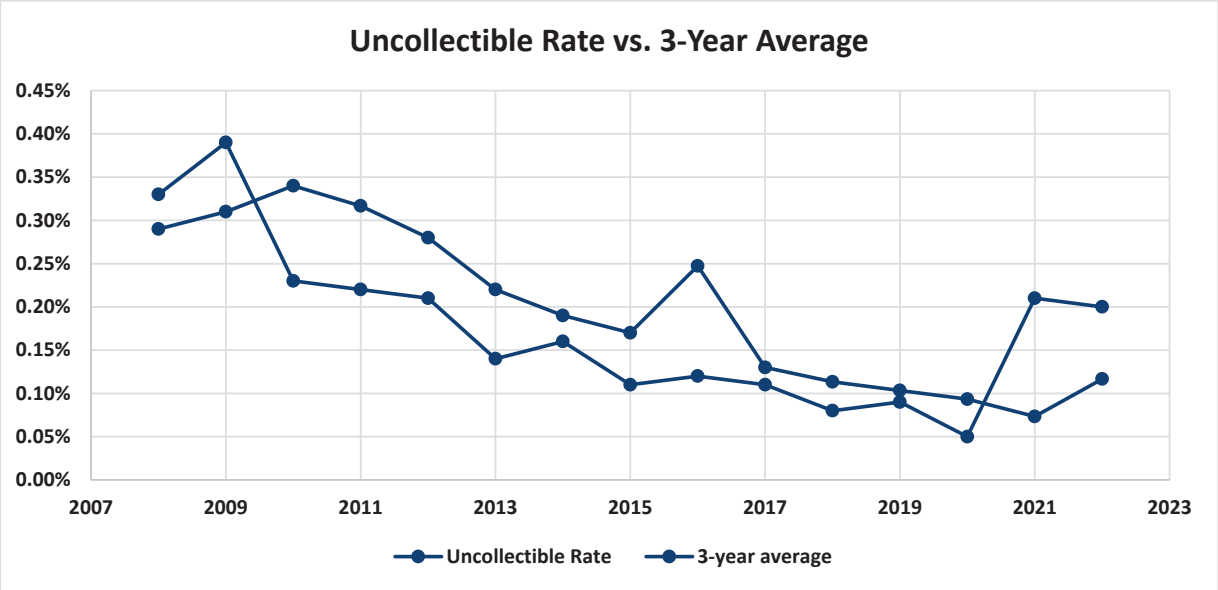
A. Staff finds the Company's lack of discussion surrounding the growth of its Bill Discount Program concerning. This concern is magnified by NW Natural's proposal to enhance and enlarge its Bill Discount Program in this docket without reflecting the impact this could have on its Uncollectible Expense. A program that provides relief to the customers that are likely to struggle the most to pay their bills on time could be expected to mitigate some amount of the uncollectible expense. The Company is proposing to recover on the bill discount program, while also receiving an uncollectible rate based on economic conditions, customer protections, and arrearage balance inputs, without discussing how this program may impact its overall uncollectible expense. Therefore, Staff finds the lack of discussion surrounding its impact on uncollectible expenses concerning. Staff requests further information from the Company in its Reply Testimony on its decision to not adjust the uncollectible expense based on increased participation and funding for the Bill Discount Program.

Q. Please summarize Staff's analysis of the overall methodology NW Natural uses to forecast the uncollectible rate.

A. Staff finds that the methodology put forth by the Company to forecast the uncollectible rate using distinct itemized adjustments is not sufficiently robust to justify deviating from the Commission's historic precedent of a three-year

average. Historically, the three-year average has tracked the overall trend of the uncollectible rate while smoothing out year-over-year variances. Figure 4 shows the Company's actual uncollectible rate plotted against the average uncollectible rate of the three preceding years.[25]

FIGURE 4. NW NATURAL UNCOLLECTIBLE RATE VS. 3-YEAR AVERAGE



Q. What is Staff's proposed adjustment for the uncollectible rate and uncollectible expense for the Test Year?

A. Staff proposes using the three-year average of the uncollectible rate between 2021 and 2023. NW Natural provided this average, an uncollectible rate of 0.182 percent, in the Company's testimony, as opposed to the .491 percent proposed.[26] Staff proposes applying this rate to the final agreed upon general revenues to calculate the appropriate level of uncollectible expense to be

[25] Staff/1203, Staff Workpaper, Uncollectible Rate.
[26] NW Natural/1300, Wilson-Sparley/18.

included in the Test Year. At this time, based on the Company's proposed general revenues in its Exhibit 201, Staff proposes a decrease of approximately $2.6 million to the Company's Test Year expense to account for a reduction to the amount forecasted by NW Natural for uncollectible accounts.

Docket No: UG 490

Staff/1200
Lockwood/21

ISSUE 2. BILL DISCOUNT PROGRAM

Q. Please provide background information on investor-owned utility bill discount programs in Oregon.

A. On January 1, 2022, House Bill (HB) 2475, The Energy Affordability Act, became effective. The bill expanded language in ORS 757.230 to include additional factors the Commission may consider when establishing rate classifications, such as the "differential energy burdens on low-income customers and other economic, social equality or environmental justice factors that affect affordability for certain classes of utility customers." The Commission's HB 2475 implementation strategy focused first on interim action to provide near-term relief under the new authority, to be followed by a longer-term investigation into differential rates and programs. Since HB 2475 became effective, Staff has been engaged with each of Oregon's six investor-owned utilities to implement interim bill discount programs that address low-income energy burden. The Commission has approved interim bill discount programs for Oregon investor-owned utilities in the following dockets:

- ADV 1365 – Portland General Electric,
- ADV 1412 – PacifiCorp,
- ADV 1390 – Northwest Natural,
- ADV 1409 – Cascade, and
- ADV 1410 – Avista.

Staff has found that reviewing utility proposals as independent advice filings facilitated a more accessible process, allowed more attention to be given to

the elements of the proposal, and provided an open communication venue that facilitated shared agreement and compromise to be reached prior to final approval.

Q. Please summarize the Company's current Residential Bill Discount Program.

A. Designed in 2022, NW Natural's current Residential Bill Discount Program, operational Schedule 330, is an income qualified percentage of bill discount program available to residential customers who were auto enrolled or demonstrate or self-attest that their gross household income, adjusted for household size, is at or below 60 percent of State Median Income (SMI). These customers may access a monthly discount of up to a 40 percent towards applicable charges. The Company currently has a four-tier discount structure with eligibility for each tier determined by household income and size, seen in Figure 6.[27] The four-tier structure was designed through conversations between the Company, Staff, and stakeholders to find a reasonable starting point.

Q. Please summarize the current participation in the Company's Bill Discount Program.

A. The program officially launched on November 1, 2022, with over 11,000 customers who had previously received energy assistance within the prior two years being auto-enrolled.[28] Since the launch, the enrollments have increased

[27] NW Natural/200, Tanaka/23.
[28] NW Natural/200, Tanaka/16.

to 37,222, representing 5.84 percent of all the Company's residential customers.[29] The estimated cost of the program in 2024 was approximately $8 million, with the largest portions of funding being spent on Tier 0 and Tier 3.[30]

FIGURE 5. NW NATURAL'S 2024 BILL DISCOUNT PROGRAM COSTS

Discount Tiers	Total Cost for 2024 ($)
Tier 0 (40%)	2,074,988
Tier 1 (25%)	1,863,105
Tier 2 (20%)	1,636,610
Tier 3 (15%)	2,356,280
Total:	7,930,984

Q. Please summarize the Company's proposed changes to the Bill Discount Program.

A. Conversations in Docket No. ADV 1390 and guidance from NW Natural's Low-Income Needs Assessment (LINA), has led the Company to propose two major changes to the program.

First, the Company is proposing to target the participant's bill after discount to be a percentage of the customer's income at or near three percent.[31] NW Natural states that a common indicator of energy burden is understood to be when a customer's energy bill is six percent of the customer's income. Therefore, the Company hopes to target three percent after discount

29 Id.
30 Staff/1204, NW Natural's Response to DR 318.
31 NW Natural/200, Tanaka/21.

to minimize energy burden. To calculate necessary levels of discounts, the Company has utilized the mid-point of the income range to determine the bill discount percentage instead of the max of the income range. The Company states that by "[u]sing the mid-point of the income range to determine the bill discount percentage for each tier provides better coverage of reduced energy burden throughout the tier."[32]

Second, the Company proposes to change the Tier 1 discount from 25 percent to 40 percent, and the Tier 0 discount from 40 percent to 80 percent. With the target of three percent energy burden related to natural gas service for customers, the Company chose to update the respective Tier discounts given the proposed rates in this docket and utilizing mid-points of income ranges instead of the max of each income range. The Company does not propose changes to Tier 2 and 3 discounts, which, based on the Company's methodology, were said to achieve the target three percent energy burden or less at their current levels.[33]

FIGURE 6. NW NATURAL'S CURRENT BILL DISCOUNT PROGRAM TIERS

	Adjusted Household Income	**Current** Discount Towards Eligible Charges	**Proposed** Discount Towards Eligible Charges
Tier 0	Up to 15% SMI	40%	80%
Tier 1	>15% up to 30% SMI	25%	40%
Tier 2	>30% up to 45% SMI	20%	20%
Tier 3	>45% up to 60% SMI	15%	15%

[32] NW Natural/200, Tanaka/23.
[33] Id.

Figure 7. Proposed Bill Discount Program Tiers and Example[34]

Bill Discount Program Impacts, Assuming Household of 4:	SMI 60% Tier 3 - 15%	SMI 45% Tier 2 - 20%	SMI 30% Tier 1 - 40%	SMI 15% Tier 0 - 80%
Income mid-point of tier	$56,246	$40,176	$24,106	$8,035
Average annual bill	$1,124.87	$1,124.87	$1,124.87	$1,124.87
Bill as % income before discount	2.0%	2.8%	4.7%	14.0%
Bill discount	$168.73	$224.97	$449.95	$899.90
Bill after discount	$956.14	$899.90	$674.92	$224.97
Bill as % income after discount	1.7%	2.2%	2.8%	2.8%

Note that this table reflects the rates for Residential Schedule 2 proposed in this case and income eligibility tables for 2023-2024.

Q. Does Staff agree with the proposed change utilizing the mid-point of the income range?

A. Not entirely. Staff appreciates the Company's effort to provide an energy burden targeted design as recommended in the UM 2211 process,[35] however, Staff is concerned that the mid-point of any income bracket does not necessarily correspond to the actual income distribution of enrollments within the Tier. For example, if enrolled customers incomes within a tier have a median below the mid-point of the income bracket, then the mid-point methodology underestimates the level of discount needed to achieve the three percent or below energy burden target.

Second, Staff is interested in providing a higher discount to the Tier 0 customers based on preliminary energy burden data Staff has seen from the

[34] NW Natural/200, Tanaka/24 (NW Natural's calculations).
[35] *In the Matter of PUBLIC UTILITY COMMISSION OF OREGON, Implementation of House Bill 2475*.

Company and peer utilities. However, rather than accept the mid-point methodology as sound, Staff would prefer to pursue the higher discount as an incremental step that may be refined and adjusted based on additional energy burden assessment information and stakeholder engagement.

Q. Does Staff agree with the proposed changes of the Tier 0 and Tier 1 discounts?

A. Not yet. While Staff appreciates the Company's efforts to move toward a more meaningful discount that endeavors to be informed by a target energy reduction methodology, Staff has two major concerns regarding the proposed change.

First, based on testimony, discussion with the Company, and DR responses received in this docket, Staff remains uncertain with the cost projections of the proposed changes and is specifically concerned with the potential increase in costs due to the increase discounts offered in Tier 0 and Tier 1. NW Natural has currently not completed any cost analysis on the implications of the redesign. Staff recognizes that cost recovery for the Bill Discount Program is not housed within the Company's revenue requirement in this docket and instead is funded through a deferral with a balancing account and an entirely separate amortization filed annually. However, Staff is uncomfortable moving forward with such large changes to the Bill Discount Program without a deeper understanding of the cost impacts of the changes.

Second, Staff's concern with the potential cost increases is exacerbated by what Staff identifies as a pressing need to review the Company's

Schedule 335 cost recovery structure from fixed non-residential charges to a volumetric charge. Staff has and will continue to pursue bill discount cost recovery discussions where we are working to ensure a more equitable distribution of cost recovery that minimizes the cost shifting effects of funding caps when programs grow.

In other words, Staff is not comfortable with moving forward with the changes to the bill discount program without better understanding the cost projections and recovery.

Q. Based on the concerns mentioned above, what does Staff request the Company do?

A. Staff requests that NW Natural perform cost projection analysis with the updated bill discount tiers and propose a change to the Company Schedule 335's cost-recovery in conjunction with this docket that is associated with the higher costs and a more equitable rate spread. Alternatively, Staff recommends the Company withdraw its proposed changes to the Bill Discount Program so that they may be addressed, in conjunction with cost recovery in a separate docket.

Q. Based on the discussion above, what is Staff's current recommendation?

A. Staff currently recommends that the Commission does not accept the proposed program changes until the Company provides further information regarding cost projections and additional information to informing the bill discount structure and cost recovery proposals moving forward. Staff welcomes and

encourages the Company to provide additional information in its Reply Testimony. Staff is particularly interested in cost estimates and the Company providing a proposal which updates the cost recovery structure to ensure equitable distribution of costs if and when the project continues to grow.

Staff wants to reiterate its appreciation for the Company's efforts to engage with stakeholders and propose changes to the Bill Discount Program based on its findings in Docket No. ADV 1390 and the LINA. Staff is however unable to recommend approval of the proposed changes to the Bill Discount Program.

Docket No: UG 490

Staff/1200
Lockwood/29

SUMMARY. STAFF RECOMMENDATIONS

Q. Please summarize your adjustments.

A. Staff proposes using the three-year average of the uncollectible rate between 2021 and 2023. NW Natural provided this average, an uncollectible rate of 0.182 percent, in the Company's testimony. Staff proposes applying this rate to the final agreed upon general revenues to calculate the appropriate amount for uncollectible accounts to be included in the Test Year. At this time, based on the Company's proposed general revenues in its Exhibit 201, Staff proposes a decrease to the Company's Test Year expense of approximately $2.8 million to eliminate some of the amount the Company forecasted for uncollectible accounts.

Staff recommends that the Commission does not accept the proposed Bill Discount program changes until the Company provides further information regarding cost projections and additional data informing the bill discount structure and cost recovery proposals moving forward. Staff welcomes and encourages the Company to provide additional information in its Reply Testimony.

Q. Does this conclude your testimony?

A. Yes.

Rates & Regulatory Affairs
UG 490
Request for a General Rate Revision
Data Request Response

Request No.: UG 490 OPUC DR 318

As it pertains to the Company's proposed bill discount program:

a. Please provide the number of residential customers in the Company's service territory on a monthly basis for 2022-2024.

b. How many customers does NW Natural estimate are able to qualify for each of the programs listed by the Company including OLGA, OLIEE, GAP, and LIHEAP? Please provide a breakdown by discount tier.

c. How many of IPCO's residential customers are currently receiving one of the programs? Additionally, how many customers are receiving two or more of the programs? Which are the most common programs to be combined?

d. Provide an estimate of the number of customers IPCO believes will be enrolled into the Bill Discount Program by the end of the calendar years 2024, 2025 and 2026, by discount tier. Please summarize the methodology used to arrive at these figures.

e. Provide a forecast of the total cost associated with the Bill Discount Program for the calendar years 2024, 2025, and 2026. Please provide a breakdown of cost categories. Please summarize the methodology used to arrive at these figures.

f. Please describe how the Company plans to monitor the kWh usage of Bill Discount Program participants for outliers. If there are no plans to monitor, please explain why.

g. Please provide the monthly average kwh usage for all residential customers for 2022-2024. Please provide a breakdown of average monthly kwh usage for LIHEAP customers for the same time period. Please provide a breakdown by dwelling type.

Response:

a. Oregon residential customer counts are as follows:

Count - 01/2022	629,034

Count - 02/2022	628,983
Count - 03/2022	629,689
Count - 04/2022	630,044
Count - 05/2022	630,161
Count - 06/2022	630,145
Count - 07/2022	629,809
Count - 08/2022	630,381
Count - 09/2022	630,787
Count - 10/2022	631,600
Count - 11/2022	632,897
Count - 12/2022	634,325
Count - 01/2023	635,376
Count - 02/2023	635,303
Count - 03/2023	635,926
Count - 04/2023	635,723
Count - 05/2023	635,653
Count - 06/2023	635,205
Count - 07/2023	634,459
Count - 08/2023	634,194
Count - 09/2023	634,533
Count - 10/2023	635,181
Count - 11/2023	636,072
Count - 12/2023	637,667

b. Please see responses to UG 490 OPUC DR 303a and b.

c. The Company interprets “IPCO” in the question as intended to read “NW Natural.” Please see UG 490 OPUC DR 318 Attachment 1. Based on the data in Attachment 1, it appears that the combination of OLGA and GAP is the most common.

d. The Company interprets “IPCO” in the question as intended to read “NW Natural.” Please see response to UG 490 OPUC DR 303b. Enrollee counts were not estimated by tier.

e. Please see response to UG 490 OPUC DR 303b. The estimated cost of the discounts for the residential bill discount program for 2024 as filed and approved in ADV 1562 was $10,718,994 excluding revenue-sensitive costs. This was comprised of an under-collected balance of $2,248,009.69 from 2023 and a forecast for 2024 of $7,930,984.25. The breakdown of the 2024 forecast by tier is as follows:

	Total cost for 2024 update
Disc tiers	
Level - 40%	2,074,988
Level - 25%	1,863,105
Level - 20%	1,636,610
Level - 15%	2,356,280
	7,930,984

f. The Company interprets "kWh" in the question as intended to read "therm." NW Natural does not currently monitor the therm usage of its residential bill discount program participants. During the Staff and stakeholder process of the Company's program in ADV 1390 during the spring and summer of 2022, stakeholders expressed concern about monitoring participants for increased usage, given the belief that an increase in usage may likely occur because participants could better afford to use more energy (e.g. customers would adjust their thermostats to a more comfortable level instead of at a colder level before the bill discount program). In addition, there may be many various reasons why some customers use more or less than others.

g. The Company interprets "kWh" in the question as intended to read "therm." Please see UG 490 OPUC DR 318 Attachment 2.

CASE: UG 490
WITNESS: MITCHELL MOORE

PUBLIC UTILITY COMMISSION
OF
OREGON

STAFF EXHIBIT 1300

Opening Testimony

April 18, 2024

Docket No: UG 490

Staff/1300
Moore/1

Q. Please state your name, occupation, and business address.

A. My name is Mitchell Moore. I am a Senior Utility Analyst employed in the Rates, Safety and Utility Performance Program of the Public Utility Commission of Oregon (OPUC). My business address is 201 High Street SE., Suite 100, Salem, Oregon 97301.

Q. Please describe your educational background and work experience.

A. My witness qualifications statement is found in Exhibit Staff/1301.

Q. What is the purpose of your testimony?

A. The purpose of my testimony is to address Northwest Natural's revenue requirements for the following issues: Distribution Operations and Maintenance (O&M) expense; Materials and Supplies; Customer Accounts; Affiliated Interest; and Atmospheric Testing.

Q. Did you prepare any exhibits for this docket?

A. Yes. I prepared Exhibit Staff/1302, consisting of 3 pages, and Confidential Exhibit Staff/1303, consisting of 6 pages.

Q. How is your testimony organized?

A. My testimony is organized as follows:

Issue 1. Distribution O&M Expense....2
Issue 2. Materials and Supplies....6
Issue 3. Customer Accounts....8
Issue 4. Affiliated Interest....12
Issue 5. Atmospheric Testing....14

Docket No: UG 490

Staff/1300
Moore/2

ISSUE 1. DISTRIBUTION O&M EXPENSE

Q. Please describe O&M expense.

A. Distribution O&M refers to those expenses and activities recorded in FERC Accounts 870–894, and include operation, supervision and engineering, distribution load dispatching, compressor station and regulator station expenses, and customer installation expenses.

Q. What is the Company's proposal for distribution O&M expenses in this case?

A. Northwest Natural is proposing to include approximately $73.6 million in distribution O&M expense (FERC Accounts 870–894) in its Test Year expense. This represents an increase of 21 percent over the $60.8 million in the Base Year.[1] The majority of this—approximately $50.77 million—is labor expense. For non-labor expense, the Company proposes an increase in distribution O&M expense from $17.9 million in the Base Year to $22.8 million in the Test Year.[2] This represents an increase of $4.88 million, or more than 27.2 percent over the 2023 Base Year.

My testimony only addresses non-labor expense. Please see Staff Witness Stephanie Yamada's testimony in Staff 2000 addressing the labor portion of distribution O&M.

Q. How does NW Natural explain the increase in non-labor distribution O&M expense?

---

1 See NW Natural/1401-1402, Davilla/1.
2 See Exhibit Staff/1302, Moore/1-2, Company response to Staff DR No. 58.

A. In its opening testimony, the Company points to two specific drivers for increased costs: Contracted locating services expense is projected to increase by $2.9 million and contracted survey services expense is projected to increase by $0.92 million in the Test Year.[3] The Company states that it entered a new agreement with its contract locating company, Health Consultants, which calls for a three percent annual increase in rates. In addition, the Company explains that the number of customers calling to request locating services is projected to increase 1.5 percent annually. The Company also amended its contract with Health Consultants for survey and inspection services, with a rate that is also expected to increase by three percent annually.

Additionally, the Company escalates its general non-labor expense using the West Region Urban CPI.

Q. Please describe your review and analysis of NW Natural's distribution O&M expense.

A. Staff first reviewed the distribution O&M expenses for the historical calendar years of 2021, 2022, and 2023. This review included looking at trends, transactional details, and adjustments proposed by NW Natural.

Staff initially looked at the annual increase in non-labor distribution O&M expenses for the past three years to determine whether the proposed increase in the Test Year is consistent with historical expenses. Staff also reviewed transaction details from the Base Year expense (2023) to ensure expenditures are justifiable for normal utility operations.

[3] See NW Natural/1400, Davilla/11-12.

Staff also reviewed the Company's responses to Staff Data Requests that focused on investigating the Company's new locating and surveying contracts with Health Services.

Q. What does Staff conclude from its review?

A. A trend analysis suggests that the proposed Test Year expenses are out of line with expense trends over previous years. Non-labor Distribution O&M expense has seen significant increases since 2021—a 10.5 percent increase in 2022, and a 14.8 percent increase in 2023 over previous years. The increase in the Test Year expense over CPI inflation is almost entirely a result of the increase in NW Natural's contract locating and survey rates. With the new contract, the cost per locating unit increased 58.4 percent from the Base Year to the Test Year over the previous contract rate. The after-hours locate rate has increased 81.3 percent over the previous contract rate.

Q. Why have NW Natural's locate and survey costs increased so much?

A. NW Natural has used Health Consultants for survey services since at least 2021. NW Natural amended a previous contract for survey services with Health Consultants, and the amended rates for survey services were about 18 to 35 percent higher than the previous contract. As noted above, these rates increased an additional three percent with the most newly executed contract.

The locating contract for most of the Base Year, and several years prior, was with Locating Inc. NW Natural signed a new contract transferring its locating services to Health Consultants effective September 1, 2023.[4]

[4] See Confidential Exhibit NW Natural/1406, Davilla/3.

Q. Did NW Natural conduct a competitive bid process for the survey and locating contracts?

A. Yes. NW Natural conducted a request for procurement (RFP) in late 2022 that sought bids for a single contractor to provide all survey and locating services. In response to a Staff Data Request, NW Natural represents that Health Consultants was selected as the vendor and had the "lowest scaled pricing" and provided excellent quality service…and was the "clear overall winner" for the awarded contract.

Q. Does Staff recommend an adjustment for non-labor distribution O&M?

A. Yes. At this time, Staff does not believe the Company has substantiated the reasonableness of the extreme increase in the cost of survey and locate rates. Therefore, Staff recommends an adjustment that reflects the three-year historical average of non-labor O&M costs, escalated for inflation at inflation rates recommended by Staff in Staff/800, which results in an adjustment of ($6.2 million) to non-labor O&M expense.

Docket No: UG 490

Staff/1300
Moore/6

ISSUE 2. NON-FUEL MATERIALS AND SUPPLIES

Q. Please summarize NW Natural's proposal for non-fuel materials and supplies.

A. Northwest Natural proposes an average Test Year balance for materials and supplies in rate base of $25,496,000 at a system level. The Oregon-allocated forecast Test Year rate base amount is $21,810,000.[5] This represents a 13.64 percent increase over the 2023 Base Year.

Q. Please summarize the Commission's historical treatment of non-fuel materials and supplies in rate base.

A. The Commission typically authorizes utilities to include an allowance for non-fuel materials and supplies in rate base.

Q. Please describe Staff's analysis of this issue.

A. Staff reviewed historical balances for the years 2021–2023 and compared the average of monthly average balances for each year with the year-end forecast for 2024. Staff believes that using an average of monthly averages balance for rate-based items provides an accurate picture of yearly rate-based components that earn a rate of return.

Using an average of monthly average balances for 2021, 2022, and 2023, escalated for inflation of 2.7 percent in 2024 and 2.0 for 2025 results in a forecast Test Year balance of $17,783,000.[6]

Q. Does Staff propose an adjustment?

---

5 See Staff/1302, Moore/3, Company response to Staff DR No. 84.
6 See Staff/1304, Moore/Workpaper.

A. Yes. Staff believes NW Natural has overestimated the non-fuel material and supplies by $4 million), and therefore recommends a downward adjustment to rate base by this amount.

Docket No: UG 490

Staff/1300
Moore/8

ISSUE 3. CUSTOMER ACCOUNTS

Q. Please describe Non-labor Customer Accounts expense.

A. Non-labor Customer Accounts expense addressed in my testimony is recorded in FERC Account Nos. 901–903.[7] This includes expense for activities such as supervision, meter reading, and customer records and collection expense.

Q. Please describe NW Natural's proposal regarding non-labor Customer Accounts expense.

A. NW Natural proposes a Test Year forecast of $12.26 million at a system level, and $10.8 million for Oregon-allocated expense. This represents a 20.5 percent increase over the Oregon-allocated Base Year expense of $8.95 million. The majority of the expense, and the increase, is in FERC Account No. 903 – Customer Records and Collection expense.

Q. What reasons does the Company provide to explain the increase?

A. NW Natural explains in its opening testimony it expected an increase in expense due to an expected amendment to its contract with Paymentus, which provides electronic bill payment services. This amendment was in fact executed in late December 2023. NW Natural explains that an increase in costs charged by Paymentus, combined with an increase in the number of customers that prefer to pay their bill by bankcard or other electronic methods, results in a total Oregon-allocated expense increase in the Test Year of $1.29 million over the 2023 Base Year.[8]

---

[7] Staff Witness Charles Lockwood addresses FERC Account No. 904 – Uncollectible Accounts in Staff/1200.

[8] See NW Natural/1400, Davilla/11.

Q. How does Staff view NW Natural's explanation for the increase?

A. Staff is concerned about the escalating cost of offering customers fee-free electronic payment options. The projected increase from the Base year to the Test Year is 42.8 percent from the Base Year to the Test Year; from $3,846,000 in 2023 to $5,490,211 in 2025.[9] In response to a Staff data request, the Company provided the amendment to the Paymentus contract that was made effective in December of 2023.[10] In comparing the fees in the amended contract with the fees outlined in the pre-existing contract, Staff finds **[BEGIN CONFIDENTIAL]** [redacted] **[END CONFIDENTIAL]**.

[9] See Exhibit Staff/1302, Moore/4-5 – Company response to Staff Data Request No. 404.
[10] See Confidential Exhibit Staff/1303, Moore/1-6 – Confidential response to Staff Data Request No. 404 attachment 1.

In previous cases, Staff has recognized that it is reasonable to make payment options available to customers to ensure customers have convenient methods to pay their bills. Further, given the importance of accessibility to payment options, Staff has supported spreading the costs of these payment options to all customers rather than requiring that the individual customers that use these options pay for them at the time of use. However, this does not mean it is reasonable to spread costs of even the most expensive methods of payment to all customers.

Staff's view is that the Company has a responsibility to communicate to its customers the costs of the various methods of payment, and if customers choose options that are less reasonably priced, the costs should not be spread to other customers. By having all customers absorb the costs of payment processing, without any transparency to what those costs are, and without absorbing—or avoiding—those costs individually, customers are left without any means to mitigate the impact of increasing costs.

Q. How does Staff forecast NW Natural's Test Year expense?

A. In this case, Staff believes it is reasonable to use a three-year historical average and then escalate the average with the expected CPI inflation index to arrive at a forecast Test Year. For customer accounts, the Test Year forecast should be $8.7 million. This forecast methodology accounts for an increase in payment processing costs and incentivizes the Company to encourage lower-cost payment options, while still allowing for more expensive options such as Amazon Pay, PayPal, and Venmo to be available to customers. Staff

is not convinced that the more expensive options are a necessary benefit to customers, but are more geared toward Company image enhancement, which benefits shareholders.

Q. Does Staff recommend an adjustment?

A. Yes. Staff recommends the Company's Test Year forecast expense for Customer Accounts be adjusted by ($2.1 million).

Docket No: UG 490

Staff/1300
Moore/12

ISSUE 4. AFFILIATED INTEREST

Q. Please explain the Commission's historical treatment of cost allocation among affiliates.

A. The Commission's historical treatment of cost allocation among affiliates is pursuant to OAR 860-027-0048 (Allocation of Costs by an Energy Utility), which addresses the allocation of costs between an energy utility and its affiliates, outlining how transactions should be recorded. OAR 860-027-0048 also states that an energy utility must keep a current Cost Allocation Manual (CAM), with detailed methodology on how costs are allocated between affiliates on file with the Commission. The rule also requires that the Allocation Manual shall be "filed yearly as an appendix to the Affiliated Interest Report required under OAR 860-027-0100."

Q. How does NWN generally allocate costs among its affiliates?

A. According to NWN's CAM, "the approach to allocating costs is to directly assign costs when applicable and to allocate costs based on the primary cost driver of the common cost, or relevant proxy, and to ensure that unauthorized subsidization of unregulated activities by regulated activities, and vice versa, does not occur." The CAM also states that "goods or services provided by the utility to an affiliate are provided at the higher of cost or market price," which is in accordance with OAR 860-027-0048. Typical affiliated transactions that occur between NWN and its affiliates include:

- Direct charges of NWN's payroll and administrative expense for affiliate use of NWN's staff;

- Payments between NWN and affiliates for tax expense or benefits;
- Annual allocation of indirect charges per the CAM;
- Direct charges for office space used by NWN's non-regulated affiliates;
- Vendor payments made by NWN on behalf of affiliates; and
- Equity distributions/contributions and dividends between NWN and affiliates.

Q. Please summarize Staff's review of the Company's Affiliate Interest transactions.

A. Staff requested transactional level detail to review cost allocation between the Company and its affiliates and non-regulated entities. Staff reviewed the Company's 2020 affiliated interest report, 43 including its MSA and CAM as well as transactions between NWN and its affiliates. NWN did not propose any changes to its CAM in this filing. Staff's review focused on ensuring allocation factors are calculated and applied correctly and in adherence with cost allocation principles outlined in NARUC's cost allocation manual and referenced above.

Q. Does Staff propose an adjustment related to this issue?

A. No. Staff proposes no adjustment related to this issue.

Docket No: UG 490

Staff/1300
Moore/14

ISSUE 5. ATMOSPHERIC TESTING

Q. Please describe NW Natural's atmospheric testing program.

A. Atmospheric Testing expenses include the cost of compliance with a federal safety mandate to inspect all portions of natural gas pipelines in contact with air for signs of corrosion. The Company uses a third-party vendor to conduct atmospheric surveys related to leakage and corrosion, and each section of pipe is inspected every three years in compliance with federal regulations.

Q. Please summarize the Company's proposal regarding atmospheric testing.

A. NW Natural proposes to include $2.4 million in Oregon-allocated atmospheric testing activities for the Test Year in FERC Account Nos. 856 (Mains Expense), 874 (Mains and Service Expense), and 892 (Maintenance of Service). This represents a decrease of $2.6 million from the Base Year, in which $4.66 million was spent.

Q. Please describe Staff's review of this issue.

A. Staff reviews the proposed forecast expense for reasonableness, and to assure compliance with federal regulations. Staff issued several data requests to determine the historical spending in this area, as well as compared the Company's historical expense in prior rate cases. The Company's spending varies from year to year, depending on the inspection cycle. The Company's forecast Test Year expense is the lowest it has been since 2019. The Company also represents that it is not proposing any new or different treatment from current or past practice.

Q. What does Staff conclude from its review?

A. Staff concludes the Company's projection is reasonable, and therefore Staff has no adjustment to recommend on this issue.

Q. Does this conclude your testimony?

A. Yes.

Moore/1

WITNESS QUALIFICATIONS STATEMENT

NAME: Mitchell Moore

EMPLOYER: Public Utility Commission of Oregon

TITLE: Senior Utility Analyst
Energy Rates, Finance and Audit Division

ADDRESS: 201 High Street SE. Suite 100
Salem Oregon 97301-3612

EDUCATION: Bachelor of Arts, Journalism and Political Science
University of Hawaii at Manoa (1992)

EXPERIENCE: I have been employed by the Public Utility Commission of Oregon since 2009, with my current position being a Senior Utility Analyst in the utility program's Energy Rates, Finance and Audit division. I have provided expert witness testimony on a number of general rate case dockets, including: UE 294, UE 319, UE 335, UG 288, UG 305, UG 325, UG 344, UG 347, UG 366, and UG 388.

My prior position at the Commission was as a Senior Telecommunications Analyst, where my assignments included reviewing carrier interconnection agreements, wholesale service quality, and resolution of carrier-to-carrier complaints.

Prior to my utility regulatory career, I worked with AT&T as a loop electronics coordinator, designing and implementing high-speed broadband and fiber optic services in Los Angeles. I have also worked as an outside plant design engineer with Qwest Corporation, and I spent several years as a newspaper reporter with the Honolulu Star-Bulletin.

NW Natural®

Rates & Regulatory Affairs
UG 490
Request for a General Rate Revision
Data Request Response

Request No.: UG 490 OPUC DR 404

Referencing NW Natural/1400, Davilla/pg. 11, Contracted Customer Payment Processing Fees (FERC 903), and NW Natural/1405, Davilla/pgs 1-14:

a. When does the current contract expire?

b. What is the Oregon-allocated total actual expense for this contract for the years 2020-2023?

c. What is the Oregon-allocated total forecast expense for this contract for 2024?

d. What is the Oregon-allocated Test Year forecast for this expense?

e. Please explain and demonstrate the basis for the Oregon-allocated forecast increase to this contract in the Test Year.

f. When (month/year) does the Company expect to have an amended contract in place?

g. What efforts has the Company made to ensure that costs for bankcard services are competitive? Please describe and demonstrate.

Response:

A. The testimony states that the Company "expects to sign a contract amendment and extension in the near term." NW Natural/1400, Davilla/Page 11, Lines 11-12. An extended contract was entered into on December 27, 2023, and is provided as Confidential UG 490 OPUC DR 404 Attachment 1. The current contract expires May 4, 2027.

B. The Oregon-allocated total actual expense for this contract for the years 2020-2023 are as follows:

Period	System Wide	Oregon Allocation
2020 Oct to Dec	$633,000	$557,000
2021	$3,460,000	$3,045,000

UG 490 OPUC DR 404
NWN Response Page 2 of 2

2022	$3,930,000	$3,459,000
2023	$4,370,000	$3,846,000

C. The Oregon-allocated total forecast expense for this contract for 2024 is as follows:

Period	System Wide	Oregon Allocation
2024	$5,339,332	$4,699,146

D. The Oregon-allocated Test Year forecast for this expense is $5,490,211 ($6,237,881 System).

E. Please see NW Natural/1400, Davilla/Page 11, Lines 12-16. Primary factors for the Oregon-allocated forecast increase to this contract in the Test Year are:

   a. Customers have expressed a significant preference for bankcard payments.
   b. Migration of customers from 1.) paper payment methods (mailing a check) and 2.) customer specific bank bill pay methods to 3.) autopay methods via ach or bankcard or 4.) one time ach and bankcard payments.
   c. Test Year transactions are expected to grow at a 10 percent compound annual growth rate from the Base Year to the Test Year.

F. Please see the response to subpart A.

G. Before extending the current contract, competitive pricing was received from two other processors that provide bankcard processing services. The pricing of each of those other two processors was greater than our current and selected processor. Vendor A's proposal was approximately 39% more expensive and Vendor B's proposal was approximately 47% more expensive. Please see Confidential UG 490 OPUC DR 404 Attachment 2 for a comparison of those proposals and the Paymentus extended contract.

OPENING TESTIMONY

Depreciation Expense, Amortization Expense, Depreciate Reserve, Amortization Reserve, and Allowance for Funds Used During Construction

April 18, 2024

Docket No: UG 490 Staff/1400
Peng/1

Q. Please state your name, occupation, and business address.

A. My name is Ming Peng. I am a Senior Economist employed in the Rates, Safety and Utility Performance Program of the Public Utility Commission of Oregon (OPUC). My business address is 201 High Street SE, Suite 100, Salem, Oregon 97301.

Q. Please describe your educational background and work experience.

A. My witness qualifications statement is found in Exhibit Staff/1401.

Q. What is the purpose of your testimony?

A. I discuss my analysis of the depreciation expense and accumulated depreciation, or depreciation reserve, and portions of Northwest Natural's (NWN or Company) revenue requirement for this rate case as documented by the Company witnesses, NW Natural/100 Palfreyman-Kravitz, and NW Natural/1600 Spanos. I also discuss my review of the Allowance for Funds Used During Construction (AFUDC) portion of revenue requirement for this rate case.

Q. Did you prepare any exhibits for this docket?

A. Yes. In addition to my witness qualifications statement, I prepared Exhibit Staff/1402, NWN Responses to Staff Data Requests.

Q. How is your testimony organized?

A. My testimony is organized as follows:

Summary of Findings and Recommendations 3
Issue 1. Depreciation Expense 5
Issue 2. Amortization Expense 10
Issue 3. Depreciation Reserve 11
Issue 4. Amortization Reserve 12

Docket No: UG 490

Staff/1400
Peng/2

Issue 5. Allowance for Funds Used During Construction (AFUDC)..... 13

Docket No: UG 490

Staff/1400
Peng/3

SUMMARY OF FINDINGS AND RECOMMENDATIONS

Q. Please summarize your findings and recommendations.

A. Please note that I may revise my recommendations based on testimony filed by other participants in this rate case.

1. Depreciation Expenses: I do not yet have a recommendation regarding depreciation expenses because I am waiting for the Oregon PUC to authorize depreciation rates before deciding if the adjustment is needed. In the UG 490 general rate case, NWN used the updated depreciation rates proposed in a new depreciation study the company filed with the Commission in January 2024, docketed as UM 2312. The procedural schedule UM 2312 includes settlement conferences in June 2024 and in the event settlement is not reached, a hearing in July 2024, so a Commission decision on depreciation rates should be issued no later than October 2024. I am currently reviewing the UM 2312 depreciation study. Once the depreciation case is settled and the Commission issues an order to authorize the updated depreciation rates, then Staff can calculate depreciation expenses for the UG 490 revenue requirement.
2. Amortization Expenses: I do not yet have a proposed adjustment because I need to wait to see if NWN's amortization expense calculation complies with Commission-authorized rates in UM 2312. In this depreciation schedule, an amortization expense is the expense for the intangible plants, which include software, cloud-based

software, and the customer information system.

3. Depreciation Reserve (Accumulated depreciation reserve): Staff has proposed no adjustment to depreciation reserves in UG 490, because the depreciation rates are still under review, and if depreciation expense is changed, the depreciation reserve will be changed accordingly.

4. Amortization Reserve (Accumulated amortization reserve): Staff has proposed no adjustment to depreciation reserves in UG 490, because the depreciation/amortization rates are under review, and if amortization expense is changed, the amortization reserve will be changed accordingly.

5. I made an adjustment to the Company's proposed AFUDC by pulling out of rate base the portion of AFUDC that exceeds the authorized rate is of 0.63 and putting it into "Excess AFUDC Regulatory Liability" on the utility's balance sheet. The Company may seek to recover the excess AFUDC through rate adjustments, subject to regulatory approval.

Docket No: UG 490

Staff/1400
Peng/5

ISSUE 1. DEPRECIATION EXPENSE

Q. What is depreciation?

A. "Depreciation" is defined by the National Association of Regulatory Utility Commissioners (NARUC) in relevant part as follows:

> As applied to the depreciable plant of utilities, the term depreciation means the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of utility plant in the course of service from causes that are known to be in current operation, against which the company is not protected by insurance, and the effect of which can be forecast with reasonable accuracy. Among the causes to be considered are wear and tear, decay, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand, and the requirement of public authorities.[1]

Q. Why is depreciation important in a revenue requirement?

A. NARUC states that:

> Depreciation has a profound effect on the revenue requirement of a utility, and for many utilities, depreciation expense represents a large percentage of total operating expenses. In addition, deferred income taxes, rate base, and cost of capital are all affected by the depreciation practices of a utility.[2]

1. From a valuation perspective, depreciation is the loss in service value not restored by current maintenance.

2. From an accounting perspective, depreciation is the allocation of the cost of fixed assets less net salvage to accounting periods, which is a capital recovery concept.

---

1 NARUC, Public Utility Depreciation Practices, p.318 (1996).
2 NARUC, Public Utility Depreciation Practices, p.195 (1996).

3. From a ratemaking perspective, both the valuation (rate base) and accounting (capital recovery) concepts of deprecation are important.

Q. Do Oregon statutes address utility depreciation rates?

A. Yes. ORS 757.140(1) states:

> Every public utility shall carry a proper and adequate depreciation account. the public utility commission shall ascertain and determine the proper and adequate rates of depreciation of the several classes of property of each public utility. the rates shall be such as will provide the amounts required over and above the expenses of maintenance, to keep such property in a state of efficiency corresponding to the progress of the industry. Each public utility shall conform its depreciation accounts to the rates so ascertained and determined by the commission. The commission may make changes in such rates of depreciation from time to time as the commission may find to be necessary.

Q. How are utility property depreciation rates determined?

A. To develop depreciation rates, it is necessary to estimate: (1) the combination of survivor curve[3]-service life (Curve-Life) of utility property, and (2) the net salvage[4] (Gross Salvage – Cost of Removal) ratio. Based on these two fundamental depreciation parameters (and other required elements, such as asset value, asset remaining life, and depreciation method) the depreciation rates are derived.

Q. What is the Commission's historical treatment of a depreciation calculation in a revenue requirement?

---

[3] "Survivor curves" are curves that show the number of units or cost of a given group that is surviving in service at given ages. The survivor curves were developed by the Engineering Research Institute of Iowa State University. These curves are frequently referred to as "Iowa Curves."

[4] Net Salvage. The gross salvage of the property retired less the cost of removal. This will be negative if the cost of removal exceeds the gross salvage.

A. A utility should use the Commission-authorized depreciation parameters and rates to calculate the depreciation and amortization expense and reserve. A Company's Depreciation Expense is determined by (OPUC-Authorized Depreciation Rate) x (Oregon net plant in service) x (allocation factor).

Q. Why do we need to use authorized depreciation rate results for the revenue requirement calculation?

A. To compute the revenue requirement (RR), which is measured by cost-of-service, a basic formula is followed:

RR = O&M Expense + "Depreciation" + Taxes + Return% x Rate Base

- Depreciation expense is calculated by (Depreciation rate) x (plant in service) x (allocation factor, if any).
- Depreciation expense represents a large percentage of total operating expenses. The deferred income taxes, rate base, and cost of capital are all affected by the depreciation. Therefore, to calculate depreciation expense and reserve, we must use the Commission-authorized depreciation parameters to reflect the true cost in the revenue requirement.

Q. Has NWN explained the key drivers for the increase in the company's revenue requirement?

A. Yes. In UG 490, NWN explains that the results of the depreciation study are one of the key drivers for the increase requested in the Company's revenue requirement. Applying the depreciation rates from the depreciation study to

Test Year plant balances results in an increase to depreciation expense of $62.4 million, and revenue requirement increase of 16.62 percent.

Q. Are there any important issues that we need to consider in the UG 490 GRC and UM 2312 depreciation filings?

A. Yes. In NW Natural/100 Palfreyman-Kravitz/Page 19-23, the witnesses stated, "In the Company's most recently filed depreciation study (UM 2214), the Commission requested that NW Natural address the issue of accelerated depreciation when it files its next depreciation study."

In Order No. 22-322 (at page 3), the Commission stated the following:

> In adopting this stipulation, we are mindful that prior to the company's next depreciation study, to be filed no later than December 31, 2027, NW Natural, Staff, and stakeholders will be engaged in significant work towards the company reducing emissions in response to the Oregon Department of Environmental Quality's Climate Protection Program or other policy and regulatory directives. We anticipate that parties may seek to evaluate accelerated depreciation or other adjustments to asset depreciation schedules as one tool to mitigate uncertainty about decarbonization pathways and manage potential future risks to customers. We ask that the company include in its next depreciation filing testimony addressing its consideration of this approach.

NW Natural/100 Palfreyman-Kravitz/Page 22 further explained:

> For this reason, the Company has updated its depreciation study, which will require a higher revenue requirement. If we can reset these rates to reflect the actual results of our depreciation study, we can then begin to discuss the justifications for, and impacts of, accelerated depreciation. For example, certain investments in our system are relatively short-lived, especially in the cloud-based IT&S environment. This is part of the changing nature of the utility industry, which is driving more frequent rate cases and higher depreciation expense. On the other hand, service and main lines are longer lived assets, have large plant balances, and any policy driven change to these lives

would cause customers' bills to rise.

However, NWN clarified in testimony that is it not proposing accelerated depreciation in this case:

> Given the near-term rate pressure associated with NW Natural's proposal to increase its depreciation expense to reflect the useful life of its assets, we do not believe that further increases to depreciation expense are appropriate to mitigate the potential future risks of certain decarbonization pathways that the Company may pursue.[5]

Q. What is Staff's understanding of accelerated depreciation on gas pipeline assets for decarbonization in this filing?

A. The accelerated depreciation may provide financial benefits for gas pipeline companies; however, it is not a direct way to reduce CO_2 emissions associated with natural gas transportation and consumption. This is because NWN primarily transports and stores natural gas, so using an accelerated depreciation alone would not directly reduce CO_2 emissions from natural gas combustion. Instead, NWN might focus more on operational strategies and investments to improve efficiency, reduce methane emissions, and mitigate environmental impacts, such as optimizing pipeline operations, investing in leak detection and repair programs, implementing best practices for pipeline maintenance and integrity management, and upgrading infrastructure to minimize fugitive emissions.

Q. What is Staff's recommendation for this depreciation issue?

[5] NW Natural/Palfreyman-Kravitz/22.

A. Currently, the UM 2312 depreciation filing is under review. The depreciation rates in NWN's filing have about 200 FERC accounts, sub-accounts, and locations. Evaluating the depreciation parameters of the Survival Curve-Projection Life and Net Salvage Rate are useful measures of a company's depreciation policy. Therefore, in the depreciation study review, I would maintain my analytical integrity based on scientific evidence to identify the industrial assets survival rate and net salvage rate and determine and propose fair and reasonable rates.

Docket No: UG 490

Staff/1400
Peng/11

ISSUE 2. AMORTIZATION EXPENSE

Q. What is amortization?

A. Amortization is the practice of spreading an intangible asset's cost over that asset's useful life. In contrast, depreciation is the expensing a fixed asset as it is used to reflect its anticipated deterioration. Accounting rules stipulate that physical, tangible assets (with exceptions for non-depreciable assets) are to be depreciated, while intangible assets are amortized.[6]

Q. Have you made an adjustment to Amortization?

A. Not yet. The UM 2312 depreciation study is currently under review. For the same reason, without a Commission-authorized rate, Staff cannot propose an adjustment.

[6] Source: Investopedia, Amortization vs. Depreciation.

Docket No: UG 490

Staff/1400
Peng/12

ISSUE 3. DEPRECIATION RESERVE

Q. What is depreciation reserve?

A. Depreciation Reserve is also called Accumulated Depreciation Reserve. It is the sum of all recorded depreciation on an asset to a specific date.

Q. What is the Commission's historical treatment of depreciation reserve?

A. Accumulated depreciation reserve refers to the life-to-date depreciation that has been recognized that reduces the book value of an asset. The Commission treats this issue by following Generally Accepted Accounting Principles (GAAP) that is as reserve increases, the Rate Base decreases. Please note, rate base is the value of property on which the utility is allowed to earn a specified rate of return, in accordance with rules set by the Commission. In this issue, rate base is the value of property of a utility minus accumulated depreciation of those assets.

Q. Have you adjusted Depreciation Reserve?

A. Not yet. The depreciation reserves are affected by depreciation expenses, asset retirements, sales, transfers, gross salvage, cost of removal, and other adjustments. If depreciation expense is changed, the accumulated depreciation should be changed accordingly. Currently, the depreciation study UM 2312 is under review. If depreciation expense changes, calculated by new depreciation rates after the Commission's authorization, the accumulated depreciation would be changed accordingly.

Docket No: UG 490

Staff/1400
Peng/13

ISSUE 4. AMORTIZATION RESERVE

Q. Describe Amortization Reserve.

A. Amortization Reserve is accumulated amortization at a point in time, which includes the total amount of recorded amortization, retirements, gross salvage, cost of removal, transfer asset, and other adjustments.

Q. What is the Commission's historical treatment of this issue?

A. Amortization Reserve is also called Accumulated Amortization Reserve. In a revenue requirement, as an amortization reserve increases, the Rate Base decreases. Rate Base is the value of property/assets of a utility minus accumulated amortization of those assets.

Q. Have you made any adjustments to Amortization Reserve?

A. Not at this time. The amortization reserves are affected by amortization expenses. If amortization expense is changed, the accumulated amortization should be changed accordingly. I did not make an adjustment to amortization expense. If any adjustments are made by other Staff witnesses, the Company's final amortization reserve would be changed accordingly.

Docket No: UG 490

Staff/1400
Peng/14

ISSUE 5. AFUDC

Q. What is AFUDC?

A. Electric (Gas) Plant Instruction No. 3(17) provides a formula for computing rates used to capitalize Allowances for Funds Used During Construction (AFUDC).[7] The formula includes a component for the weighted average cost of long-term debt. The entire issue of the use-restricted long-term debt should be included with other long-term debt used in calculating AFUDC rates. Average balances of the trust or other special funds should be included in the computation of the average balance of Construction Work in Progress (CWIP) used in the formula.

AFUDC assigned to the project should be determined by applying AFUDC rates to the eligible project expenditures and also balances in the trust or special funds. Fund earnings during construction should be credited to the cost of construction of the project facilities.

Q. What is the purpose of the AFUDC review?

A. The purpose of this review is to address whether the Company complied with guidance[8] related to AFUDC and the capitalization of assets based on the regulations of both the Federal Energy Regulatory Commission (FERC) and the Oregon Public Utility Commission (OPUC) in this filing.

Q. Please provide more details regarding AFUDC.

---

7 https://www.ferc.gov/enforcement-legal/enforcement/accounting-matters/allowance-funds-used-during-construction.

8 FERC 18 C.F.R. Part 101 (17). https://www.law.cornell.edu/cfr/text/18/part-101

A. AFUDC is a non-cash item that is included in the cost of Utility Group utility plant and represents the cost of borrowed and equity funds used to finance construction. AFUDC is the cost of both the debt and equity funds used to finance utility plant additions during the construction period for such additions, determined in accordance with Generally Accepted Accounting Principles (GAAP).

FERC has prescribed two formulas for calculating maximum allowable AFUDC rates:[9]

1. DEBT: This formula determines the maximum rate that can be used to capitalize an allowance for borrowed funds (i.e., debt) used for construction purposes.
2. COMMON EQUITY: This formula determines the maximum rate that can be used to capitalize an allowance for other funds (e.g., common equity) used for construction purposes.

FERC has indicated that if the FERC AFUDC rate is different than the state-approved rate, the AFUDC capitalized should be split between utility plant and a regulatory asset. The amount capitalized in utility plant would be based on the FERC AFUDC rate. The amount included in the regulatory asset would be the difference between the State AFUDC rate and the FERC AFUDC rate.

The FERC formula and elements for the computation of the allowance for funds used during construction are:[10]

[9] FERC 18 C.F.R. Part 101 (17). https://www.law.cornell.edu/cfr/text/18/part-101
[10] FERC 18 C.F.R. Part 101 (17) Allowance for funds used during construction (a), (b): https://www.law.cornell.edu/cfr/text/18/part-101

Ai=s*(S/W)+d*(D/D+P+C)*(1-S/W) = Gross allowance for borrowed funds used during construction rate

Ae=[1-S/W]*[p*(P/D+P+C)+c*(C/D+P+C)] = Allowance for other funds used during construction rate

- S=Average short-term debt
- s=Short-term debt interest rate
- D=Long-term debt
- d=Long-term debt interest rate
- P=Preferred stock
- p=Preferred stock cost rate
- C=Common equity
- c=Common equity cost rate
- W= Average balance in construction work in progress, less asset retirement costs related to plant under construction

Q. What is the Regulatory Treatment for AFUDC in Oregon?

A. OPUC allows utilities to include the capitalized AFUDC as part of the rate base. This allows the utility to recover the cost of financing during construction through rates charged to customers. The AFUDC rate is an important component of a utility's rate base, allowing the utility to recover the cost of financing construction expenditures incurred during the development of long-term projects.

Q. Is the AFUDC rate included in the rate base?

A. Yes. AFUDC Rate (%) represents the cost of capital for the utility, including both debt and equity. Including AFUDC in the rate base helps ensure that the utility is able to earn a fair return on its investments while providing customers with reliable service at reasonable rates. Also, please note, the AFUDC rate is

related to interest costs; it is not a fixed interest rate but rather a rate used to capitalize interest expenses during the construction period of long-term assets.

Q. Did you make any adjustments after your review?

A. Yes. The AFUDC rate cannot exceed the overall rate of return applied to rate base, to ensure Oregon-jurisdictional rates are just and reasonable. I proposed an adjustment to NWN's 2023 AFUDC rate for the following reasons:

NWN calculated total AFUDC rate in 2023 was 7.47 percent, which exceeded OPUC-authorized Weighted Average Cost of Capital (WACC) rate of 6.84 percent.

UG 490	Calculated AFUDC Rate					rate of return
DR 369	AFUDC	AFUDC	AFUDC	Authorized	Authorized	Authorized
Year	Debt	Equity	Total AFUDC	LT Debt	Common Equity	WACC
	Rate	Rate	Rate	Rate	Rate	Rate
2023	3.05%	4.42%	7.47%	4.48%	9.40%	6.84%

In 2023, NWN's total AFUDC rate is higher than the state-authorized rate of return, the portion of AFUDC that exceeds the authorized rate is 0.63 percent (=7.47 percent - 6.84 percent). When the total AFUDC rate is higher than the state-authorized rate of return, the portion of AFUDC that exceeds the authorized rate is typically recorded as a regulatory liability on the utility's balance sheet. Therefore, I recommend:

1. NWN's AFUDC capitalized should be split between Utility Plant and a Regulatory Asset.
2. NWN should record the exceeded portion as a "Excess AFUDC Regulatory Liability" on the utility's balance sheet. This regulatory liability

represents the amount that the utility is not currently authorized to recover from ratepayers but may be eligible for recovery in the future.

3. Check errors in the capital structure calculation. NWN might need to identify if any data or calculation procedure errors occurred. For example, a short-term and long-term debts in capital structure, because Oregon's capital structure does not include a short-term debt. NWN should also check CWIP eligibility to find the impact on capitalized AFUDC, because the material deviations in excess of 25 basis points could result in significant AFUDC errors.

Ultimately, to be recoverable in rates, amounts in NW Natural's Excess AFUDC Regulatory Liability account would be subject to regulatory review, adjustment, and approval in a rate proceeding.

Q. Did you make any additional adjustments to the AFUDC issue?

A. No. NWN complied with the OPUC policy to exclude CWIP in the rate base, because Oregon does not allow a utility to recover costs of a plant not yet placed in service in retail rates. The Company's AFUDC calculations meet FERC calculation procedures and meet Oregon regulatory requirements.

Q. Does this conclude your testimony?

A. Yes.

EMPLOYER: Public Utility Commission of Oregon

TITLE: Senior Economist
Accounting and Finance Section of the Rates, Safety and Utility Performance Program

ADDRESS: 201 High Street SE, Suite 100
Salem, OR 97301

EDUCATION & TRAINING:

M.S. Applied Economics
University of Idaho, Moscow

B.S. Statistics
People's University of China, Beijing

CRRA Certified Rate of Return Analyst in 2002
Society of Utility and Regulatory Financial Analysts

Depreciation studies – the Society of
Depreciation Professionals

NARUC Annual Regulatory Studies Program
Michigan State University, East Lansing

400+ credit hours on 30+ training topics in the public utility industry

EXPERIENCE: 1/11/1999 – Present, Public Utility Commission of Oregon

I have been employed by the Public Utility Commission of Oregon (Commission) for 25 years. My roles have included:

Expert Witness, Case Manager, Principal Analyst, Econometrician, Economist, Utility Analyst, and Policy Analyst.

Docket No. UG 490 Staff/1401
Peng/2

I have testified in various formal state hearings and performed numerous analyses, including economic, financial, statistical, mathematical, marketing, and policy analyses in the public utility industry.

Principal Analyst and Case Manager, Settlement Lead/Negotiator for Depreciation Ratemaking:
I have served as a Principal Analyst and Case Manager for the determination of Energy Property Depreciation Rates (Oregon Revised Statute 757.140) for the past 15 years. In this role, I've had a strong focus on Depreciation Rate Determination (fixed cost allocation, and capital recovery). I was also a Principal Analyst and Case Manager for the determination of Energy Property Depreciation Rates (Oregon Revised Statute 757.140) during this time period.

In this position, I investigated, analyzed, and calculated energy asset retirement cost and impact, as well as power plant decommissioning cost and impact, on customer rates. I reviewed, calculated, and analyzed fixed asset depreciation and proposed depreciation parameters for each of FERC accounts on Generation, Transmission, Distribution, General, and Coal Mining Plants. The energy sources I have worked on Steam/Coal, Hydraulic, Natural Gas, Wind, Solar, and Geothermal.

My analyses of "Power-Plant-Shutdown" activities (accelerated plant retirement, and decommissioning cost recovery) include the following cases:

1. PGE closes Boardman Coal-fired plant (UM 1679 & UE 215).
2. PacifiCorp closes Carbon Coal Plant in Utah (UE 246).
3. Multi-state PacifiCorp Klamath Hydro Dam Removal Cost recovery for (1) J. C. Boyle Dam, (2) Copco 1 Dam, (3) Copco 2 Dam, and (4) Iron Gate Dam removal under ORS 757.734 – Recovery of investment in Klamath River dams in OPUC UE 219.
4. Idaho Power Valmy Coal-fired power plant Shutdown (UE 316).
5. PGE Colstrip Coal-fired power plant Shutdown (UM 1809).

I conduct case investigations and analyses on Utility's filings, make rate adjustments, lead settlement negotiation, prepare testimony, and appear on behalf of the Commission. The energy companies I work with are: (1) PacifiCorp (serves 6 states), (2) PGE, (3) Northwest Natural Gas (NWN), (4) Idaho Power, (5) Avista Corp (Washington), and (6) Cascade Gas (CNG; Montana).

Lead Analyst and Case Manager on Financial Dockets:

Prior to my current position, I was a Lead Analyst and Case Manager for cost of debt capital for nine years. I reviewed market risks, derivatives and hedging, debt issuance, and stock flotation. My analysis directly informed utility and energy policy.

Docket No. UG 490 Staff/1401
Peng/3

I advised the Commission on over 60 financial dockets. The Commission incorporated all of my recommendations into final orders.

I was certified by the Society of Utility and Regulatory Financial Analysts as a Certified Rate of Return Analyst in 2002.

Public Utility & Policy Analyst:

Rulemaking: I have formulated energy regulation rules for utility performance incentives and cost-of-service regulation.

Energy Utility Merger & Acquisition: I have testified in formal state hearings involving utility mergers & acquisitions. I conducted Acquisition Premiums & Credit Risk Analysis and testified on behalf of the Commission in MidAmerican Energy Company's application to purchase PacifiCorp. I also reviewed Scottish Power's earlier purchase of PacifiCorp, and PGE's emergence from Enron after the Enron bankruptcy.

Integrated Resource Planning (IRP, Least Cost Planning): I provided comments to the Commission for decision making on Boardman to Hemingway (B2H), a 500-kV transmission power line, which included a cost and benefit list, a pros and cons list, alternatives, and the relevant legal risks. I also provided comments on utility's IRPs, such as total cost for power generation, power capacity (MW) replacement cost, avoided cost for free fuel, and emission trading cost.

Clean Energy – Dollar Impact on Customer Rates: I analyzed and calculated the rate impact and comparative advantage of clean energy. I built the portfolio optimization models to analyze the coal-fired generating capacity replacement.

General Rate Cases: I have been a part of *almost every energy rate case* since I joined the Oregon PUC on January 11, 1999. Historically, my reviews included fuel price forecasting, property sales, load forecasting, weather normalizations, cost of debt, and capital structures. Currently, my reviews are focused on depreciation and reserve, and AFUDC Capitalization Policy.

Survey Sampling Design: Results of my statistical sampling design and sampling procedures are incorporated into my revenue requirement testimony in Commission Docket No. UM 1288.

Auditing, Interest Rate, Late Payment: I audited cost of capital and financial components. My survey report and analyses are published annually for Oregon (UM 779).

Survey for Market Competition & Economic Policy: I conducted and wrote the report on Telecommunications, "Market Competition and Economic Policy Survey

Analysis" for House Bill 2577. This report has been published on the OPUC web annually for 15 years.

Mentor in the ICER - International Confederation of Energy Regulators: I was selected to act as a mentor in the ICER (International Confederation of Energy Regulators) Women in Energy (ICER WIE) pilot mentoring program. My mentoring topics focus on Incentive Regulation; Rate and Economic Impacts of "Cost-of-Service" regulation in the U.S.; "Price-Cap Performance Based Regulation" in UK; Cost of Capital, Energy Demand and Price Forecasting Modeling; Least Cost Planning; Regulatory Policy; and Renewable Energy issues within regulated rate structures.

Rates & Regulatory Affairs
UG 490
Request for a General Rate Revision
Data Request Response

Request No.: UG 490 OPUC DR 372

In Attachment A, tab name "490 AFUDC Calc", please fill out the columns M, N, O, keep the calculation formulas in Excel, and explain in detail whether the Company's calculations of its AFUDC rates comply with the FERC AFUDC rate formulas and accounting requirements.

The explanation should include the following details:

a. Under FERC AFUDC Accounting, the formulas assume that short-term debt is the first source of construction funding. If the balance of "short-term debt exceeds the average balance of CWIP," the total AFUDC rate is comprised of only an allowance for borrowed funds used during construction equal to the short-term debt rate. Were these the assumptions you based the calculations on?

b. If the average balance of "CWIP exceeds the balance of short-term debt", the calculation assumes that the construction funding was not met by short term debt. How did the Company incorporate the different capital sources and cost rates to arrive at the total debt and other funds maximum allowable AFUDC rates? Please explain.

Response:

Please see the Company's response to UG 490 OPUC DR 369.

a. Yes. If the balance of short-term debt exceeds the average balance of CWIP, the total AFUDC consists only of short-term debt.

b. If the average balance of CWIP exceeds the balance of short-term debt, the Company's calculation assumes that the construction funding was not met by short term debt, and the Company then uses the weighted average cost of capital (WACC) to incorporate the Company's other capital sources to arrive at the total debt and equity rates to use for AFUDC.

Opening Testimony
Medical Benefits and Pensions

April 8, 2024

Docket No: UG 490

Staff/1500
Peterson/1

Q. Please state your name, occupation, and business address.

A. My name is Nicola Peterson. I am a Senior Telecoms Analyst employed in the Rates Division of the Public Utility Commission of Oregon (OPUC). My business address is 201 High Street SE, Suite 100, Salem, Oregon 97301.

Q. Please describe your educational background and work experience.

A. My witness qualifications statement, which details my educational background and work experience can be found in Exhibit Staff/1501.

Q. Did you prepare any exhibits?

A. Yes. Exhibit Staff/1501 is my Witness Qualification Statement.

Q. What is the purpose of your testimony?

A. The purpose of my testimony is to discuss NW Natural's Test Year Employee Medical Benefit and Pension costs. My testimony is limited to current employee expenses and does not cover post-retirement amounts.

Q. How is your testimony organized?

A. My testimony is organized as follows:

Issue 1. Medical and Health Insurance 2
Figure 1: OR Allocated Totals for Medical Benefit Costs 3
Figure 2: Total Benefits Per FTE Expenses 3
Issue 2. Current Pension Costs 6
Figure 4: Utility Retirement Benefits 7
Figure 5: Adjustment calculation 7
Summary of Findings and Recommendations 8

Docket No: UG 490

Staff/1500
Peterson/2

ISSUE 1. MEDICAL AND HEALTH INSURANCE

Q. Please describe the Company's request regarding medical and health insurance.

A. NW Natural included $19.6 million in medical and dental benefits for the Test Year.[1] The expense includes costs for both bargaining (union) and non-bargaining (non-union) (NBU) employees and is roughly split between the two groups.

NW Natural described the medical benefits provided to its employees and the steps it had taken to mitigate costs. NW Natural also included in its testimony the results of an independent survey that rated the health benefits offered by the NWN in comparison to 34 other Utilities in the PNW. NW Naturals offerings were rated as equal to and substantially at market.[2]

Q. Please discuss Staff's analysis of this issue.

A. Staff analyzed the information provided in NW Natural's testimony and the four-year trend in Figure 1 below. Staff also looked at these costs on a per FTE basis in relation to applicable FTE increases and industry inflation expectations. Staff issued data requests asking for reconciliations for clarification of amounts and explanations of specific increases in costs.

Figure 1 shows the benefits, both medical and pension in the NWN application that Staff has analyzed to date. Staff added the percent increase from Base year to Test Year.

Docket No: UG 490

Staff/1500
Peterson/3

FIGURE 1: OR ALLOCATED TOTALS FOR MEDICAL BENEFIT COSTS

Utility Oregon	Test Year 2025	Base Year 2023	% BY to TY	Base Year -1 2022	Base year -2 2021
Medical/Dental	$ 19,562,722	$ 16,321,054	20%	$ 15,799,591	$ 16,217,793
401(k)	$ 5,720,041	$ 5,328,286	7%	$ 4,886,964	$ 4,599,304
Group Life Insurance	$ 158,989	$ 139,926	14%	$ 139,070	$ 135,752
Retiree Life Insurance	$ 126,274	$ 121,173	4%	$ 117,634	$ 119,490
LT Disability	$ 721,102	$ 599,584	20%	$ 585,819	$ 564,836
Other	$ 168,421	$ 165,127	2%	$ 147,348	$ 145,753
Total	**$ 26,457,550**	**$ 22,675,150**	**17%**	**$ 21,676,426**	**$ 21,782,928**

According to NW Natural, medical costs increased by 7.1 percent in 2023 and are expected to rise further in 2024 by 9.5 percent.[3]

Figure 2 shows NW Natural' s forecasted employee benefit costs on an FTE basis.

FIGURE 2: TOTAL BENEFITS PER FTE EXPENSES

	Test Year Per FTE 1247	Base year Per FTE 1210	Per FTE % change
Medical/Dental	$18,462	$15,896	16%
401(k)	$5,398	$5,190	4%
Group Life Insurance	$150	$136	10%
Retiree Life Insurance	$119	$118	1%
LT Disability	$681	$584	17%
Other	$159	$161	-1%
Total	**$24,968**	**$22,085**	**13%**

Medical benefit costs per FTE are increasing over the Base Year by 16 percent, however on an FTE basis, total benefit costs are increasing by only 13 percent. From the above table we can see that it is primarily due to the small increase in 401k benefits that is causing this difference.

[3] NW Natural/1000, Rogers/15.

Staff compared these increases to other industry projections. PwC Health Research Institute[4] forecasts health care costs to increase by 7 percent in 2024 compared to a 6 percent rise in 2023. The Peterson Center on Healthcare and Kaiser Family Foundation[5] predict health care costs to rise by 5 percent in 2024.

Q. Does Staff agree with the Company's proposal?

A. Staff recognizes that the Company's forecasted costs are higher than what is indicated by the percentage increases forecasted by the Peterson Center, PwC Health Research, and Kaiser Family Foundation noted above. However, assuming the percentage increase for NWN's benefits is as reported in the tables above, Staff does not believe an adjustment to NW Natural's forecast of costs is warranted. However, Staff does have an adjustment to align the Test Year amount for medical benefits with the adjusted number of FTEs that Staff witness Steph Yamada is proposing in Staff/2000. This adjustment is equal to a reduction of 20.96 FTE. Also, as explained below, Staff is waiting for additional information regarding NW Natural's costs for employee benefits before reaching its final conclusion regarding the reasonableness of NW Natural's Test Year forecast for employee benefits.

Q. Please explain why you are waiting for additional information.

4 https://www.pwc.com/us/en/industries/health-industries/library/behind-the-numbers.html.
5 Health Cost and Affordability Policy Issues and Trends to Watch in 2024 - Peterson-KFF Health System Tracker.

Docket No: UG 490

Staff/1500
Peterson/5

A. Staff based its analysis and proposed adjustment amounts included in the Company's response to SDR 63, which asks for medical benefit costs for the Test Year, Base Year, and the three years prior to the Base Year. However, according to the Company's reply to DR 478, the amounts in SDR 63 represent the O&M allocated payroll overheads only. Therefore, at this time, Staff also is only proposing an adjustment to O&M expense based on the Staff-proposed adjustment to FTEs. Further clarification is required prior to recommending an adjustment to capitalized benefits or before Staff can draw conclusions regarding the overall level of costs.

Docket No: UG 490

Staff/1500
Peterson/6

ISSUE 2. CURRENT PENSION COSTS

Q. Please describe the Company's request regarding current pension costs.

A. NW Natural included $10.8 million in retirement benefits for the Test Year. [6] The expense includes costs for both RKSP – Matching Contribution which is open to all employees, and RKSP – Enhanced Contribution, which is open to NBU employees hired after December 31, 2006, and BU employees hired after December 31, 2009. NWN Natural's defined benefits plan, "NW Natural Retirement Plan," is closed to new employees hired after the dates listed above.

RKSP – Matching is a savings plan with employer match based on the percentage saved by the employee, and NW Natural included in their Initial application details of a change in proposed Employer contribution rate. RKSP – Enhanced, includes a fixed Employer contribution rate and requires no employee contribution and therefore should increase in line with salaries and wages.

Q. Please discuss Staff's analysis of this issue.

A. Staff analyzed the information provided in the application and compared it to the information provided in the previous rate case UG 435.[7] See Figure 4 below.

---

[6] NW Natural/1000, Rogers/20.

[7] *NORTHWEST NATURAL GAS COMPANY, dba NW NATURAL, Request for a General Rate Revision*, UG 435 (filed December 17, 2021).

Docket No: UG 490

Staff/1500
Peterson/7

FIGURE 4: UTILITY RETIREMENT BENEFITS

	Test Year	UG435 Test Yr	% Change
RKSP-Matching Contribution	$ 5,720,000	$ 5,136,300	11.36%
RKSP-Enhanced Contribution	$ 4,588,300	$ 3,851,200	19.14%
WSP-Withdrawal Liability	$ 497,100	$ 506,100	-1.77%
Total	$ 10,805,400	$ 9,493,600	13.81%

Staff found an overall increase of 14 percent over the retirement benefits included in NWN's previous rate case.

Q. Does Staff agree with the Company's proposal?

A. Staff is currently unable to ascertain whether the Company's proposed cost for pensions per FTE is reasonable because Staff is still investigating the capitalized pension costs.

Q. Does Staff have a proposed adjustment at this time?

A. Staff is proposing a combined adjustment of ($523,336), which is based on the fact that both medical and pension Costs are FTE dependent. Staff has calculated a per FTE expense and reduction. This adjustment is based on the amounts included in SDR 63 and an FTE adjustment of (20.96). This adjustment is part of the payroll overhead.

FIGURE 5: ADJUSTMENT CALCULATION

	OR Allocated
Total Medical & Pension Benefit per FTE expense	$24,968
FTE Adj	(20.96)
Total Adjustment	**($523,336)**

Docket No: UG 490

Staff/1500
Peterson/8

SUMMARY OF FINDINGS AND RECOMMENDATIONS

Q. Please summarize your findings and recommendations.

A. Staff's recommendations are as follows:

- Forecasted medical and health Insurance. Staff agrees with the Company's cost per FTE and is currently only recommending adjusting these expenses in line with the adjustments Staff is proposing with regard to number of FTE. This is currently an adjustment to O&M only and additional adjustments to Capital maybe forthcoming. That adjustment is included in the figure below.
- Forecasted pension costs. Staff is awaiting responses to data requests and clarity regarding the Company's capitalized pension costs before reaching a decision as to whether the Company's total proposed pension costs is reasonable. Therefore, Staff is currently only recommending adjusting the Company's proposed O&M expense for pensions in line with the adjustments Staff is proposing with regard to number of FTE.

Staff is recommending a combined adjustment to Test year expense of ($523,336).

Q. Does this conclude your testimony?

A. Yes.

TITLE: Senior Telecommunications Analyst
Rates and Telecommunications Section
Rates, Safety and Utility Performance Program

ADDRESS: 201 High Street SE. Suite 100
Salem, OR. 97301

EDUCATION: BA (Hons) Accounting & Finance
Middlesex University
Associate Chartered Accountant – Institute of Chartered Accountants of England & Wales

EXPERIENCE: I have been employed with the Public Utility Commission of Oregon since 2014. I am a Senior Telecommunications analyst in the Rates and Telecommunications Section of the Safety and Utility Performance Program. My assignments have mainly involved the administration and organization of the Oregon Universal Service Fund (OUSF). I have been the case manager on several OUSF dockets, managing workshops and stakeholder conferences, as well as chairing the OUSF Advisory Board. My other assignments include analysis of tariff filings, rulemakings, eligible telecommunication carrier certification with the FCC and annual reporting and budgeting.

Prior to the OPUC, I began my career in public practice as a Chartered Accountant and Audit Senior and then moved into the telecommunications industry. I have worked for numerous telecommunication companies (NYNEX, British Telecom, Esat Ireland, Digicel Jamaica) in various finance roles, from Financial Analyst to Financial Controller/ Finance Director.

Q. Please state your name, occupation, and business address.

A. My name is Rose Pileggi. I am a Senior Energy Analyst employed in the Rates, Safety and Utility Performance Program of the Public Utility Commission of Oregon (OPUC). My business address is 201 High Street SE, Suite 100, Salem, Oregon 97301.

Q. Please describe your educational background and work experience.

A. My witness qualifications statement is found in Exhibit Staff/1601.

Q. What is the purpose of your testimony?

A. The purpose of my testimony is to address the Company's testimony on Capital Structure.

Q. Did you prepare any exhibits for this docket?

A. Yes. I prepared Exhibit Staff/1602, responses to Staff Data Requests.

Docket No: UG 490

Staff/1600
Pileggi/2

ISSUE 1. CAPITAL STRUCTURE

Q. When did the Commission last consider this issue?

A. The Commission entered Order No. 22-388 in Docket No. UG 435 adopting a partial stipulation in which the parties agreed to a capital structure of 50 percent equity and 50 percent long-term debt.[1] This is the same capital structure proposed by NW Natural (NWN or Company) in its initial filing in Docket No. UG 435.

Q. What capital structure did the Company propose in its opening testimony?

A. NW Natural has proposed a capital structure in its current General Rate Case (GRC) of 50 percent equity and 50 percent long-term debt.[2]

Q. Does the Company always maintain a precise 50/50 capital structure?

A. No. NW Natural's capital structure fluctuates over time. The fluctuations are expected as issuances, redemptions, and maturations on financial instruments are not in perfect sync nor is it always beneficial for the company to maintain a perfectly uniform capital structure. NW Natural provided the previous 5 years of data on capital structure in response to Staff Data Request No. 286.[3]

Q. Did NW Natural maintain a capital structure near its 50/50 capital structure over the past 5 years?

---

1 *In the Matter of Northwest Natural Gas Company, dba NW Natural, Request for a General Rate Revision,* UG 435, Order No. 22-388 (October 24, 2022).
2 NW Natural/300, Wilson/1, line 16.
3 See Staff/1602, Pileggi/1.

A. Yes. The Company experienced swings in capital structure in which the equity percentage ranged from a low of 47.9 percent to a high of 51.4 percent. The average equity percentage over this period was 49.0 percent.

Q. How has the Commission treated capital structure for NW Natural's peers in recent years?

A. In UG 461, the Commission approved a stipulation for a 50 percent equity and 50 percent long-term debt capital structure for Avista. In UG 390, the Commission approved a stipulation for a 50 percent equity and 50 percent long-term debt capital structure for Cascade Natural Gas.

Q. What does Staff recommend for the capital structure of NW Natural?

A. Staff recommends a notional capital structure of 50 percent equity and 50 percent long-term debt. The notional capital structure acknowledges that the Company knows what timing of debt and equity issuances works best for the Company and centers around the typical 50/50 split that NW Natural and its peers already utilize. While rates charged to customers are based on a 50/50 capital structure, the Company may operate on the financing authorizations granted by the Oregon PUC and capital structures it chooses consistent with those authorizations. This is no different than any other cost or expense item projected in the test year. Those decisions by the Commission do not constrain the Company to incur those exact expense level decisions by the Commission.

Q. Could Staff's position change on this issue?

A. Staff will closely monitor the Company's and intervenors' testimony and analysis, which will be considered in Staff analysis and rebuttal testimony.

Q. Does this conclude your testimony?

A. Yes.

Q. Please state your name, occupation, and business address.

A. My name is Paul Rossow. I am a Utility Analyst employed in the Accounting and Finance Section of the Rates, Safety and Utility Performance Program of the Public Utility Commission of Oregon (OPUC). My business address is 201 High Street SE, Suite 100, Salem, Oregon 97301.

Q. Please describe your educational background and work experience.

A. My witness qualifications statement is found in Exhibit Staff/1701.

Q. What is the purpose of your testimony?

A. I discuss my review of several topics of NW Natural's (NWN or Company) Test Year Operations and Maintenance (O&M) non-payroll expenses, including expenses for political activities, advertising expenses, memberships, dues and donations, meals and entertainment, awards, gifts, airfare, lodging, and travel.

Q. Did you prepare any exhibits for this docket?

A. Yes. I prepared the following support exhibits:

Exhibit Staff/1701. Witness Qualification Statement
Exhibit Staff/1702. Responses to Data Requests (Non-Confidential)
Exhibit Staff/1703. Membership Work Paper (Non-Confidential)
Exhibit Staff/1704. Meals and Entertainment Work Paper (Non-Confidential)

Q. How is your testimony organized?

A. My testimony is organized as follows:

Issue 1. Political Activities 3
Issue 2. Advertising 5
Issue 4. Memberships, Dues, and Donations 11
Issue 5. Meals and Entertainment, Awards, Gifts, Refreshments, Airfare, Lodging, and Travel 14

Rossow/3

ISSUE 1. POLITICAL ACTIVITIES

Q. Please explain the Commission's historical treatment of political activities.

A. The Commission has not allowed regulated utilities to recover political activity or lobbying expenses through rates charged for regulated services. Political activity along with lobbying are discretionary and are not required to provide safe and adequate service to customers.[1]

Political activities and lobbying expenses can occur by:

- Directly communicating with officials,
- Providing transportation for elected officials,
- Attending government conferences and expressing special interest views,
- Drafting special interest legislation and presenting it to a legislator for consideration,
- Providing support for elected officials on trade missions, by providing in kind services to special interest groups,
- Hosting receptions for congressional delegations, and
- Attempting to influence legislators and other public officials to introduce or support measures that favor some special interest.

[1] *In re Pacific Northwest Bell Telephone Company,* UT 43, Order No. 87-406 (March 31, 1987) (1987 WL 257178), p. 43: "The Commissioner views lobbying and similar political activities as essentially the same issue presented by community activities. Ratepayers should not be required to contribute to the advancement of political positions in which they may not believe. *See Pacific Power & Light Company* [*PacifiCorp*], UF 3074, Order 74-658 at 13."

Q. Does NW Natural seek recovery of expense for political activities or lobbying in this rate case?

A. The Company testifies it is not seeking recovery for these expenses in the 2025 Test Year.[2]

Q. Please describe your analysis for the political activities and lobbying expenses.

A. Staff reviewed NWN's Direct Testimony, issued Data Request Nos. 341 – 351, and analyzed NW Natural's transactional data in its response to Standard Data Request No. 57. Staff noted 104 lobbying transactions recorded to cost element titled "Meals and Entertainment" that Staff recommends expenses excluding 100 percent, which revealed $12,535 recorded to the total Company's Base Year under FERC Account 921. This equates to an Oregon Base Year allocated amount of $11,047.

Next, Staff applied All-Urban CPI inflation factors of 2.7 percent and 2.0 percent in 2024 and 2025, respectively, resulting in an Oregon escalated Test Year adjustment to Lobby expenses of ($11,572).

Q. What are Staff's findings regarding political activities and lobby expenses?

A. Staff finds that an adjustment of ($11,572) is needed for the Test Year.

[2] NW Natural/1200, Williams/2-7.

Docket No: UG 490

Staff/1700
Rossow/5

ISSUE 2. ADVERTISING

Q. Does the Commission have a standard means of determining how advertising expenses are treated?

A. Yes. OAR 860-026-0022 specifies how advertising expenses are treated in a utility rate case. The rule describes five categories (A-E), each with a different standard for inclusion in rates.

Category “A” includes energy efficiency or conservation advertising expenses that do not relate to a Commission-approved program, utility service advertising expenses, and utility information advertising expenses.[3] Category A advertising expenses no greater than twelve and one-half hundredths of one percent (0.125 percent) of the gross retail operating revenues determined in that proceeding are presumed just and reasonable for rate making purposes, though the presumption is rebuttable.[4] The utility bears the burden to prove that any Category A expense that exceeds the threshold is just and reasonable for ratemaking purposes.

Category “B” includes legally mandated advertising expenses, which are assumed to be reasonable for rate making purposes.[5]

Category "C” includes institutional advertising expenses, promotional advertising expenses, and any other advertising expenses not fitting into Category “A”, “B”, or “D”.[6] Utilities must demonstrate these expenses are just

3 OAR 860-026-0022(2)(a).
4 OAR 860-026-0022(3)(a).
5 OAR 860-026-0022(2)(b).
6 OAR 860-026-0022(2)(c).

and reasonable for inclusion in rates, as well as separately state the amount of advertising expenses in this category.

Category "D" includes political advertising expenses and non-utility advertising expenses, which are presumed to be not just and reasonable for ratemaking purposes.[7]

Lastly, Category "E" includes energy efficiency or conservation advertising expenses that relate to a Commission approved program. Utilities must show these expenses are reasonable and recoverable in rates. With Commission approval, advertising expenses in Category "E" may be capitalized.[8]

Q. Please describe the Company's Oregon Test Year expense for advertising.

A. The Company proposes to include $1,378,465 in Category A and $975,000 in its Category B advertising in the 2025 Test Year as illustrated in Figure 1. The Company reports it has not included any expense for Categories C, D, or E advertising in the 2025 Test Year.

FIGURE 1. TOTAL ADVERTISING IN THE TEST YEAR

Category	Included in Rates?	2025 Expenses $
A	Yes	$1,378,465
B	Yes	$975,163
C	No	$0
D	No	$0
E	No	$0
Total		$2,353,628

7 OAR 860-026-0022(2)(d).
8 OAR 860-026-0022(2)(e).

Q. Please describe your analysis of NW Natural's proposed advertising expenses for Category A.

A. Staff analyzed NW Natural's advertising data in its response to Standard Data Request Nos. 57, 104, 335 -340, and 454, which inquired about NW Natural's advertising expenditures. Staff confirmed that advertisements were related to energy efficiency, safety, and conservation.

Q. How does the Company's Oregon Test Year advertising expenses compare to historical spending?

A. NW Natural's Oregon Test Year request of $1,378,465 for Category A expenses is a 20 percent increase from what was allowed in UG 435 Test Year expense for Category A of $1,148,090.[9]

The Company's Oregon Test Year request of $975,163 for Category B expense is an 18 percent increase from what was allowed in UG 435 Test Year expense for Category B of $827,027.[10]

Q. Please describe how the Category A Test Year expenses are calculated for Oregon ratepayers.

A. Staff's review found that NW Natural is proposing Category A advertising expense of $1.95 per customer, which is $0.03 higher than the amount that is presumed reasonable under OAR 860-026-0022(3)(a).

Docket No: UG 490

Staff/1700
Rossow/8

FIGURE 2. 2025 TEST YEAR CATEGORY A ADVERTISING CALCULATION

Category A Expense:	
NW Natural Oregon Proposed Operating Revenue:	$1,083,624,393
*Factor per OAR:	0.125%
Calculation = $1,083,624,393 x .00125 =	$1,354,530
Test Year Number of Customers:	707,022
Per Customer Calculation = $1,354,530/707,022 =	$1.92

Proposed Category A Expense:	
NW Natural Oregon Proposed Operating Revenue:	$1,083,624,393
*Factor per OAR:	0.125%
Proposed Test Year Budget:	$1,378,465
Test Year Number of Customers:	707,022
Per Customer Caluclation = $1,378,465/707,022 =	$1.95
Difference between Company and Staff:	$23,935

*OAR 860-026-0022 Rule = 1/8 of 1% of sales is presumed reasonable

Q. What is your recommendation regarding Category A Advertising expense?

A. Staff proposes to limit the Company's recovery of Category A expense to the amount that is presumed reasonable under OAR 860-026-0022(3)(a), which is $1,354,530 or $1.92 per customer for the Oregon Test Year.

Q. Why do you propose to disallow expense that exceeds the threshold for the rebuttable presumption?

A. As discussed elsewhere in Staff testimony, utility customers are facing significant pressure from escalating costs, including utility costs. NW Natural has not shown that it is appropriate for customers to bear costs for advertising

above the administratively set threshold for presumed reasonableness. Staff expects the utility to be diligent in cost cutting and minimizing given that it has had rate three general rate increases in the last six years.

Q. Please describe your analysis of the Company's proposed advertising expenses for Category B.

A. Category "B" includes legally mandated advertising expenses, which are presumed to be just and reasonable for rate-making purposes, though the presumption is rebuttable.

Q. Please explain your proposed Category B advertising expense.

A. Staff analyzed NW Natural's Category B advertising expense data in its responses as referenced above for Category A advertising expense. Staff confirmed that advertisements were related to safety-related communications. NW Natural plans to expand their website to offer multi-language content and deploy broader multi-language media for the Test Year.

Staff recognizes that the Company's proposed Category B expense is presumed reasonable but believes that the presumption is overcome in this case. For the reasons discussed above, there is no justification for rate recovery of a 22 percent increase in expense from 2023 actuals or an 18 percent increase from the expense allowed in the last GRC.

Given the presumption of reasonableness is rebutted due to the steep increase proposed by NW Natural, Staff recommends determining the Test Year expense for Category B advertising by averaging in the expense for the years before and after the Base Year to smooth out the increase in the Test

Year. This modification results in a Test Year expense of $836,078, Staff recommends an adjustment of ($139,085) to NW Natural's proposed Test Year Category B advertising expense of $975,163.

FIGURE 3. 2025 TEST YEAR CATEGORY B ADVERTISING CALCULATION

Category B Expense	
Year	Oregon Allocated
2022 Actual:	$911,928
2023 Actual:	$802,055
2024 Budget:	$794,250
Average:	$836,078
2025 Test Year:	$975,163
Difference between Company and Staff Proposal:	($139,085)

Q. What is the total adjustment to advertising?

A. Staff proposes adjusting overall advertising expense on an Oregon allocated Test Year by ($163,020).

Docket No: UG 490

Staff/1700
Rossow/11

ISSUE 3. MEMBERSHIPS, DUES, AND DONATIONS

Q. Please explain the Commission's historical treatment of memberships, dues, and donations.

A. The Commission has determined that some expense associated with memberships, dues, and donations to some organizations is not appropriately included in a utility's revenue requirement, primarily because some or all the organizational activities are:[11]

- Not necessary for utility service,
- Primarily to promote the company within the community,
- Not to benefit ratepayers, or
- Not recoverable in rates if done by the utility itself.

Additionally, Commission policy does not require ratepayers to pay for causes that they do not necessarily support. [12]

To limit the amount of ratepayer funding of activities that fall within the categories listed above, Commission practice is to exclude membership expenses related to economic development and civic organizations and to exclude a certain percentage of membership costs for trade organizations. With respect to other organizations, Staff follows Commission precedent by disallowing all memberships or dues unless the utility can present a convincing argument that the membership is necessary for utility service or otherwise to benefit ratepayers.

[11] See Order No. 87-406.
[12] See OPUC Order No. 87-406 at 40-41, Order No. 91-186 at 16, and Order No. 09-020 at 20-21.

Docket No: UG 490

Staff/1700
Rossow/12

Q. Did NW Natural propose an adjustment to its Test Year to remove memberships, dues, and donations?

A. No.

Q. Please explain your analysis for the memberships, dues, and donations adjustment.

A. Staff analysis included the review of NWN's memberships and dues expenses listed in Standard Data Request 90.

Q. What was the result of Staff's analysis for memberships, dues, and donations?

A. Staff's adjustment utilizes a list of memberships from NW Natural's response to Data Request No. 90. Staff identified $57,120 expense for memberships related to economic development and civic organizations in NWN's Oregon allocated Base Year. Next, Staff applied All-Urban CPI inflation factors of 2.7 percent and 2.0 percent in 2024 and 2025, respectively, resulting in an Oregon escalated Test Year adjustment to memberships of ($59,835).

Staff also identified $1,611,788 expense for memberships related to national and regional industry trade organizations in NWN's Base Year. Staff removed 25 percent of the expense to the Base Year in the amount of $402,947. Staff applied All-Urban CPI inflation factors mentioned above, resulting in an Oregon escalated Test Year adjustment to memberships of ($422,103).

Q. What is Staff's total adjustment to memberships, dues, and donations?

A. Staff's analysis results in an escalated Oregon allocated Test Year adjustment to memberships of ($481,938).

Docket No: UG 490

Staff/1700
Rossow/14

ISSUE 4. MEALS AND ENTERTAINMENT, AWARDS, GIFTS, AIRFARE, LODGING, AND TRAVEL

Q. Please explain the Commission's historical treatment of O&M non-payroll discretionary expenses.

A. O&M non-labor discretionary expenses include expenses for items such as awards, food, gifts, meals, and entertainment. In Docket No. UE 197, the Commission clarified its policy that expenses for meals and entertainment, office refreshments, catering, gifts, and awards are discretionary and should be shared equally by customers and shareholders.[13] Accordingly, a 50 percent sharing of such expenses between customers and shareholders is routinely recommended by Staff. In addition, Staff recommends disallowance of O&M non-payroll expenses that are imprudent or excessive or do not benefit Oregon regulated utility operations at a transactional level.

Q. Did the Company propose an adjustment to its Test Year to remove meals and entertainment and awards expenses?

A. No.

Q. Please describe your analysis for the meals and entertainment O&M non-payroll expenses.

A. Staff reviewed NW Natural's Direct Testimony, NWN's Standard Data Response No. 57, NWN's response to Data Request Nos. 442 – 455, and NWN response Data Request No. 201 Attachment 3, which includes meals

[13] *See In the* Matter *of Portland General Electric Company Request for a Rate Revision*, Docket No. UE 197, Order No. 09-020, p. 16 (January 22, 2009).

and entertainment, awards, gifts, refreshments, airfare, lodging and travel type of expenses, to identify any O&M non-payroll discretionary expenses that appear to be excessive or not related to the provision of safe and reliable energy to customers. In the Company's response to Data Request No. 201 Attachment 3, the Company provided O&M non-payroll transactional expenses in Excel format. The accounting data includes category fields, account number, cost element numbers, FERC accounts, transaction descriptions, source descriptions, and currency amount.

From this workbook, Staff searched through the data to aid in Staff's analysis of O&M non-payroll discretionary expenses. Staff filtered the data by transaction description and account number name. Some of the selected expenditure types were meals and entertainment, awards, gifts, refreshments, airfare, lodging, and travel.

Staff reviewed the selected expenditure types mentioned above to determine whether they benefit customers or are discretionary and should be shared between customers and shareholders according to Commission policy. Items Staff found to have no benefit to customers, Staff excludes at 100 percent. Those expenses Staff believed benefitted both customers and shareholders, Staff disallowed at 50 percent. Once Staff determined the disallowance based on 2023 dollars, Staff adopted the All-Urban CPI inflation factors. The inflation factors reflect assumed inflation of 2.7 percent and 2.0 percent in 2024 and 2025, respectively.

Q. Would you please explain your adjustment?

A. Yes. For example, within the selected expenditure types, Staff noted transactions related to expenses described as: meals and entertainment, awards, gifts, refreshments, and retreat at Skamania Lodge that Staff recommends excluding 50 percent.

Q. What was the result of Staff's review for these expense types?

A. After reviewing O&M non-payroll expenses, Staff identified 2023 total Company Base Year expense of $691,631 with an associated Oregon allocated Base Year amount of $597,759. After removing 50 percent of the allocated Base Year results in an amount of $298,880. Next Staff applied the All-Urban inflation factors mentioned above, resulting in an adjustment to the Oregon Test Year allocated amount of ($313,088).

Q. Is there an issue relating to airfare?

A. Yes. In the Company's response to Staff data request No. 447, it was revealed that NW Natural inadvertently included first class airfare totaling a Base Year amount of $36,257. Staff applied All-Urban CPI inflation factors mentioned above, resulting in an Oregon escalated Test Year adjustment to airfare of $37,981. The Company will correct the revenue requirement in their reply testimony to exclude the total of these transactions.

Q. What is Staff's total meals and entertainment adjustment?

A. Staff's total adjustment is an adjustment of ($351,069) to O&M non-labor discretionary expenses.

Docket No: UG 490

Staff/1700
Rossow/17

SUMMARY FINDINGS AND RECOMMENDATIONS

Q. Please summarize your findings and recommendations.

A. Staff's recommendations are as follows:

- Issue 1 (Political Activities) – a total adjustment of ($11,572) to the Oregon allocated Test Year expense for FERC Account 921;
- Issue 2 (Advertising) – a total adjustment of ($163,020) to the Oregon allocated Test Year for FERC Account 909;
- Issue 3 (Memberships, Dues, and Donations) – a total adjustment of ($481,938) to the Oregon allocated total Test Year expense for FERC Accounts 832-932; and
- Issue 4 (Meals and Entertainment, Awards, Gifts, refreshments, Airfare, Lodging, and Travel) – a total adjustment of ($351,069) to the Oregon allocated total expense for FERC Accounts 816-936. Additionally, the Company will update its revenue requirement in its reply testimony relating to first class airfare for a total Oregon Test Year amount of $37,981.

Q. Does this conclude your testimony?

A. Yes.

NW Natural®

Rates & Regulatory Affairs

UG 490

Request for a General Rate Revision

Data Request Response

Request No.: UG 490 OPUC DR 341

Please discuss the Company's current expenses for political activities/public affairs. Does the Company propose any approaches or budgeting that is new or different from the last two general rate cases.

Response:

NW Natural, like other utilities in Oregon, engages in public affairs matters on behalf of our customers and are included in the revenue requirement for UG 490. This includes working with a local jurisdiction on obtaining permits for utility construction projects, language updating franchise agreements or right of way ordinances, and safety and security efforts within our jurisdictions.

Political expenses are not requested for recovery. This includes incidental expenses, like mileage, associated with any political activities.

In our prior rate case, the allocations for political activities for the Government and Community Affairs team were based on historical allocations used by the Company. In the current case, the Government and Community Affairs team have recorded exception time for political activities in the base year, and the Company is not seeking recovery of those costs in the Test Year. The Company included information about timekeeping and accounting to differentiate time spent on political activities versus general utility activities such as safety and security efforts within our jurisdictions in NW Natural/1200, Williams.

UG 490
Request for a General Rate Revision
Data Request Response

Request No.: UG 490 OPUC DR 342

Are these activities included in the revenue requirement for UG 490? If yes, please identify FERC Accounts that contain these expenditures.

Response:

The heading for this Staff data request is: **RE: Political Activities/Public Affairs**

Please see the Company's response to UG 490 OPUC DR 341.The public affairs activities described in UG 490 OPUC DR 341 are included in the revenue requirement for UG 490 and are included in FERC 921, as such activities include "informational engagement and education for local governments for which ratepayer support is appropriate." UG 435, Order No. 22-388 (entered October 24, 2022), page 24.

As it relates to NW Natural/1200, Williams, the described political lobbying activities or activities intended to influence that are tracked through exception reporting are not included in the revenue requirement for UG 490. As described in NW Natural/1200, Williams these activities are charged to FERC 426.4 – Expenditures for certain civic, political, and related activities. FERC 426.4 is not included in the revenue requirement and is considered "below the line".

UG 490
Request for a General Rate Revision
Data Request Response

Request No.: UG 490 OPUC DR 447

If NW Natural is seeking rate recovery for first class airline tickets in docket UG 490, please provide:

a. the amount of each transaction on a system and Oregon allocated basis,
b. justification for purchasing first class airline tickets,
c. the FERC account number, and
d. Oregon allocation factor.

Response:

The policy of the Company is not to request cost recovery for expenses related to the incremental difference between the cost of first/business class airline tickets and base-fare airline tickets.

Through our review of the airfare transactions in development of this response, it appears that there are certain transactions that were not coded correctly and the incremental cost between base fare and first-class fare was inadvertently included in Base Year. Refer to Confidential UG 490 OPUC DR 447 Attachment 1 for a summary. The Company will correct the revenue requirement in our reply testimony to exclude the total of these transactions in the Base Year of $36,257 on an Oregon-allocated basis.

Please also see the Company's response to UG 490 Coalition DR 446.

Opening Testimony
Marginal Cost, Rate Spread and Rate Design

April 18, 2024

Docket No: UG 490

Staff/1800
Shierman/1

Q. Please state your name, occupation, and business address.

A. My name is Eric Shierman. I am a Senior Utility Analyst employed in the Energy Resources and Planning Division of the Public Utility Commission of Oregon (OPUC). My business address is 201 High Street SE., Suite 100, Salem, Oregon 97301.

Q. Please describe your educational background and work experience.

A. My witness qualification statement is found in Exhibit Staff/1801.

Q. What is the purpose of your testimony?

A. This testimony reviews NWN's proposals on marginal cost, rate spread, and rate design and offers Staff's recommendations.

Q. Did you prepare any exhibits for this docket?

A. Yes, Exhibit Staff/1801 is my witness qualification statement.

Q. How is your testimony organized?

A. My testimony is organized as follows:

Issue 1. Marginal Cost 2
Issue 2. Rate Spread 6
Issue 3. Rate Design..... 16

Docket No: UG 490

Staff/1800
Shierman/2

ISSUE 1. MARGINAL COST

Q. What is the Long Run Incremental Cost (LRIC) Study and what is its goal?

A. Estimates of the NWN LRIC is developed through a study and identifies the different costs to serve each rate schedule. Utilities do not keep granular accounting records of costs by customer type. As such, the LRIC uses the replacement costs (by assuming all inputs are variable) of the entire system to attribute costs to particular rate schedules. The costs are functionalized by dividing them into several cost categories and then attributed to different customer classes by how the customer class uses the facilities.

For example, distribution mains are large pipes utilized by all customer classes to deliver gas for use. These can be broken down into "system mains" and "main extensions" based on their size and position in the distribution system. Since a major cost driver of these large-diameter mains is meeting peak demand, a customer class's burden to pay for these system mains should correlate to each customer schedule's own peak day load. The higher the peak day load for a schedule, the more that schedule is requiring the Company to invest in system mains to meet peak demand.

Once each cost category is broken down and each customer class's cost causation has been identified, ratios are used to allocate the revenue requirement for each designated functional category.[1] Ultimately, the study compares what portion of costs each customer class is currently paying to what

[1] See UG 490 - Exh. 1801 - WP6 - Long-Run Incremental Cost Study (LRIC) Model.

they should be paying based on the above noted allocation method. This can be used as the basis for cost-based rates, the theory being you should pay for the costs you are causing to the system.

Costs that can be easily divided up are calculated by taking the per-customer average and multiplying by the number of customers in that schedule. The remaining costs are allocated by identifying cost types within each cost category and customer class. Many other considerations often can and do go into rate spread and rate design, but usually the LRIC is a large driving force behind the rates a customer pays.

Q. Has the Company's LRIC methodology changed since the last rate case?

A. Yes. The Company made two changes based on Staff's feedback in UG 435.[2] The Company modified the Maximum Daily Demand Value (MDDV) calculation for design day load factor development, which accounts for changing incremental customer counts across time, in response to Staff's feedback that nonresidential customers going in and out of business gave the false appearance of lower use per customer. Second, the Company modified its system core main allocation to calculate weighted peak day deliveries for all rate schedules as a basis for core main cost assignment by allocating interruptible customers a 50 percent credit for system core main allocation, down from 100 percent.[3] In UG 435, Staff noted that these customers do use

[2] NW Natural/1800, Wyman/32-33.
[3] Id.

system capacity, so weighting them with no marginal system core main cost underestimates their marginal cost.[4]

Q. Do you believe that the Company implemented Staff's feedback effectively?

A. Based on Staff's inspection of the Company's LRIC workpapers, it appears to Staff that this feedback was implemented effectively. Staff has no additional feedback regarding the Company's LRIC at this time but looks forward to reading other parties' testimony and perhaps updating its position.

Q. What did the Company's new LRIC show?

A. The LRIC shows nearly half of customers classes, including residential customers, are paying closer to parity than was the case in UG 435. [5] The customers paying below parity are RS 2 Residential, RS 3 Commercial, and RS 27 Dry-Out. Table 1 displays the parity ratios at present rates.[6]

Table 1. LRIC Study Parity Ratio at Present Rates, by Rate Schedule

RATE SCHEDULE	02R	03C	03I	27R	31CSF	31CTF	31ISF	31ITF
LRIC Study Determined Parity Ratio	**0.96**	**0.95**	**1.21**	**0.82**	**1.66**	**1.95**	**1.63**	**2.34**
RATE SCHEDULE	32CSF	32ISF	32CTF	32ITF	32CSI	32ISI	32CTI	32ITI
LRIC Study Determined Parity Ratio	**1.61**	**1.91**	**2.22**	**1.65**	**1.30**	**1.46**	**2.64**	**1.25**

[4] NW Natural/1800, Wyman/43-44.
[5] NW Natural/1800, Wyman/57-58.
[6] Table from UG 490 NW Natural/1800, Wyman/57. Rate Schedule 2 (Residential), Schedule 3 (Commercial), 27 (Residential Heating Dry-Out Service), Schedule 31 (Non-Residential Firm Sales and Firm Transportation Service), Schedule 32 (Large Volume Non-Residential Sales and Transportation Service).

A parity ratio of one is equal parity between total LRIC for a class of customers and total revenues for that class given revenue from rates charged to that class of customers. A ratio under one means the customer class is paying less than its LRIC and a ratio greater than one means the customer class is paying more than its LRIC.

Q. Does Staff have adjustments to NWN's assessment of marginal cost?

A. Staff has no adjustments at this time but may after reviewing other parties' testimony.

Docket No: UG 490

Staff/1800
Shierman/6

ISSUE 2. RATE SPREAD

Q. Please describe rate spread.

A. Rate spread is the practice of allocating a company's revenue requirement to its various customer classes. Doing so effectively should balance concerns of economic efficiency, equity and energy justice concerns, and rate shock.

Q. How does one properly balance these potentially conflicting concerns?

A. In general, rate spread allocations begin by conducting a LRIC study to determine the optimal way to allocate costs between the Company's various customer classes. As described in this testimony, the LRIC provides valuable insight into the costs to serve each of the Company's customer subgroups, which can be compared to the revenues generated by each subgroup. While there is often disagreement in methodology that an LRIC employs, one goal of rate spread is to align the revenue earned from each customer class with the costs to serve each customer class according to the LRIC. This is often referred to as "moving towards parity."

If the LRIC does show a need to move towards parity from current rates, it is best practice to make the move towards parity deliberate enough that customers can properly adapt to these new different rates and to signal that they are still operating under a regulatorily stable environment. This is often referred to as avoiding rate shock or inequitable results from a policy perspective—an example of which may be significantly increasing the rates of one customer class so that other customer classes may have a rate decrease.

Finally, the Commission has been statutorily authorized to consider equity and environmental justice concerns as factors in rate spread. A move towards parity may put costs on environmental justice or underserved groups in a way that may not be optimal from a socio-economic perspective. Further, to the extent that current modeling approaches employed with the LRIC look only at costs to the system, disparities in the system benefits received by different customer groups remain unaccounted for.

These various concerns of lack of modeling clarity, rate shock, and awareness of environmental justice concerns make it so every rate spread methodology has tradeoffs and selecting an optimal rate spread methodology must balance all these concerns.

Q. How does the Company's proposal align with parity considering what the LRIC shows with respect to cost causation?

A. NWN's proposal brings each rate class to the parity ratios that are closer to 1 than they would otherwise be with no change to the current rate spread. Table 2 below shows the current parity ratios of the classes discussed above and the parity rations that would result from the Company's proposal.

Table 2: NWN's Proposed Change in Parity Ratios

Schedule	Current Parity Ratio	Proposed Parity Ratio	Change
02R	0.96	0.97	0.01
03C	0.95	0.96	0.01
03I	1.21	1.13	(0.08)
27R	0.82	0.86	0.04
31CSF	1.66	1.54	(0.12)
31CTF	1.95	1.73	(0.22)
31ISF	1.63	1.51	0.12)
31ITF	2.34	2.07	(0.27)
32CSF	1.61	1.50	(0.11)
32ISF	1.91	1.70	(0.21)
32CTF	2.22	1.97	(0.25)
32ITF	1.65	1.47	(0.18)
32CSI	1.3	1.21	(0.09)
32ISI	1.46	1.36	(0.10)
32CTI	2.64	2.34	(0.30)
32ITI	2.64	1.11	(1.53)

Q. Does Staff agree with the use of LRIC as a basis for the Company's rate spread?

A. Staff supports the use of LRIC as a baseline resource for rate spread proposals. As a general matter, pricing and customer cost allocations should reflect long-run-incremental cost-causation as much as possible.

A strict LRIC-based target allocation of marginal costs to the various customer schedules would be the outcome of allocating shares of embedded cost categories to customer schedules strictly in proportion to their respective

shares of LRIC costs for the respective categories. However, as the Company testifies, relying entirely on parity may result in very large rate increases for many customers and perhaps inadvertently signal rate volatility.[7] Staff agrees with the Company's position that rate spread must balance the interests of rate equity and rate volatility with the results of an LRIC. However, at times these priorities can be at odds with each other.

Evolutions to the rate spread cost allocation from the LRIC can avoid the burden of imposing an increase to a particular customer schedule that is unacceptably out of line with the overall increase and avoid allowing some schedules to receive a rate decrease in the context of a significant increase being imposed on most of the other customer schedules. This "deviation" appears particularly appropriate in the context of the Company's UG 490 proposal, such that the results of the LRIC results would implement an increase relative to total revenues of 21.0 percent for Schedule 2 Residential, 19.5 percent for Schedule 3 Commercial, and 32.1 percent for Schedule 27 Dry-Out rate classes while the large commercial, industrial, and transportation rate classes would receive overall rate decreases.[8] As a percentage of marginal revenues, the disparity appears even more dramatic. Table 3 presents the percentage change of marginal revenues to bring each rate class to parity according to the Company's LRIC.

[7] NW Natural/1800, Wyman/81.
[8] NWN/1800, Wyman/82.

Table 3: Percent of Margin Increase for Each Customer Class

Rate Schedule	Average	02R	03CSF	03ISF	27R	31CSF	31CTF	31ISF	31ITF
Target Increase (LRIC)	29.30%	34.2%	35.8%	6.5%	57.0%	-22.0%	-33.7%	-20.5%	-44.7%
Rate Schedule	**32CSF**	**32ISF**	**32CTF**	**32ITF**	**32CSI**	**32ISI**	**32CTI**	**32ITI**	**33T**
Target Increase (LRIC)	-19.7%	-32.4%	-41.8%	-21.8%	-0.7%	-11.3%	-51.1%	3.5%	0.0%

While such a spread would result in rate parity across the classes, the impact to customers in terms of price signals, affordability, and reasonableness would be substantial. Further, as highlighted by the Company, the Commission has provided some precedent on how it may regard mismatches between rates derived from the LRIC and proposed rate changes, stating, as noted earlier, that it is not inclined to raise some rates while lowering others without compelling evidence that immediate action is warranted. [9]

Q. How has the Company proposed to balance the concerns of moving towards parity, mitigating rate shock, and ensuring no customer receives a rate decrease while others receive a rate increase?

A. The Company proposes to balance these concerns by first applying a cap to the proposed increases relative to margin according to the LRIC to Schedule 2, Schedule 3, and Schedule 27. The Company chose to cap the rate increase to each of these customer classes to no more than a multiplier value tied to the

[9] Id.

average increase of 29.3 percent presented in Table 3. The multipliers were 1.04, 1.05, and 1.22 for Schedules, 2, 3, and 27, respectively.[10]

For the remainder of the revenue requirement increase, the Company applies a rate increase floor that allocates half of the increase in margin revenues to all customers whose parity ratio is over 1.75 percent. The remainder of costs are spread to all remaining customer classes on an equal percent of margin basis.[11]

Q. What is the effect on total revenue requirement of the Company's rate spread proposal?

A. Table 4 presents the total revenue requirement increase per schedule and the ratio of the percentage increase per schedule relative to the average increase.

32ITI	$ 810,559	14.7%	0.88
33T	$ -	0.0%	0.00
Total	$ 154,909,651	16.7%	1.00

Q. Why does Staff believe that it is important to present the rate increase for each customer class as a ratio to the percent of the total rate increase – including gas costs?

A. Staff and other parties are proposing adjustments to the Company's proposed revenue requirement. As an example, Staff in its opening testimony recommends adjustments to the Company's revenue requirement totaling between ($36 million) and ($42 million) depending on the Return on Equity (ROE) assumptions used.[12] Discussing rate spread proposals on a total dollar or a percentage increase basis becomes difficult as agreements or Commission orders may change the overall size of the revenue requirement

[12] See Staff/200.

pie that must be split among the rate classes. Therefore, Staff believes it to be easier and more appropriate to instead present its rate spread recommendations as a ratio to the average percentage increase and a set of guidelines to fairly allocate rate spread as the case evolves.

Q. Does Staff find the Company's proposed rate spread to be fair?

A. No. While the Company does move towards parity and the ratio of cost increases relative to the average is relatively small, Staff does not believe that concerns about the relatively large rate increases are properly addressed by the proposed spread of incremental revenue requirement. As can be seen above, various industrial schedules have received as little as 22 percent of the average increase while other customer schedules receive up to 121 percent of the average increase. Given the overall size of the company's proposed increase to revenue requirement, Staff believes it would be preferable to slow the move towards parity and spread rates more evenly across customer classes.

Q. How does Staff propose moving towards parity while more evenly spreading the rate increase across customer classes?

A. Staff proposes to use the Company's current rate spread as a starting point and implement a floor of 75 percent of the average percentage increase when determining the lowest possible rate spread allocation to each schedule. In effect, this raises the allocated revenue requirement for Schedule 31 and Schedule 32 customers. Any revenue requirement added to these schedules

will then be taken away from the three schedules that were given a cap in the Company's initial rate spread methodology.

This means that the incremental revenue requirement to Schedule 2 and Schedule 27 customers is lowered, but still remains above the average percentage increase. Staff has expressed concerns about relying solely on the LRIC for determining parity, and Staff believes that this more optimally balances the pursuit of parity based on the LRIC with concerns about customers experiencing relatively large rate increases.

Q. Please explain Staff's rationale for this proposal.

A. Staff has long argued that in the face of exceptional overall rate increases a narrower rate spread should be adopted.[13] While the LRIC is informative for determining rate spread, Staff argues that a scenario in which some rate schedules experience nearly a 19 percent rate increase, while others see only a 4 percent increase,

is inequitable.

Q. What is the effect of Staff's adjustment to the Company's proposed rate spread model?

A. The rate spread under Staff's proposed method is contained below in Table 5. For ease of presentation, Staff presents this proposal using the Company's filed proposed revenue requirement rather than Staff's proposed revenue requirement presented in the testimony of Staff Witness Luz Mondragon in Staff Exhibit 200. For scale, Staff proposes a total of ($36 million) to

[13] For a recent example of this see UE 426 Staff/1500, Stevens/37.

($42 million) in adjustments to the Company's requested revenue requirement.[14]

Table 5. Staff's Proposed Rate Spread

Schedule	Rev. Req. Increase	% Increase	Ratio of Increase
02R	$ 102,416,260	17.52%	1.05

Shierman/16

ISSUE 3. RATE DESIGN

Q. Please summarize the Company's rate design proposals?

A. NWN proposes three changes to the monthly charge:

- Increase the basic charge for residential single-family customer from $8 to $10.[15]
- Implement a bifurcated basic charge that keeps the multi-family basic charge at $8.[16]
- Create a new monthly charge premium of $16.25 for all new customers to the Company's system that would be added onto the Company's basic charge proposal.[17]

Q. Why is a monthly charge generally included in a residential rate design?

A. The monthly charge is the price a customer pays in a month regardless of the amount of energy consumed. If one were to set rates purely on short-run cost causation, the basic charge would be used to recoup the Company's fixed costs that do not vary with a customer's natural gas usage.

However, Staff notes that setting a basic charge purely on the merits of assumed Company fixed costs comes with some notable shortcomings. First, studies of the fixed per-customer costs can vary dramatically depending on the assumptions used by the modeler. Staff has discussed these general concerns about the LRIC in this testimony as well as many other proceedings and notes that LRIC is long run where all inputs are variable while short-run

[15] NW Natural/1800, Wyman/60.
[16] NW Natural/1800, Wyman/73.
[17] NW Natural/1800, Wyman/77.

allows for fixed costs. In the short run, main and distribution pipes costs are fixed and no reinforcements are needed, while in the long-run all of the Company's facilities are variable. Second, a high basic charge has the potential to exacerbate existing energy equity and affordability issues for certain communities by improperly saddling low-income and low-usage customers with higher overall bills than they would otherwise have. While it is difficult to make this determination absent better data on how natural gas usage varies with income, Staff believes that a key consideration to changes to rate design is the disproportionate impacts the changes may have to environmental justice communities. Staff discusses these and other energy justice concerns associated with the Company's basic charge proposal further in Staff/300.

Q. How do the Company's proposed monthly charges align with the customer and fixed costs that the Company modeled?

A. The Company's LRIC Study in this rate case models the per-customer single family fixed cost of service at approximately $37 per month.[18] Based on the Company's study on multi-family cost of service, the Company expects the multi-family fixed cost of service to be between $9 and $15, depending on the capital cost payback assumptions used.[19]

[18] NW Natural/1800, Wyman/60.
[19] See Workpaper 3 to NW Natural Exhibit 1800.

Q. Based on this analysis, does Staff agree with the Company's proposal to bifurcate the basic charge into a single-family and multi-family charge?

A. Yes. Staff appreciates the Company carrying out the thorough analysis following our recommendation in UG 435.[20] NWN has studied the cost differences and confirmed the two-dollar credit for multifamily residential customers is justified by cost savings from operational efficiencies.[21] While the proper methodology to study the fixed cost of service is sensitive to the assumptions made in the study, Staff is convinced that the Company's modeling is adequate to justify a bifurcated basic charge even if one were to view it through a cost causation lens. Staff further notes that it expects a bifurcated basic charge to have positive equity impacts, as low-income Oregonians within NW Natural's service territory are generally more likely to live in multi-family dwellings.

Q. Does Staff agree with the Company's proposal to raise the monthly charge for single-family residential customers from $8 to $10?

A. Staff takes no issue with the increase to the basic charge at this time. Staff notes that NWN has among the lowest monthly charge among peer utilities.[22] That being said, looming affordability concerns across many utility customers gives reason to consider this proposed increase directly through the lens of

[20] See Docket No. UG 435, OPUC Staff, Opening Comments, April 22, 2022, Staff/1300 Scala/48.
[21] NWN/1800, Wyman/72.
[22] NWN/1800, Wyman/60.

customer impacts. As such, Staff may update its views following the Energy Justice Issues Public Workshop and its review of intervenors' testimonies.

Q. What is the Company's proposal for new residential customers?

A. NWN proposes to charge new premise residential customers a $16.25 premium over existing customers in the monthly basic charge. In effect, this will raise the monthly charge to $26.25 for single family customers and to $24.25 for multi-family customers who join NW Natural's Oregon gas system as a new premise customer on or after November 1, 2024. As a result, residential customers would have four different monthly charges under NWN's proposal. These four proposed monthly charges can be seen in Table 6.

Table 6. NWN's Proposed Residential Monthly Charges

Density	Old Customer	New Premise Customer
Single Family	$10	$26.25
Multi-Family	$8	$24.25

Q. What is the Company's stated reason for this higher basic charge for new premise residential customers?

A. NWN's load forecast finds new premise customers have, on average, a use per customer (UPC) roughly 210.8 therms lower than existing customers.[23] The Company states that it wants to collect a more equitable amount of revenue from new premise customers as compared to revenue collected from existing customers as part of its "responsible growth strategy". With lower margins from new premise customers, the Company seeks to raise revenue from new

[23] NW Natural/1800, Wyman/77.

premise customers in the fixed monthly charge to recoup lost revenue from lower volumetric sales.

Q. Does Staff support the NWN proposal?

A. No. Staff believes that issues related to new customers are more appropriately addressed by the Company's line extension allowance (LEA) policy and NWN's decoupling mechanism. Staff Witness Dr. Curtis Dlouhy discusses Staff's issues with the Company's LEA proposal in Staff Exhibit 900, which are not just limited to the Company's new premise basic charge. Further, issues with variances in volumetric sales are best solved by the Company's decoupling mechanism rather than a blanket charge that applies to all new customers. Proposals to modify the decoupling mechanism are addressed in Staff Witness Dr. Bret Stevens' testimony in Staff Exhibit 1900.

Q. Does Staff believe that a new premise basic charge is equitable?

A. Neither Staff nor the Company have a strong grasp of the demographics that would be subject to a new premise basic charge. Absent this knowledge, it is impossible for Staff or stakeholders to understand whether the financial impacts and cost shifting that result from this proposal would ultimately benefit or harm marginalized communities. Our concerns about LEA policy and decoupling aside, Staff believes that components justified as part of the Company's larger business or "responsible growth strategy" should be explored in a comprehensive planning setting such as an IRP where stakeholders can review the Company's intended trajectory more holistically

and have an opportunity to express concerns or share their expertise before such a sweeping change is proposed in a general rate case.

Q. Does Staff believe that it is fair and just rate design to distinguish residential customers by their status as a new customer or existing customer?

A. No. Staff prefers this to be handled through the decoupling mechanism which has different revenue per customer targets based on whether the customer is "new" or existing. The decoupling mechanism is designed to recover the Company's fixed cost regardless of variable consumption. This mechanism decreases the risk that the Company under-recovers these costs. NWN is proposing to differentiate between existing and new customers in its decoupling mechanism calculation, however Staff sees the rationale for this proposal as sufficiently different from the rationale for the new premise basic charge.

The decoupling mechanism proposal is meant to address an issue that is dependent on the customer connection date. In particular, Staff's decoupling mechanism proposal is accounting for the fact that new premise customers tend to consume less than existing customers *and* that their lower consumption is not taken into account when NWN calculates its decoupling revenues between rate cases. Staff argues that it is the combination of these issues that makes the decoupling proposal appropriate.

Q. Does Staff believe that the Company's LEA proposal and new premise basic charge send a fair signal to new customers?

A. No. Staff notes that in spite of the Commission's decision to incrementally decrease the LEA each year in UG 435 to under $1000, the Company has proposed an allowance as high as $3700 for the lowest usage new customers.[24] Taken in a vacuum, a new customer may choose to build natural gas into their home based on the financial incentives from the generous allowance. However, the Company's proposal to recover a higher fixed charge from new customers would reduce the financial benefit from the LEA.

Staff is concerned a new customer will be more likely to see a generous LEA than to notice the additional basic charge for new premises customers in the Company's tariffs for residential customers. Therefore, Staff believes that this structure of a large LEA and new premise fixed charge could be somewhat deceptive. In effect, this higher up-front allowance and higher monthly fixed charge acts like a loan to connect to the Company's natural gas system, but there is no guarantee the customer is aware they are paying for the benefit of the loan with a higher fixed charge than existing customers.

Q. Does this conclude your testimony?

A. Yes.

STAFF EXHIBIT 1900

Opening Testimony
Load Forecast, Decoupling, and Rate Base

April 18, 2024

Docket No: UG 490

Staff/1900
Stevens/1

Q. Please state your name, occupation, and business address.

A. My name is Bret Stevens. I am a Senior Economist employed in the Rates and Telecommunications Section of the Rates, Safety and Utility Performance Program (RSUP) of the Public Utility Commission of Oregon (OPUC). My business address is 201 High Street SE., Suite 100, Salem, Oregon 97301.

Q. Please describe your educational background and work experience.

A. My witness qualifications statement is found in Exhibit Staff/1901.

Q. What is the purpose of your testimony?

A. I discuss and review several issues in Northwest Natural's (NWN) general rate case. This includes NWN's Test Year load forecast, decoupling, and the calculation of rate base for purposes of establishing the return component of NWN's revenue requirement.

Q. How is your testimony organized?

A. My testimony is organized as follows:

Issue 1. Load Forecasting 2
Issue 2. Decoupling 20
Issue 3. Rate Base Calculation 25
Summary 26

Q. Could there be changes or updates to Staff's position and recommendations?

A. Yes. My testimony represents issues identified to date. My recommendations and issues may change when informed by new data and after reviewing testimony and analysis by other parties.

Docket No: UG 490

Staff/1900
Stevens/2

ISSUE 1. LOAD FORECASTING

Q. Please describe the results of Northwest Natural's (NWN) Test Year load forecast.

A. NWN forecasts an Oregon load of 1,050 million therms in the Test Year. Roughly 40.6 percent, 17.5 percent, and 41.9 percent of this total load is attributable to the residential, small commercial, and industrial & transportation customers respectively.[1]

Q. Please describe NWN's methodology for this forecast.

A. NWN forecasts Test Year load in three steps. First, NWN forecasts usage per customer (UPC) in the Test Year by using an ARIMA model on historical usage, weather, and economic data. This Test Year load is forecasted assuming normal weather in the Test Year based on 25-year climate normals.[2] Second, NWN forecasts Test Year customer counts. This forecast is based on historical regional business and employment growth trends, housing start forecasts, and other economic factors.[3] Lastly, the UPC forecast and customer count forecast are multiplied to create the schedule-wide load forecast.

Q. Does Staff have any major concerns regarding the fundamentals of NWN's load forecast methodology?

A. No, Staff has no major concerns with NWN overall load forecast methodology. In general, Northwest Natural uses industry standard methodologies and is

1 NWN/1801, Wyman/1.
2 NWN/1800, Wyman/6.
3 NWN/1800, Wyman/7.

receptive to feedback regarding model improvements. That said, nearly all econometric models have room for improvement across various metrics.

Q. Does Staff have any proposed changes to NWN's load forecast methodology?

A. Yes. Staff is recommending changes to the load forecast with the intention of improving transparency and model flexibility. Staff is recommending a unique set of changes for each rate class UPC forecast. Staff's recommendations can be categorized as the following:

1. Algorithmically parameterize ARIMA models as baseline with any deviations justified in testimony.
2. Attempt to use non-linear weather terms when applicable and discuss rationale for excluding these terms.
3. Use monthly dummies as opposed to the natural logarithm of the number of weekend and holiday days in each month.
4. Drop variables with very small effects.

Q. Has Staff performed these changes to the forecast?

A. Partially. Staff has estimated regression results for various schedules but has not yet evaluated the impact of these proposed changes on the Company's proposed revenue requirement or rates. Staff is working with the Company to implement these changes and understand the full effect of Staff's recommendation on rates. Staff does not anticipate that these changes will have a large impact on the proposed rates in this case but contends that these changes will improve the accuracy of NWN's load forecast.

Q. Please describe Staff's proposed changes to the residential forecast.

A. Staff is proposing several changes to the residential forecast. First, Staff supports using a (1,1,1) ARIMA model as opposed to NWN's proposed (1,0,0)(0,0,1)[2] ARIMA model. This parameterization was automatically selected using the Hyndman-Khandakar algorithm. Staff also recommends modifying the covariate matrix to include monthly fixed effects to control for seasonality, a squared HDD term to control for non-linear effects of weather, and the exclusion of various weather terms that did not produce meaningful coefficients.

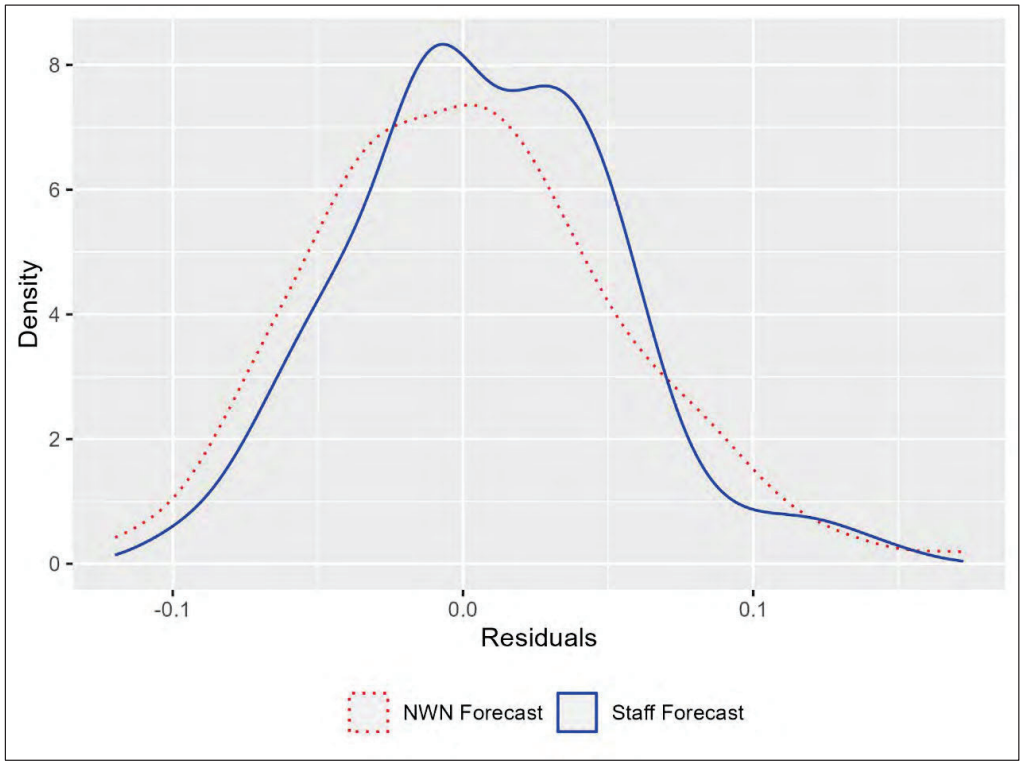
Q. How do Staff's proposed changes affect the residential load forecast?

A. These modifications to the load forecast are largely to help the model be more flexible and help improve interpretability. Staff's changes do improve the fit of the model as measured by the Akaike information criterion (AIC) and Bayesian information criterion (BIC). The distribution of residuals between Staff and NWN's proposed models can be seen below in Figure 1.

Docket No: UG 490

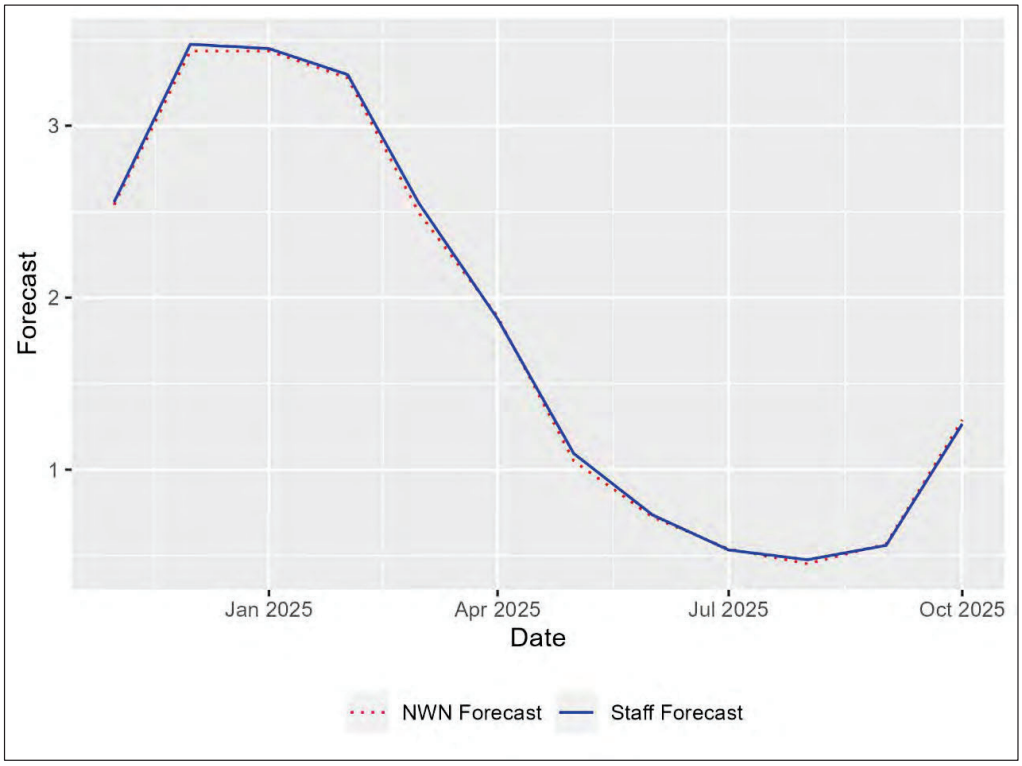
Staff/1900
Stevens/5

Figure 1. Comparison of Residential Model Residuals



Staff's changes do not greatly affect the residential load forecast. The difference between Staff's and NWN's monthly residential load forecasts can be seen in Figure 2 below.

Figure 2. Residential Test Year Load Forecast Comparison



Q. Please describe Staff's proposed changes to the commercial load forecast.

A. Staff is proposing several changes to the commercial forecast. First, Staff notes that NWN uses two models to forecast commercial usage. One model forecasts usage for all commercial customers, while the other only forecasts usage for small commercial customers. For the model forecasting all commercial customers, Staff supports using a (1,0,0)(1,1,1)[12] ARIMA model as opposed to NWN's proposed (1,0,0)(0,0,1)[2] ARIMA model. Staff also recommends that all monthly fixed effects be removed from this model.

Instead, the seasonal differencing will account for the seasonal variation in usage.

Staff notes that this parameterization was not chosen by algorithm but was instead manually chosen by Staff. Staff chose to override the model as the algorithmically parameterized model forecasted summer months much higher than the historical norms. A comparison of the forecasts produced by each of these models can be seen in Figure 3. Staff also included a squared HDD term in its model and removed weather variables with negligible impact on the model. Overall, Staff's model has a comparable fit to the automatically parametrized model with monthly fixed effects. The comparison of residuals of each of these models can be seen in Figure 4.

Docket No: UG 490

Staff/1900
Stevens/8

Figure 3. Comparisons of Commercial Forecasts

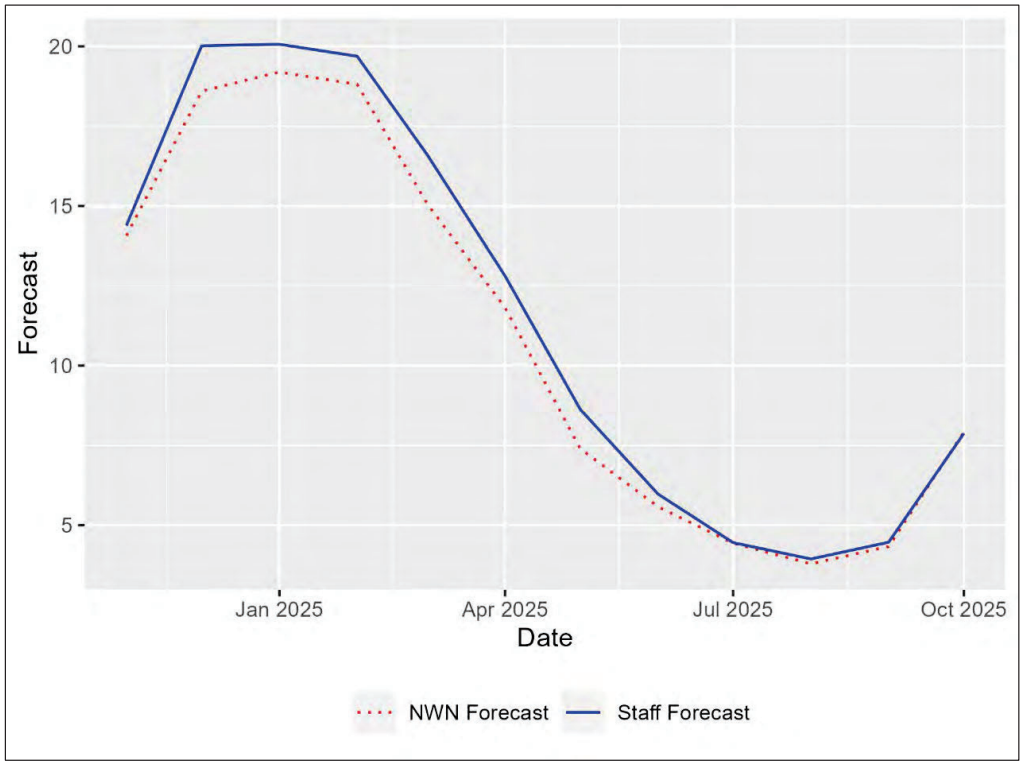


Figure 4. Comparison of Commercial Model Residuals

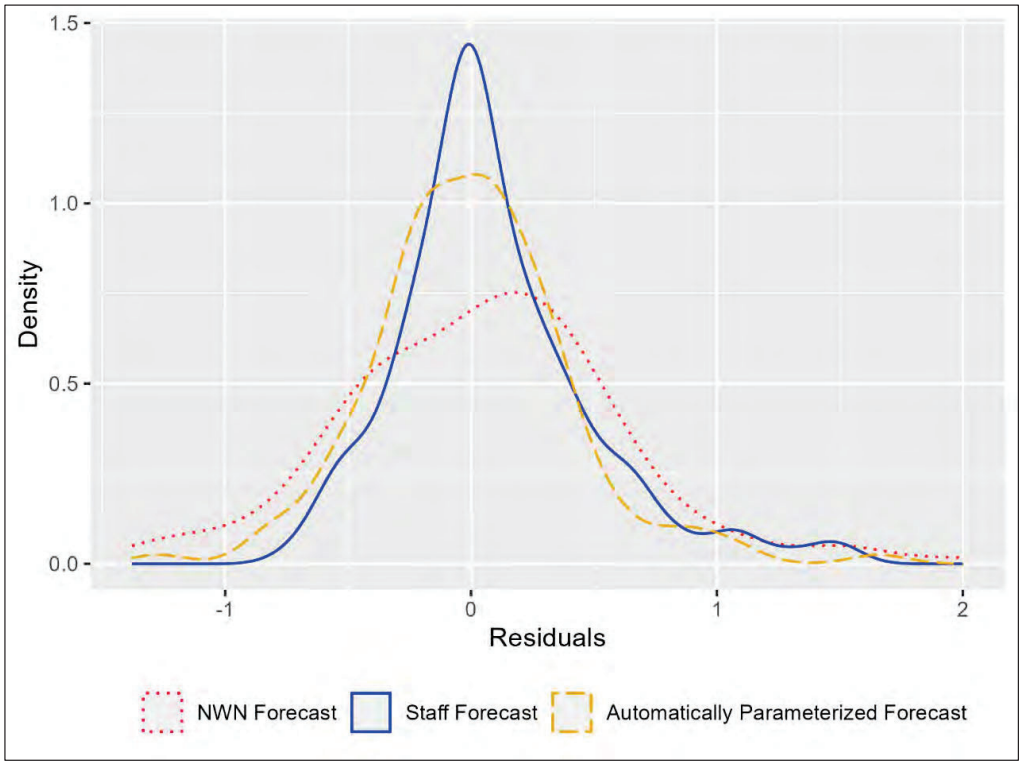

For the small commercial model, Staff similarly recommends removing monthly fixed effects from the model and instead relying on seasonal differencing. Staff recommends using a (0,1,1)(1,2,1)[12] ARIMA model as opposed to NWN's (1,0,0)(0,0,1)[2] ARIMA model. Again, the model produced via Staff's preferred parameterization algorithm produced unrealistic summer usage estimates. Staff also included a squared HDD term and removed weather variables with negligible impacts on the model. A comparison of the forecasts and model fit can be seen in Figure 5 and Figure 6 respectively.

Docket No: UG 490

Staff/1900
Stevens/10

Figure 5. Comparisons of Small Commercial Forecasts

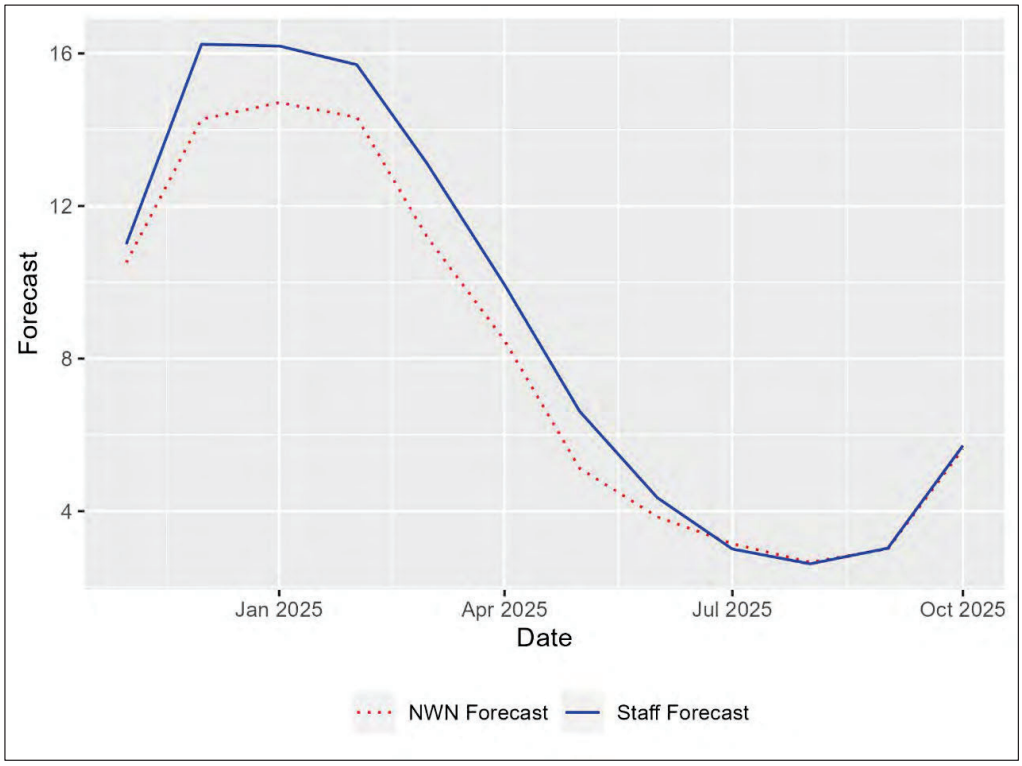

Figure 6. Comparison of Small Commercial Model Residuals

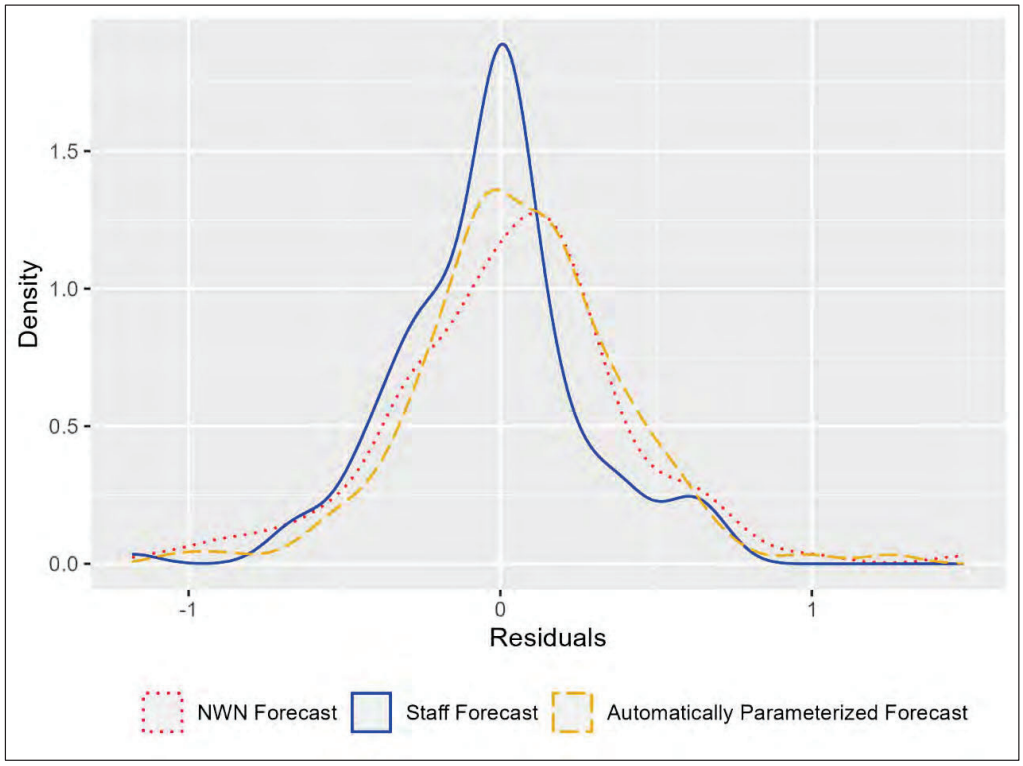


Q. How do Staff's proposed changes affect the commercial load forecast?

A. Staff's proposed modifications to the load forecast are to enhance the model's flexibility and improve its interpretability. Staff's changes do improve the fit of the model as measured by the AIC and BIC. Staff's forecast slightly increases the Test Year load forecast for commercial customers, primarily through a higher forecasted peak consumption in winter months.

Q. Please describe Staff's proposed changes to the Schedule 27 (Residential Dry-Out) forecast.

A. Staff is proposing several minor modifications to the Schedule 27 model. First, Staff proposes using a (1,0,0) ARIMA model as opposed to NWN's proposed

(1,0,1) ARIMA model. Staff's proposed parameterization was automatically selected using the Hyndman-Khandakar algorithm. Further, Staff recommends using monthly fixed effects and removing weather variables with a negligible effect on the model.

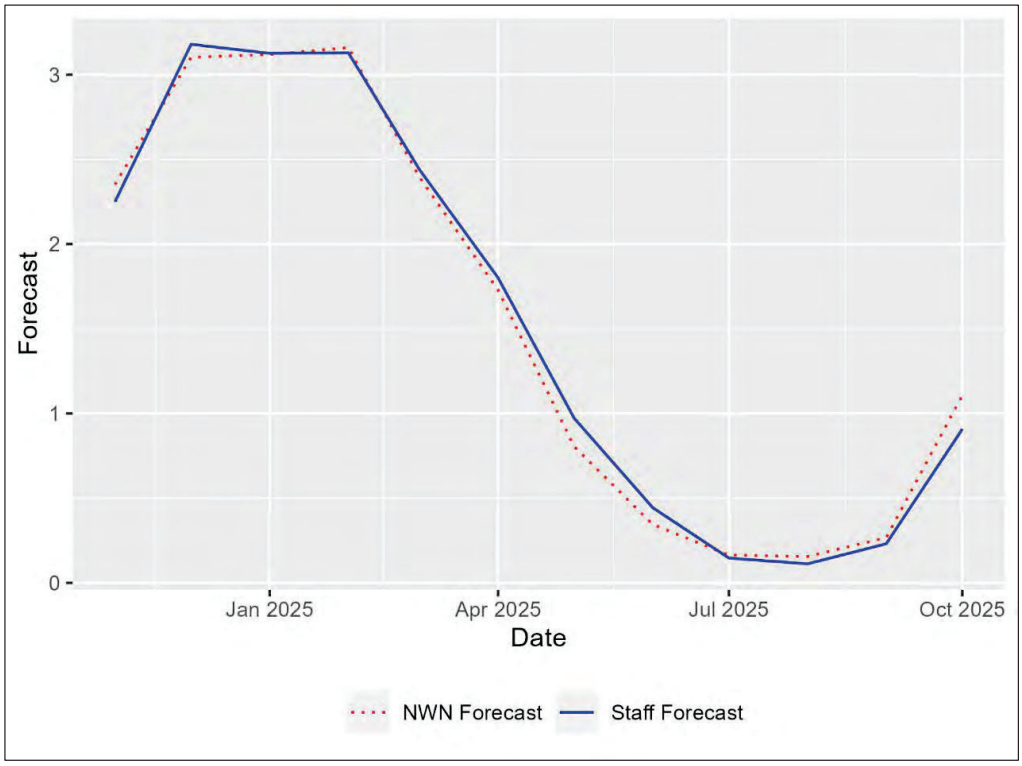
Q. How do Staff's proposed changes affect the Schedule 27 load forecast?

A. Staff's recommended modifications have a very small impact on the Schedule 27 load forecast. The difference between Staff's and the Company's forecasts can be seen below in Figure 7. These modifications to the load forecast are largely to help the model be more flexible and help improve interpretability. Staff's changes do improve the fit of the model as measured by the AIC and BIC. The comparison of Staff and the Company's proposed models can be seen in Figure 8 below.

Docket No: UG 490

Staff/1900
Stevens/13

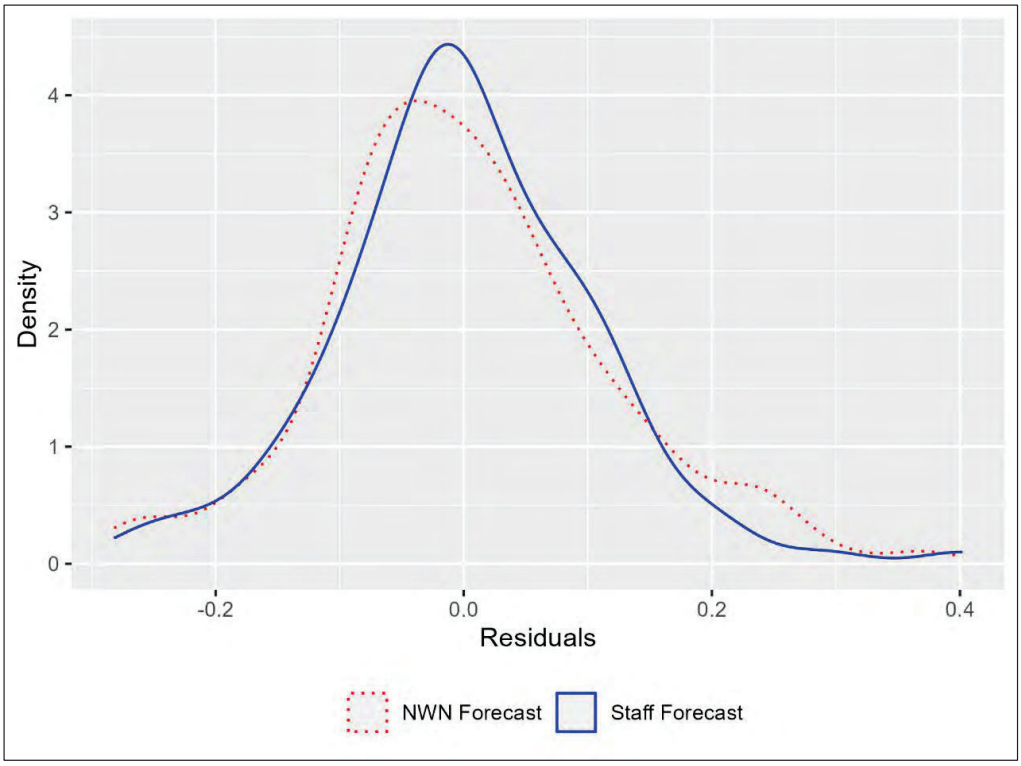
Figure 7. Comparison of Schedule 27 Forecasts



Docket No: UG 490

Staff/1900
Stevens/14

Figure 8. Comparison of Schedule 27 Model Residuals



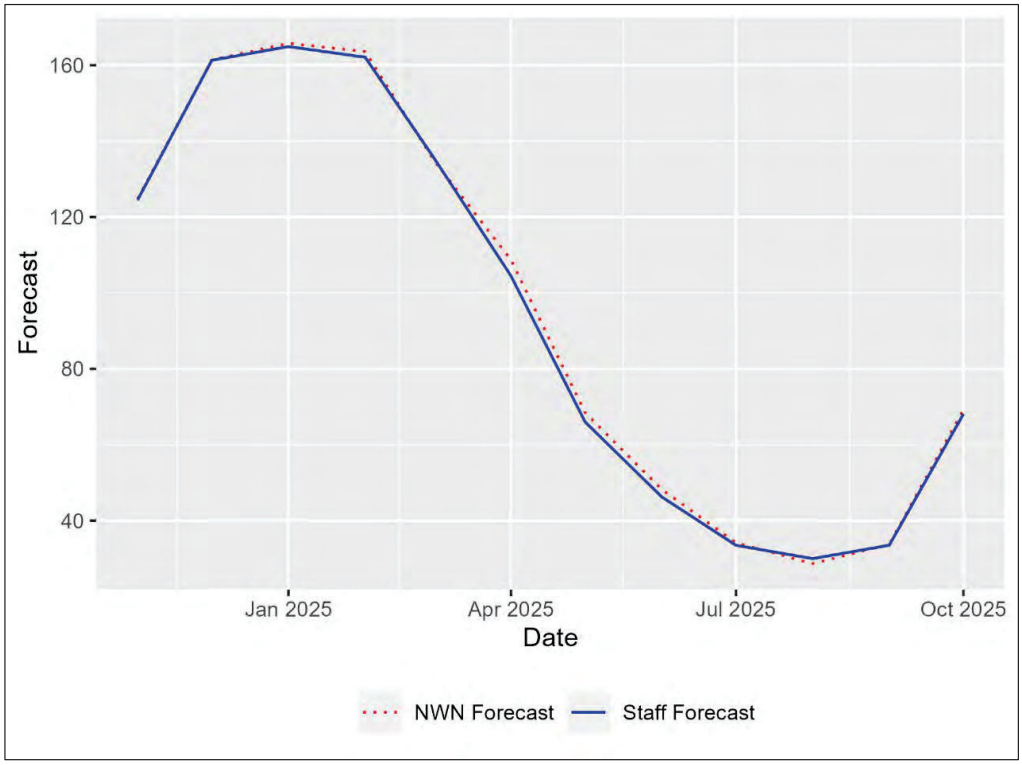
Q. Please describe Staff's proposed changes to the Schedule 31 (Non-Residential Firm Sales and Firm Transportation Service) forecast.

A. For NWN's Schedule 31 forecast, Staff is recommending the same changes be made as recommended for the Schedule 27 forecast. Namely, Staff recommends that a (1,0,0) ARIMA model be used as opposed to a (1,0,1) ARIMA model, monthly fixed effects be used, and weather variables with a negligible impact on the model be omitted.

Q. How do Staff's proposed changes affect the Schedule 31 load forecast?

A. Again, the effects of Staff's recommended changes have a relatively small impact on the overall forecast for Schedule 31 and are largely to help the model be more flexible and help improve interpretability. The Staff and Company forecasts can be seen below in Figure 9. Staff's changes do improve the fit of the model as measured by the AIC and BIC. The comparison of Staff and the Company proposed models can be seen in Figure 10 below.

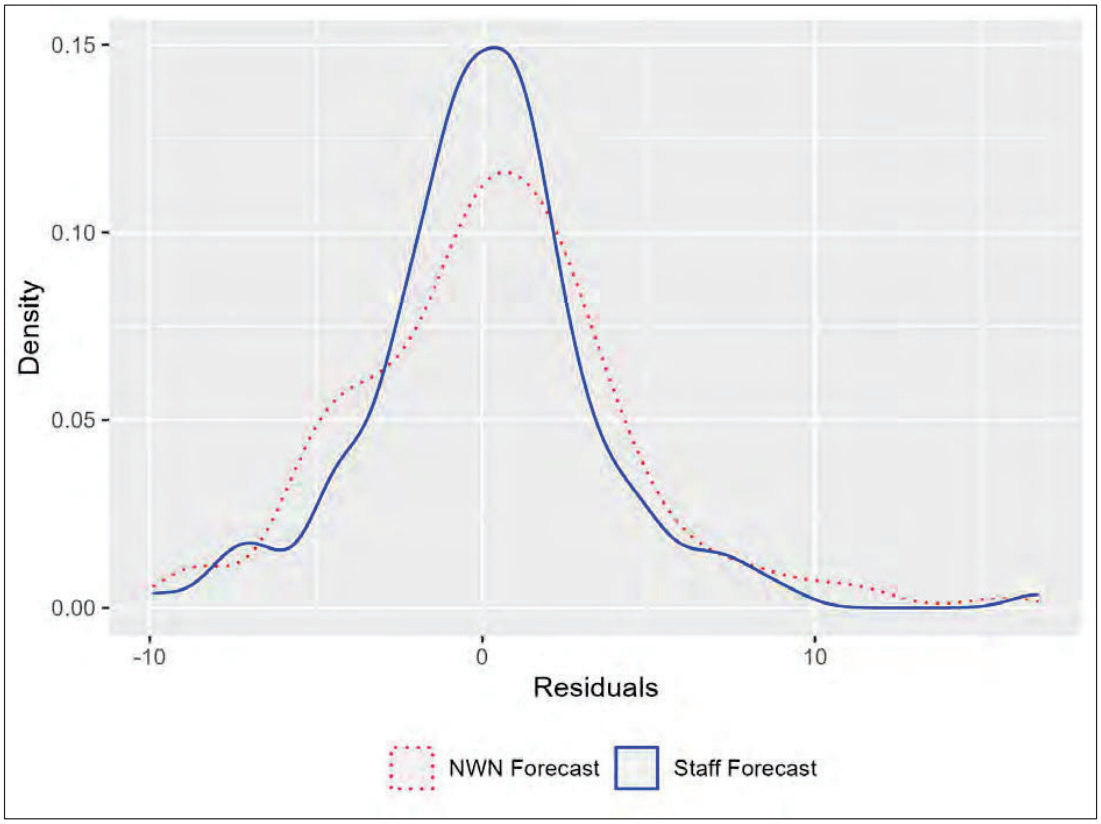
Figure 9. Comparison of Schedule 31 Forecast



Docket No: UG 490

Staff/1900
Stevens/16

Figure 10. Comparison of Schedule 31 Residuals



Q. Please describe Staff's proposed changes to the Schedule 32 (Large Volume Non-Residential Sales and Transportation Service) forecast.

A. For NWN's Schedule 31 forecast, Staff is recommending more substantive changes. Staff recommends that a (1,0,0)(1,2,1)[12] ARIMA model be used as opposed to a (1,0,0) ARIMA model. As with the commercial models discussed above, Staff is recommending that no monthly fixed effects be included in the model and that seasonal differencing instead be used to control for seasonal variation. Staff is also recommending that weather variables that have a negligible effect on the forecast be removed.

Staff notes that this parameterization was not chosen algorithmically but was manually selected by Staff. Similar to the commercial models, the algorithmically parameterized model with monthly fixed effects produced a summer season forecast that was much higher than any historical consumption. Staff's parameterization is meant to produce a summer forecast that is more in line with historical consumption, while still improving fit and adequately controlling for seasonality.

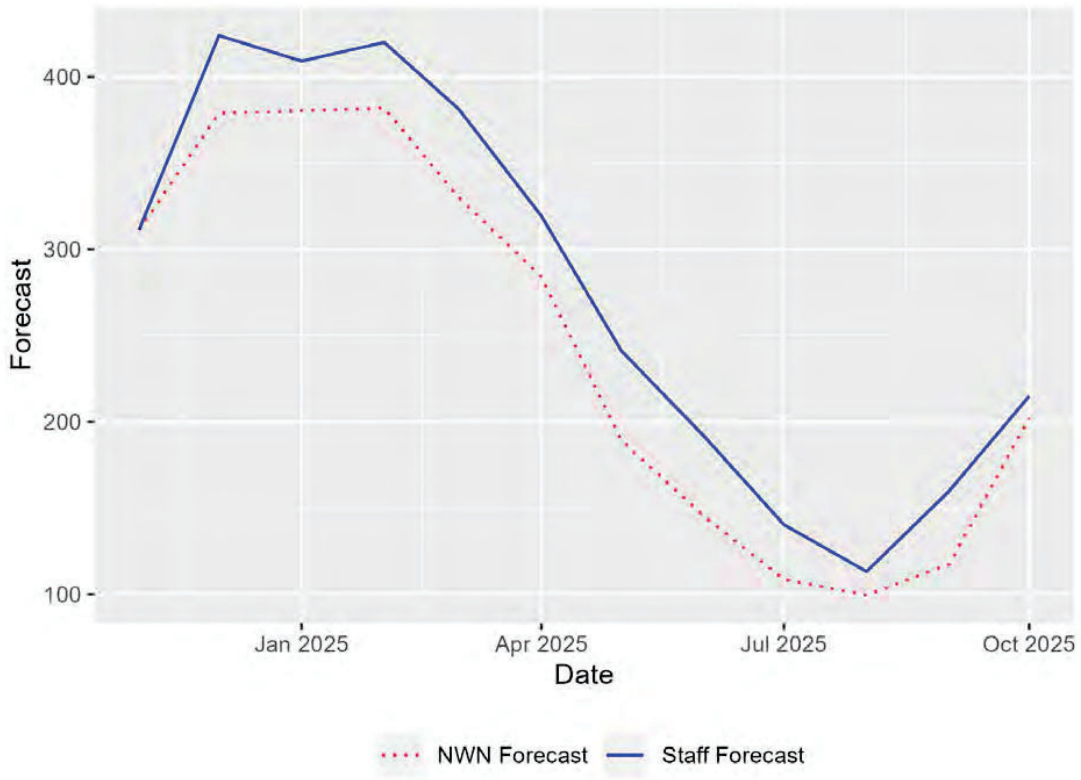
Q. How do Staff's proposed changes affect the Schedule 32 load forecast?

A. Staff's recommended changes increase the Schedule 32 slightly. This increase is uniform in each month but is most pronounced in the peak period. The difference between Staff's recommended model, NWN's model, and the algorithmically parameterized models can be seen below in Figure 11.

Docket No: UG 490

Staff/1900
Stevens/18

Figure 11. Comparison of Schedule 32 Forecast



Both Staff's model and the algorithmically parameterized model provide improvement to the fit as measured by the AIC and BIC. Each model's distribution of residuals can be seen below in Figure 12.

ISSUE 2. DECOUPLING

Q. Please summarize NWN's proposal regarding its decoupling mechanism.

A. NWN is proposing to bifurcate the residential Decoupling calculation between established customers and new customers that join the system after each rate case. This change would modify the decoupling revenue calculation by comparing new premise residential customer usage to a lower baseline level. NWN's proposal is based on Staff's recommendation in UG 435. This proposal is meant to account for the fact that customers joining the system will not have the same baseline consumption distribution as established customers on the system. If the system-wide baseline consumption, calculated in the most recent rate case, is applied to all customers joining the system between rate cases, the Company may over collect via its decoupling mechanism as new customers consume significantly less than the system-wide average.

NWN proposes using customer usage data from 2018-2022 to estimate the baseline consumption of new customers connecting between rate cases. NWN also proposes beginning the bifurcation of the Decoupling mechanism after the difference between normal and actual heating degree days is calculated.

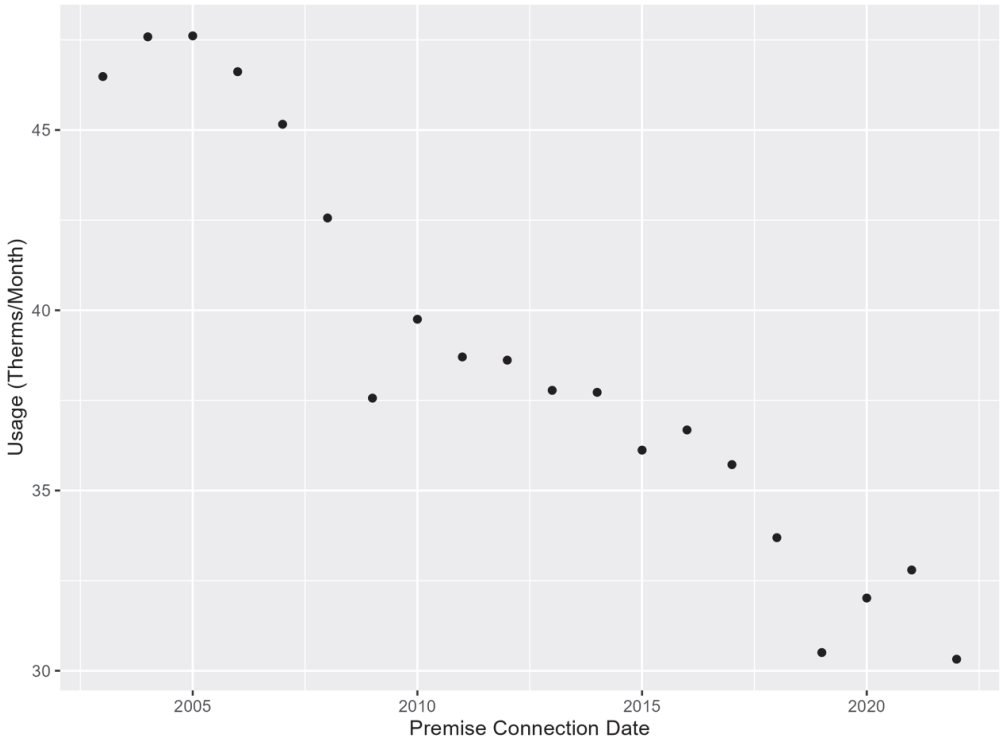
Q. How has usage changed for newer customers?

A. Figure 13 shows the average monthly usage for premises connected from 2003-2022.[4] This shows that the average yearly consumption of a premise

[4] Figure 13 was created using data obtained in Staff DR 390.

connecting to NWN's system has consumed nearly one less therm per month than a premise that was connected in the prior year. This decrease in average usage is stark and represents many technological and economic changes in NWN's service territory.

Figure 13. Average Monthly Usage by Premise Connection Year



Q. Does Staff agree that the bifurcation should only be applied to customers being added between rate cases?

A. No. After further review of the data, Staff is recommending that the residential class, for the purposes of the Decoupling mechanism, be fully bifurcated between "new" and "existing" customers on a permanent basis.

That is, “new” customers would not be folded into the “existing” customer category during rate cases and would remain separate going forward.

Q. What is Staff’s rationale for this recommendation?

A. Staff’s concern is largely around customer attrition. Staff’s initial decoupling recommendation in UG 435 was made to solve the issue presented by new customers being systematically different than existing customers. However, in this updated recommendation Staff is aiming to also address the fact that customers leaving the system are likely different than customers who have recently joined the system.

NWN’s decoupling mechanism accounts for differences both in usage per customer and customer count compared to the load forecast. If the baseline for “existing” customers includes all customers connected at the time of the rate case, then the system-wide baseline usage and heating coefficient will be the weighted averages of older and newer customers. However, customers who leave the system are likely not customers who have only connected to the system recently. As such, the usage distribution of customers leaving the system is likely shifted to right of the usage distribution for the entire system. This would then lead to a mechanism that compares customers remaining on the system to a baseline usage that is skewed upward. Permanently bifurcating the decoupling mechanism between “existing” and “new” customers would help mitigate the impact of this phenomenon.

Q. What year should be used to designate "new" customers for the decoupling mechanism going forward?

A. "New" customers, for the purpose of the decoupling bifurcation, should be considered as any customer who connected to the system beginning in 2018. Staff chose this year for several reasons. First, NWN implicitly acknowledges in its testimony that customers who joined the system after this date have significantly different consumption compared to existing customers as they used this group to calculate their indicative baseline for new customers. Second, all houses built on and after 2018 would be subject to the updated residential building codes set in 2017. Lastly, Figure 13 shows that average usage of customers that connected to the system between 2018-2022 has remained fairly constant. This indicates that the rate of change in UPC may be stabilizing, or at least slowing down. As such, this cohort of customers will likely be more similar to each other than customers who connected to the system before 2018.

Staff does recognize that the exact year of delineation is somewhat subjective. One could easily argue that 2017 or 2019 may be better or equally as good as 2018 for separating these groups and as such, no delineation should be made. However, Staff argues that it is still worthwhile to establish a partition between these groups even if no delineation will be perfect.

Q. Does Staff believe that the definition of this bifurcation group should remain unchanged in all future rate cases?

A. No. If customer usage patterns sufficiently change in future years, it may be prudent to redefine the delineation between older and new customers.

Q. Does Staff agree that the bifurcation should take place after the difference between the normal and actual heating degree days is calculated?

A. No. Staff recommends that the Company calculate separate heating coefficients separately for both customers who connected before and after 2018. Staff recognizes that this recommendation runs counter to Staff's proposal in UG 435.[5] However upon further review, Staff has altered its recommendation. This change is meant to reflect the fact that new customers to the system will likely both have lower baseline usage and reactions to weather fluctuations. This phenomenon is due to newly connected premises having newer and more efficient heating systems and homes that were built to modern residential building codes. If the weather normalized usage for these customers is not updated to reflect this, then the decoupling mechanism will be set assuming a higher level of usage for new customers than should be anticipated.

Docket No: UG 490

Staff/1900
Stevens/25

ISSUE 3. RATE BASE CALCULATION

Q. From a high level, please describe how Northwest Natural calculates rate base in this case.

A. NWN is proposing to use a 13-month Average-of-Monthly-Averages (AMA) approach to calculate rate base in this case. In this calculation, they do include growth-related capital additions in the Test Year, however, but do not include major capital additions.

Q. Does this methodology indicate a significant break from how rate base was calculated in the past?

A. No. Staff reviewed testimony from UG 435, and the high-level rate base calculation has remained the same.

Q. Does Staff agree with this calculation?

A. Yes. This is Staff's preferred methodology for calculating rate base. Staff is still in the process of reviewing the exact capital additions included in the calculation, but at this time has no issues with NWN's methodology. Staff may recommend that certain capital additions be excluded in future testimony if any inappropriate costs are found.

Docket No: UG 490

Staff/1900
Stevens/26

SUMMARY

Q. Please summarize your recommendations.

A. Staff is proposing relatively minor changes to NWN's load forecast. These changes are meant to improve transparency and flexibility of NWN's econometric load forecasting models. In general, these recommendations involve automatically parameterizing ARIMA models as a baseline, using non-linear weather variables, using seasonal ARIMA terms when applicable, and removing weather variables with small effects. Staff is proposing that NWN bifurcate its proposed decoupling mechanism before the difference between normal and actual heating degree days is calculated. This necessitates that a heating coefficient is separately calculated for new customers. Lastly, Staff does not have any recommendation regarding NWN's overall rate base calculation methodology at this time.

Q. Does this conclude your testimony?

A. Yes.

CASE: UG 490
WITNESS: BRET STEVENS

PUBLIC UTILITY COMMISSION
OF
OREGON

STAFF EXHIBIT 1901

Witness Qualifications Statement

April 18, 2024

Docket No. UG 490

WITNESS QUALIFICATIONS STATEMENT

NAME: Bret Stevens

EMPLOYER: Public Utility Commission of Oregon

TITLE: Senior Economist
Rates, Safety, and Utility Performance

ADDRESS: 201 High Street SE. Suite 100
Salem, OR. 97301

EDUCATION: Ph.D., Agricultural & Resource Economics (2023)
University of California, Davis

M.S., Agricultural & Resource Economics (2017)
University of California, Davis

B.A., Economics/Environmental Studies (2016)
Western Washington University

EXPERIENCE: I have been employed at the Public Utility Commission of Oregon since September of 2022. My primary responsibilities revolve around providing research and analysis on rate spread and rate design. I have been a staff witness in UE 407, UE 410, UE 412, UE 414, UE 416, UE 421, UE 426 and UG 461. Prior to working for the Commission, I was employed by the University of California, Davis as a graduate student researcher, associate instructor, and teaching assistant. I taught courses on econometrics, finance, and microeconomics.

OPENING TESTIMONY
Highly Confidential Information is Subject to Modified Protective Order No. 23-480

April 18, 2024

Docket No: UG 490

Staff/2000
Yamada/1

Q. Please state your name, occupation, and business address.

A. My name is Steph Yamada. I am a Senior Utility Analyst employed in the Rates and Telecommunications Section of the Rates, Safety and Utility Performance (RSUP) Program of the Public Utility Commission of Oregon (OPUC). My business address is 201 High Street SE, Suite 100, Salem, Oregon 97301.

Q. Please describe your educational background and work experience.

A. My witness qualifications statement is found in Exhibit Staff/2001.

Q. What is the purpose of your testimony?

A. The purpose of my testimony is to provide background, analysis, and recommendations regarding the Company's Test Year inclusions for wages, salary, incentives, and full-time equivalents (FTE).

Q. Did you prepare any exhibits for this docket?

A. Yes. In addition to my witness qualifications statement provided in Exhibit Staff/2001, I prepared the following supporting exhibits: Exhibit Staff/2002 (NW Natural's Non-Confidential DR Responses), Exhibit Staff/2003 (NW Natural's Highly Confidential DR Responses), and Exhibit Staff/2004 (Staff's Highly Confidential Workpapers).

Q. How is your testimony organized?

A. My testimony is organized as follows:

Issue 1. Salaries & Wages 3
Figure 1: Test Year Salaries, Wages, Overtime 3
Issue 2. Incentives 8
Figure 2: Company Proposed Incentives 8

Figure 3: Staff's Annual Incentives Adjustment – Oregon 11
Issue 3. FTE 14
Figure 4: Company Proposed FTE 14
Figure 5: Staff Proposed FTE 16
Figure 6: Staff's Exempt & Nonexempt FTE Adjustment - Oregon 19
Issue 4. Other Related Adjustments 20
Figure 7: Summary of Staff's Adjustments – Oregon 21

Q. Could there be changes or updates to Staff's position and recommendations?

A. Yes. My testimony represents issues identified to date. My recommendations and issues may change when informed by new data and after reviewing testimony and analysis by other parties.

Docket No: UG 490

Staff/2000
Yamada/3

ISSUE 1. SALARIES & WAGES

Q. Please summarize the Company's proposal for salaries and wages in this case.

A. The Company proposes to include salaries, wages, and overtime totaling **[BEGIN HIGHLY CONFIDENTIAL]** [redacted] **[END HIGHLY CONFIDENTIAL]** in Oregon in the Test Year,[1] as summarized in Figure 1.

FIGURE 1: TEST YEAR SALARIES, WAGES, OVERTIME

[BEGIN HIGHLY CONFIDENTIAL]

Category	Base Salaries & Wages	Overtime
Officers	$4,982,411	$0
Exempt	$65,175,815	$0
Nonexempt	$748,875	$5,242
Union	[redacted]	[redacted]
Total	[redacted]	[redacted]

[END HIGHLY CONFIDENTIAL]

For non-union employees and officers, the base wage amounts shown in Figure 1 were determined by escalating calendar year 2023 costs by 5.30 percent in 2024 and 4.85 percent in 2025.[2] The base wages for union employees were calculated **[BEGIN HIGHLY CONFIDENTIAL]** [redacted][3]

[1] Staff/2003, NW Natural's Response to Staff's SDR 92, HIGHLY CONFIDENTIAL Attachment 1 (Viewable only in Huddle).
[2] NW Natural/1000, Rogers/6.
[3] NW Natural/1000, Rogers/7, lines 11-13 and 17-20, HIGHLY CONFIDENTIAL.

[redacted] **[END HIGHLY CONFIDENTIAL]**[4]

Q. How does the Company determine employee compensation?

A. For non-union employees, NW Natural uses survey data to align its base pay with the median of the market for comparable jobs with other companies.[5] Union employees' total compensation is determined through a negotiated process that incorporates selected market survey data and union contracts.[6] For officers, the Company uses competitive compensation data, which are collected and analyzed by an independent compensation consultant, Pay Governance, to determine appropriate compensation levels.[7]

Q. Please provide a summary of the Commission's historical method for determining the amount to include in a utility's revenue requirement for salaries and wages, including overtime.

A. The Commission generally determines the appropriate level of wages and salaries for employees in the Test Year using Staff's three-year Wage and Salary (W&S) model to estimate union and non-union payroll levels for energy utilities.[8,9] The model calculates an appropriate level of Test Year expense

9 *See Pacific Power & Light*, UE 116, Order No. 01-787 at 40; *In the Matter of Northwest Natura*l, Docket No. UG 132, Order No. 99-697 at 43 (November 12, 1999); *In the Matter of PGE*, Docket No. UE 102, Order No. 99-033 at 61 (January 27, 1999); *In the Matter of PGE*, Docket No. UE 88, Order No. 95-322 at 10 (March 29, 1995).

and capital investment for wages and salaries by escalating the Company's base year wages and salaries by annual changes to the All Urban CPI (for non-union labor) or negotiated increases (for union labor). For the purposes of this analysis, the base year is three years prior to the Test Year. The model then applies a sharing mechanism between the wages and salaries determined by the W&S model and the wages and salaries proposed by the utility. The Commission has previously declined to apply the sharing mechanism to union wages, instead basing the Test Year inclusion on the contracted increases in applicable union agreements.[10]

Q. Why has the Commission used the W&S model to determine the Test Year inclusion for non-union wages and salaries?

A. The Commission has explained its rationale in previous orders. For example, in an order issued in 1999, the Commission explained:

> The [Three Year] model incorporates actual market-based data by using, as a starting point, actual historic wages. We also agree with Staff's use of the All-Urban CPI index to adjust historic wages and salaries. Adjusting payroll levels by changes in inflation provides the employees the same real level of compensation as in the base year and provides an incentive to companies to minimize labor costs. Contrary to the assertions by NW Natural, local economic conditions are represented in the All-Urban CPI, as the Bureau of Labor Statistics includes prices in Oregon when it conducts its survey. Moreover, Staff's method of sharing the difference between payroll projections equally between ratepayers and shareholders also allows NW Natural some ability to increase wages above the rate of inflation in response to changes in market conditions without allowing unchecked escalation.[11]

[10] *In the Matter of PacifiCorp*, Docket No. UE 374, Order No. 20-473 at 100 (December 18, 2020).
[11] *In the Matter of Northwest Natural*, Docket No. UG 132, Order No. 99-697 at 43 (November 12, 1999).

Q. Please explain how Staff used the Three-Year W&S model to arrive at its recommendation for base wage and salary levels for the Test Year.

A. Consistent with the W&S model, Staff began with actual wage information from three years prior to the Test Year.[12] With a Test Year of November 1, 2024, to October 31, 2025, Staff began with 2022 wage information and escalated it to 2025 using All-Urban CPI rates, which are 4.1 percent for 2023, 2.7 percent for 2024, and 2.0 percent for 2025.[13] Staff then applied the sharing principle to Staff's and the Company's projected 2024 Test Year amounts for non-union labor. The sharing principle, which allows the Company to share 50/50 the lesser of the difference between the Company's and Staff's calculated projections, or a 10 percent band around Staff's calculated projection, results in a ($672,170) adjustment to Staff's projection for officer wages and a ($801,812) adjustment to exempt employee wages at the Oregon level.[14] Finally, these adjustments are allocated 64.9 percent to O&M and 35.1 percent to capital.[15] Staff did not make any adjustments to union labor.

Q. What is Staff's recommended adjustment for base salaries and wages?

A. Staff recommends a total adjustment of ($1,473,983) attributable to the Company's base salaries and wages for Oregon, excluding union labor. This amount is allocated ($956,615) to O&M and ($517,368) to capital.

15 Staff/2002, NW Natural's Response to Staff's SDR 93.

Docket No: UG 490

Staff/2000
Yamada/7

Q. Does Staff recommend further adjustments to union employee wages?

A. Yes. Staff recommends that union wages be updated to reflect actual negotiated union wage increases for the Test Year once those amounts are known. Staff's recommended totals reflect the Company's current estimate for union compensation, which was developed as discussed previously. The current contract for union employees is set to expire on May 31, 2024, and NW Natural is currently in negotiations with the bargaining unit for a new contract.[16] The Company **[BEGIN HIGHLY CONFIDENTIAL]** [redacted][17] [redacted] **[END HIGHLY CONFIDENTIAL]**.[18]

Q. Please explain how Staff used the Three-Year W&S model to arrive at Staff's overtime recommendation for the Test Year.

A. Staff's overtime analysis follows the same methodology as that used for base salaries and wages, which was discussed previously. The results of this analysis are shown in Staff's workpapers.[19]

Q. What is Staff's recommended adjustment for overtime?

A. Staff recommends an adjustment of ($4,935) attributable to the Company's non-exempt employee overtime for Oregon. This amount is allocated ($3,203) to O&M and ($1,732) to capital.

ISSUE 2. INCENTIVES

Q. Please summarize the Company's proposal for incentives in this case.

A. The Company is seeking recovery of incentives totaling $9,340,431 in Oregon.[20] This amount is allocated from a system total of $10,528,091.[21] The breakdown of the Oregon amount is summarized in Figure 2, as follows.[22]

FIGURE 2: COMPANY PROPOSED INCENTIVES

Incentive	Exempt	Non-Exempt	Total
Annual Incentive (Short-Term)	$8,065,357	$52,562	$8,117,919
Long Term Incentive Pay (O&M)	$130,315	$0	$130,315
Stock Expense (RSU) (O&M)	$895,024	$0	$895,024
Employee Stock Purchase Plan	$197,173	$0	$197,173
Total	**$9,287,869**	**$52,562**	**$9,340,431**

The Company has excluded all executive incentive compensation from the Test Year.[23,24] Union employees are not eligible for pay-at-risk.[25] The Employee Stock Purchase Plan (ESPP) is not identified by employee type,[26] and is included in the Exempt column in Figure 2.

Q. Does NW Natural argue that incentives should be fully includable in rates?

A. Yes. NW Natural proposes to include the full amount of non-officer incentives as shown in Figure 2. The Company argues that pay-at-risk "represents an

[20] NW Natural/1000, Rogers/13, line 6.
[21] Staff/2002, NW Natural's Response to Staff's DR 142, Attachment 1.

[26] Staff/2002, NW Natural's Response to Staff's DR 142, Attachment 1.

essential part of competitive total compensation," and "is necessary for NW Natural to compete in the job market."[27] Regarding Restricted Stock Units (RSUs), the Company asserts that RSUs, which vest over four years, are "eligible for full cost recovery,"[28] stating that such incentives "are not awarded to incentivize financial performance."[29] While the Company has excluded officer incentives from its request "[g]iven the sizeable increase to revenues requested in this rate case,"[30] it maintains that such costs are prudently incurred, and that its "position [has not] changed regarding the ability to recover the costs of pay-at-risk pay for officers of the Company."[31] The Company further argues that the "Commission should treat the question of cost recovery for pay-at-risk on a case-by-case basis."[32]

Q. Please provide a summary of the Commission's historical method for determining the amount to include in a utility's revenue requirement for incentives.

A. To determine the appropriate amount to include in revenue requirement for incentives paid to employees, the Commission's policy is to disallow 100 percent of officers' bonuses because they are typically based on increased earnings, which benefits shareholders.[33] It is also Commission policy to disallow 75 percent of performance-based bonuses because they are generally

33 See Order No. 99-033 at 62; and *In the Matter of the Application of US West*, Docket No. UT 125, Order No. 97-171 at 74-76 (May 19, 1997).

focused on increased earnings and therefore bring more benefit to shareholders.[34] The Commission disallows 50 percent of merit-based bonuses because they equally benefit shareholders and ratepayers.[35] Union bonuses are treated in the same manner as non-union bonuses.[36] In this case, the issue of union bonuses is not relevant because union employees are not eligible for such compensation.

Q. Please describe Staff's analysis with regard to incentives.

A. As discussed previously, the Company proposes to include incentives totaling $9,340,431 in the Test Year. Since the Annual Incentives are calculated as a percentage of payroll and Staff made downward payroll adjustments as described previously, Staff first made a corresponding adjustment to the Company's proposal for Annual Incentives. Since the Company's proposed Annual Incentive inclusion is limited to exempt and nonexempt employees, Staff based its corresponding adjustment on Staff's base salary & wage adjustment in those employee categories. Staff allocated the reduction to exempt and nonexempt employees in the same proportions reflected in the Company's Test Year proposal. This adjustment is summarized in Figure 3 as follows.

[34] See Order No. 20-473 at 104.
[35] See Order No. 20-473 at 104.

Company Proposed Annual Incentive	$8,117,919
Staff's Exempt & Nonexempt Salary Adjustment	-5.30%
Staff's Corresponding Annual Incentive Adjustment	$(430,136)
Staff Adjusted Annual Incentive	**$7,687,783**

Next, Staff adjusted the Company's Long-Term Incentive Pay, Stock Expense, and ESPP in accordance with Staff's proposed FTE adjustment. Staff's proposal for exempt and nonexempt FTEs (discussed elsewhere in this testimony) represents a 4.14 percent reduction from the Company's proposed level. Consequently, Staff reduced Long Term Incentive Pay, Stock Expense, and the ESPP by 4.14 percent, or a total of ($50,597) in those categories.

Staff categorized the incentives as merit-based. Consequently, Staff reduced its adjusted incentives figures by 50 percent, in line with standard Commission practice. Staff's adjustment was allocated between O&M and capital in the same manner as described previously for salaries and wages. As described previously, the Company has already excluded 100 percent of officer incentives, in line with standard Commission practice.

Q. Has NW Natural demonstrated that the Commission should deviate from its longstanding practices regarding incentives and include the full amount of the Company's proposal?

A. No, NW Natural has not made a persuasive demonstration for why the Commission should deviate from its longstanding practices. The Company has primarily argued that pay-at-risk "represents an essential part of competitive

total compensation," and "is necessary for NW Natural to compete in the job market[.]"[37] The Company has made similar arguments in previous cases. For example, in Docket No. UG 132, the Company initially proposed "that 100 percent of the non-officers' bonuses be included in utility expense," and argued that "the bonuses are designed to make the company's total compensation package for these employees competitive with comparable jobs in the regional labor market."[38] In that case, the Commission concluded that Staff's recommendation to exclude 75 percent of performance-based bonuses and 50 percent of merit-based bonuses was "consistent with past ratemaking treatment of bonuses in prior electric and natural gas cases," stating that "NW Natural has not persuaded us that a change in policy is warranted."[39]

Q. The Company specifically argues that RSUs are eligible for full cost recovery. Why did Staff include RSUs in the amount that was reduced by 50 percent in its adjustment?

A. As discussed previously, the Commission typically excludes 50 percent of non-officer, non-performance-based incentives. Staff applied this reduction to its adjusted figure for RSUs, in accordance with Standard Commission practice.

Q. What is Staff's recommended adjustment for incentives?

---

37 NW Natural/1000, Rogers/8, lines 6-7.
38 See Order No. 99-697 at 44.
39 See Order No. 99-697 at 45.

A. Staff recommends a total Oregon-allocated adjustment of ($4,910,582) attributable to the Company's employee incentives.[40] This amount is allocated ($3,186,968) to O&M and ($1,723,614) to capital.

ISSUE 3. FTE

Q. Please summarize the Company's proposal for FTE in this case.

A. NW Natural proposes to include 1,183 employees in the Test Year at the system level.[41,42] This includes 1,170 FTEs existing at the end of the 2023 base year plus 13 additional employees that NW Natural expects to hire in the first half of 2024.[43] The Company removed 64.3 vacant FTEs and 63.7 non-regulated FTEs to arrive at the 1,183 total.[44] The system-wide and Oregon allocations are summarized in Figure 4 as follows.

FIGURE 4: COMPANY PROPOSED FTE

Type	System FTEs	Oregon FTEs
Officers	12.4	10.9
Exempt	560.4	497.1
Nonexempt	10.5	9.3
Union	599.6	531.9
Total	**1,183.0**	**1,049.2**

Q. Why does NW Natural propose to add 13 additional employees in 2024?

A. Eight of the proposed new FTEs relate to Information Technology & Services (IT&S) functions. These include four new Customer Information System (CIS) positions related to H2: Vista, three new operational technology positions, and

41 NW Natural/1000, Rogers/22.
42 Staff/2002, NW Natural's response to Staff's SDR 92, Attachment 1 (Non-Confidential portion).
43 NW Natural/1000, Rogers/21.
44 NW Natural/1400, Davilla/5.

one new security position.[45] The other five proposed new FTEs relate to decarbonization and compliance with the Climate Protection Program (CPP).[46]

Q. How has the Commission previously determined the appropriate FTE level for inclusion in rates?

A. Specific methodologies may vary somewhat on a case-by-case basis. However, the Commission has previously adopted Staff's principle that A&G non-union workforce should be limited to levels forecasted as a function of customers per FTE.[47]

Q. Please describe Staff's analysis with regard to FTEs.

A. For exempt and nonexempt employees, Staff first analyzed FTEs as a function of customers served per FTE. Staff's analysis indicated that between 2021 and 2023, the Company served an average of 1,469.9 customers per FTE at the Oregon level.[48,49] The Test Year proposal reflects 1,396.2 customers served per FTE in Oregon, representing a decrease of 73.7 customers per FTE, or five percent. Based on the total projected Oregon customer count of 707,022 at the end of the Test Year,[50] the three-year historical average of customers served per FTE would require a total of 481 exempt and nonexempt FTEs attributable to Oregon. The Company proposes to include 506.4, which is 25.4 higher than Staff's calculation. Staff proposes to remove these 25.4

higher-than-average FTEs. This adjustment is applied to the exempt and nonexempt employee categories in the same proportions as reflected in the Company's Test Year proposal.

Staff also proposes to add back certain FTEs related to the new positions proposed by the Company. As discussed previously, the Company proposes to add 13 new employees in the Test Year—five related to the CPP, and eight related to IT&S functions. Staff proposes to exclude four of the eight proposed new IT&S FTEs and four of the five proposed new CPP FTEs. The resulting net increase of five FTEs is allocated 88.7 percent to Oregon,[51] and added to the exempt employee category. Together with Staff's 25.4 FTE reduction that was discussed previously, Staff's proposal represents a net reduction of 20.96 at the Oregon level compared to the Company's Test Year proposal. Staff's proposed FTE totals are summarized in Figure 5, following.

FIGURE 5: STAFF PROPOSED FTE

Type	Company (System)	OR Alloc.	Company (OR)	Staff Adjustment	Staff (OR)
Officers	12.42	88.1%	10.94		10.94
Exempt	560.39	88.7%	497.06	(20.49)	476.57
Nonexempt	10.52	88.7%	9.33	(0.47)	8.86
Union	599.63	88.7%	531.88		531.88
Total	**1,182.96**		**1,049.22**	**(20.96)**	**1,028.26**

Q. Did Staff make any adjustments to officer or union FTEs?

[51] Staff/2002, NW Natural's Response to Staff's SDR 92 (Non-Confidential portion).

A. No. While the Company's system-level officer FTE count has increased from 11.4 in 2020 to 12.4 in the Test Year,[52] this does not appear to be a departure from historical levels.[53] Union FTEs have increased by only 1.2 percent since 2020.[54]

Q. Please explain why Staff recommends the exclusion of four FTEs related to the CPP.

A. As explained in the testimony of Staff witness Curtis Dlouhy (Exhibit Staff/900), Staff believes that there is not enough work to warrant full time positions for at least two of the requested five new FTEs nor would it be proper to allow cost recovery for four of the five requested FTEs now that the CPP rules have been invalidated by the Oregon Court of Appeals Two of the roles were meant to perform duties directly related to CPP compliance prior to its invalidation, and the Company has not adequately convinced Staff that there is enough work for these roles to do absent the CPP.

Further, NW Natural and other litigants asked the Court to invalidate the CPP rules on both procedural and substantive grounds and the Court's opinion invalidating the rules only addressed the procedural concerns.[55] Staff anticipates that if the DEQ implements new CPP rules, the rules will be challenged once again. Staff believes that it is not in customers' best interest to

55 *Northwest Natural Gas Company, et al. v. Environmental Quality Commission,* 329 Or. App. 648, 652 (2023) ("Petitioners raise numerous assignments of error, contending the CPP Rules are invalid. In this opinion, we address only one of those assignments because it is dispositive regarding the validity of the CPP Rules.").

allow the cost recovery of four out of the five positions to implement the CPP while the future of the CPP is still in doubt. Staff supports the inclusion of costs associated with the Peak Load Management Analyst because Staff believes that this position can provide value to customers even without the CPP.

Q. Please explain why Staff recommends the exclusion of four FTEs related to IT&S.

A. As explained in the testimony of Staff witness Julie Dyck (Exhibit Staff/1000), Staff expects that current CIS employees and the other remaining four new IT&S positions will be cross trained as this is replacing a legacy system. Those employees that were working on CIS-related projects before are better equipped to learn a new system. In addition, their IT&S FTE count in 2023, when completing the larger Horizon 1 program was 104, whereas their UG 490 request is 116. So even if all 8 positions are approved, their total IT&S FTE are likely to be around 112, which is four less than their request, since they are unlikely to fill all positions. Lastly, the costs of these FTEs are expected to be included in a Company requested deferral of costs to implement H2 along with the costs of the program itself. The Company plans to update their plans for deferral in their Reply Testimony.

Q. What is Staff's recommended adjustment for FTEs?

A. Staff's adjustment for FTEs at the Oregon level is summarized in Figure 6 as follows.

Docket No: UG 490

Staff/2000
Yamada/19

FIGURE 6: STAFF'S EXEMPT & NONEXEMPT FTE ADJUSTMENT - OREGON

Description	Exempt	Nonexempt	Total
Test Period Base Wages & Salaries	$65,175,815	$748,875	$65,924,691
Staff Adjustment to Test Period Payroll	($801,812)	$0	($801,812)
Adjusted Payroll	$64,374,003	$748,875	$65,122,878
Ave. # of Employees (Test Year FTE)	497.06	9.33	506.40
Adjusted Average Salary	129,508	80,255	$209,763
Staff Proposed FTE	476.57	8.86	485.44
Staff Proposed Proforma Payroll	$61,720,286	$711,323	$62,431,609
Net Payroll Adjustment	**($2,653,716)**	**($37,553)**	**$2,691,269**

This adjustment is allocated between capital and O&M in the same manner as salaries & wages, as discussed previously. Staff's resulting recommended adjustment totals ($2,691,269) for Oregon, which is allocated ($1,746,634) to O&M and ($944,636) to capital.[56]

[56] See Staff/2004, Staff's HIGHLY CONFIDENTIAL Workpapers, "PUC FTE" Tab.

Docket No: UG 490

Staff/2000
Yamada/20

ISSUE 4. OTHER RELATED ADJUSTMENTS

Q. Do Staff's recommended adjustments to base salaries and wages, overtime, incentives, and FTEs, as discussed previously in this testimony, result in other related adjustments to the Test Year?

A. Yes. Staff's adjustments in these areas also result in associated reductions to depreciation expense and payroll tax.

Q. Please explain Staff's adjustment to depreciation expense.

A. Staff's recommended adjustments to base salaries and wages, overtime, incentives, and FTEs result in a total capital adjustment of ($3,187,350) related to Oregon. The removal of this amount from rate base requires a corresponding reduction to depreciation expense. The Company's filing reflects depreciation expense representing 4.15 percent of gross plant;[57] Staff applied that percentage to its proposed capital reduction, resulting in a $(132,130) adjustment to O&M.[58]

Q. Please explain Staff's adjustment to payroll tax.

A. Staff's payroll adjustments reflect a 3.24 percent reduction compared to the Company's proposed amounts. Staff made a corresponding adjustment to the Company's proposed inclusion for payroll taxes.[59] The resulting adjustment attributable to Oregon is ($367,505).[60]

Q. Please summarize the adjustments described in your testimony.

---

NAME: Steph Yamada

EMPLOYER: Public Utility Commission of Oregon

TITLE: Senior Utility Analyst
Rates and Telecommunications Section
Rates, Safety and Utility Performance Program

ADDRESS: 201 High St SE, Suite 100, Salem, OR, 97301

EDUCATION: Master of Business Administration
Western Governors University

Bachelor of Science in Accounting
University of Oregon

EXPERIENCE: I have been employed with the Public Utility Commission of Oregon since 2013. I am currently a Senior Utility Analyst in the Rates and Telecommunications Section of the Rates, Safety and Utility Performance Program. My responsibilities include leading research and providing technical support on a wide range of technical and policy issues for water and telecommunications companies. I have analyzed and addressed numerous telecommunications issues including special contracts, promotional concessions, tariff changes, price listings, numbering issues, service abandonment, property sales, and price plans, and provided testimony in UM 1895. With regard to water, I have analyzed and addressed numerous issues including tariff changes, property sales, affiliated interest transactions, financing requests, revenue requirement calculations, cost of service, rate spread, and rate design. I have also served as case manager and provided testimony in UW 163, UW 166, UW 173, UP 384, UW 176, UW 181, UW 189, UW 191, UW 192, UW 195, UW 196, and UW 197. With regard to energy, I have provided testimony in UE 426.

Data Request Response

Request No.: UG 490 SDR 93

For the Test Year, please provide the breakout between O and M and rate base for all labor expense expressed as percentages. If applicable, please also provide the breakout for all labor expense between Total Company and Oregon expressed as a percentage.

Response:

Test Year labor expenses expressed as percentages:

O&M	64.9%
Capital	35.1%

Oregon Test Year labor expense represents 88.7% of Total Company labor expense.

NW Natural®

Rates & Regulatory Affairs
UG 490
Request for a General Rate Revision
Data Request Response

Request No.: UG 490 OPUC DR 142

NW Natural/1000, Rogers/13 states, "The Company is proposing to recover $9,340,431 in total at-risk pay for NBU employees in this rate case."

a. Please provide the underlying data for this information. Please provide all data in electronic workbook format with all cell formulae and references intact.

b. Please reconcile this figure with the Oregon-specific test year figure for incentives shown in the Company's highly confidential response to SDR 92.

c. Please provide the Company's proposed incentives separated by incentive type and employee type (exempt, nonexempt, etc.). Please also provide the total Company vs. Oregon amounts.

d. Does the Company's proposed incentives total of $9,340,431 include the stock purchase plan and incentive plan expenses described in NW Natural/1400, Davilla/17, lines 7-13? Please separately state the amount attributable to each.

Response:

a) See UG 490 OPUC DR 142 Attachment 1 for calculations and references for the $9,340,431 identified as at-risk pay. Please note that the $197,173 of expense for Non-Officer Employee Stock Purchase Plan (ESPP) was inadvertently categorized as at-risk pay when in fact employees have the option to opt out at any time. The total at-risk pay in this case is $9,143,258 which, when added to the $197,173 of expense for Non-Officer ESPP, equals the $9,340,431 for which the Company is seeking recovery in this rate case.

b) UG 490 OPUC DR 142 Attachment 1 identifies the items and amounts included in SDR 92.

c) UG 490 OPUC DR 142 Attachment 1 breaks out between exempt and non-exempt. Exempt excludes Officers as no incentive compensation for Officers is

included in this case. Non-Officer ESPP is not identified as either exempt, non-exempt or union. In Attachment 1 the full amount of Non-Officer ESPP is shown in the exempt column.

d) Yes, the difference between SDR 92 amount and the $9,340,431 in testimony is due to the stock purchase plan, ESPP and long-term incentive compensation amounts. Those are identified separately in Attachment 1.

Staff/2002
Yamada/4

NW Natural's Attachment 1 provided in response to Staff's DR 142 is available in electronic spreadsheet format only.

Data Request Response

Request No.: UG 490 OPUC DR 148
Non-confidential data provided in response to SDR 92 shows the following FTEs attributable to officers:

2020	2021	2022	2023	Test Year
11.4	10.5	11.6	11.9	12.4

Please explain why it is necessary to increase officer FTEs from the 2020-2023 average of 11.3 to 12.4 in the Test Year.
Response:

The number of officers can fluctuate from year to year if we have officers resign or retire, and it can take time to find replacements for those positions. Additionally, in late 2022, we did move our Sr Director of Rates and Regulatory to the VP of Rates and Regulatory officer position. This is a position that was an officer position in the past but had been vacant since Spring of 2016.

Data Request Response

Request No.: UG 490 OPUC DR 155

Regarding payroll taxes,

a. How much does the Company propose to include in this case? Please provide the total Company and Oregon specific amounts.

b. Please explain how they are calculated. Please include the underlying data and calculations in electronic workbook format with all cell formulae and references intact.

c. Where are they included in the Company's rate request?

Response:

a. Projected Total Company payroll expense is $13,982,300 during the Test Year. This is allocated to O&M, Capital, and Non-Utility. The Capital allocated system amount is $4,692,277. The capital is included in project spend in this case and is allocated to many different FERC accounts with varying allocations to OR. The O&M allocated system amount is $8,718,527, and OR allocation is $7,758,059. This is moved out of O&M and to Other Taxes in the Revenue Requirement. The Non-Utility allocated amount is not included in this case.

b. See UG 490 OPUC DR 155 Attachment 1. The calculation for individual pieces of payroll taxes is taken by multiplying payroll dollars applicable to the tax times the tax rate.

c. Capital is included in project spend. The OR allocated expense can be found included in Other Taxes in the Revenue Requirement calculation. See Workpaper UG 490 – Exh. 1700 – WP1 – Revenue Requirements Model, tab Exhibit 1712 – Other Taxes, cell G24.

Docket No: UG 490

Staff/2100
Hennessy/1

Q. Please state your name, occupation, and business address.

A. My name is Kevin Hennessy. I am the Natural Gas Engineering and Safety Manager employed in the Utility Safety, Reliability, and Security Division of the Public Utility Commission of Oregon (OPUC). My business address is 201 High Street SE, Suite 100, Salem, Oregon 97301.

Q. Please describe your educational background and work experience.

A. My witness qualifications statement is found in Exhibit Staff/2101.

Q. What is the purpose of your testimony?

A. I review Daniel Kizer's testimony regarding investments being made by Northwest Natural Gas Company (NW Natural, NWN or Company) for safety-related programs.

Q. Did you prepare any other exhibits for this docket?

A. No.

Q. How is your testimony organized?

A. My testimony is organized as follows:

Issue 1. NW Natural Safety and Inspection Programs 2

Q. Could there be changes or updates to Staff's position and recommendations?

A. Yes. My testimony represents issues identified to date. My recommendations and issues may change when informed by new data and after reviewing testimony and analysis by other parties.

Docket No: UG 490

Staff/2100
Hennessy/2

ISSUE 1. NW NATURAL SAFETY AND INSPECTION PROGRAMS

Q. Did you review Daniel Kizer's testimony regarding investments being made by Northwest Natural for safety-related programs?

A. Yes. I did.

Q. Did you have any concerns regarding the approach being taken with these programs.

A. Not generally, however certain programs warrant further mention.

Q. Are these programs consistent with the annual Safety Project Plan (SPP) filed by the Company in UM 1900?

A. Yes. Staff appreciates that the Company has created alignment between this portion of the rate case and the Safety Project Plan[1] to provide early indications of future actions and spending.

Q. Which program do you highlight?

A. First, I have concerns regarding the "ILI," Inline Inspection Program.

Q. What is your primary concern?

A. The Company is currently converting transmission lines to ensure the Company can conduct integrity assessments with inline inspections. Mr. Kizer testified the Company incurred significant costs for one of the ILI conversion projects completed in 2022, the P31/P75 McMinnville Trans ILI Project, after it went into service. Specifically, the Company spent an additional $1.4 million to

[1] *In the Matter of Northwest Natural Gas Company, dba NW Natural, Annual Natural Gas Safety Project Plan*, UM 1900, NW Natural's 2024 Oregon Safety Project Plan (September 27, 2023).

address and remediate three sites on the pipeline where the Company could not perform the inline assessment.[2]

Q. What recommendation to you have for the Commission to better control these cost escalations?

A. I suggest the Commission require NW Natural keep additional records and perform research in advance of construction to mitigate such construction overruns or surprises. Since this program just starting, incorporating learning developed in the McMinnville project makes sense.

Q. What other programs do you want to address?

A. Next, I discuss the underground storage-well integrity program, which will be ongoing for the foreseeable future.

Q. What recommendation to you have for the Commission regarding the Company's underground storage and integrity program?

A. I recommend the Commission require that NW Natural develop clear cost estimates "for the life of the facility" and that the Company include these cost estimates in the Company's annual Oregon Safety Project Plan filed in Docket UM 1900.

Q. Do you wish to discuss any other projects?

A. Yes. The last topic I address is the NW Natural's non-hazardous leakage projects.

Q. What is your concern in this regard?

[2] NW Natural/500, Kizer/44-45.

A. It is important to reduce or eliminate such leakage. In both the Safety Project Plan and in NW Natural's testimony it's not clear to me how many facilities have such leaks.

Q. What recommendation to you have for the Commission regarding non-hazardous leakage?

A. I recommend the Commission require that NW Natural capture and provide more detail in the Safety Project Plan, showing starting or prior counts and severity of leaks, the reduction in the count and severity, the estimated methane reduction, and the costs for the year.

Q. Does this conclude your testimony?

A. Yes.

Mini-Review

Gas Stove Pollutants: Consequences on Indoor Air Quality and Health

Barae Jomaa[1], Damiën van Berlo[2] and Héloïse Proquin[2]

[1]*Colonial Chemical EU B.V., Johan Cruijff Boulevard 65, 1101 DL Amsterdam, The Netherlands*
[2]*National Institute for Public Health and Environment (RIVM), Bilthoven, 3721 MA De Bilt, The Netherlands*

Abstract

Gas stoves are prevalent in residences worldwide as they are both reliable and economical. However, there is a growing body of evidence that indicates that they emit significant levels of indoor air pollutants, including nitrogen dioxide (NO_2), carbon monoxide (CO), volatile organic compounds (VOCs) such as formaldehyde, and particulate matter (PM), which pose serious health risks. Studies demonstrate that hourly average NO_2 concentrations in kitchens can exceed 200 µg/m^3, surpassing the World Health Organization (WHO) indoor air quality guidelines. Similarly, CO levels can reach above 34 mg/ m^3, potentially exceeding the WHO guidelines for indoor air quality of 35 mg/m^3 over 1 hour. VOCs and PM add to the pollution burden, with indoor formaldehyde concentrations ranging from 0.18 mg/m^3 to 0.45 mg/m^3 and PM levels reaching over 86 µg/m^3 during gas oven use. These emissions may exacerbate respiratory diseases, such as asthma, cardiovascular and neurological health issues. This review consolidates scientific literature on the health impacts of these gas stove pollutants and discusses mitigation strategies that can effectively reduce exposure.

Keywords

Indoor Air Pollution; Gas Stove Emissions; Nitrogen Dioxide (NO_2); Particulate Matter (PM2.5); Volatile Organic Compounds (VOCs); Health Impacts of Cooking Appliances.

1 Introduction

According to a 2019 estimate by the WHO, household air pollution accounts for approximately 3.2 million deaths annually: the main source of pollution is still smoking, but cooking is the second largest contributor [1]. In developing countries, many people cook on open fire fuelled by kerosene or biomass such as animal dung and crop waste, but the modern gas stove is a source of air pollution as well. Gas stoves are common in households worldwide due to their long track record of reliability and cost-effectiveness. In recent years, these advantages have been faced with increasing concerns in relation to indoor air pollution and the corresponding health risks. Notably, in a recent study it was estimated that 12.7% of childhood asthma cases in the US might be attributed to gas stove use [2]. Another study has shown that benzene is emitted by gas stoves at levels similar to what one would be exposed to when in the presence of a cigarette smoker [3]. The impact on mortality is significant: gas stove-emitted nitrogen dioxide has been estimated to cause around 40,000 premature deaths per year in the EU and UK combined [4]; this is higher than the number of people estimated to perish from second-hand smoke exposure in the EU each year, which is around 24,000 [5], and the number of yearly deaths from car crashes in the EU (20,400 in 2023) [6]. It should be noted that the mentioned statistics only reflect mortality due to nitrogen dioxide emission, which is only one of the harmful substances emitted by gas stoves. This review explores the toxicological effects of gas stove pollutants, including nitrogen dioxide (NO_2), carbon monoxide (CO), volatile organic compounds (VOCs), and particulate matter (PM).

The health impacts of these emissions can be substantial. Both NO_2 and PM are correlated with respiratory issues, such as the occurrence of asthma symptom episodes and decreased lung function [7, 8]. CO exposure can impair oxygen transport due to its ability to react with hemoglobin to form carboxyhemoglobin (COHb), thereby affecting cardiovascular and neurological health over the long term [9]. Formaldehyde contributes to diseases of the respiratory tract as well as cancer, further amplifying public health concerns arising from the continued use of gas stoves [10].

Despite clear health concerns, regulatory standards for gas stove emissions are often insufficient globally. This is aggravated by the nature of the indoor environment: air dilution is minimal compared

to the outside, and especially in older houses ventilation may hardly occur in the colder seasons.

This review consolidates scientific literature on gas stove emissions and their health impacts then evaluates mitigation strategies to reduce associated risks.

2 Nitrogen dioxide (NO_2)

2.1 Chemical properties and sources

NO_2 is a reddish-brown gas with a sharp odour at high concentrations yet clear and odourless at lower concentrations. The high heat that is generated during the combustion of fuel causes the nitrogen and oxygen in the air to react and form NO_2.

2.2 Exposure

Gas stoves are a notable source of nitrogen dioxide (NO_2). Studies have indicated that hourly average NO_2 levels in kitchens can exceed 200 μg/m^3 [11], which is the 1-hour limit value set by the World Health Organization's (WHO) for indoor air quality [12] (Tab. 1).

2.3 Mechanism of toxicity

NO_2 irritates the respiratory tract and exacerbates conditions such as asthma, particularly in children, through oxidative stress and inflammatory responses [14].

2.4 Epidemiology

A meta-analysis found a 24% increased risk of developing current asthma and 42% increased risk of developing lifetime asthma in children living in homes with gas cooking. Even more, the analysis revealed a 15% increase in current wheeze for the children per 15ppb of NO_2 [14]. NO_2 exposure from gas cooking appliances is estimated to be responsible for approximately 41,000 pediatric asthma cases in the EU and UK [4].

As an oxidant, NO_2 may impair endothelial function by reducing nitric oxide bioavailability, potentially leading to arterial stiffness and inflammation of the vascular endothelium. This process increases the risk of hypertension.

3 Carbon monoxide (CO)

3.1 Chemical properties and sources

CO is a colourless and odourless gas produced by incomplete combustion. Inefficient burners contribute to higher CO emissions [15].

3.2 Exposure

Another substance of concern is carbon monoxide (CO) that is produced by incomplete combustion and can reach levels of ≥30 ppm (ca. ≥34 mg/m^3) indoors [16], potentially surpassing World Health Organization's (WHO) indoor air quality guideline of 35 mg/m^3 over 1 hour [12].

3.3 Mechanism of toxicity

CO competes with oxygen by reacting with hemoglobin to form carboxyhemoglobin, thereby impairing oxygen transport. This can exacerbate respiratory conditions like COPD and diminish immune responses [17].

3.4 Epidemiology

A number of epidemiology studies have focussed on respiratory outcomes including pulmonary function, hospital admissions related to respiratory disease, and asthma and exacerbation of asthma symptoms [18]. As it relates to pulmonary function, ATDSR concluded that the results are mixed and conflicting and it is difficult to sort the effects of CO from the urban air pollutants. The confounding effect of other air pollutant is also present in the outcome of hospital admission related to respiratory diseases. Nonetheless, studies do provide evidence of an association between CO and an increasing risk of respiratory symp-

Tab. 1: OECD air quality guidelines for $PM_{2.5}$ [13] and indoor air quality guidelines for benzene, carbon monoxide, formaldehyde and nitrogen dioxide [12]

Pollutant	Guideline value	Averaging time	Comments
$PM_{2.5}$	5 μg/m^3	Annual average	-
	15 μg/m^3	24 hours	99th percentile (i.e. 3-4 exceedance days per year)
Benzene	No safe level	Not applicable	Lifetime cancer risk at 1 μg/m^3 is 2.2–7.8 in a million. Airborne concentrations with risks: 17 (1/10,000), 1.7 (1/100,000), 0.17 μg/m^3 (1/1,000,000). Unit risk of leukemia per 1 μg/m^3 is 6×10^{-6}.
Carbon monoxide	100 mg/m^3	15 minutes	Not to occur more than once per day (light exercise).
	35 mg/m^3	1 hour	Not to occur more than once per day (light exercise).
	10 mg/m^3	8 hours	Arithmetic mean (light to moderate exercise).
	7 mg/m^3	24 hours	Arithmetic mean (awake and alert, not exercising).
Formaldehyde	0.1 mg/m^3	30 minutes	Arithmetic mean.
Nitrogen dioxide	200 μg/m^3	1 hour	Arithmetic mean.
	40 μg/m^3	Annual average	-

toms that require medical assistance. Furthermore, the association between CO exposure and asthma symptoms is clearer as results show that the odds ratio for asthma diagnosis increase with an increase CO concentration. Schildcrout et al. examined 990 children in North America and showed that a 1 ppm increase in CO concentration was associated with an odds ratio of 1.08 for asthma symptoms [19].

4 Volatile organic compounds (VOCs)

4.1 Chemical properties and sources

VOCs include hazardous compounds, such as formaldehyde and benzene, that are emitted from the combustion of gas during cooking.

4.2 Exposure

Formaldehyde was found to be present at concentrations ranging from 0.18 mg/m^3 to 0.45 mg/m^3 during cooking [20]. The WHO guideline limit for formaldehyde in indoor air is 0.1 mg/m^3 over 30 minutes whereas benzene has no safe level [12]. Gas stoves have been found to emit 2.8 to 6.5 µg/min benzene [3]. Furthermore, VOC concentrations were evaluated in 69 residential houses in Boston and benzene was found to be present in 95% of the samples at mean concentrations of 164 ppbv (parts per billion by volume) (CI:134-196). In comparison, the Environmental Protection Agency (EPA) measured benzene in Boston urban air between 2020 and 2023 and found a median concentration of 0.14 ppbv [21].

4.3 Mechanism of toxicity

VOCs exposure may lead to respiratory issues with some VOCs, including formaldehyde and benzene, causing cancer. Benzene is widely distributed throughout the body after inhalation, and its metabolism produces highly reactive metabolites that contribute to its toxic effects. The primary and most sensitive targets of benzene toxicity are the hematopoietic systems and the immune system [21]. Formaldehyde, on the other hand, primarily affects the respiratory system and is a potent irritant, with prolonged exposure linked to nasopharyngeal cancer and leukemia [10].

4.4 Epidemiology

Exposure to VOC indoors in various, a study in 69 residential houses in Boston found not only methane and ethane but also 296 unique non-methane VOCs of which 21 were designated as hazardous air pollutants like benzene [22]. In the Agency for Toxic Substances and Disease Registry (ATDSR) evaluation, the minimal risk levels (MRL) of benzene were evaluated and showed that after inhalation these risks are dependent on the exposure duration (Tab. 2) [21].

Tab. 2: Minimal Risk Levels (MRLs) for benzene inhalation: Adapted from the ATDSR toxicological profile for benzene [21]

Exposure duration	MRL (provisional)	Critical effect
Acute	0.009 ppm (0.03 mg/m^3)	Reduction in peripheral lymphocyte count and impaired function of bone marrow lymphocytes
Intermediate	0.007 ppm (0.02 mg/m^3)	Delayed immune response of splenic lymphocytes to foreign antigens
Chronic	0.002 ppm (6 x 10^{-3} mg/m^3)	Decreased peripheral lymphocyte count

5 Particulate matter (PM)

5.1 Chemical properties and sources

PM2.5 (PM < 2.5 µm in size) can be formed from fuel combustion and are prevalent during high-temperature cooking. Moreover, combustion processes can readily generate ultrafine particulate matter (UFPM), with a diameter of <0.1 µm. The presence of extremely small nanoparticles with a particle size in the range of 1–3 nm, referred to as atmospheric nanocluster aerosol, has been associated with cooking episodes [23]. However, it should be noted that frying meat or vegetables generates indoor particulate matter regardless of whether a gas or electric cooker is used.

5.2 Exposure

Gas oven usage contributes significantly to PM2.5 emissions, with concentrations exceeding 86 µg/m^3 over one hour [24]. The World Health Organization's (WHO) air quality guideline is set at 15 µg/m^3 for a 24-hour average [13] and while a 1-hour limit is not set, high short-term peaks can meaningfully elevate daily exposure levels [13]. When considering even smaller particles (ultrafines/nanoparticles), it has been shown that as much as 90% of total exposure to ultrafine particles occurs in the indoor environment [25]. Extremely small (1–3 nm) nanoparticle numbers of 10^5 to 10^7/cm^3 have been measured in the indoor air during propane gas cooking episodes [23]. The highest levels of particle emission were produced during the self-cleaning cycle of stoves.

5.3 Mechanism of toxicity

PM2.5, consisting of small particles, penetrates lung tissue and can cause inflammation and can exacerbate cardiovascular conditions. This can be made worse by hazardous substances that adsorb onto the surface of PM. The smallest particles, in the nano range, can cross the blood-lung barrier, migrate into the systemic circulation and thereby reach organs distal to the lung [26].

5.4 Epidemiology

In a great number of epidemiological studies, associations between particulate matter air pollution and a broad range of adverse health effects have been found [27–29]. The adverse impact on human health included cardiovascular (e.g., cardiac arrhythmia, increased chance of stroke and cardiac arrest) and respiratory (e.g., decreased lung function, exacerbation of asthma, airway irritation) health effects as well as overall mortality. The WHO estimates that PM air pollution contributes to 800,000 premature deaths each year, which means it is the 13th leading cause of mortality (worldwide). Associations between exposure and adverse health effects were stronger for smaller particle fractions, i.e., PM2.5 and PM0.1 (UFP) [30].

6 Outlook and conclusion

Addressing the health risks of gas stove emissions requires an integrated approach combining a transition towards electric stoves, improved ventilation for gas powered stoves, and comprehensive reg-

ulations. Public awareness and financial incentives may prove to be essential for creating healthier indoor environments and reducing the global burden of disease associated with indoor air pollution.

Summary

Background Health inequalities are deeply entrenched in society, and finding ways to reduce these, therefore, represents a major health policy challenge. Focusing on the two highest weighted Index of Multiple Deprivation domains, namely income and employment, we sought to synthesise the evidence on the association between these major determinants of socioeconomic status and asthma outcomes.

Methods In this systematic review and meta-analysis, we searched key concepts related to employment, income, and asthma outcomes using Medline and Embase for studies published between January 1, 2010 and April 3, 2025. Studies were eligible for inclusion if they were in English and described an association between income and/or employment and asthma outcomes, including exacerbations, hospital admissions and mortality, in people with asthma. Risk Of Bias In Non-randomized Studies–of Exposures (ROBINS-E), Risk of Bias (RoB) and adapted RoB tools were used to assess the risk of bias in the included studies. Using the restricted maximum likelihood method, we meta-analysed the rate of exacerbations and explored heterogeneity between age-related population groups: children (under 18 years) and adults (18 years and older). This study was registered with PROSPERO, CRD42024527300.

Findings We identified 4153 potentially eligible studies, of which 3141 were screened. 30 studies met the inclusion criteria, with most having a low risk of bias. 19 studies reported income as the exposure and exacerbation as the outcome, of which ten were included in the meta-analysis. People in the lowest income group were more likely to experience an asthma exacerbation than those in the highest income group: OR 1.25; 95% CI 1.13–1.37 overall and when stratified by age: children (1.36 [1.23–1.50]) and adults (1.19 [1.05–1.33]). Only three studies investigated the role of unemployment and were narratively synthesised. While unemployment was associated with increased emergency care visits, its role in predicting exacerbations was less clear.

Interpretation There is a need for upstream interventions aiming to reduce income inequalities and to investigate their impact on reducing asthma inequalities.

Introduction

Addressing the impact of deprivation on asthma outcomes has been identified as both a research and health policy priority in the UK.[1] An estimated 5.4 million people have asthma, approximately 8 in every 100, placing the UK among the countries with the highest asthma prevalence worldwide.[2] The UK also has one of the highest asthma death rates for 5- to 34-year-olds in Europe.[3] The inequalities over the last decade due to austerity, poverty and COVID-19 have contributed to

Research in context

Evidence before this study

Embase and MEDLINE (via the OVID interface) were used to identify previous systematic reviews and meta-analyses published in English from 2010 until 2025 on the association between socioeconomic status and asthma outcomes. The search terms deployed were: ((asthma) AND (mortality OR *admissions OR exacerbations OR hospitali?ations) AND (socioeconomic status OR ses) AND (inequalities OR deprivation OR imd OR index of multiple deprivation) AND (systematic review OR meta-analysis)). Two previous studies were identified. One study investigated socioeconomic status as a whole and by specific domains, such as education and employment, and included studies published between 2000 and 2005. The main findings revealed that lower socioeconomic status was associated with more secondary care healthcare utilisation. The other study focussed on asthma prevalence and allergies, with the former being associated with a lower socioeconomic position (an indicator of socioeconomic status) and the latter being associated with a higher socioeconomic position.

Added value of this study

This is an up-to-date review of the role of socioeconomic inequalities in asthma outcomes for children and adults from 2010 to 2025. Amid regional and global economic and political challenges, this timely review focuses on the two highest weighted components of the Index of Multiple Deprivation (IMD) domains, income and employment, and synthesises these specific factors contributing to socioeconomic status and the association with asthma outcomes. The association was assessed overall and by children and adults separately, indicating that lower income is associated with a higher risk of asthma exacerbations in children and adults.

Implications of all the available evidence

Lower income and unemployment reflect the material disadvantage (the lack of income, goods and services), which can have synergistic effects on poorer asthma outcomes in four ways: 1) the high costs of healthy living; 2) indoor and air outdoor pollution and loss of protective factors; 3) the pathobiology of poverty; and 4) inverse care law. Addressing the material disadvantages is paramount to improving widespread disparities and, as such, requires a multipronged approach. Researchers will need to investigate further the underlying mechanisms at IMD domain level, including the direct role of unemployment and income on hospital admissions and mortality in a heterogeneous adult population. Clinicians should recognise and consider options to mitigate these material disadvantages that manifest in the clinical pathway and impact outcomes. Policymakers should consider policies, such as better housing conditions and unemployment-related stress, targeting the worst deprived groups to improve outcomes and reduce long-term inequalities.

over a million premature deaths and are likely to have led to poorer asthma outcomes, notably in management, in the most deprived deciles.[4–6] Asthma costs the UK health service an estimated £1.1 billion annually, with almost three-quarters spent on providing primary care services (60% prescribing and 14% consultations).[7]

England's National Health Service (NHS) launched the Core20PLUS5 in 2021 as part of its 10-year Long Term Plan.[8] This initiative aims to tackle healthcare inequalities in the most deprived IMD quintile (Core20) among the most vulnerable (PLUS) based on five key clinical outcomes requiring 'accelerated improvement', including chronic respiratory disease.[9]

The role of socioeconomic inequalities in asthma care and outcomes is well-documented in the literature.[10–12] Socioeconomic status (SES), the most common measure of socioeconomic inequalities, is considered a social determinant of health and a risk factor for worse asthma outcomes.[13] Previous systematic reviews have reviewed the association between SES broadly and asthma prevalence and allergies as well as health care utilisation, exacerbations and mortality.[14,15] However, SES is a social construct encompassing many factors.[16] To that end, SES is most commonly proxied by the Index of Multiple Deprivation (IMD).[17] IMD, last recorded in 2019, comprises seven unevenly weighted domains, i.e., income (22.5%), employment (22.5%), health (13.5%), education (13.5%), crime (9.3%), barriers to housing and services (9.3%) and living environment (9.3%).[18] As the interest is on where to improve and what can be modified, it is important to tease out the components of IMD, starting with those most highly weighted, namely income and employment.

No previous systematic reviews have been conducted focused on the association between employment/income domains of socioeconomic status and asthma outcomes. We sought to critically assess and synthesise the evidence on the association between income and employment as the two key contributors to SES and asthma outcomes from 2010 to 2025.

Methods

This systematic review is reported following the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) 2020 statement and its checklist (Supplementary material Table S1).[19] The

protocol was documented and registered in the International Prospective Register of Systematic Reviews (PROSPERO) (CRD42024527300). Ethical approval and participant consent were not required because we analysed data from published studies. Health Data Research United Kingdom's (HDR-UK) Patient and Public Involvement and Engagement (PPI) were consulted on the conception, approach and search strategy.

Search strategy and selection criteria

Embase and MEDLINE (via the OVID interface) were the bibliographic databases selected for the systematic review, as they provided the scientific literature in public health and biomedical sciences with the most relevant and 'unique' references.[20,21]

A preliminary search was conducted on Embase and MEDLINE on March 7, 2024, to validate the concept and prevent redundancy in research efforts.[22] Once the search was completed, the results were reviewed to verify the concepts and ensure a sufficient collection of relevant studies for review. The search terms were refined for the next search and reviewed iteratively until the results accurately captured the research question and only included studies that covered search terms in the titles and abstracts, such as generic terms of the main exposures (economic, deprivation, employment) and observable asthma outcomes from diagnosed asthma patients (admissions, exacerbations and mortality). The search terms were finalised on April 3, 2025. The search terms included English language publications from January 1, 2010, to April 3, 2025. The search strategy was devised by ZG, HW and JKQ (clinician) (Supplementary material Table S2a–c).

The Population, Intervention, Comparator, Outcome, and Study (PICOS) framework was employed to formulate the eligibility criteria (Supplementary material Table S3).[23] Outcome measures included binary, count, rates or time to (first) event, thus reporting odds ratio (OR), risk ratio (RR), incidence rate ratio (IRR) or hazard ratio (HR).

The RIS files of the databases were exported to Covidence to automatically identify and remove duplicates for screening the titles and abstracts.[24] To minimise the risk of error/bias, multiple independent reviewers (IK, EM, AMA, and AT) assessed the titles and abstracts of the retrieved studies according to the eligibility criteria. In cases of disagreement, a referee was consulted (HW). Then, the full text of the remaining studies was screened to determine its relevance to the research question and ensure that none of the exclusion criteria were present. Justification was provided for the excluded studies (Supplementary material Table S4). The PRISMA flow diagram illustrates all the steps in the selection process (Fig. 1).

Data from the full-text studies were extracted from Covidence to outline the study's main characteristics, including exposure, population, outcomes, sociodemographic covariates, body mass index (BMI), smoking, and key findings (ZG, lK, EM, AMA, and AT). Any discrepancies were discussed between the two sets of initial reviewers, and where an agreement could not be reached, a referee was consulted (HW).

Three risk-of-bias tools for eligible studies were used depending on the study design. ROBINS-E was used to evaluate the risk of bias in observational studies.[25,26] The Risk of Bias (RoB 2) was used for randomised control trials.[27] For cross-sectional studies, an adapted RoB domains framework was used.[28,29] After completing the domains, an overall judgement was made (low, moderate or high) and reported in the review. Two reviewers (ZG, HW) independently assessed the risk of bias in all included studies and completed the assessment tool in Word (Supplementary material Table S5a–c).

Data analysis

Data were pooled using random-effects meta-analysis using Stata (version 18) based on comparable exposure, outcomes, covariates and methodology.[30] Forest plots illustrated the heterogeneity between studies, where the I^2 statistic >50% indicated a substantial impact of heterogeneity.[31] Since odds ratios have favourable mathematical properties, meta-analyses were based on odds ratios.[32]

Ad-hoc transformations were applied to selected unit effect measures to allow comparisons based on a derivation of the conversion formula (Supplementary material Appendix S1).[33,34] We estimated the baseline risk for studies reporting HR. In Cardet et al.,[35] β coefficients were reported from the structural equation model predicting the direct association between low SES (latent variable) and asthma-related hospitalisations (0 or 1+). While the paper did not specify whether the structural equation model was probit or logit, it was more likely to be probit because the β coefficients are reported by standard deviation. From Amemiya's study,[36] probit estimates can be transformed to log odds by a factor of 1.6 and then exponentiated to obtain approximate odds ratios and 95% confidence intervals. Renzi-Lomholt et al.[37] reported the odds ratio for exacerbations in the least deprived compared to the most deprived (reference category). In contrast, the other studies had the least deprived group as the reference category. For consistency, the odds ratio and 95% confidence interval were transformed by taking the inverse for quantitative aggregation.[33,38]

The overall effect size was estimated using a random-effects (RE) model. The weighting of the RE model was based on the inverse of the total variance. The estimator for between-study variability was based on the Restricted Maximum Likelihood (REML) method to obtain an unbiased, non-negative estimate of between-study variability.[39] Subgroup analysis was also performed to explore heterogeneity between age-related population groups (patients below 18 compared to patients at least 18 years old).

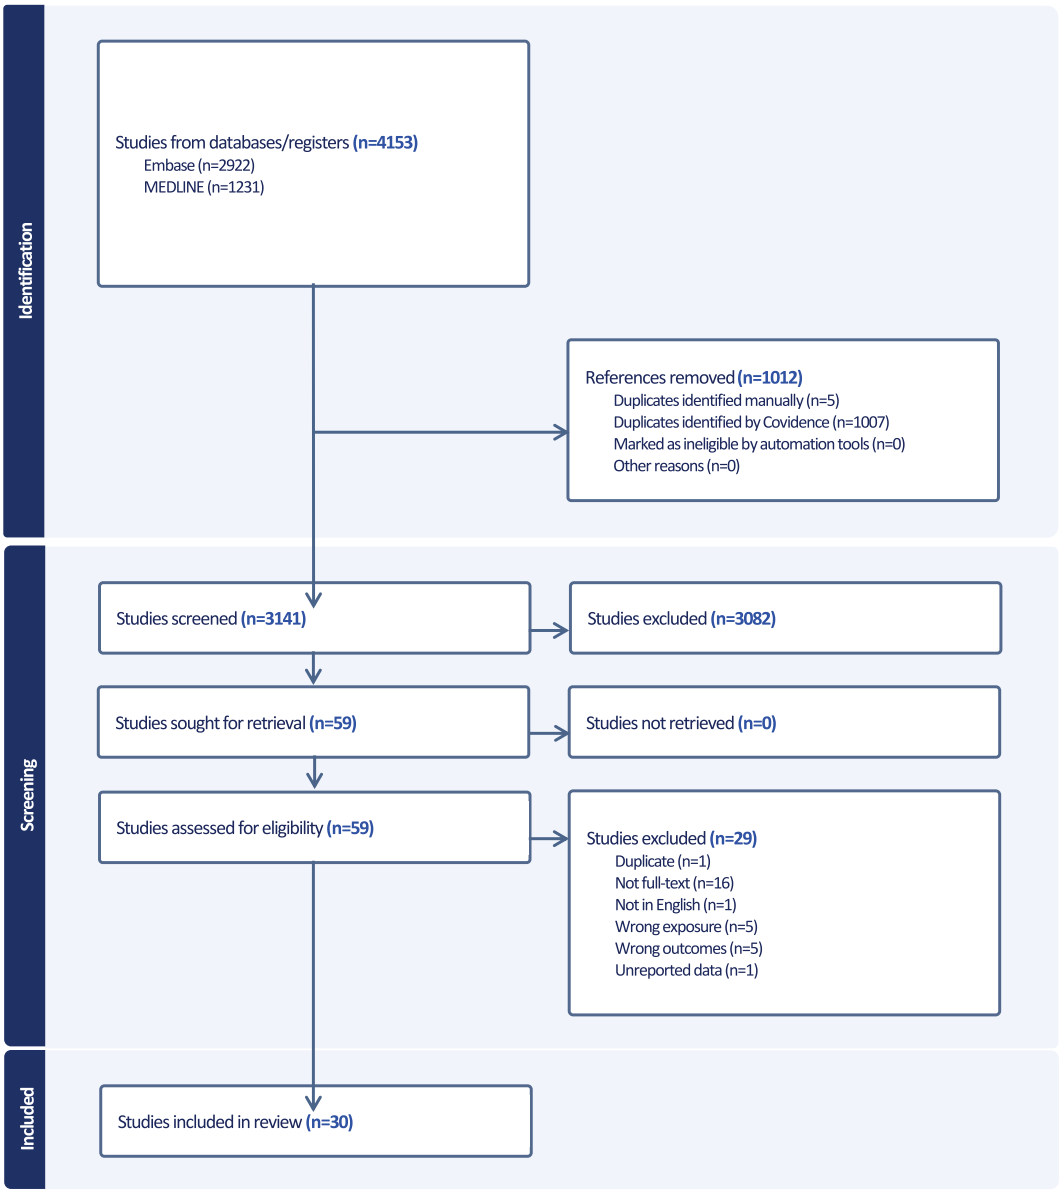

Fig. 1: **PRISMA flow diagram of study screening and selection.**

Role of the funding source

The funder of the study had no role in study design, data collection, data analysis, data interpretation, or writing of the report.

Results

3632 studies were identified, 2583 from Embase and 1049 from MEDLINE (Fig. 1). After removing duplicates (1012 articles), 3141 articles were screened based on their titles and abstracts. 59 articles were included in the full-text screening, of which 29 were excluded (Supplementary material Table S4). Therefore, 30 studies were included in the systematic review and meta-analysis.[35,37,40–67]

Studies were conducted in five different countries: USA (n = 18; 60%), UK (n = 7; 23%), Canada (n = 3, 10%), France (n = 1; 3%) and Denmark (n = 1; 3%) (Table 1). The publication dates of the included studies ranged from 2010 to 2025, with most papers published in 2024 (n = 9; 30%). Analyses were generally of observational design (n = 29; 97%), with cohort studies (retrospective, prospective or population-based) the most common. One study was both a cross-sectional and longitudinal study.[65]

Studies either had measured income per se as an exposure (n = 15; 50%) or as part of a deprivation index

Study	Country	Population	Study type	Main exposure(s)	Main outcome(s)	Variable(s)	Definition(s) or measurement(s)	Main findings[a] (95% CI)

Table 1: **Study characteristics of the included studies.**

(n = 13; 43%), such as IMD, WIMD, Neighborhood Deprivation Index (NDI), Distressed Communities Index (DCI), Institut national de santé publique du Québec (INSPQ) Deprivation Index and Ontario Marginalization Index (ON-Marg). The remaining two studies measured poverty[35] or perceived financial status.[61] One study assessed the relationship between SES and asthma-related emergency department (ED) visits.[67] In addition to income, three studies (10%) measured employment per se as an exposure and were included in the narrative synthesis.[35,47,61]

The sample size varied between 193 and 1,665,516 patients.[60,66] The percentage of females in the studies ranged from 37% to 83.9%.[35,54] The mean and median age were commonly reported, with similar highest ages: 52.1 years (mean)[51] and 53 years (median).[59] Of the studies that measured ethnicity, white was the largest ethnic group, reaching as high as 97.5%.[51] Studies that reported the BMI categories had most participants in the normal range.[42,45,46,53,58] However, studies reporting the average BMI were between overweight and obese BMI, ranging from 27.8 to 32.3.[40,51] Most patients were non- or never-smokers.[35,45,48,51,58,64]

19 studies (63%) investigated the association between income as a proxy for SES, deprivation or poverty, and exacerbations.[35,37,40,44–46,48,49,51,53–56,59,61,63–66] Generally, studies defined exacerbations by ED visits/hospitalisations or oral corticosteroids (OCS)/hospitalisations, though some studies used both.[53,64,66] Multiple studies defined exacerbations by prescription only: acute OCS,[35] systemic corticosteroid,[63] and OCS or lower respiratory infection requiring antibiotics.[51] Three studies included the following definitions: failure to meet treatment criteria of levalbuterol or systemic corticosteroid and diagnostic tests,[40] medical contact and death,[45] and intensive care admissions and prednisolone.[37] Eight (%) included physician-defined exacerbations,[37,46,49,51,54,56,59,63,66] and six studies (%) relied on self-reported exacerbations.[35,40,45,48,55,61] One study specified physician-defined and hospital-managed exacerbations.[53] One study identified risk factors associated with recurrent severe asthma exacerbations from two visits, by exploring the possible permutations to see whether both the risk factor and outcome changed or 'persisted' in both visits.[65] Depending on the study methods, exacerbations were mainly measured as a binary outcome (yes/no) and reported ORs. Other studies reported exponentiated Poisson coefficients and rate ratios for the exacerbation risk,[44,64] HRs for time to exacerbation,[53,56] and IRRs for childhood asthma with recurrent exacerbations.[63]

Five studies (23%) investigated the impact of SES on the number of hospital admissions.[43,50,52,57,58] General and specific definitions were applied. Alsallakh et al.[50] included asthma admissions per se to distinguish them from emergency admissions, which were defined as "coming via A&E departments, urgent referrals from GPs, consultant clinics, bed bureaus, or NHS Direct". Similarly, Simms-Williams et al.[58] had asthma admissions as a primary outcome and asthma-related ICU admissions as a secondary outcome. Disano et al.[43] and Gupta et al.[57] provided a general definition of hospital admissions, while Mukherjee et al.[52] focussed on the number of paediatric intensive care unit (PICU) admissions. Three of the five studies reported age-standardised rates.[43,52,57]

Five studies (23%) examined the association between SES and asthma mortality.[41,50,52,57,62] Three studies used ICD-9[41] and ICD-10 codes[50,57] to identify asthma as the underlying cause of death. To et al.[41] further established asthma as a secondary cause, defined as asthma-contributing mortality, and Alsallakh et al.[50] also included deaths with any mention of asthma in the definition of mortality. Mukherjee et al.[52] based mortality in PICU on a prediction score from a model known as the Paediatric Index of Mortality version 2 (PIM2). While assessing seasonal variations and differential outcomes in adult admissions for asthma, Khalid et al.[62] reported the association between income and in-hospital mortality using the US National Inpatient Sample database.

Four studies (13%) had more than one exposure and/or outcome, thus reporting multiple associations.[50,52,57,64] Further information on the study covariates and outcomes, including effect sizes and measures, is provided in Supplementary material Table S6a–d.

Most of the studies were assessed using the ROBINS-E tool (n = 19; 63%). Four studies (13%) were deemed at high risk of bias due to confounding (not adjusting for confounding or persistent residual confounding) and selection bias (Table 2). Most studies had a low risk of bias, with uncontrolled or residual confounding as the most common bias. Most studies adjusted for at least two of the three prespecified confounders (age, sex/gender or ethnicity), with seven (%) adjusting for all.[35,49,54,58–60,62,66] Gaietto et al.[65] was assessed using the ROBINS-E tool given the outcome of interest, i.e., the association between a 'persistent' risk factor (income) and 'persistent' recurrent severe asthma exacerbations with persistent defined as having a risk factor and outcome in both visits 1 and visits 2, was reported in the longitudinal model.

Ten of the 19 studies were eligible for a meta-analysis, with half contributing to each population group (Table 3). Seven studies reported ORs, two reported HRs, and one reported β coefficients. The remaining studies had results that were not comparable in terms of age,[53,65,66] exposure,[61] effect measure,[40,44,63,64] and lack of covariate adjustment.[45]

The lowest income group were more likely to be hospitalised or (re)admitted due to an exacerbation than the highest income group, albeit with substantial heterogeneity between studies (OR 1.25 [95% CI

The odds ratios presented in the final or transformed estimates originate from binary (yes/no) variables (8 studies) or event time variables (2 studies). Binary (yes/no) variables reported odds ratios (7 studies) and regression coefficients (1 study). Event time variables reported hazard ratios (2 studies). OR = odds ratio. HR = hazard ratio. β = regression coefficient. n = number of exacerbations. N = number of patients.

Table 3: **Studies included for meta-analysis with the absolute, original and final/transformed estimates.**

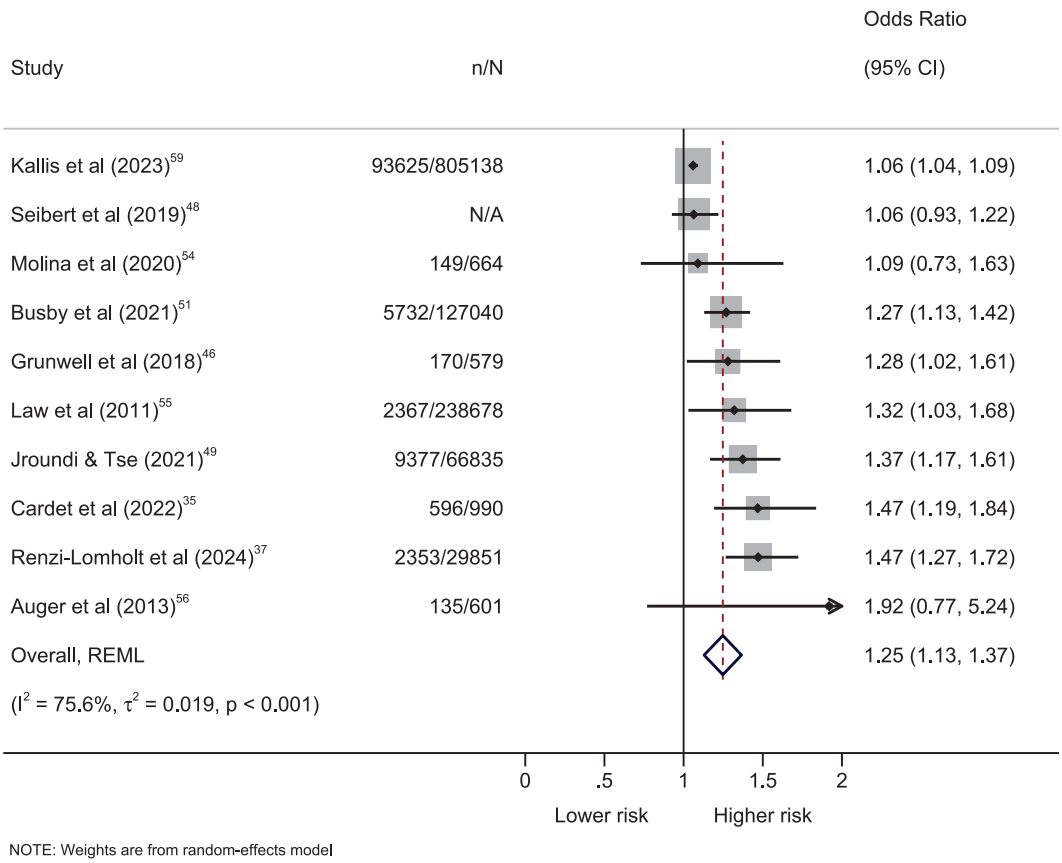

***Fig. 2*: Forest plot of the association between income and exacerbations.** Odds ratios are presented with 95% confidence intervals. The odds ratios presented in the original studies originate from binary (yes/no) variables (8 studies) or event time variables (2 studies). The red vertical line is the average effect estimate. The black vertical line shows no effect. OR = odds ratio. n = number of exacerbations. N = number of patients.

I2 = 0.0%) and adults (1.19 [1.05–1.33]; I2 = 75.1%) (Fig. 3). With the potential impact of heterogeneity greater in adults than in children, we can infer that studies with adults correspond to most of the variability of the effect sizes. The test of group differences indicated no statistically significant subgroup effect (p = 0.076), meaning that the population group does not modify the effect of income on exacerbation.

Two studies investigated the association between employment and EC attendance or ED utilisation, using unemployment as an indicator or component of SES.[35,47] The first study examined the pathways and identified mediating factors in African American/Black and Hispanic/Latinx adults with moderate to severe asthma.[35] Unemployment showed stress-mediated indirect associations with increased healthcare utilisation. Those living in poverty, who were more likely to be unemployed (73.7% vs. 40.8%; p < 0.001), experienced higher rates of asthma hospitalisations (23.6% vs. 14.0%; p < 0.001). Notably, unemployment was the only SES measure showing stress-mediated indirect associations with emergency room/urgent care visits (β 0.03 [95% CI 0.01–0.06]).

The second study was a cross-sectional study on a paediatric asthma cohort in New York.[47] Children living in areas where regional economic development projects were completed during the study period (2011–2015) had lower ED utilisation. The unemployment rate was used as an indicator for the latent SES variable in a spatial regression analysis to account for geographic variation and local economic conditions. While there was a significant decrease in ED utilisation in areas where economic development projects were completed ($\beta_{\text{difference-in-differences}}$-1.526 [SE = 0.686]), this was not directly linked to changes in unemployment rates. The relative risk for unemployment was not statistically significant in 2011 (RR -0.01 [95% CI –0.04–0.03]) and 2015 (–0.01 [–0.04–0.03]), suggesting no evidence of an association between unemployment and asthma-related ED utilisation. However, other SES indicators, namely median household income and health insurance coverage, were key socioeconomic predictors of children's

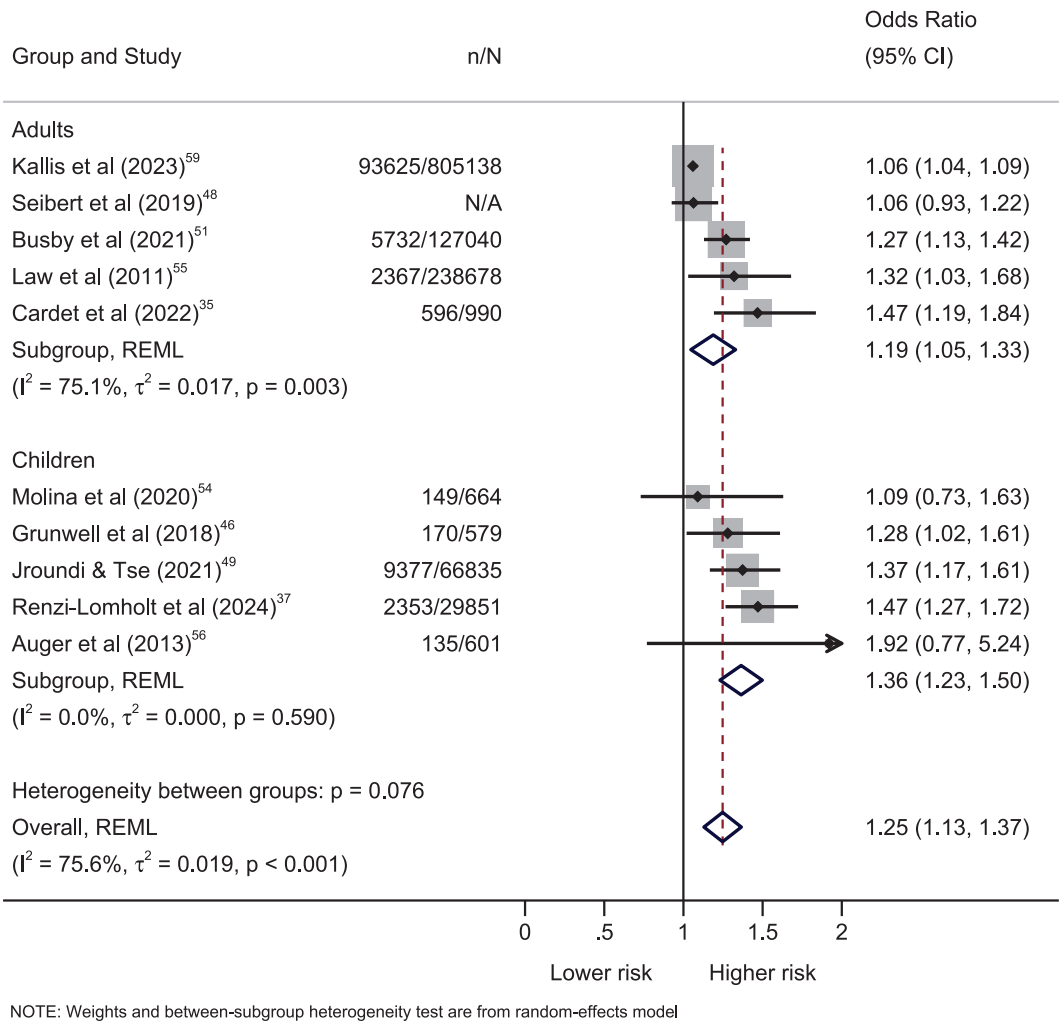

Fig. 3: **Forest plot of the association between income and exacerbations by population group (children and adults).** Odds ratios are presented with 95% confidence intervals. The odds ratios presented in the original studies originate from binary (yes/no) variables (8 studies) or event time variables (2 studies). The red vertical line is the average effect estimate. The black vertical line shows no effect. OR = odds ratio. n = number of exacerbations. N = number of patients.

asthma-related ED utilisation. While unemployment was significantly associated with asthma-related EC utilisation in adult populations, mainly through stress-mediated pathways, its association with paediatric asthma outcomes is less clear compared with other indicators.

One study examined whether employment was associated with uncontrolled asthma based on having two or more exacerbations in the previous year.[61] Based in rural Appalachia, Kentucky, this cross-sectional study measured employment using employment status. While employment appeared to impact whether an individual reported having asthma, it was not a statistically significant predictor of uncontrolled asthma after controlling for age, sex, perceived financial status, and accommodation (OR 0.69 [0.23–2.05]). Given the broad categorisation, where unemployment was in the same group as part-time employment, full-time students and retired, it is hard to determine the role of unemployment in predicting exacerbation-based uncontrolled asthma.

Discussion

Overall, we found a clear association between lower income and exacerbations in both children and adults. We were unable to assess statistically the association between unemployment and asthma outcomes; instead, we narratively synthesised the role of unemployment. Despite the limited evidence, narratively, we found that unemployment was associated with ED visits. However, the association between unemployment and uncontrolled asthma based on exacerbations was unclear.

The narrative synthesis indicated a stress-mediated indirect association between unemployment and asthma-related healthcare utilisation. This suggests that the psychological burden of unemployment may exacerbate asthma symptoms and hinder effective self-management. Evidence indicates that sustained physiological stress intensifies the immune response, such as hypothalamic-pituitary-adrenocortical activation.[68–71] This leads to a decrease in β_2 adrenergic and glucocorticoid receptors, which reduces the responsiveness to asthma medication and, in turn, increases the risk of exacerbation.[70,72] Employment provides financial stability and benefits, such as employer health insurance and sick leave, that can facilitate disease management.[73] Without these privileges, the unemployed are likely to delay or forgo health care-seeking behaviours and present themselves in ED with more severe outcomes.[7,74] However, this is limited to adults as unemployment is not a strong predictor of paediatric asthma outcomes compared with other SES indicators.

The wider literature on income and asthma corroborates our findings. Low-income households are strongly associated with limited access to essential resources and amenities, including nutritious food and healthcare services, that increase their risk of asthma exacerbations.[75–77] They are more likely to live in subsidised or social housing, which is often too small and of poor quality, beset with overcrowding and disproportionate levels of indoor and outdoor pollution.[78] Maintaining and repairing these homes is expensive, thus increasing their exposure to damp, mould, pests, and second-hand smoke. Unsurprisingly, subsidised housing is associated with experiencing asthma attacks in the previous year.[79] Children are at greater risk due to their limited immune response to microbial exposure and more so in urban areas whose greater residential density increases the concentration of these agents.[80,81] Also, children with asthma living in these settings are at greater odds of an ED visit than children residing with homeowning parents.[82] As a result, asthma patients on low incomes are denied the structural means to ameliorate their condition. They may also struggle to afford medication.

Pooled estimates from six high-income countries indicated that lower household income in early childhood was associated with the risk of developing poorer asthma-related outcomes.[83] A study investigating the association between socioeconomic position (SEP), an indicator of SES,[84,85] and asthma in a historical cohort of male university students found an association between low SEP in early life and asthma.[86] However, there is no association between adult SEP and adult-onset asthma. Using a different measure of SES, such as IMD, would possibly yield different results. Notwithstanding the smaller magnitude, our findings align with previous systematic reviews and meta-analyses on socioeconomic status and asthma outcomes. Lower SEP was associated with higher rates of asthma-related ED attendances.[15] A systematic review identified 31 studies where the lowest-income group had between 1.5 and 5 times the hospitalisation rate for asthma compared with the highest-income group.[87] Unlike these reviews, this review conducted a subgroup analysis of children and adults to explore heterogeneity by population. While there was a clear association in both children and adults, there was no evidence of a significant difference in the magnitudes of effect.

Other factors, such as medication use and adherence (or lack thereof), may relate directly to poor asthma outcomes. There is a tendency to overuse short-acting β-2 agonists (SABA), which do not address inflammation but only offer immediate symptom relief. High SABA use is found to be associated with poorer clinical outcomes, including exacerbations,[88,89] hospitalisations,[90,91] and mortality.[92,93] Evidence illustrates a dose–response relationship between SABA inhaler use and exacerbation risk, with even mild asthma patients experiencing exacerbations, whose risk was further elevated with high SABA use.[94–98] Many studies have demonstrated the benefits of high adherence to asthma controller therapy in reducing the risk of exacerbation and death.[99–102] However, the effects of inhaled corticosteroids (ICS) adherence on mainly exacerbations are less clear. Studies identified a non-linear, U-shaped association between ICS adherence and exacerbations.[103–106] In other words, better adherence does not always mean better asthma outcomes. Analysis from England observed that ICS adherence was better in Clinical Commissioning Group regions with greater socioeconomic deprivation, with these areas also having worse asthma outcomes which may relate to SES factors specifically.[107] Also, the relationship between socioeconomic deprivation and asthma outcomes did not appear to be primarily mediated by poor adherence to ICS. SABA over-reliance and ICS adherence could be driven by suboptimal patient knowledge about the difference between maintenance and reliever medication, the patient's need for immediate symptom relief, concerns about the side effects of steroids, and poor communication between patients and physicians as well as different prescribing behaviours by physicians due to perverse incentives.[108]

The main strength of this review was summarising the evidence on the effect of income and, though limited, employment, the most weighted IMD domains, on asthma outcomes. Both the meta-analysis and narrative synthesis offer a better understanding of the association between these domains and asthma outcomes. The studies included in this review were published between 2010 and 2025, thus reflecting more recent evidence than in previous reviews.[14,15]

However, there are limitations to this review. 60% of the included studies were from the US (18 studies) compared to seven from the UK, three from Canada

and only two from the other European countries (Denmark and France). There are likely to be different constructs to assess SES. On the one hand, some North American studies used state[49,65] or federal[40,55,62] income thresholds. Other studies included stress,[40] health insurance coverage,[47] and race/ethnicity.[67] Depending on the population, studies also looked at bespoke deprivation indices, such as the Child Opportunity Index (COI),[63,66] Distressed Communities Index,[60] and Neighborhood Deprivation Index.[64] On the other hand, UK-based studies predominantly used IMD.[50–53,57–59] Not only does this affect the generalisability of findings to other Western countries but also many non-Western countries where there are greater inequalities. Only studies published in English were included for practical reasons, potentially introducing a language bias. We were unable to search in other language databases and, therefore, may have missed potentially useful studies.

Moreover, there are some limitations to the evidence. Due to the lack of studies available to conduct a meta-analysis, we narratively synthesised the role of unemployment on asthma outcomes. However, this was limited to only three studies. Likewise, there were insufficient studies to quantify the association between income and hospital admissions and mortality. The studies included in the meta-analysis predominantly defined exacerbations by ED visits, hospitalisations and/or OCS. The exacerbation rate ranges from <1% to 29% in the included studies, or <10 exacerbations per 1000 patients vs. 290 exacerbations per 1000 patients.[46,55] Depending on the baseline exacerbation rate, the pooled OR estimate of 1.25 could pose an uneven burden on EDs. In practice, this could translate from as little as 500 more events per 100,000 patients per year (1–2 more events per day) to as high as 7200 per 100,000 patients per year (approximately 20 more per day), which could overwhelm EDs. Considering these findings mainly reflect severe exacerbations, the results are likely skewed, and the burden on secondary care will likely be overestimated. Nonetheless, more evidence is required to assess the associations between income and asthma outcomes beyond severe exacerbations and between unemployment and asthma outcomes.

The subgroup analysis showed no significant difference, with the variation in the definition of exacerbation explained mainly by the heterogeneity in adults. Further studies need to address the heterogeneity in adults. Also, only one moderator was examined as other possible effect-modifying study-related factors were subject to reporting differences in sex (by intervention or exposure), age (mean, median and frequency) and ethnic groups. Therefore, we cannot rule out the impact of these moderators on the associations.

Our findings have research, clinical, and policy implications. Since all studies investigated the association at a high-income/employment level, there is scope to disentangle the mechanisms underpinning these inequalities in disadvantaged populations. Not only does this indicate a persistent issue that has yet to be resolved, but it is also multifaceted. Employment and income represent material disadvantages, i.e., limited wealth and access to goods and conveniences (Fig. 4).[109] As living a healthy life is prohibitively expensive, the most deprived are more likely to live in substandard housing and have poor nutrition. These adverse exposures may work synergistically against the most deprived groups, who are excessively exposed to indoor and outdoor air pollution while lacking the protective effects of a healthy diet to stimulate an immune response.[110,111] This can have pathobiological effects on people born into deprivation, who have worse airways or who are already born in a pro-inflammatory state.[112,113] Evidence indicates that the incidence of developing asthma is statistically significantly increased when children are exposed early in life.[114] The most deprived children were reported to have higher levels of airway inflammation and worse lung function.[115] Meanwhile, these groups are affected by The Inverse Care Law: the "availability of good medical care tends to vary inversely with the need for it in the population served".[116] Given their precarious working arrangement, such as zero-hour contracts, leaving work to access appointments is expensive. Not only is there the risk of loss of income and employment but also the risk of long-term poorer health outcomes from restricted access to healthcare.[112] These are likely to have knock-on effects on education, health, housing, and the wider environment.[117] Improving the material disadvantages can improve the "structural (e.g., systemic racism); social (e.g., socioeconomic status [SES]); biological (e.g., genetics);

Fig. 4: **A matrix illustrating the synergistic effects of material disadvantages on poor asthma outcomes.**

and behavioural (e.g., smoking) factors" driving the widespread disparities.[118] Addressing the material disadvantages is paramount to improving widespread disparities, which will require researchers to explore at the domain level rather than the aggregate level.

When developing interventions, clinicians need to understand how underlying mechanisms manifest in the clinical pathway and affect outcomes. Here, clinicians should consider the co-existing drivers for inequality that may have synergistic effects, where the Inverse Care Law may manifest in clinical pathways, and how the pathobiology of poverty might impact clinical outcomes (and what can be done to address this). This can support efforts to advance knowledge of the interactions between environmental, genetic and immunological factors, as well as policies highlighting the need for equity in reducing health disparities.[13]

Policymakers could reduce the effects of income and unemployment on asthma outcomes by improving housing conditions, especially for at-risk populations like children, and unemployment-induced stress. Despite the housing shortages and the need to build new homes, houses should be free from indoor and outdoor pollution. Offering a tailored package of housing improvements, such as remediation, to low-income households should include incentives such as shopping vouchers and credit to utility bills.[119] Amid welfare reform, including changes to unemployment benefits, policymakers should provide further psychological resources and career support to facilitate government efforts to 'get Britain working again'. Policies should embed mental health support in employment programmes, offering regular contact and health checks (including asthma reviews) until the individual finds a job.[120] Should these policies be implemented successfully, more people will be working and earning an income. Living in a secure and stable environment means less disposable income is spent on repairs and maintenance. Addressing these widespread disparities will improve asthma outcomes and reduce overall inequalities in the long term.

In conclusion, income is an important indicator of SES that is associated with severe asthma exacerbations in children and adults. In contrast, we were unable to determine the role of unemployment in asthma outcomes. More evidence is required to assess the associations between income and asthma outcomes beyond severe exacerbations and unemployment and asthma outcomes more generally. Domain-level studies can help fully understand the mechanisms underlying these associations. Studies also need to investigate further the heterogeneity in adults. Interventions addressing the material disadvantages can inform and better target policies, such as improved housing conditions and unemployed-related stress. These will help researchers, clinicians, and policymakers get closer to improving asthma outcomes and reducing health inequalities.

Contributors

ZG, AS, IS, GAD, HW, CK and JKQ conceived the study design. ZG, IDK, EM, AMA and AT screened the studies for inclusion and extracted the data. ZG assessed the studies for risk of bias, conducted the meta-analysis and drafted the manuscript. HW and CK provided methodological and statistical support. AS, IS, GAD, CK, HW and JKQ edited and reviewed the manuscript. HW, CK and JKQ provided supervision. ZG, HW, CK and JKQ accessed and verified the underlying data. All authors had full access to all the data in the study and had final responsibility for the decision to submit for publication.

Data sharing statement

Requests for data can be made to the corresponding author.

Declaration of interests

AS has received grant funding from Health Data Research UK (to his institution). JKQ has been supported by institutional research grants from the Medical Research Council, NIHR, Health Data Research, GSK, BI, AZ, Insmed, Sanofi and received personal fees for advisory board participation, consultancy or speaking fees from GlaxoSmithKline, BI, Sanofi, Chiesi, AstraZeneca. ZG, IDK, EM, AMA, AT, GAD, HW and CK declare no competing interests.

83rd OREGON LEGISLATIVE ASSEMBLY--2025 Regular Session

Enrolled
House Bill 3179

Sponsored by Representative SOSA, Senator TAYLOR, Representative MARSH, Senator SOLLMAN; Representatives ANDERSEN, CHAICHI, CHOTZEN, DOBSON, FRAGALA, GAMBA, GOMBERG, GRAYBER, HARTMAN, HUDSON, KROPF, LEVY E, LIVELY, MCDONALD, MUNOZ, NERON, NGUYEN D, NGUYEN H, RIEKE SMITH, WALTERS, Senators GOLDEN, PATTERSON, PHAM K (at the request of Citizens' Utility Board) (Presession filed.)

CHAPTER .....

AN ACT

Relating to public utilities; creating new provisions; amending ORS 757.210, 757.215, 757.457 and 757.461; and declaring an emergency.

Be It Enacted by the People of the State of Oregon:

ELECTRIC AND NATURAL GAS UTILITY RATES

SECTION 1. Section 2 of this 2025 Act is added to and made a part of ORS 757.210 to 757.220.

SECTION 2. (1) As used in this section, "electric or natural gas company" means any entity that is a public utility that is engaged in the business of distributing electricity or natural gas to retail customers in this state.

(2) In determining whether an electric or natural gas company's proposed residential rate or schedule of rates to be established or increased or changed is fair, just and reasonable, the Public Utility Commission shall balance the interests of the utility investor and the consumer by considering the cumulative economic impact of the proposed rate or schedule of rates on the electric or natural gas company's residential ratepayers.

(3) An electric or natural gas company shall conduct and include with its filing an analysis of the cumulative economic impact of a proposed rate or schedule of rates on the electric or natural gas company's residential ratepayers if the electric or natural gas company's proposed residential rate or schedule of rates will result in an increase of residential rates and the electric or natural gas company's return on equity is subject to review and modification. The analysis must take into consideration the following:

(a) For each classification of service of the electric or natural gas company affected by the proposed rate or schedule of rates and, if applicable, distinguished by ratepayers who reside in single-family housing and ratepayers who reside in multifamily housing:

(A) Ratepayers' average monthly utility bill for the 18 months ending on the date before the date the proposed rate or schedule of rates is to take effect;

(B) The approximate range of utility bills from November 1 to March 31 for the prior two years for residential ratepayers who use the utility service for space heating; and

(C) The estimated dollar amount and percentage increase in ratepayers' utility bills;

(b) The average cost of living and cost of fuel and utilities for the region, state and, where available, service territory of the electric or natural gas company, as determined by the commission using the Consumer Price Index for All Urban Consumers, West Region (All Items), as most recently published by the Bureau of Labor Statistics of the United States Department of Labor, and any other macroeconomic data as determined by the commission;

(c) The electric or natural gas company's data on residential service disconnection for nonpayment, including:

(A) The number of ratepayers the electric or natural gas company disconnected for nonpayment in the previous 12 months;

(B) The number of ratepayers receiving energy assistance, including any government assistance, utility bill discount or utility arrearage program, that the electric or natural gas company disconnected for nonpayment in the previous 12 months;

(C) The number of ratepayers who have a medical certificate filed with the electric or natural gas company; and

(D) Data related to customers who are enrolled in the electric or natural gas company's energy assistance programs, including disconnection moratorium programs;

(d) The electric or natural gas company's data on overdue balances, as determined by the commission, such as:

(A) The number of ratepayers who have an overdue balance;

(B) The average amount of the overdue balances; or

(C) The total amount of overdue balances owed to the electric or natural gas company;

(e) Data on the cost of energy for commercial and industrial customers relative to the cost of energy for commercial and industrial customers in other states in the region together with historical trends; and

(f) Any other relevant data, as determined by the commission, such as indicators of financial hardship, residential customer energy burden or affordability of utility bills.

(4) The commission may contract or coordinate with other state agencies, energy assistance providers or the nongovernmental entity that administers funds collected pursuant to ORS 757.054, through natural gas tariffs or through public purpose charges pursuant to ORS 757.612, to collect data necessary to carry out this section.

(5) The commission may establish rules to carry out this section, including rules that require electric and natural gas companies to gather information or data necessary to carry out this section.

SECTION 3. ORS 757.210 is amended to read:

757.210. (1)(a) Whenever any public utility files with the Public Utility Commission any rate or schedule of rates stating or establishing a new rate or schedule of rates or increasing an existing rate or schedule of rates, the commission may, either upon written complaint or upon the commission's own initiative, after reasonable notice, conduct a hearing to determine whether the rate or schedule is fair, just and reasonable. The commission shall conduct the hearing upon written complaint filed by the utility, its customer or customers, or any other proper party within 60 days of the utility's filing; provided that no hearing need be held if the particular rate change is the result of an automatic adjustment clause. At the hearing the utility shall bear the burden of showing that the rate or schedule of rates proposed to be established or increased or changed is fair, just and reasonable. The commission may not authorize a rate or schedule of rates that is not fair, just and reasonable.

(b) As used in this subsection, "automatic adjustment clause" means a provision of a rate schedule that provides for rate increases or decreases or both, without prior hearing, reflecting increases or decreases or both in costs incurred, taxes paid to units of government or revenues earned by a utility and that is subject to review by the commission at least once every two years.

(2)(a) Subsection (1) of this section does not apply to rate changes under an approved alternative form of regulation plan, including a resource rate plan under ORS 757.212.

(b) Any alternative form of regulation plan shall include provisions to ensure that the plan operates in the interests of utility customers and the public generally and results in rates that are just and reasonable and may include provisions establishing a reasonable range for rate of return on investment. In approving a plan, the commission shall, at a minimum, consider whether the plan:

(A) Promotes increased efficiencies and cost control;

(B) Is consistent with least-cost resources acquisition policies;

(C) Yields rates that are consistent with those that would be obtained following application of ORS 757.269;

(D) Is consistent with maintenance of safe, adequate and reliable service; and

(E) Is beneficial to utility customers generally, for example, by minimizing utility rates.

(c) As used in this subsection, "alternative form of regulation plan" means a plan adopted by the commission upon petition by a public utility, after notice and an opportunity for a hearing, that sets rates and revenues and a method for changes in rates and revenues using alternatives to cost-of-service rate regulation.

(d) Prior to implementing a rate change under an alternative form of regulation plan, the utility shall present a report that demonstrates the calculation of any proposed rate change at a public meeting of the commission.

(3) Except as provided in ORS 757.212, the commission, at any time, may order a utility to appear and establish that any, or all, of its rates in a plan authorized under subsection (2) of this section are in conformity with the plan and are just and reasonable. Except as provided in ORS 757.212, such rates, and the alternative form of regulation plan under which the rates are set, also shall be subject to complaint under ORS 756.500.

(4) Periodically, but not less often than every two years after the implementation of a plan referred to in subsection (2) of this section, the commission shall submit a report to the Legislative Assembly that shows the impact of the plan on rates paid by utility customers.

(5) The commission and staff may consult at any time with, and provide technical assistance to, utilities, their customers, and other interested parties on matters relevant to utility rates and charges. If a hearing is held with respect to a rate change, the commission's decisions shall be based on the record made at the hearing.

(6) The commission may adjust rates to mitigate an increase in residential customer rates if the increase is of such magnitude that, if applied at the higher rate or all at one time, the increase would affect the ability of residential customers to maintain adequate utility service. In considering whether to adjust rates under this subsection, the commission:

(a) Must determine whether the proposed adjusted rates are fair, just and reasonable;

(b) May not adjust rates in a manner that results in rates that are not fair, just and reasonable; and

(c) Shall consider and may approve deferred accounting for future cost recovery from customers for those amounts that are subject to rate mitigation.

(7) Any increase in residential rates may not take effect from November 1 to March 31.

SECTION 4. (1) Notwithstanding any other provisions of law, if an electric or natural gas company's proposal to increase rates under ORS 757.210 subjects the electric or natural gas company's return on equity to review or modification by the Public Utility Commission, the rate increase may not take effect within 18 months from the effective date of the electric or natural gas company's last rate increase under ORS 757.210 that subjected the electric or natural gas company's return on equity to review or modification by the commission.

(2) Notwithstanding ORS 757.259, the commission shall consider and may approve deferred accounting for future cost recovery from ratepayers under an electric or natural gas company's requested rate revision, if the rate revision subjects the electric or natural gas company's return on equity to review or modification.

(3) As used in this section, "electric or natural gas company" means a public utility, as defined in ORS 757.005, that is engaged in the business of distributing electricity or natural gas to retail customers in this state.

SECTION 5. Section 4 of this 2025 Act is repealed on the earlier of:

(1) January 2, 2027.

(2) The date the Public Utility Commission adopts permanent rules to implement section 7 of this 2025 Act.

SECTION 6. Section 7 of this 2025 Act is added to and made a part of ORS chapter 757.

SECTION 7. (1) As used in this section, "electric or natural gas company" means any entity that is a public utility that is engaged in the business of distributing electricity or natural gas to retail customers in this state.

(2)(a) The Public Utility Commission shall establish rules requiring an electric or natural gas company to establish a multiyear rate plan for rate revisions that subject an electric or natural gas company's return on equity to review or modification.

(b) The rules must:

(A) Include procedural and content requirements for a multiyear rate plan.

(B) Require an electric or natural gas company to file a multiyear rate plan on a regular interval that is no less than three and no more than seven years long.

(C) Establish a limit on the number of electric or natural gas companies that are allowed to request a rate increase in any given year.

(c) The rules may:

(A) Provide for incentives for efficient utility operations.

(B) Authorize refunds to customers under certain circumstances.

(C) Allow an electric or natural gas company, or third party, to request an exception to a requirement established by rule under this section on a showing of good cause.

(3) The provisions of this section do not allow for cost recovery that is not permitted under ORS 757.355.

SECTION 8. ORS 757.215 is amended to read:

757.215. (1) The Public Utility Commission may, pending such investigation and determination, order the suspension of the rate or schedule of rates for a period of up to [*nine*] **10** months beyond the time when such rate or schedule would otherwise go into effect.

(2) This section does not prevent the commission and the utility from entering into a written stipulation at any time extending any period of suspension.

(3) After full hearing, whether completed before or after such rate or schedule has gone into effect, the commission may make such order in reference thereto as would be proper in a proceeding initiated after such rate or schedule has become effective.

(4) If the commission is required to or determines to conduct a hearing on a rate or schedule of rates filed pursuant to ORS 757.210, but does not order a suspension thereof, any increased revenue collected by the utility as a result of such rate or rate schedule becoming effective shall be received subject to being refunded. If the rate or rate schedule thereafter approved by the commission is for a lesser increase or for no increase, the utility shall refund the amount of revenues received that exceeds the amount approved as nearly as possible to the customers from whom such excess revenues were collected, by a credit against future bills or otherwise, in such manner as the commission orders.

(5) The commission may in a suspension order authorize an interim rate or rate schedule under which the utility's revenues will be increased by an amount deemed reasonable by the commission, not exceeding the amount requested by the utility. Any such interim increase for a public utility as defined in ORS 757.005 that produces, transmits, delivers or furnishes heat, light or power shall be effected by rates designed to increase the utility's revenues without materially changing the revenue relationships among customer classes or between the revenues derived from demand charges and from energy charges. An interim rate or rate schedule shall remain in effect until terminated by the commission. Upon completion of the hearing and decision, the commission shall order the utility to refund that portion of the increase in the interim rate or schedule that the commission finds is not justified. Any refund of an interim increase under this subsection shall be based upon an analysis of the utility's earnings for a period reasonably representative of the period during which the in-

terim increase was in effect. Refunds shall be made as nearly as possible to the customers against whom the interim rates were charged, by credits against future bills or in such other manner as the commission orders.

(6) Refunds ordered by the commission under subsection (4) or (5) of this section shall include interest on the amount determined to be subject to refund from the date such interim rate or rate schedules took effect.

FINANCING OF CERTAIN RATE RECOVERY EXPENDITURES

SECTION 9. ORS 757.457 is amended to read:

757.457. As used in this section and ORS 757.459, 757.461 and 757.463:

(1) "Assignee" means a person, and any subsequent assignee, to which a public utility assigns, sells or transfers all or part of the public utility's interest in or right to rate recovery assets, except as security.

(2) "Bond" includes bonds, notes, certificates of beneficial interests in a trust or other evidence of indebtedness.

(3) "Bondholder" means a holder or owner of a rate recovery bond.

(4) "Finance subsidiary" means an assignee at the time rate recovery bonds are issued:

(a)(A) That is beneficially owned, directly or indirectly, by a public utility; or

(B) In the case of a trust, for which a public utility or subsidiary of the public utility is the grantor; or

(b) That is unaffiliated with a public utility and acquires bondable rate recovery assets from a public utility in a transaction or under an agreement that is approved by the Public Utility Commission.

(5) "Financing costs" includes the following costs related to rate recovery bonds, whether incurred and paid upon issuance or over the life of rate recovery bonds:

(a) The costs of issuing, serving, managing, repaying or refinancing rate recovery bonds, including any fees, expenses or charges incurred and the costs of any activities performed in connection with the rate recovery bonds, including:

(A) Information technology programming;

(B) Obtaining a financing order;

(C) Serving, accounting or auditing;

(D) Services related to trustees;

(E) Legal services;

(F) Consulting;

(G) Services related to financial and structuring advisors;

(H) Administration;

(I) Placement and underwriting;

(J) Services related to independent directors and managers;

(K) Services related to rating agencies;

(L) Stock exchange listing and compliance;

(M) Securities registration and filing; and

(N) Services necessary to ensure a timely payment of rate recovery bonds or other amounts or charges payable in connection with rate recovery bonds;

(b) Principal, interest and acquisition, defeasance and redemption premiums payable on rate recovery bonds;

(c) Payments required under an ancillary agreement and any amounts required to fund or replenish a reserve or account established under the terms of an indenture, ancillary agreement or financing document related to rate recovery bonds;

(d) Applicable federal, state and local taxes, franchise fees, license fees, gross receipts or other taxes or charges, whether paid, payable or accrued; and

(e) The Public Utility Commission's costs in performing the commission's duties related to rate recovery bonds that are recoverable by the commission under ORS 756.310.

(6) "Financing order" means an order issued by the Public Utility Commission that authorizes one or more the following:

(a) The recovery of rate recovery expenditures and financing costs;

(b) The creation of rate recovery assets;

(c) The issuance of rate recovery bonds;

(d) The imposition, collection and periodic adjustment of rate recovery charges; or

(e) The sale, assignment or transfer of rate recovery assets to an assignee.

(7) "Financing party" includes:

(a) Bondholders, trustees, agents and secured parties related to rate recovery bonds;

(b) A person acting for the benefit of bondholders, trustees, agents or secured parties; and

(c) A party to rate recovery bond documents or an ancillary agreement.

(8) "Public utility customer" means:

(a) For an electric utility, a retail electricity consumer, as defined in ORS 757.600.

(b) For a natural gas utility, the end use consumer served by the natural gas utility, including those served by the natural gas utility under ORS 757.516, regardless of whether the end use consumer purchases natural gas from the natural gas utility.

(9) "Rate recovery asset" means a right to recover from customers rate recovery expenditures and associated costs and expenses approved in a financing order, including the right to:

(a) Impose, charge, bill, collect, receive, hold and apply rate recovery charges authorized under a financing order or obtain, to the extent authorized, periodic adjustments of rate recovery charges; and

(b) All claims, accounts, revenues, payments, collections, moneys or proceeds arising from the rights and interest specified in a financing order, regardless of whether the claims, accounts, revenues, payments, collections, moneys or proceeds arising from the rights and interest specified in the financing order are commingled with other claims, accounts, revenues, payments, collections, moneys or proceeds.

(10) "Rate recovery charge" means charges to public utility customers authorized by the Public Utility Commission to recover rate recovery expenditures and financing costs and to be used to pay, repay or refinance rate recovery bonds.

(11) "Rate recovery expenditures" means costs and expenses incurred or to be incurred [*through the date of issuance of a financing order*] by a public utility associated with:

(a) An event that is the subject of a federal or state declaration of a state of emergency, such as severe weather, catastrophic wildfire, pandemic or other event that causes or threatens to cause widespread loss of life, injury to person or property, human suffering or financial loss, except those costs and expenses that are or are associated with criminal or civil fines or penalties or judgments from a civil action based on negligence related to the event.

(b) An energy conservation program that provides loans and cash payments to public utility customers for the installation of energy conservation measures funded by the public utility including, but not limited to, the costs or expenditures for specific acquisition program development, promotion and labor costs and associated general supervision, rents, leases and overheads.

(c) A capital investment:

(A) That by itself will cause residential rates to rise by more than five percent; and

(B) When combined with other expected investments or expenses, has the potential to significantly impact the affordability of residential rates.

(d) Retiring a generation asset, including undepreciated investments, decommissioning and restoring a facility site, related capital and operating costs, accrued carrying charges and deferred costs.

(e) Planned or past remediation of a contaminated site or environmental remediation activities and related partial or final payments or settlements.

(f) An event in which the availability of electricity or natural gas within a regional energy market is significantly constrained.

(12) "Secured party" means a financing party that has been granted a security interest in rate recovery assets.

SECTION 10. ORS 757.461 is amended to read:

757.461. (1)(a) A public utility may apply to the Public Utility Commission for a financing order designating all or part of rate recovery expenditures as bondable rate recovery expenditures, for the purpose of financing or refinancing the designated expenditures under ORS 757.415 (1)(f).

(b) After notice and an opportunity for a hearing, the commission may approve an application if the commission finds that:

(A) The rate recovery expenditures included in the application are reasonable and prudent;

(B) Financing or refinancing the rate recovery expenditures through the issuance of rate recovery bonds is likely to be more favorable to public utility customers for the recovery of rate recovery expenditures as compared to other methods; and

(C) Bonds, notes, certificates of beneficial interests in a trust and other evidences of indebtedness or ownership issued pursuant to the approval are reasonably likely to receive a determination of, at a minimum, investment grade by credit rating agencies.

(c) The commission shall issue an order within 180 days of an application approving or denying the application. If the commission approves the application, the commission shall issue a financing order.

(2)(a) A financing order issued under this section shall specify the highest amount of rate recovery expenditures that qualify as bondable rate recovery expenditures.

(b) In specifying the amount for rate recovery expenditures associated with an event described in ORS 757.457 (11)(a), net of appropriate adjustments as determined by the commission to be reasonable, the commission may include, but is not limited to including, the following rate recovery expenditures:

(A) Capital and operating costs incurred or to be incurred as a result of the event;

(B) Lost revenue associated with the event;

(C) Costs and expenses that may be recovered at a later time from third parties or insurers and returned to public utility customers through a separate rate proceeding consistent with cost causation and rate design principles and statutory or regulatory requirements; and

(D) Carrying costs or charges.

(3) A financing order issued under this section must include the following provisions:

(a) Confirmation of the existence of recoverable rate recovery expenditures and authorization to recover rate recovery expenditures and associated financing costs, including the maximum principal amount of bondable rate recovery expenditures and financing costs that may be recovered through securitization;

(b) Authorization for the creation of rate recovery assets and imposition of rate recovery charges that allow for the recovery of rate recovery expenditures, as determined by the commission, and associated financing costs;

(c) A requirement that the rate recovery charges authorized by the financing order are ongoing and may not be avoided by a public utility customer, as described under subsection (4) of this section, until all principal, interest, premium and other amounts due on the rate recovery bonds and financing costs have been paid in full;

(d) A methodology for:

(A) Allocating rate recovery charges between the different classes of public utility customers, which may include not allocating rate recovery charges to one or more classes of public utility customers, that is consistent with cost causation and rate design principles and statutory or regulatory requirements; and

(B) Adjusting rate recovery charges as necessary to ensure timely payment on, and payment in full of, the rate recovery bonds and associated financing costs or in response to changes to applicable customers, service territories or collection rates;

(e) Authorization for the public utility to issue one or more series of rate recovery bonds with flexibility for the public utility to establish the terms and conditions of the rate recovery bonds, including repayment schedules, initial interest rates and initial financing costs;

(f) Authorization to assign rate recovery assets to a financing subsidiary and grant security interests in the rate recovery assets to secured parties without limiting the rights of subsequent assignees;

(g) Authorization for the bond documentation and ancillary documents related to the rate recovery bonds, including servicing arrangements for the rate recovery charges, without requiring the authorization to be on the final forms of the documents;

(h) Authorization **for the reasonable opportunity** for the public utility to earn a return, at the cost of capital authorized in the public utility's most recent general rate case prior to the date of the financing order, on any moneys advanced by the public utility to fund advances, reserves or capital accounts established under the terms of any indenture, ancillary agreement or financing documents related to the rate recovery bonds;

(i) A finding that the proposed issuance of rate recovery bonds and the imposition of rate recovery charges is expected to provide the lowest possible reasonable and prudent cost on a net present value basis to public utility customers for recovery of the rate recovery expenditures as compared to **the public utility's weighted average cost of capital or** other methods of financing and recovery;

(j) A date, not earlier than one year from the date that the financing order becomes final, on which the authority to issue rate recovery bonds granted in the financing order expires;

(k) A requirement that the public utility notify the commission if the public utility recovers costs and expenses from a third party or insurer; and

(L) Any other conditions that the commission finds appropriate and that are consistent with this section.

(4) Rate recovery charges authorized by a financing order shall be collected through the rates or charges paid by, and may not be avoided by, the public utility customers located within the public utility's allocated service territory, as the territory existed on the date of the financing order or, if the financing order provides, as such service territory may be expanded, even if:

(a) The public utility customer receives electricity or natural gas, electricity or natural gas services or ancillary services from a successor or assignee of the public utility;

(b) The public utility customer elects to receive electricity or natural gas, electricity or natural gas services or ancillary services from another public utility, utility provider or service provider in the service territory; or

(c) After the date of issuance of the financing order, the public utility customer changes customer class.

(5)(a) Rate recovery assets, including rate recovery charges, and the rights of public utilities, assignees, bondholders and financing parties, established by a financing order issued under this section, are irrevocable and unchangeable, except as provided in the financing order, until all principal, interest, premium, interest and amounts due on the rate recovery bonds and financing costs are paid in full.

(b) Until all principal, interest, premium, interest and amounts due on the rate recovery bonds and financing costs are paid in full, the commission, except as provided in the financing order, the State of Oregon and a public body, as defined in ORS 174.109, may not:

(A) Revalue the rate recovery expenditures or financing costs for ratemaking purposes;

(B) Determine that the rates or revenues authorized under the financing order are unjust or unreasonable;

(C) Reduce, alter or impair the rate recovery assets, rate recovery charges or the collection of the rate recovery charges, or rate recovery bonds or the security for the rate recovery bonds;

(D) Rescind, suspend, amend or impair the financing order; or

(E) When setting other rates or charges for the public utility or taking other actions pursuant to the commission's authority, consider the rate recovery bonds as debt of the public utility, the rate

recovery assets to be revenue for the public utility or the rate recovery expenditures to be costs of the public utility.

(6) If the commission determines that financing certain rate recovery expenditures through the issuance of rate recovery bonds would potentially result in benefits to public utility customers, the commission may identify those rate recovery expenditures and direct a public utility to investigate and report to the commission on the costs, benefits and risks of financing those rate recovery expenditures. The report may include an analysis of the following:

(a) Any future need for the use of rate recovery bonds;

(b) The ability of the public utility to raise capital;

(c) Intergenerational equity;

(d) The percentage of customers' utility bills that are currently dedicated to rate recovery bond payments; and

(e) The percentage of customers' utility bills that would need to be dedicated to rate recovery bond payments to finance the rate recovery expenditures analyzed in the report.

[*(6)*] **(7)** The commission may not require a public utility to:

(a) Apply to the commission for a financing order designating all or part of rate recovery expenditures as bondable rate recovery expenditures; or

(b) Finance or refinance rate recovery expenditures that the commission has designated as bondable rate recovery expenditures.

[*(7)*] **(8)** Jurisdiction for review of a financing order issued under this section shall be as provided for orders in contested cases pursuant to ORS 183.482, except that a petition for rehearing or reconsideration is not allowed. If a petition is not filed with the Court of Appeals within 60 days following the date of issuance of a financing order, the order becomes a final and irrevocable action of the commission and the State of Oregon and is not subject to administrative or judicial challenge.

(9) In determining whether an event as described under ORS 757.457 (11)(f) qualifies as a rate recovery expenditure, the commission shall take into consideration the following factors:

(a) The cost and availability of wholesale power or natural gas during the event;

(b) The applicability of any regional reliability assistance programs; and

(c) Any issuance of a declaration related to energy reliability by a regional balancing authority.

REPORTS BY PUBLIC UTILITIES

SECTION 11. Sections 12 and 13 of this 2025 Act are added to and made a part of ORS chapter 757.

SECTION 12. (1) As used in this section and section 13 of this 2025 Act, "electric or natural gas company" means any entity that is a public utility that is engaged in the business of distributing electricity or natural gas to retail customers in this state.

(2) Each calendar year, an electric or natural gas company shall provide to the Public Utility Commission, and make publicly available on the electric or natural gas company's website, a visual representation of the cost categories that are included in the electric or natural gas company's residential customer rates and the percentage amount of the residential customer rates for each cost category.

(3) The commission shall by rule establish the cost categories. Cost categories must include the following:

(a) Transmission services infrastructure;

(b) Distribution services infrastructure;

(c) Power costs;

(d) Wildfire mitigation;

(e) Catastrophic events and emergencies;

(f) Insurance, including self-insurance; and

(g) Any other expenses, as determined by the commission, that an electric or natural gas company seeks to recover through residential customer rates.

SECTION 13. (1) The Public Utility Commission shall require each electric and natural gas company to, at least annually, file with the commission, and make publicly available, a report on any rate adjustments that the electric or natural gas company expects within the next 12 months.

(2) A report under this section must:

(a) Identify all rate adjustment requests that an electric or natural gas company has filed or reasonably knows or anticipates to file;

(b) Identify other requests or applications that could result in a rate adjustment;

(c) Provide estimates on the amounts of expected rate adjustments, if the amounts in expected rate adjustments are not known with certainty; and

(d) For each rate adjustment request that an electric or natural company has filed or reasonably knows or anticipates to file:

(A) Specify the date the electric or natural gas company filed or anticipates filing the request with the commission;

(B) Specify the date the electric or natural gas company requests or anticipates requesting that the rate adjustment take effect;

(C) Provide the overall estimated rate impact, expressed in dollar and percentage amounts, that would result from the rate adjustment if approved;

(D) Provide the cumulative rate impact of a rate adjustment in the aggregate with all other rate adjustments that take effect between the date of the report and the date the rate adjustment takes effect; and

(E) Identify the classification of service or customer that may be affected by a rate adjustment and forecast how the rate adjustment may affect rates for the other customer classes of the electric or natural gas company.

(3) An electric or natural gas company is not required under this section to make publicly available any information or material that is subject to confidentiality under the rules of the commission.

(4) The commission shall adopt rules to carry out the provisions of this section. The rules must provide for procedures for an electric or natural gas company to protect the confidentiality of the information described under subsection (2) of this section through the use of a protective order, subject to review and approval by the commission.

APPLICABILITY

SECTION 14. (1) Except as provided in subsection (2) of this section, sections 2 and 4 of this 2025 Act and the amendments to ORS 757.210 and 757.215 by sections 3 and 8 of this 2025 Act apply to proceedings before the Public Utility Commission that commence on or after the effective date of this 2025 Act.

(2) ORS 757.210 (7) applies to increases in residential rates that are approved on or after the effective date of this 2025 Act.

EXPENDITURES LIMIT

SECTION 15. Notwithstanding any other law limiting expenditures, the limitation on expenditures established by section 1 (1), chapter ___, Oregon Laws 2025 (Enrolled House Bill 5034), for the biennium beginning July 1, 2025, as the maximum limit for payment of expenses from fees, moneys or other revenues, including Miscellaneous Receipts, but excluding lottery funds and federal funds, collected or received by the Public Utility Commission of Oregon,

for the utility program, is increased by $463,653, to evaluate utility rate increases for electric and natural gas providers.

CAPTIONS

SECTION 16. The unit captions used in this 2025 Act are provided only for the convenience of the reader and do not become part of the statutory law of this state or express any legislative intent in the enactment of this 2025 Act.

EMERGENCY CLAUSE

SECTION 17. This 2025 Act being necessary for the immediate preservation of the public peace, health and safety, an emergency is declared to exist, and this 2025 Act takes effect on its passage.

OREGON STATE LEGISLATURE

November 7, 2025

Chair Letha Tawney
Commissioner Les Perkins
Commissioner Karin Power
Oregon Public Utility Commission
201 High St. SE, Suite 100
Salem, Oregon 97301

Re: Utility Shutoffs Amid the Federal Government Shutdown

Dear Chair Tawney, Commissioner Perkins, and Commissioner Power,

Since the federal government shutdown began on October 1, 2025, the economic impacts have rippled throughout our economy and hurt household budgets across Oregon. Many households now face an impossible choice between buying food or paying their energy bills.

Federal employees have been on furlough or working without pay for over a month. The shutdown has delayed the distribution of Supplemental Nutrition Assistance Program (SNAP) and Low-Income Home Energy Assistance Program (LIHEAP) funds, which help families put food on the table and keep their lights on. Even though SNAP benefits are flowing again this morning, these benefits remain at risk as the shutdown drags on. If the government does not reopen by November 15, funding will also end for the Women, Infants, and Children (WIC) program, which supports pregnant people, moms, and young children.

In regular times, utility companies have shutoff policies for when customers fail to pay their utility bills. However, the federal shutdown is an unprecedented crisis that is hitting families hard, through no fault of their own. We are also entering the cold weather season, when families need access to heating. Disconnecting households from their utilities during this time would compound Oregonians' suffering and make it even more difficult for families to stay afloat.

In this extraordinarily difficult time for our state, we urge Oregon's utility companies and the Oregon Public Utility Commission to act to prevent the suspension of SNAP, LIHEAP, and other at-risk public benefits from causing utility shutoffs. Oregonians have always come together to take care of each other during times of crisis. Please adopt policies to prevent utility disconnections during the federal government shutdown.

Sincerely,

Deb Patterson

UG 527

NW Natural Alternative Rate Mechanism

Data Request Response

Request No.: UG 527 CUB DR 34

Regarding the Company's internal processes and policies surrounding the temporary November (part month) and December (full month) 2025 disconnection moratorium; Please provide all DRs in public and confidential versions, where applicable:

a. What date and under what circumstances did NW Natural realize its error?

b. Please provide an explanation and timeline of how and when (dates) the Company's Customer Service Representatives (CSRs) were trained on this 2025 disconnection moratorium temporary policy; include relevant internal communications to CSRs about this temporary policy, including Company expectations for CSRs;

c. Please provide copies and explanation of all public facing communications the Company used to inform its customers of the temporary 2025 November and December - including but not limited to, emails, letters, social media;

d. What did CSRs tell customers in the bill discount program when they called to be turned back on after disconnection?

    i. Please provide all CSR training materials for this policy

e. Please provide all CSR transcripts with Bill Discount Program customers from November and December (while protecting identifying, account holder information);

f. How many customers called the Company in November and December to inquire about the 2025 temporary disconnection moratorium?

g. How has the Company addressed this error to date? Please include what has already been done and what the Company plans to do in the future.

    i. Please include details on when the Company began reaching out to impacted customers, along with all details of the communication (email, mailed letter, phone call, voicemails); please also attach relevant examples of language used by the Company;

ii. Please explain the customer response the Company has received regarding this matter;

iii. Please include details on what relevant stakeholders it reached out to and when;

h. Does the Company plan to do public outreach regarding this error, if for no other reason than to help track down the remaining impacted customers it cannot reach to date? Please explain.

i. What bill credit and/or refund process is the Company considering? Provide relevant Commission policy/regulations/rules to support this answer.

Response:

a. NW Natural noted there were disconnection count results included in metric 5 of Table 3 in Staff's template for the Energy Burden Metric report when the report was submitted for the 4th quarter 2025 period on January 29, 2026. The Company began researching the cause for this at that time. UG 527 CUB DRs 31-32 were received on February 12, 2026, which further heightened the priority of finding the cause.

As discussed in the Company's response to UG 527 CUB DR 31, the cause was due to NW Natural not implementing the voluntary temporary winter disconnect moratorium for bill discount participants and medical certificate customers as intended. Due to an internal miscommunication, the Company continued disconnections for non-payment for these customers despite processes being put in place to do so.

b. Instruction material was developed for CSRs by November 19, 2025, but this was ultimately not communicated to the CSRs due to an administrative error. The error was the delayed approval of the CSR instruction material and lack of follow-up to secure approval. This was exacerbated by the pending retirement of a key employee, who needed to approve the material and was providing knowledge transfer during this time. By the time the follow-up for approval occurred, NW Natural had approached the normal holiday moratorium where no disconnections would take place, so the training was not deployed. The holiday moratorium in 2025 included the entire weeks of December 22 and December 31 through January 2. The instruction that should have deployed provided: "Due to the recent government shutdown, customers who are certified as low-income or have a medical certificate on file will not be routed for disconnection through January 5, 2026." Note that January 1, 2026, was a holiday and January 2-4, 2026 was a Friday and the ensuing weekend, so no disconnections would have taken place on those days, regardless of the voluntary winter moratorium.

c. NW Natural did not provide customer communications focused exclusively on the voluntary temporary winter disconnect moratorium for bill discount participants and medical certificate customers. However, the NW Natural payment assistance webpage includes a message that customers impacted by federal funding uncertainty have options available and to contact the Company for more information S

d. As noted in the response to item b above, distinct training for the voluntary temporary winter disconnect moratorium for bill discount participants and medical certificate customers was not deployed; therefore, any customer calling to reconnect after a disconnection would have received the same information as any other customer about the requirements for reconnecting service, which includes the discussion of payment assistance.

e. Please see the response to UG 527 CUB DR 36 for anonymized customer contact detail logs of the customers impacted by NW Natural's failure to implement the voluntary temporary winter disconnect moratorium.

f. NW Natural is unable to track the reasons why customers initially call the contact center, including whether customers called to ask about the voluntary temporary winter disconnect moratorium.

g. As noted in the response to UG 527 CUB DR 31, there were 192 customers that were mistakenly disconnected. To date, 171 of those customers have been reconnected, with the majority of those reconnecting the same day or next day of the disconnection. Any fees that were charged related to those reconnections have been refunded. On February 19, 2026, NW Natural reached out to the remaining customers to inform them they would be reconnected for no charge; of those customers, one customer was reconnected the same day (included in the 171), 11 customers were left voice messages, 2 customers stated they had moved and did not want to reconnect, 2 customers stated they wanted the gas to remain off and the account to remain closed, and 6 customers were not reachable due to non-working phone numbers. Note that these customer counts are system totals, consistent with the response to UG 527 CUB DR 31. The breakout of these numbers by state is as follows:

	OR	WA	Total
Total impacted	176	16	192
Reconnected (majority done same or next day)	155	15	170
pre-2/19 not yet Reconnected	21	1	22
CSST Outreach			
Reconnected 2/19	1	0	1
Customer does not want service	4	0	4
Left voicemail	10	1	11
Non-working phone numbers	6	0	6
Total	21	1	22

On February 27, 2026, NW Natural implemented a $150 bill credit for all impacted customers. The bill credit will appear on the customer's next bill as a line item with the bill message indicating: "The $150 credit on this bill corrects a service disconnection error related to a temporary pause in your service last year. This courtesy credit helps lower your bill." Customers who have closed accounts will be issued a corrected final bill that includes the credit, which will reduce the final balance and may result in a refund check.

When the error of not implementing the moratorium was confirmed, NW Natural's Vice President of Regulatory Affairs and Resource Planning reached out to the OPUC Chair and the Executive Director of Oregon CUB to inform them on or around February 19, 2026. NW Natural's Senior Manager of Regulatory Affairs also reached out to OPUC Staff's Regulatory Strategy Manager to inform them on February 20, 2026.

h. After discussion with CUB, NW Natural will be reaching out to CAPO and the community action agencies serving the areas of the remaining customers who have not returned the Company's voicemail or who have not been reached due to non-working phone numbers to assist in continuing to attempt outreach to such customers.

i. Please see the Company's response to g above.

OFFICE OF SENATOR DEB PATTERSON

FOR IMMEDIATE RELEASE

November 12, 2025

Press Contact: Megan Wai, sen.debpatterson@oregonlegislature.gov

Oregon Senator Deb Patterson and Colleagues Secure Commitments to Keep Service Connected for Struggling Families

Urging from lawmakers prompted swift action by major Oregon utility companies

SALEM, OR – Following calls from Senator Deb Patterson (D-Salem) and 17 of her legislative colleagues urging protection for struggling Oregonians during the ongoing federal government shutdown, multiple utility companies have agreed to take steps to ensure customers can stay warm.

On November 7, Senator Patterson and her colleagues delivered a letter to the Oregon Public Utilities Commission urging action to prevent utility disconnections for Oregonians affected by the federal government shutdown. Utility providers have responded quickly to share their plans to keep customers connected. Major utilities have announced measures to hold off on disconnecting service to households whose finances are hit hard by the federal shutdown.

“I’m grateful to see Oregon’s major utilities stepping up for families during this challenging time,” said Senator Patterson. “No one should be left without heat or electricity because of political gridlock in D.C.”

The Oregon Public Utility Commission has worked extensively in recent years on disconnection protections. The commission has authority to impose a moratorium on service shutoffs, but it can happen faster when utilities voluntarily make that move. Senator Patterson’s letter to Oregon’s energy-sector leaders prompted swift action.

“These agreements show what's possible when we work with local leaders to put people first,” Patterson added.

Summary of commitments:

- Pacific Power and PGE are halting shutoffs through the end of the year for income-qualified and medically vulnerable customers.
- NW Natural is suspending shutoffs through the end of the year for income-qualifying customers.
- Cascade Natural Gas is suspending collections and disconnections for 30 days for customers who receive financial utility assistance or who report they have been affected by the federal government shutdown.

- Avista Corp will provide a 30-day grace period for customers affected by the federal shutdown, which will prevent them from entering the collections process and potential shutoffs.
- Idaho Power will implement a temporary moratorium on disconnections for customers affected by the government shutdown until the federal government reopens.

Power companies to help customers impacted by government shutdown

koin.com/news/oregon/pnw-utility-companies-help-customers-impacted-government-shutdown

Michaela Bourgeois November 13, 2025

'No one should be left without heat or electricity because of political gridlock in D.C.,' Oregon State Sen. Deb Patterson said

PORTLAND, Ore. (**KOIN**) – Local utility companies have made agreements with state lawmakers to help customers who have been impacted by the federal government shutdown, Oregon State Senator Deb Patterson (D-Salem) announced.

The announcement comes after Sen. Patterson and 17 other Oregon state lawmakers **sent a letter to the Oregon Public Utility Commission** on Nov. 7, urging the organization to help protect struggling Oregonians impacted by the six-week shutdown, which came to a close on Wednesday, as reported by the **Associated Press**.

‘Like poop in my house’: Nearby residents accuse Longview paper mill of creating a big stink in lawsuit

The request was also sent to executives at PacifiCorp, PGE, NW Natural, Idaho Power, and Cascade Natural.

In response to the lawmakers, some utility providers made commitments to keep customers connected.

These commitments include decisions by Northwest Natural, Pacific Power and Portland General Electric to halt power shutoffs through the end of the year for income-qualified customers – with the latter two companies also agreeing to suspend shutoffs for medically vulnerable customers.

Additionally, Cascade Natural Gas is suspending collections and disconnections for 30 days for customers who receive financial utility assistance or for customers who report that they have been impacted by the federal government shutdown.

Avista Corp has also agreed to provide a 30-day grace period for customers affected by the shutdown to prevent customers from entering the collections process and avoid potential power shutoffs.

Further, Idaho Power is implementing a temporary moratorium on disconnections for customers affected by the shutdown until the federal government reopens.

In a press release Wednesday announcing the measures, Sen. Patterson noted that the Oregon Public Utility Commission has worked extensively in recent years to protect customers from disconnections.

The commission has the authority to impose a moratorium on service shutoffs however, Patterson noted that these measures to protect customers can happen faster when utility companies voluntarily make the move.

Parkrose Grocery Outlet workers ‘don’t feel safe’ as owner considers closing due to crime

“I’m grateful to see Oregon’s major utilities stepping up for families during this challenging time,” said Senator Patterson. “No one should be left without heat or electricity because of political gridlock in D.C.”

In a statement shared with KOIN 6 News, the Oregon Public Utility Commission said, “The Oregon Public Utility Commission (PUC) is deeply aware of the financial strain placed on many households by the federal government shutdown. Delays in federal assistance programs, in combination with seasonal heating needs, are creating heightened risk for many Oregonians. We appreciate that the investor-owned electric and natural gas companies that we regulate stepped up and quickly agreed to discontinue service shutoffs due to nonpayment for the most vulnerable customers impacted by the shutdown.”

The request comes one week after a new **NW Natural rate hike went into effect Nov. 1**, costing residents a 5.4% increase — or an average increase of $4.38. The public utility commission approved the increase after NW Natural said it needed more money to modernize its systems and construct new resource centers.

In August, **Gov. Tina Kotek signed House Bill 3179** — also known as the FAIR Energy Act — to put limits on proposed utility rate hikes in the state. This comes after customers saw **staggering increases in 2024**.

I. Introduction 1

II. Low-income customers are disproportionately impacted by inequitable utility service. 6

III. The Commission should reject Northwest Natural's proposed fixed charge increase because it will disproportionately impact low-income residential customers. 11

IV. The Commission should reject Northwest Natural's requested Return on Equity. 18

V. The Commission should ensure Northwest Natural is effectively implementing its low-income programs and thoroughly assessing its customers' bill assistance need. 21

VI. The Commission should order Northwest Natural to reform certain aspects of its disconnection policies. 30

VII. The Commission should ensure Northwest Natural develops and implements a language access plan. 39

VIII. The Commission should not allow Northwest Natural to recover fees and costs which the Commission and the Governor prohibited Northwest Natural from charging during the COVID-19 pandemic. 44

IX. The Commission should order Northwest Natural to revise and add to its proposed Performance-Based Ratemaking metrics and to post them on its public website. 47

X. The Commission should ensure Northwest Natural's proposed Thermal Energy Network pilot project will serve low-income housing when considering the equity implications of the proposed rate base merger to pay for the project. 50

I. Introduction

Q: Please state your name and business address.

A: My name is Shaylee Nicole Stokes. My business address is P.O. Box 7130, Olympia, WA 98507.

Q: How would you like to be addressed in this proceeding?

A: You may call me Witness Stokes. I use the pronouns she, her, and hers.

Q: By whom are you employed and in what capacity?

A: I am employed by the Washington State Community Action Partnership as the Director of The Energy Project ("TEP").

Q: How long have you been employed by the Washington State Community Action Partnership?

A: I became TEP Director in September 2023. Prior to this, I was the Senior Manager of Energy Programs at Hopelink, a Community Action Agency that serves low-income families, children, seniors, and people with disabilities in King County.

Q: Would you please summarize your professional background as it relates to low-income programs?

A: I have been involved in the administration and design of low-income programs for more than a decade. Hopelink hired me in 2010 to screen customers for energy assistance, review customers' energy assistance applications, and award energy assistance grants to low-income customers. Over time, I moved into a management role, training front-line staff in the administration of energy assistance procedures and approving payments. By the time of my departure in 2023, I was the Senior Manager of Energy Programs, leading a staff of more than 30 in the day-to-day administration of energy assistance programs. In

2024, I was selected to serve on the Governance Board of the National Energy & Utility Affordability Coalition. I hold a Bachelor of Arts from the University of Washington in Seattle, WA. I have been a member of Northwest Natural Gas's ("NWN" or "Company") low-income advisory group and energy efficiency advisory group since 2023.

Q: On whose behalf are you testifying?

A: I am testifying on behalf of TEP, an intervenor in this proceeding that represents the interests of low-income customers and vulnerable populations. TEP works with Community Action Agencies ("CAAs" or "agencies") that provide low-income weatherization and bill payment assistance for customers in NWN's service territory.

Q: Have you previously testified before the Washington Utilities and Transportation Commission ("Commission" or "WUTC")?

A: Yes. I previously provided testimony concerning PacifiCorp's 2023 General Rate Case, Docket UE-230172; PacifiCorp's Clean Energy Implementation Plan, Docket UE-210829; Puget Sound Energy's 2022 General Rate Case, Docket UE-220066/UG-220067; Puget Sound Energy's 2024 General Rate Case, Docket UG-240004/UG-240005; Avista Corporation's 2024 General Rate Case, Docket UE-240006/UG-240007; Cascade Natural Gas's 2024 General Rate Case, Docket UG-240008; and PacifiCorp's 2025 Power Cost Only Rate Case, Docket UE-250224. I also previously provided public comments at UTC meetings and have worked closely with Commission staff on numerous occasions.

Q: Are you sponsoring any exhibits?

A: Yes. As described in the exhibit list, I am sponsoring exhibits SNS-2 through SNS-17.

Q: Please describe the scope of your testimony.

A: My testimony primarily concerns NWN's low-income customer service, including issues related to equity, affordability, and rates.

Q: Could you please summarize your testimony?

A: Yes. My testimony concerns issues related to equity, affordability, low-income customer service, and NWN's rate and recovery proposals.

First, I discuss the equity concerns driving my testimony and TEP's involvement in this rate case. This portion of my testimony focuses on the ways in which economic pressures have outsized impacts on low-income utility customers and identifies NWN's and the Commission's obligations to consider the unique needs of low-income customers in this case.

Second, I explain why the Commission should reject NWN's proposed residential basic charge increase due to equity concerns. I identify how NWN's own testimony shows the increase will cause an overall bill increase for low-income customers, and I discuss the impacts of higher fixed charges on low-income customers, who tend to use less natural gas than higher-income customers. I discuss the available literature that documents the coping strategies low-income customers use to adapt to higher bills and the safety concerns that stem from these strategies.

Third, I discuss my concerns with NWN's proposed return on equity ("ROE") and advocate for a lower ROE that takes into account recent Federal Energy Regulatory Commission ("FERC") decisions rejecting the Risk Premium and Expected Earnings analyses, two common economic models the Commission has used to set ROEs in the past. Based on the testimony of the non-company parties in this case, the Commission

should take a fresh look at its ROE paradigm because its earlier decisions too heavily favor the interests of shareholders over ratepayers.

Fourth, I discuss the need for energy assistance in NWN's service territory and how inflation has amplified affordability concerns for low-income NWN ratepayers. I explain how NWN's current method of communicating with the agencies that implement its low-income programs lacks needed functionality and should be replaced by a secure access portal. I also praise NWN's implementation of its bill discount and arrearage relief programs.

Fifth, I summarize NWN's residential disconnection policies and identify specific policies that are inequitable. Under NWN's current disconnection thresholds, a customer who has maintained a past-due balance as small as $150 for as few as 14 days is eligible to be routed toward disconnection. This low threshold disproportionately burdens low-income customers. Further, NWN's practice of allowing collections agencies to report customer credit info to credit bureaus results in unnecessary punishment of low-income customers. I describe the Commission's equity lens, which uses the four energy justice tenets to evaluate if a policy is in the public interest, and recommend that NWN use this equity lens to review its disconnection policies. Specifically, I recommend the Commission order NWN to (1) prohibit disconnection for customers owing less than $300; (2) not initiate disconnection procedures until a customer bill is at least 60 days past due; (3) prohibit the collections agencies NWN works with from reporting to credit bureaus; and (4) permanently remove fees and deposits currently waived per the term sheet in the Commission's COVID-19 docket (U-200281), and then modify NWN's billing system to end the inefficient and inconsistent manual refunds of fees.

Sixth, I detail how NWN can improve its ability to meet its customers' language access needs. NWN has taken several good first steps to improve language access, including offering translation services upon request and providing written materials to customers in preferred languages. Nevertheless, data show that NWN likely still undercounts customers who would prefer services in a language other than English. Also, NWN has no comprehensive framework in place to identify language access needs. I recommend the Commission order NWN to track customers' language preferences and adopt a language access plan to proactively meet its customers' language access needs.

Seventh, I recommend the Commission reject NWN's proposal to recover deferred costs from (1) late payment and reconnection fees not charged to customers and (2) other direct costs, like COVID-19 costs related to personal protective equipment and cleaning supplies. NWN's proposal would result in customers paying an apportioned late fee on charges that were already waived. Moreover, NWN's proposal to recover direct costs related to COVID-19 measures is fundamentally inequitable, as it requires customers who already bore those costs for themselves to additionally cover NWN's costs.

Eighth, I recommend NWN revise two of its proposed Performance-Based Ratemaking ("PBR") metrics and include two additional metrics in its reporting. The changes I recommend would clarify NWN's reporting on customers in arrears, better align reporting on utility assistance program effectiveness with current implementation trends, and ensure NWN reports all Commission-endorsed Policy Statement metrics. Additionally, I recommend NWN post its PBR metrics on its public website.

Ninth, I highlight uncertainties that remain regarding NWN's proposed Thermal Energy Network ("TEN") and the rate base merger NWN proposes to pay for that project. TEP cannot support merging the rate base or the proposed project without knowing whether the project would serve low-income customers and how much of the cost natural gas customers would bear. I urge the Commission to emphasize the equity factors in the law governing the proposed rate base merger.

II. Low-income customers are disproportionately impacted by inequitable utility service.

Q: What is the purpose of your testimony today?

A: Achieving equitable treatment and affordable service for low-income residential customers and vulnerable populations is TEP's fundamental goal in its work with utilities and other stakeholders in Washington. TEP's unique role as intervenor in this rate case is to advance this goal. Washington law allows the Commission to consider equity as a part of its public interest standard for decision making.[1] The Commission has recognized the importance of applying an "equity lens in all public interest considerations" to remedy systemic harms to vulnerable populations.[2] An equity lens focuses on characteristics "for which groups of people have historically, and are currently, marginalized."[3] Energy justice and its core tenets, including distributional, procedural, recognition, and restorative justice, are integral standards and sources of insight as the Commission

[2] *WUTC v. Cascade Natural Gas Corp.*, Dkt. UG-210755, Final Order 09 Adopting Settlement Agreement Subject to Conditions, ¶ 58 (Aug. 23, 2022) (hereinafter "Cascade 2021 GRC Order") ("So that the Commission's decisions do not continue to contribute to ongoing systemic harms, we must apply an equity lens in all public interest considerations going forward.").

[3] *Id*. (citing RCW 43.06D.010(4)).

applies its equity lens.[4] The Commission specifically seeks to ensure that utility policy is "addressing historic underinvestment and exclusionary policies and practices that have allowed inequity to flourish."[5] Regulated companies must assess whether proposed modifications to their practices correct or perpetuate inequities.[6]

Throughout my testimony, I emphasize the importance of assessing the impact of NWN's proposals and practices on low-income customers through the Commission's equity lens.[7]

Q: What kinds of equity concerns are particularly relevant to the Commission's decisions in this rate case?

A: The data I provide below shows that low-income customers and vulnerable populations are disproportionately impacted by economic pressures like inflation and utility rate increases, in part because of their budget-limited ability to adapt to financial stressors. The Commission should consider that for many households in these communities, higher energy bills or utility disconnections are not merely financial inconveniences; they pose real safety hazards and have cascading economic and other effects with uncertain or

[4] *Id*. ¶ 56.

extended recovery times. Recent research shows low-income families nationwide are already experiencing rising utility debt.[8]

Q: Do high utility bills have disproportionate impacts on low-income customers?

A: Yes. In its deliberations, the Commission should consider that inflation disproportionately impacts low-income households. Lower-income households have a higher average utility burden than the average household. NWN's 2024 energy burden assessment ("EBA") demonstrates that NWN's Washington residential customers are carrying $7.3 million in excess energy burden (i.e., energy assistance need).[9] Low-income households make up 23% of NWN's Washington service territory, but they carry about 80% of this total energy assistance need.[10] This figure is consistent with national data showing that low-income households have energy burdens that are about three times higher than the median household burden.[11]

At the same time, low-income households experience the pressures of inflation more acutely and severely than other households do. The U.S. Department of Labor's Bureau of Labor Statistics ("BLS"), the agency that calculates and reports the "rate of inflation" (i.e., the Consumer Price Index) each month, reports that "consumers with

[9] Exh. CJT-3 at 24.

[10] *Id.* at 23-24.

[11] Exh. SNS-8 at 2 (American Council for an Energy-Efficient Economy, *Data Update: City Energy Burdens* (Sep. 2024) (finding low-income households spent a median of 8.3% of annual income on energy bills, while the overall household median was 2.9%)).

different incomes experience inflation quite differently."[12] According to this research, as shown in the table below, households earning lower incomes spend a higher share of their household budget on necessities such as rent, food, and medical care.

Table 1. Household budget shares of expenditure items for lowest and highest income quartiles, 2017-2018[13]

Expenditure	Lowest Income Quartile	Highest Income Quartile
Rent or owner's equivalent	34.93%	27.93%
Food at home	9.44%	6.58%
Medical care	8.36%	8.09%
Household utilities	4.36%	2.73%
Motor fuels	3.46%	3.42%
Motor vehicle operation	3.44%	3.40%
Telephone service	2.32%	2.00%

Prices for those necessities also rise faster than for other products.[14] As a result, lower income households tend to face higher rates of inflation.[15] According to an independent analysis of BLS consumer price index statistics, prices have risen about 10% faster from 2005 to 2024 for low-income households compared to average households.[16] Not

[12] Joshua Klick & Anya Stockburger, *Spotlight on Statistics: Inflation Experiences for Lower and Higher Income Households*, U.S. Dept. of Labor, Bureau of Labor Stats. (Dec. 2022), https://www.bls.gov/spotlight/2022/inflation-experiences-for-lower-and-higher-income-households/home.htm.

surprisingly, household income is a key driver of whether inflation is experienced as "very stressful."[17] Low-income families cannot adapt to rising prices easily because they already tend to conserve spending and cannot afford to stock up on goods before prices spike.[18]

These concerns about the disproportionate impacts of rising prices carry over directly to the price of utilities like natural gas. Low-income customers of utilities are less able to afford rising energy bills and are more likely to employ risky coping strategies when bills are too high. Households that have recently been disconnected or otherwise experienced energy insecurity are more likely to take measures like avoiding heating their homes because of the expense, or foregoing spending on necessities like medication and food in order to pay their utility bills.[19]

Q: Do these concerns extend to NWN's customers?

A: Yes. TEP recognizes that NWN has taken significant steps toward addressing concerns low-income customers present regarding energy affordability. NWN witness Cecilia Tanaka's list of NWN's equity and affordability programs in her direct testimony demonstrates NWN is making progress.[20] And TEP appreciates that NWN's initial implementation of its bill discount program and arrearage forgiveness grant has been

[20] Tanaka, Exh. CJT-1T at 8:1-8:3 & tbl.1.

successful, resulting in a high number of customers receiving discounted bills and grants.[21] However, as reflected in the results of NWN's EBA, the low-income customers in NWN's service territory are still struggling with economic pressures made worse by high energy bills. In NWN Witness Tanaka's words, NWN must "operationalize equity" in its rates and policies that effect low-income and vulnerable populations.[22] TEP's recommendations are intended to help NWN do that.

Q: How should these equity concerns factor into the Commission's decisions in this case?

A: I urge the Commission to ensure NWN's rates and policies remedy, rather than worsen, unfair or disproportionate burdens on low-income utility customers. This includes ensuring equitable rate design, rate of return, disconnection policies, language access policies, COVID-19 policies, and performance-based metrics. In doing so, I urge the Commission to follow the core principles of energy justice. These principles, which include distributional, procedural, recognition, and restorative justice, are integral standards and sources of insight as the Commission applies its equity lens.[23]

III. The Commission should reject Northwest Natural's proposed fixed charge increase because it will disproportionately impact low-income residential customers.

Q: Please describe NWN's proposed increase in its fixed charge.

[21] *Infra* Section V.

[22] Tanaka, Exh. CJT-1T at 10:19-10:23 ("The WUTC's evolving regulatory framework . . . requires natural gas utilities to operationalize equity across all 20 aspects of planning, ratemaking, and customer engagement. Each tenet of equity requires new data systems, stakeholder engagement models, and internal capacity to interpret and act on community input.")

[23] Cascade 2021 GRC Order, ¶ 56.

A: NWN proposes to significantly increase its fixed charge for both its residential schedules: Rate Schedule 1 Residential ("RS 1 Residential") and Rate Schedule 2 ("RS 2").[24] NWN's proposal includes raising the fixed charge from $5.50 to $10 for RS 1 Residential, and from $8 to $10 for RS 2, over two rate years ("RYs").[25] NWN's proposal represents a more than an 80% increase for RS 1 Residential and a 25% increase for RS 2.

Q: Do you have any concerns with this proposal?

A: Yes. This proposed increase will disproportionately negatively impact low-income customers. I thus recommend that the Commission deny the request. In presenting this analysis, I first document the fact that low-income customers tend to have lower usage levels than residential customers generally. While I do not assert that all low-income customers are also low use customers, I do conclude that low-income customers tend to be, and are disproportionately, also low use customers. Income and energy usage are directly related. As low use customers, low-income customers will be disproportionately harmed by the proposed increase in the fixed charge. In addition, I consider the ways in which the fixed charge impedes the ability of low-income customers to respond to higher bills through a reduction in their consumption.

[24] NWN uses two separate rate schedules for different types of residential customers. NWN Tariff WN U-6, Schedules 1 & 2. A residential customer *without* gas equipment that qualifies as a primary heating system under RS 2 falls under RS 1 Residential. A residential customer *with* gas-fired equipment that is the primary source of space heating requirements falls under RS 2. NWN does not collect information regarding relative incomes of RS 1 Residential and RS 2 customers. Exh. SNS-5 (NWN Response to TEP DR 22). Based on NWN's understanding of the two schedules, neither schedule appears skewed toward customers of a certain income level; therefore, TEP objects to the rate increase request for both.

[25] Wyman, Exh. RJW-1T at 65:21-66:3.

Q: What data supports your conclusion that low-income customers tend to use less natural gas?

A: A wide range of sources support this conclusion, as TEP's filings in prior Commission proceedings have demonstrated.[26] The U.S. Department of Labor's annual Consumer Expenditures Survey ("CEX"), which provides data on natural gas expenditures by income level, is particularly instructive. The table below uses data from the CEX organized by two measures of income: absolute dollars and deciles.[27]

Table 2. Natural Gas Expenditures by Income (2024)
(Consumer Expenditures Survey Tables 1203 and 1110)

Less than $15,000	$15,000 to $29,999	$30,000 to $39,999	$40,000 to $49,999	$50,000 to $69,999	$70,000 to $99,999	$100,000 to $149,999	$150,000 to $199,999	$200,000 and more
$230	$322	$373	$436	$438	$480	$553	$655	$806

Lowest 10 percent	Second 10 percent	Third 10 percent	Fourth 10 percent	Fifth 10 percent	Sixth 10 percent	Seventh 10 percent	Eighth 10 percent	Ninth 10 percent	Highest 10 percent
$226	$350	$372	$449	$425	$491	$540	$569	$668	$834

UE/UG-220066/67, Pfeiffer-Rosenblum, Exh. APR-1T at 14-15 (Dec. 8, 2022).

[27] Bureau of Labor Statistics, Consumer Expenditures Surveys, Tables 1110 and 1203 (2024) (Table 1110: https://www.bls.gov/cex/tables/calendar-year/mean-item-share-average-standard-error/cu-income-deciles-before-taxes-2024.xlsx; Table 1203: https://www.bls.gov/cex/tables/calendar-year/mean-item-share-average-standard-error/cu-income-before-taxes-2024.xlsx).

As the above table shows, as income decreases, household natural gas expenditures decrease as well.

Q: How does the conclusion that lower-income customers use less gas prove such customers will be disproportionately impacted by NWN's fixed charge increase?

A: The disproportionate impact is twofold. First, a higher fixed charge means more of a customer's bill is not dependent upon usage; this impedes the ability of low-income customers to control their natural gas bills by reducing their usage. Second, NWN's higher fixed charge will result in a net bill increase for low-usage customers, while providing a net bill decrease for higher-usage customers. Because low-income users tend to use less gas than average, this is an inequitable result because it benefits higher-income customers at the direct expense of low-income customers.

Q: Regarding the first impact you identified, what do you mean when you discuss low-income customers' efforts to reduce usage?

A: Customers who have recently faced energy insecurity are more likely to forego spending on necessities, avoid using heat in their home despite cold temperatures, and take other potentially dangerous measures to avoid high energy bills.[28] Research indicates that low-income households seek to reduce bills by closing off parts of their homes, lowering heating temperatures, or substituting ovens or stoves to heat their homes. By "reducing usage," I refer not just to energy efficiency improvements like weatherization, but to these risky measures as well.

The most recent National Energy Assistance ("NEA") survey published by the NEA Directors Association provides detail on what kinds of actions low-income

[28] Exh. SNS-9 at 2-4 (*Coping Strategies*).

customers take to reduce energy bills they can't afford, and how often they do so.[29] Between one in three and one in five low-income customers (ranging between 0% and 150% of the federal poverty line ("FPL")) close off parts of their home in at least some months.[30] One in four households below 50% FPL reduce the temperature in their homes to unsafe or unhealthy levels in at least some months.[31] At least one out of ten low-income customers use their kitchen stove or oven to heat their homes.[32] Households under 50% FPL are the most likely to take these actions almost every month. The table below illustrates the findings of the NEA survey.

Table 3. Energy Reduction Actions in Response to Inability-to-Pay by Range of Federal Poverty Level (each attributed to "not having enough money to pay energy bill")[33]

	Closed Off Part of Home			Kept Temp at Unsafe or Unhealthy Level			Used Kitchen Stove or Oven to Heat		
	0-50%	51-100%	100-150%	0-50%	51-100%	100-150%	0-50%	51-100%	100-150%
Almost every month	10%	14%	7%	8%	3%	3%	1%	1%	1%
Some months	24%	13%	14%	18%	12%	10%	14%	11%	8%
1 – 2 months	12%	10%	11%	7%	8%	9%	22%	19%	14%
Never / No	54%	63%	67%	67%	76%	76%	63%	69%	77%

[32] *Id.* at 23 (tbl.IV-9C).

[33] *Id.* at 20, 22, 23.

These data show low-income customers frequently take unsafe and unhealthy actions to reduce utility bills. A range of other research supports this conclusion.[34] The conclusion is also documented in public comments to Commission proceedings.[35] It is unreasonable and inequitable for NWN to make it even more difficult for low-income households to reduce their bills when those households are already forced to resort to heating their homes (or only a portion of their homes) using their kitchen stove or oven, or keep their homes at unsafe or unhealthy temperatures because they cannot afford to pay their bills.

NWN's proposal to increase the fixed monthly charge makes a higher part of the bill unavoidable, resulting in less flexibility for low-income customers who are already taking sometimes drastic measures to cut costs. But these customers cannot afford *not* to take these measures. As a result, the fixed charge increase will incentivize more intense usage reduction measures, increasing risks to low-income customers.

Q: As to the second type of impact you identify, what evidence supports your conclusion that NWN's higher fixed charge will result in a net bill increase for low-income customers?

A: First, NWN Witness Robert J. Wyman's testimony admits the fixed charge increase will shift more of the cost burden onto lower-usage customers. Wyman welcomes this outcome, as it avoids "intra-class subsidization that flows from the higher usage

[34] *See, e.g.*, Exh. SNS-9 at 5 (*Coping Strategies*); Exh. SNS-11 at 7-8 (Shuchen Cong et al., *Unveiling Hidden Energy Poverty Using the Energy Equity Gap*, 13 Nature Comms. (No. 2456 2022)).

[35] *See, e.g.*, *WUTC v. Avista Corp.*, Dkt. UE/UG-240006/07, Exh. BR-1, Public Comment Exhibit, Attach. 2 at 4 (Oct. 8, 2024) (letter from customer describing using no heat in winter "until I'm very chilled" to cut costs, and no air conditioning in summer despite needing to sleep with a wet towel in 100-degree heat).

customers to the lower usage customers."[36] As I have explained, however, low-usage customers will tend to be lower-income. This reduction in "intra-class subsidization" means lower-income customers will shoulder a greater portion of the cost burden of gas service.

Second, NWN's own data shows that bills would rise for both average-use customers and lower-use customers under its proposal. The proposed fixed charge increase will raise the bill for RS 1 Residential customers using the average of 14.6 therms per month by 63 cents.[37] RS 1 Residential customers who use less would pay even more. RS 1 Residential customers enrolled in the bill discount program who use less than 14.5 therms in winter (about 40% of such customers) would have higher bills in every month of the year.[38] For RS 2 customers, the proposed fixed charge increase would slightly raise bills for average-usage customers (54.5 therms/month in RY 1; 54.1 therms/month in RY 2).[39] It would raise bills in every month of the year for customers at each bill discount tier.[40]

Wyman focuses heavily on distinguishing certain months in which lower bills are expected for some customers as a result of the fixed charge increase.[41] However, despite Wyman's focus on the higher-usage customers who will see lower bills in winter, low-

[36] Wyman, Exh. RJW-1T at 71:19-71:21.

[37] *Id.* at 73:5-73:7; *see* Exh. RJW-18 at 1:7, 1:9, 4:7, 4:9. This exhibit is a table that displays the average normal monthly use of RS 1 and RS 2 customers. The average for RS 1 Residential is 14.6 therms/month; RS 2 is 54.5 therms/month in RY 1 and 54.1 therms/month in RY 2.

[38] Wyman, Exh. RJW-1T at 74:1, tbl.5.

[39] Exh. RJW-18 at 1:9, 4:9.

[40] *Id.* at 79:12, tbl.8.

[41] Wyman, Exh. RJW-1T at 81:4-81:23.

usage customers will face higher bills all year.[42] As Wyman admits, low-usage customers (who tend to be low-income) will pay a larger share of the cost of service compared to the current fixed charge scenario.

Q: What do you conclude?

A: NWN's proposed fixed charge increase will raise bills for low-income residential customers and encourage more intense, risky usage reduction measures. NWN's own testimony shows that its proposal will put a higher proportionate cost burden on low use, lower-income customers. This is an inequitable result. The Commission should reject NWN's proposal.

If the Commission is inclined to allow any increase in the fixed charge, I alternatively recommend that the Commission embrace the regulatory principle of gradualism and only allow an increase of only $0.15-0.25 for the fixed charge during the rate plan. As it stands, NWN's proposal to raise its fixed charge by more than 80% for RS 1 Residential and by 25% in one year for RS 2 contradicts that principle and the Commission should reject it on that basis, if on no other.

IV. The Commission should reject Northwest Natural's requested Return on Equity.

Q: What ROE is NWN requesting?

A: NWN is requesting a ROE of 10.1% in RY 1, phasing to 10.2% beginning in RY 2.[43] This is based on NWN's estimation that its cost of equity is between 10% and 11%.[44]

Q: What are your concerns with this proposed ROE?

[42] *Id.* at 76:7-76:12; 80:12-80:18.

[43] Nelson, Exh. JEN-1T at 5:1-5:3.

[44] *Id.* at 4:7-4:9, 80:19-80:21.

A: My primary concern is that the proposed ROE will adversely impact low-income customers by adding to their energy burdens. NWN's current ROE, which the Commission approved in 2021, is 9.4%.[45] NWN thus asks for a 0.8% hike in ROE in this rate case. My understanding is that a significantly higher ROE will support a significantly higher revenue requirement for NWN, which will result in faster-growing natural gas bills for customers. I am not an expert in the field of setting utility profit margins. Nevertheless, setting a fair ROE is one lever the Commission can use to benefit *all* customers. Because of the significant increase NWN seeks in this case, I urge the Commission to apply heavy scrutiny to the ROE lever here, as the Commission's decision will impact the entire NWN customer base, including low-income customers.

Q: What specifically do you want the Commission to consider in setting a ROE for NWN?

A: Because it impacts rates, the ROE must be set in light of the Commission's obligation to ensure rates are fair, just, reasonable, and sufficient.[46] Moreover, the Commission must weigh the interests of ratepayers against those of NWN's investors in setting a just and reasonable ROE.[47] In recent years, investor-owned utility ("IOU") residential rates have increased almost 49% more than inflation.[48] If inflation rates are not a significant

[45] *WUTC v. NWN*, Dkts. UG-200994/95/96 & UG-210085, Order 05 Approving and Adopting Settlement Agreement, ¶ 31 & n.12 (Oct. 21, 2021).

[46] RCW 80.28.010(1).

[47] *See Federal Power Comm. v. Hope Natural Gas Co.*, 320 U.S. 591, 602-03 (1944) ("The ratemaking process under the Act, *i.e.,* the fixing of "just and reasonable" rates, involves a balancing of the investor and the consumer interests.").

[48] Exh. SNS-12 at 2 (Mark Ellis, *Rate of Return Equals Cost of Capital: A Simple, Fair Formula to Stop Investor-Owned Utilities from Overcharging the Public*, American Economic Liberties Project (Jan. 2025)).

predictor of recent rate growth, we must critically examine cost driver correlation among other strata, including within institutionalized utility profit structures. Recent research finds a correlation between growth in rates relative to inflation and growth in ROEs relative to prevailing interest rates and cost of capital.[49] This correlation between increased ROEs and increased rates indicates the balance of ratepayer interests and investor interests has tipped too far in favor of investors. The purpose of this part of my testimony is to highlight how rapidly rising utility rates are driven in part by high ROEs. I also advocate for the Commission to rebalance its approach to setting ROE in a way that appropriately considers ratepayer interests (and, thereby, equity concerns of low-income customers who cannot afford higher rates).

I expect the other non-company parties in this case will raise important issues concerning the cost of capital, and I urge the Commission to seriously consider all their proposals. Among these may be concerns about the economic models the Commission uses to evaluate proposed ROEs. FERC has recently rejected the use of two models to justify ROE: the Risk Premium model and the Expected Earnings model.[50] FERC found the Risk Premium model is not actually used in financial circles and is an unreliable indicator of costs,[51] and it found the Expected Earnings model is inconsistent with

[49] *Id.* at 8-9; Exh. SNS-13 at 2 (Joe Daniel et al., *Rebalancing "Return on Equity" to Accelerate an Affordable Clean Energy Future*, Rocky Mountain Institute (Feb. 21, 2025)); *see WUTC v. Avista Corp.*, Dkts. UE/UG-240006/07, Initial Post-Hearing Brief of Public Counsel, ¶ 84 & n.236 (Oct. 28, 2024) (citing studies finding excess growth in returns on equity going back to 1980).

[50] *See* 189 FERC ¶ 61,036 at 16 (Oct. 16, 2024) (rejecting Risk Premium model for determining ROE); 169 FERC ¶ 61,129 at 103 (FERC Opinion No. 569) (Nov. 21, 2019) (rejecting Expected Earnings model for determining ROE).

[51] 189 FERC ¶ 61,036 at 16.

Supreme Court precedent.[52] NWN uses a Risk Premium-based model in this rate case to justify its requested ROE.[53] Unless the Commission has reason to believe that FERC's decisions are legally or factually erroneous, it should follow FERC's precedent and not use these two models in its decision-making.

In conclusion, the UTC's paradigm for ROE analysis is ripe for reevaluation based on the non-company parties' testimony in this case. I encourage the Commission to seriously consider other parties' proposals to avoid adding to the affordability crisis for low-income ratepayers.

V. The Commission should ensure Northwest Natural is effectively implementing its low-income programs and thoroughly assessing its customers' bill assistance need.

Q: How would you describe the low-income population in NWN's service territory?

A: As a result of TEP's prior advocacy, NWN's energy assistance programs now use the same definition of low-income as the other IOUs in Washington. Customers can access low-income programs if their household income is at or below 200% of the FPL or 80% of AMI, whichever is higher. NWN's 2024 EBA shows that about 23% of households in NWN's service territory in Washington qualify as low-income.[54] The EBA also estimates about 18,000 out of a total of 78,000 households that are NWN customers in Washington qualify as low-income.[55]

[55] *Id.* at 50.

Q: Please explain the concepts of total energy burden and gas bill burden.

A: Energy burden is the percent of a household's total income spent on all energy expenses. Energy expenses typically include only electric and natural gas bills, but sometimes also wood, fuel oil, bottled gas, or other heat sources. By contrast, a gas bill burden is the percent of a household's income that is spent on a natural gas bill.

Q: How do you assess the level of need for low-income energy assistance in NWN's service territory in Washington?

A: NWN only provides natural gas service, so its affordability can be measured by examining the natural gas bill burden only, as opposed to total energy burden. Through the Department of Commerce and UTC's Clean Energy Transformation Act rulemakings, the state has standardized a measure of high energy burden at 6% total income.[56] However, the state has not standardized a measure of single-fuel natural gas bill burden. In my testimony in the Cascade Natural Gas 2024 rate case, I summarized Cascade data that showed electric burdens for Cascade's service territory made up about 60% of the total household energy burden, while natural gas bill burdens made up about 40% of the total energy burden.[57] Thus, there I concluded that a 2% natural gas bill burden should be characterized as a high burden.[58] Here, NWN's EBA considers a household's gas burden "high" if it is above 2% in "marine climate counties" and above 3% in "cold climate counties."[59] TEP has reservations about the soundness of this approach. It makes sense

[56] WAC 194-40-030 and WAC 480-109-060(14).

[57] *WUTC v. Cascade Natural Gas Corp.*, Dkt. UG-240008, Stokes, Exh. SNS-1T at 8:2-8:7 (Sep. 25, 2024).

[58] *Id.* at 8:10.

[59] Exh. CJT-3 at 10.

that customers in colder climates may have increased natural gas usage on average, but that does not decrease electric usage or change the 6% total energy burden threshold. It seems more consistent with a total energy burden framework to expect climate to have a larger impact on energy burden in cold zones compared to marine zones, potentially resulting in more energy-burdened customers in colder areas, rather than to expect natural gas users in colder zones to spend a greater percentage of their total income on gas before they are considered highly burdened by those bills. Compared to the 2% threshold TEP has used, NWN's 2/3% approach is somewhat high, but it is still useful as a low-end approximation of excess gas bill burden. The EBA finds that about 13,000 households have a high gas bill burden based on the 2/3% threshold it uses.[60] EBA estimates the median low-income gas burden is 2.2% among NWN's Washington residential customers.[61] This means the average low-income household served by NWN in Washington has a high energy burden. Because this data relies on average burdens, there are some customers with more extreme energy burdens, and others with lower burdens. Regardless, these data show a continued substantial need to help NWN's low-income customers better afford their gas bills. In total, the EBA estimates $5.9 million of excess gas bill burden for low-income NWN customers in Washington.[62] This is a significant gap.

Q: What steps is NWN taking to close this gap?

[60] *Id.* at 24; Tanaka, Exh. CJT-1T at 23:1, tbl.6.

[61] Exh. CJT-3 at 44.

[62] *Id.* at 24.

A: TEP appreciates the efforts NWN is already making to address the bill assistance needs in its Washington territory. TEP is aware of, and credits NWN for, the equity-focused actions NWN is taking, as summarized in Witness Tanaka's direct testimony.[63]

In particular, TEP appreciates NWN's efforts to implement its relatively new bill discount program in Washington, which launched in 2024. The program provides tiered bill discounts of up to 80% depending on a customer's household income.[64] NWN automatically enrolled customers who accessed energy assistance in the past two years.[65] NWN also performed commendable community outreach supporting its bill discount program. Enrollment rates in the program (due to this outreach and the automatic enrollment, among other factors) are the best among all the IOUs in Washington: 8,982 customers, or roughly 50% of low-income customers, as of May 2025.[66] My understanding is that this enrollment figure has increased since. The high enrollment is a strong signal that NWN is succeeding in rolling out this bill discount program. Additionally, TEP commends NWN on successfully starting to implement its Arrearage Management Program, which launched in April 2025 and has delivered over $85,000 in utility debt forgiveness since then.[67] This performance corresponds directly to the Commission's proposed performance metric regarding customer participation in

[66] *Id.* at 13:2-13:7.

[67] *Id.* at 24:10-24:12.

assistance programs, which is a key metric for TEP and which NWN proposes to report in this rate case.[68]

Q: What additional steps do you propose NWN take to better understand and respond to the excess energy burden in its Washington territory?

A: First, the Commission should require NWN to provide more frequent and detailed information on energy burdens in its Washington territory. Second, the Commission should order NWN to work with its Gas Residential Energy Assistance Tariff ("GREAT")[69] Advisory Group to plan for the creation of a secure access portal for the agencies that implement NWN's low-income programs in Washington (i.e., Washington Gorge Action Programs ("WAGAP") and Clark Public Utility District ("Clark PUD") (collectively, "the agencies")). The purpose of this access portal is to improve the agencies' ability to efficiently provide low-income assistance to more customers. NWN's current system lacks several levels of important functionality, which I discuss more below.

Q: As to the first request, what additional energy burden data do you propose NWN report?

A: TEP recommends that NWN regularly perform an energy burden analysis that includes an assessment of stratified energy burdens and identifies excess burdens. TEP recognizes and commends NWN for its efforts in producing the 2024 EBA, which is useful in determining excess energy burdens. Additionally, TEP recognizes that NWN is already

[68] *See* Siores, Exh. NCS-1T at 5, tbl.1.

[69] *See* Tanaka, Exh. CJT-1T at 24:12-24:17.

agreeing in this rate case to provide the following energy burden data annually as a performance metric:

> Energy burden: Annual residential bill divided by area median income by census tract for all customers, comparing outcomes in Named and Non-named Communities. The number and percentage of customers experiencing high energy burden by census tract.[70]

However, these measures do not go far enough. First, the EBA does not provide an assessment of stratified energy burdens. Second, the EBA is also already a year and a half old;[71] regularly updated data will be important to continual monitoring of progress toward closing the excess energy burden gap.

Q: Please explain what you mean by an assessment of stratified bill burdens.

A: The assessment of energy burdens should extend beyond a simple yes or no toggle (*i.e.*, they are either bill burdened or not bill burdened). A more refined analysis would include a stratification of bill burdens. A natural gas-only stratification would include: (1) Affordable (= < 2%); (2) High Burdens (2% - 6%); (3) Very High (6% - 10%); and (4) Extreme Burdens (>10%).

Q: How should the bill burden assessment identify household income?

A: A robust evaluation should acknowledge and seek to ameliorate, to the extent possible, the inherent limits in reporting energy burden metrics based on median income levels. TEP recommends including at least two household income metrics: median income for the geographic area studied, and one or more indicators of low-income status, *e.g.*, the

[70] Siores, Exh. NCS-1T at 4:1, tbl.1.

[71] Exh. CJT-3 at 2.

census bureau's first quintile income and analysis of actual identified low-income energy burdens compared to the median.

Q: What geographic granularity should the assessment include?

A: The assessment should provide data by census tract.

Q: Should the assessment provide energy burden data for gas only?

A: No, the assessment should provide customer-level data to support findings regarding both gas-only and dual fuel energy burdens. NWN and Clark PUD both currently use the same consultant, Empower Dataworks, to create their EBAs. NWN should explore the opportunity to work with Clark PUD to modify their data sharing agreements and contracts with Empower Dataworks to allow Empower Dataworks to identify individual customer bills from NWN and Clark PUD. This would allow the next EBAs from NWN and Clark PUD to include customer-level data on burdens from both fuel sources. As a result, the EBA could present both single fuel and dual fuel energy burdens using actual customer data, producing an EBA with a more precise and complete dataset.

Q: How often should NWN perform this assessment?

A: TEP recommends that NWN perform an energy burden analysis at least every two years (biennially), to ensure that up-to-date data are always available. The usefulness of EBA data for timely and accurate assessments of affordability has a fixed shelf life. As rates, gas costs, customer base, and environmental factors fluctuate or escalate, so does affordability. A biennial burden assessment allows NWN to timely target its resources to relieve excess burdens as well as track affordability trends, *i.e.*, customer bill assistance needs, over time.

Q: Does TEP recommend that the Commission's order in this case require each element of the energy burden assessment you describe above?

A: No. TEP recommends that the Commission order NWN to perform a biennial energy burden analysis that includes an assessment of stratified energy burdens. To design the specifics of the assessment, the Commission should ask NWN to engage with its GREAT Advisory Group, where we can work through the details of exactly how to design the energy burden assessment. These conversations should address the exact stratification to use, the identification of incomes, the geographic granularity, and the appropriate timing.

Q: Please explain your second request—that NWN create a secure access portal to implement low-income programs.

A: NWN's current system for communicating customer information to the agencies (WAGAP and Clark PUD) that implement the low-income programs lacks essential functionality. The current system relies on back-and-forth emailing that is subject to delays and does not allow the agencies to directly access the customer information they need to enroll customers in bill assistance. By contrast, an access portal that permits the agencies to securely access relevant customer information and interact with customers' accounts on low-income program matters would improve the implementation and

collaboration potential of these programs. TEP expects that such a portal would improve the efficiency of the enrollment process for both the Company and agencies.

Q: Is there precedent for IOUs in Washington adopting such an access portal?

A: Yes. Puget Sound Energy, Cascade Natural Gas, Pacific Power, and Avista have all adopted a secure access portal with similar functionality to what TEP would like to explore working with NWN to develop.

Q: What should the access portal allow the agencies to do?

A: NWN should work with the GREAT Advisory Group to develop the portal's specific functionalities. The key elements of a robust access portal system are that it provides secure access to client data in "real time," allowing agencies to verify account status and process applications more efficiently and responsively to client needs. Additionally, it would enable agencies to directly enroll customers in utility programs and take related actions regarding customer accounts. The customer information to which the agencies would likely need access includes:

1. the current balance on an account;
2. the name on the account as well as any authorized users;
3. the billing usage history;
4. age of account;
5. any history of enrollment in other programs, such as the last time the customer received a benefit (like arrearage help);
6. the bill discount rate information for the account (including the discount tier, the enrollment date, and verification status); and
7. the account's dunning status.

Regarding taking actions concerning an account, the portal should allow the agencies to:

1. post bill assistance pledges;
2. enroll customers in BDR and arrearage forgiveness programs; and
3. flag "exempt" customers who are seeking assistance and should not be routed toward disconnection. (This would allow the agencies to lock a

customer's account so the customer does not receive a disconnection notice or collection actions.)

Q: When should NWN create and implement this access portal?

A: While TEP would prefer a more immediate timeline, we recognize that NWN has a long-term plan to replace its existing customer information system ("CIS").[72] NWN plans to replace its CIS by 2032.[73] The Commission should order NWN to incorporate development of a secure access portal into NWN's long-term CIS replacement project. Ensuring NWN creates the portal as part of this project is critical, because it will likely be a very long time before NWN again overhauls its CIS, and there is therefore a window of opportunity to include an access portal that would be missed if NWN were permitted to delay the portal longer. Additionally, it is likely more efficient to create a secure access portal while the entire CIS is being redesigned, rather than as an independent project. I thus request that the Commission order NWN to work with its GREAT Advisory Group to create a secure access portal as part of its planned CIS overhaul.

VI. The Commission should order Northwest Natural to reform certain aspects of its disconnection policies.

Q: What rules and procedures does NWN follow when determining whether to disconnect a customer?

A: NWN follows three sets of rules for determining whether to disconnect a customer for non-payment. First, NWN is subject to Washington's rules and regulations governing

[72] Fellon, Exh. BEF-1CT at 18:3-18:6.

[73] *Id.* at 19:4-19:5.

disconnection.[74] Second, NWN follows the disconnection rules in Rules 2, 4, and 5 of its Washington tariff.[75] Third, NWN implements internal policies and procedures that it uses to determine when it will disconnect a customer for nonpayment. These are outlined in internal documents, not NWN's tariff. Throughout this testimony, I will refer to these three categories collectively as NWN's "disconnection policies."

Q: Please describe NWN's disconnection timeline and process.

A: NWN uses an internal process to determine whether to disconnect a customer for non-payment. If a customer owes more than $150 in arrears and is more than 14 days past-due, NWN may send a disconnection notice. This notice is followed by additional communications that ultimately permit a customer to be disconnected as soon as 34 days after a bill is due.[76] NWN will make at least two attempts to contact a customer before disconnecting (as required under WAC 480-90-128). After a customer has been disconnected for non-payment, NWN may send this "bad debt" to a collection agency, which may report the bad debt to a credit bureau.[77]

Q: Please summarize your concerns with NWN's disconnection policies.

A: NWN's disconnection thresholds (in terms of time past-due and dollar amount owed) are too low. Additionally, NWN permits its collection agencies to report customer

[74] *See* WAC 480-90-128 (utilities must provide at least 3 days advance notice before disconnection); WAC 480-90-133 (utilities must make all reasonable efforts to reconnect within 24 hours after sufficient payment of past-due bill is made); WAC 480-90-138 (requiring utilities to offer payment arrangements).

[76] Exh. SNS-3 at 1 (NWN Response to TEP DR 03).

[77] *Id.* at 4 (NWN Response to TEP DR 09).

information on disconnections to credit bureaus. NWN's disconnection thresholds, and its practice of allowing bill collection agencies to report bad debt to credit bureaus, are inequitable because they make it more likely customers will be disconnected for relatively minor non-payments and raise the risk that the financial impact of the disconnection will be magnified through a correlating reduction in credit score.

Q: Where do these concerns originate?

A: I have several years of professional experience working directly with disconnected households in King County seeking assistance to get their service restored, and thus have a firsthand frame of reference to the payment barriers and negative consequences of shut-offs for vulnerable, under-resourced households. Beyond this, my concerns continue to grow due to an ever-expanding body of research and literature that demonstrates how problematic utility disconnections are from an equity standpoint. The literature shows that low-income ratepayers who are disconnected for non-payment tend to be facing complex economic burdens,[78] and disconnections only exacerbate these problems, as utility debt increases these customers' financial stress, and going without heat is a serious health and safety risk. In assessing NWN's disconnection policies, the Commission should employ the principles of energy equity that form the equity lens the Commission applies in all public interest considerations.[79] In applying this lens, the Commission seeks to ensure that utility policy is "addressing historic underinvestment and exclusionary

[78] *See, e.g.*, Exh. SNS-14 at 5, tbl.2 & 3 (Callie Ginapp et al., *Exploring the Relationship Between Debt and Health After Incarceration: A Survey Study*, J. Urban Health (Feb. 2023) (hereafter "*Debt and Incarceration*")) (showing high prevalence of multiple debts as well as utility debts among formerly incarcerated individuals).

[79] Cascade 2021 GRC Order, ¶ 58.

policies and practices that have allowed inequity to flourish."[80] Regulated companies must assess whether proposed modifications to their practices correct or perpetuate inequities.[81]

NWN's low disconnection thresholds and its practice of allowing collection agencies to send customer information to credit bureaus are inequitable because the burdens of disconnections inordinately fall on marginalized populations.[82] People of color and low-income residents are disproportionately likely to have outstanding utility debt.[83] Formerly incarcerated people are especially likely to have utility debt.[84] Research consistently shows that people of color, low-income households, households with young children, and households residing in deficient or energy inefficiency housing conditions are more likely to experience energy insecurity and utility disconnections.[85]

U-210800, Comments of Joint
(footnote continued on next page)

Q: Explain in more detail your concerns with NWN's practice of allowing collections agencies to send customer disconnection information to credit bureaus.

A: NWN allows the two collections agencies it works with to report bad debt to credit bureaus.[86] This practice reinforces existing systemic barriers and perpetuates a cycle of poverty. Low-income customers and people of color are already more likely to have lower credit scores.[87] Further, credit reports are routinely pulled by prospective landlords, meaning that a negative credit report caused by utility debt can result in renters being unable to find housing.[88]

For these and similar reasons, Puget Sound Energy, Avista, and Cascade Natural Gas instructed the collection agencies they contract with not to report bad debt to the credit bureaus.[89] TEP asks NWN to do the same.

U-200281, WUTC Open Meeting March 24, 2022, Statements of Shawn Bonfield Representing Avista Corporation (noting that as a result of Avista's intervention, its contractor collections agencies "no longer report to credit bureaus on the customers we send to them."); Dkt. U-210800, Credit and Collections Rulemaking, Deposits, Fees, Payment Arrangements, and Customer Notice Workshop (September 9, 2023).

Q: Explain in more detail your concern with NWN's disconnection thresholds.

A: NWN currently sends a shut-off notice just 14 days after a bill is due. A customer can be disconnected as soon as 34 days after a bill is due.[90] This practice raises equity concerns because low-income customers struggling with significant energy burdens will find it particularly challenging to meet short payment timelines and have an increased likelihood of facing the destabilizing consequences of multiple shut-offs in succession. This makes the challenge of preventing disconnections more difficult for the kinds of customers who already face shutoffs disproportionately. NWN has presented no evidence that this timeline was adopted with equity in mind. A longer timeline would give low-income customers greater opportunity to resolve their arrears through payment or assistance, thus reducing the distributional equity concerns disconnections pose. To align with timelines the Commission has approved for other utilities,[91] NWN should not send a shut-off notice (or otherwise implicitly or explicitly threaten disconnection) to residential customers until their bills are at least 60 days past-due.

Also, NWN currently allows customers to be disconnected who owe as little as $150 in past-due utility bills.[92] This is slightly more than one month's average bill for low-income, high-burden customers, who pay an average of $1,380 annual in gas bills

[90] Exh. SNS-3 at 1 (NWN Response to TEP DR 03).

[91] *WUTC v. Puget Sound Energy*, Dkt. UE/UG-220066/67, Order 32/18, ¶ 56 (May 16, 2024) (requiring minimum 90 days past due); *WUTC v. Cascade Natural Gas Corp.*, Dkt. UG-240008, Order 05 Rejecting Tariff Sheets; Approving and Adopting Settlement with Conditions; Authorizing and Requiring Compliance Filing, ¶ 88 (Feb. 24, 2025) (approving raising threshold to 60 days past due).

[92] Exh. SNS-3 at 1 (NWN Response to TEP DR 03).

(averaging $115 per month).[93] That means a NWN customer risks disconnection for failing to pay one higher-than-average monthly bill. This puts low-income, energy-burdened customers at risk of disconnection quickly. A more equitable disconnection dollar threshold would be $300, which is just over 2.5 times the average monthly bill for a highly energy burdened customer in NWN's Washington service territory. This would allow energy-burdened customers more time to correct their arrearage before risking being shut off.

To clarify, TEP is not asking that NWN be restricted from communication and outreach to energy-insecure customers. Put simply, disconnection and the threat of disconnection must be treated less as a primary collections strategy and instead as a last resort due to the significant equity concerns and likelihood of harm to vulnerable households. NWN has not demonstrated that it considered equity and potential harm when adopting its current thresholds. The Commission should order NWN to increase the number of days a customer must be past-due to trigger disconnection procedures to 60 days and increase the disconnection dollar threshold to $300.

Q: Do you have any other specific concerns related to disconnections that you want the Commission and NWN to consider?

A: Yes. NWN should permanently remove fees and deposits that are currently waived under the settlement term sheet in the Commission's COVID-19 docket, U-200281.[94] These waived fees apply to all residential customers and include (1) late fees and deposits, (2)

[93] Exh. CJT-3 at 24.

[94] Dkt. 200281, Order 06 Amending Order 03; Exempting Gas and Electric Companies From WAC 480-100-113 and WAC 480-90-113, ¶ 18 (Mar. 29, 2022) (extending settlement term sheet waiving fees).

disconnection and reconnection fees, and (3) disconnection and reconnection visit fees.[95] NWN's fees and deposits in these categories are set forth in NWN's tariff.[96] This would implement the draft WAC 480-90-113 the Commission issued in the Credit and Collections rulemaking docket on August 28, 2023.[97] Even without those draft rules being effective, permanently removing fees and deposits from NWN's tariff is consistent with the current WAC 480-90-113, which does not require utilities to collect deposits.[98]

I recommend this because NWN's process for removing waived fees from customer accounts is manual and subject to human error. Reports provided to TEP by partner organizations and in the GREAT Advisory Group note that due to human error, some customers have been charged these waived fees.[99] To eliminate the need for NWN to have manual fee reversal processes (and associated human errors), NWN should remove the fees from its tariff and remove the automatic imposition of these fees from its billing software.

Q: Do you have any broader concerns for the Commission to consider with respect to NWN's disconnection policies?

[95] Dkt. 200281, Order 06, Appx. A – Fourth Revised Term Sheet, Section C – Fees, ¶¶ 1-3.

[96] *See* WN U-6, Schedule C (fees) and Rule 3 Sheet 3.1 (deposits). *Id.* Rule 4 Sheet 4.1.1, Schedule C and other rules discuss these fees and deposits.

[97] Dkt. U-210800, Notice of Opportunity to Provide Comments and Workshop Agenda, Attachment A (Aug. 28, 2023), https://apiproxy.utc.wa.gov/cases/GetDocument?docID=163&year=2021&docketNumber=210800. The relevant section is WAC 480-90-113(1), which, as the draft amendment provides, would prohibit utilities from collecting deposits from residential customers.

[98] WAC 480-90-113 ("gas utility may collect a deposit . . .").

[99] NWN reversed fees after the error was brought to the Company's attention.

A: Yes. NWN has not performed a full equity review of its disconnection policies. This means that the equity implications of NWN's current policies are not well-understood. My recommendations today are based on the limited information available regarding NWN's internal policies, and there is no indication NWN tracks how its disconnections impact different customer demographic groups. The Commission should order NWN to perform such a review in consultation with its GREAT Advisory Group and Community & Equity Advisory Group ("CEAG").[100]

Q: Why should NWN conduct an equity review of its disconnection policies?

A: Mandating a robust equity review of the policies in consultation with their advisory groups will improve the policymaking process. By working to apply an equity lens to the full suite of NWN's disconnection practices, NWN can proactively reform inequitable elements of its disconnection policies beyond the changes I advocated for above.

Q: How can the Commission ensure that NWN conducts a robust equity review?

A: TEP recommends the Commission order NWN to proceed in two steps after developing new policies according to this testimony:

1) By September 1, 2026, NWN must present its new disconnection for nonpayment policy and procedures to a meeting of its CEAG and GREAT Advisory Group and solicit feedback on the equity impacts of its policy and procedures.

2) By February 1, 2027, NWN must incorporate the feedback it receives and make a subsequent filing (pursuant to WAC 480-07-885) with new disconnection policies and procedures. The subsequent filing will discuss any feedback received which NWN did not incorporate and the reasons why it did not incorporate that feedback.

[100] *See* Tanaka, Exh. CJT-1T at 33:10-33:21 (overview of NWN's equity advisory group).

These steps promote accountability, collaboration, and timely revisions, and ensure an orderly course of action for reviewing NWN's disconnection policies.

VII. The Commission should ensure Northwest Natural develops and implements a language access plan.

Q: What steps has NWN taken to serve customers who speak a primary language other than English?

A: NWN has recently taken several good first steps to improve its language access services. NWN provides customers with bill discount program information in the top five non-English languages spoken within its service territory.[101] NWN also lets CEAG members review and give feedback on customer written communication materials on topics like bill discount programs, arrearage management, weatherization, and energy efficiency.[102] Additionally, NWN offers translation services on request, translates written materials into multiple languages with help from a nonprofit focused on immigrant and refugee populations' needs, writes many of its customer communications in plain language, and has plans to translate its customer website into the top five non-English languages in its territory.[103] TEP appreciates these efforts.

Q: Can NWN improve its language services?

A: Yes—significant gaps in NWN's language access services remain. First, NWN does not track language preferences at the individual customer level.[104] This indicates that NWN

[101] Beck, Exh. CAB-1T at 6:12-6:15.

[102] *Id.* at 7:1-7:9; Exh. SNS-2 at 2 (NWN Response to TEP DR 02).

[103] Beck, Exh. CAB-1T at 8:4-9:7.

[104] Exh. SNS-2 at 1 (NWN Response to TEP DR 01).

has not identified—and does not know—which of its customers would prefer services in a language other than English. Tracking individual customer preferences would allow NWN to tailor communications to the correct language for each customer, rather than relying on on-the-spot translation options and high-level data concerning the top languages spoken in NWN's service territory.

Second, NWN does not yet have a comprehensive plan to identify gaps in its language access services. Without one, NWN risks continuing to underserve its non-English preferring customers.

Q: Does TEP have any recommendations regarding language access?

A: Yes. The Commission should order NWN to track individual customers' language preferences. Additionally, the Commission should order NWN to develop a comprehensive language access plan to proactively meet its customers' language needs. NWN has already indicated it is considering adopting such a plan by the end of 2026.[105]

Q: What does a language access plan include?

A: Language access plans are policies that set out the language needs and preferences of an organization's clients and partners and the steps the organization will take to improve language access and multilingual services.[106] These plans typically include several primary components, including: (1) a comprehensive needs assessment; (2) identification and implementation of improvements to language services; (3) actions to enhance awareness among clients and customers regarding the organization's available language

[105] Beck, Exh. CAB-1T at 11:8.

[106] United Language Group, *Guide to Developing a Language Access Plan*, https://www.unitedlanguagegroup.com/resources/developing-a-language-access-plan.

services; (4) training for employees on language access needs, policies, and programs; and (5) a framework and metrics to evaluate the success of the language access plan.[107]

Q: Why should NWN adopt a language access plan?

A: Language access plans serve several important functions. The plan will (1) prompt a comprehensive evaluation of customer language preferences and existing services, identifying deficiencies and room for improvement; (2) improve customer relations; (3) provide more equitable access to NWN programs targeted toward low-income customers, including weatherization and energy assistance programs; and (4) help NWN learn best practices for multilingual services. In general, the language access plan promotes reflection and accountability by giving NWN and other stakeholders clear criteria to evaluate NWN's language access efforts.

Q: Has the Commission supported the adoption of utility language access plans before?

A: Yes. The Commission has explained that "[a]ccessibility and the development of language access plans are an important consideration for all investor-owned utilities."[108] The Commission has stated support for NWN increasing its language access before; it has also done so in cases concerning Puget Sound Energy, Cascade Natural Gas, and

[107] *Id.*

[108] *WUTC v. Puget Sound Energy*, Dkts. UE/UG-220066/67, Order 32/18, ¶ 57 (May 16, 2024).

PacifiCorp.[109] Cascade Natural Gas, Puget Sound Energy, and PacifiCorp have or are in the process of developing language access plans.[110]

Q: How should the Commission ensure that NWN develops and implements an effective language access plan?

A: The Commission should direct NWN to take five steps to develop a language access plan.

First, by September 1, 2026, NWN should complete an evaluation of language barriers to accessing low-income programs in a draft language access plan. Comprehensively evaluating language barriers to low-income programs will show how NWN can cost-effectively meet customer language access needs.

Second, also by September 1, 2026, NWN should provide its GREAT Advisory Group and CEAG with a draft language access plan for its low-income programs and request feedback on the plan. Soliciting feedback on a draft plan enables collaboration and early identification of oversights. A formal feedback mechanism will allow the advisory groups to shape NWN's approach and identify areas for improvement.

Third, by December 31, 2026, NWN should incorporate feedback it receives, discuss any feedback received on the draft not incorporated into the final, state the reason NWN did not incorporate the feedback into the final, and make a subsequent filing (pursuant to WAC 480-07-885) with a final language access plan for its low-income programs. This process will facilitate accountability and transparent decision-making.

[109] *Id.*; *WUTC v. PacifiCorp*, Dkt. UE-230172, Order 08, ¶ 104 (Mar. 19, 2024); *WUTC v. NWN*, UG-200994, Order 05, ¶ 45 n.22 (Oct. 21, 2021); *WUTC v. Cascade Natural Gas Corp.*, Dkt. UG-240008, Order 05, ¶ 99 (Feb. 24, 2025).

[110] *WUTC v. Puget Sound Energy*, Dkts. UE/UG-240004/05, Final Order 09/07, ¶ 185 (Jan. 15, 2025); *WUTC v. PacifiCorp*, Dkt. UE-230172, Final Order 08, ¶ 22 (Mar. 19, 2024); *WUTC v. Cascade Natural Gas Corp.*, Dkt. UG-240008, Order 05, ¶ 99 (Feb. 24, 2025).

Rather than requiring the Commission or interested parties to undertake the cumbersome process of determining what feedback was integrated or rejected, NWN will clearly explain the choices it makes.

Fourth, NWN should annually report on its progress toward accomplishing the language access plan in its annual energy assistance report to the Commission. Regular reporting serves transparency and informs the Commission and interested parties about NWN's efforts. The annual report is an existing opportunity NWN can use to provide updates.

Finally, NWN should maintain and revise the language access plan as needed, with approval and feedback from the GREAT Advisory Group and the CEAG. As NWN implements its language access plan, it will succeed in some efforts and discover new barriers to language access programming. Requiring regular revision of the plan will ensure that NWN learns from its efforts, meets new and changing needs of its customers, and collaborates with its advisory groups moving forward.

To summarize, the Commission should direct NWN to take five steps:

1. By September 1, 2026, evaluate language barriers to accessing low-income programs in a draft language access plan.
2. By September 1, 2026, provide its GREAT Advisory Group and CEAG with a draft language access plan for its low-income programs and request feedback on the plan.
3. By December 31, 2026, incorporate feedback it receives, discuss any feedback received on the draft not incorporated into the final, state the reason NWN did not incorporate the feedback into the final, and make a subsequent filing (pursuant to WAC 480-07-885) with a final language access plan for its low-income program.
4. Report on its progress toward accomplishing the language access plan in its annual energy assistance report to the Commission, and
5. Maintain and revise the language access plan as needed, with approval and feedback from the advisory groups.

VIII. The Commission should not allow Northwest Natural to recover fees and costs which the Commission and the Governor prohibited Northwest Natural from charging during the COVID-19 pandemic.

Q: What costs is NWN seeking to recover related to its COVID-19 deferral?

A: NWN Witness Kyle Walker states that NWN is seeking a total of approximately $1.4 million in COVID-19 deferral expenses.[111] NWN's costs fall into four categories:[112]

a. Direct costs;

b. Bad debt expense accrued above baseline;

c. Late payment fees not assessed (including forecasted amounts through Q2 2026[113]); and

d. COVID-19 bill payment assistance program costs.

NWN is not proposing to recover interest with the COVID-19 deferral costs.[114]

Q: What is your opinion on NWN's proposal not to recover interest?

A: I agree with this proposal.

Q: What is your opinion on NWN's proposal to recover costs from late payment fees not yet assessed?

---

[111] Walker, Exh. KTW-1T at 52:17.

[112] *In the Matter of the Petition of NWN for an Order Approving Deferral of Costs Associated with the COVID-19 Public Health Emergency*, Dkt. U-200264, NWN's Third Quarter 2025 COVID-19 Report Required by Order 01 (Oct. 30, 2025).

[113] *See* Exh. SNS-4 (NWN Response to TEP DR 19) (discussing difference between $1.4 million and $1.31 million stated in most recent NWN "quarterly COVID report" in Commission docket U-200264).

[114] *Id.*

A: The Commission should not allow NWN to recover these costs from customers. The fundamental question is whether it is appropriate for NWN to charge its customers now for late payment fees that were never assessed during the pandemic. NWN was prohibited from charging these fees during the pandemic via proclamations of the Governor of Washington and by Commission orders. NWN thus had no right to recover those fees and never assessed them. It would be unfair to now let NWN indirectly charge those fees by including them in its revenue requirement, which will be paid for from the pockets of NWN's customers via higher rates going forward. NWN's proposal would make thousands of customers for whom charges were waived nonetheless pay an apportioned late fee, a result directly contrary to the Governor's proclamation. Plus, customers who would not even have accrued late fees during the pandemic would have to bear some of the costs. This is an inequitable proposal.

Public Counsel and The Energy Project raised questions about the legality of recovering this category of COVID-19 costs at the time deferral of the costs was requested.[115] In its Order approving the deferral, the Commission explicitly stated that allowing the deferral of uncollected fees "in no way guarantees their later recovery, and the Commission can revisit this issue at the time it performs its prudence review."[116] The Commission should decline to allow these costs to now be included in rates.

[115] *See* Dkt. UG-200264, Petition of Northwest Natural Gas Co. for an Accounting Order Associated with COVID-19 Public Health Emergency, Joint Response of The Energy Project and Public Counsel, at 14-18 (Nov. 11, 2020), https://apiproxy.utc.wa.gov/cases/GetDocument?docID=75&year=2020&docketNumber=200479.

[116] Dkt. UG-200264, Order 01 Granting Accounting Petition Subject to Conditions, ¶ 23 (Dec. 10, 2020).

Q: How much is NWN seeking to recover in uncharged late fees?

A: NWN is seeking $383,971 in late fees counted through Q3 2025, plus about $74,600 in late fee activity forecast through Q2 2026.[117] This totals approximately $459,000—over one third of the total NWN COVID-19 deferral recovery request.

Q: Next, what is your opinion of NWN's proposal to recover other direct costs?

A: In this cost category, NWN is asking its customers to pay the company's costs for things like personal protective equipment, cleaning supplies and services, contact tracing, medical testing, financing costs, information technology updates, and equipment for remote work options.[118] Many of these types of costs were incurred by nearly every individual household in Washington. NWN's customers had no ability to shift their comparable costs onto someone else; the costs were a part of coping with the realities of the pandemic. NWN admits that its only consideration of "equity" regarding its decision to seek recovery of its COVID deferral was the notion that it would be better to make current customers pay for these costs than future customers.[119] It is fundamentally inequitable for NWN to force its own customers to bear NWN's PPE, cleaning, remote work, and COVID testing costs on top of their own costs.

Q: Please summarize your recommendation concerning COVID deferred costs.

A: The Commission should allow NWN to recover bad debt expenses above baseline but should refuse to allow NWN to recover uncharged fees and direct costs.

---

[117] Dkt. U-200264, NWN Third Quarter 2025 COVID-19 Report Required by Order 01 (Oct. 30, 2025); Exh. SNS-4 at 1 (NWN Response to TEP DR 19).

[118] *See* Dkt. U-200264, Amendment to Petition of NWN, ¶ 10 (Nov. 5, 2020).

[119] Exh. SNS-4 at 2 (NWN Response to TEP DR 20).

IX. The Commission should order Northwest Natural to revise and add to its proposed Performance-Based Ratemaking metrics and to post them on its public website.

Q: Please explain the metrics NWN proposes which TEP seeks to revise and its reasoning regarding those revisions.

A: TEP recommends revising two metrics NWN proposes and rejecting NWN's proposal not to track the workforce and supplier diversity metrics established in the Policy Statement. First, NWN proposes to report a metric titled Arrearages as "[n]umber of customers in arrears by period and total amount of arrearages by month, by class, measured by census tract to include 30+, 60+, and 90+ days in arrears."[120] TEP supports reporting this metric but suggests revising the metric to clarify how each band of customers in arrears is calculated. At present, it is unclear whether a customer that is 61 days late would be reported in both the 30 day and 60 day data or only the 60 day data. The Commission has previously suggested, and TEP has previously supported, calculating at the highest interval, so the customer 61 days late would only be reported in 60+ data.[121] TEP recommends including metric language that adopts that mode of calculation.

NWN also proposes measuring Utility Assistance Program Effectiveness as "[o]n an annual basis, utility customer-funded assistance funds dispersed divided by total available customer-funded assistance received, as well as the percentage of estimated low-income needs met with dispersed funds."[122] First, it is noteworthy that NWN's metrics are based on the policy docket, and the Commission appears primed to remove the first

[120] Siores, Exh. NCS-1T at 4, tbl.1.

[121] Dkt. U-210590, The Energy Project's Eighth Comments on Performance-Based Regulation (PBR) and the UTC's Interim Policy Statement at 6 (May 17, 2024).

[122] Siores, Exh. NCS-1T at 4, tbl.1.

portion of this metric in that proceeding.[123] TEP did not object to that proposal; with the advent of Bill Discount Programs, low-income assistance is shifting from being based on a fixed amount of funding to one in which trackers provide cost recovery based on enrollment and demand. Accordingly, measuring outlays is no longer the best measurement of program effectiveness.[124] TEP would similarly not object to revising the metric here if the Commission formally removes the first portion of the metric in the policy docket.

For the remainder of the metric, NWN needs to further define the term "estimated low-income need." Evaluating low-income program effectiveness will depend on the purpose of specific programs. In its most recent PBR update, the Commission indicated that utilities could use any of the following methodologies for this data: (a) Section 120 reporting, (b) Energy Burden Assessment data completed within the past two years, or (c) Methodology established with the low-income advisory group.[125] NWN should establish which source of data it will use for this metric in this proceeding. TEP encourages NWN to use the EBA data option.

In addition, NWN should revise the title of the metric. Despite its current title, the metric is a less useful indicator of utility assistance program effectiveness than the number and percentage of estimated low-income customers enrolled in bill assistance programs. While TEP still views the proposed metric as valuable, future analysis will be

[123] *Id.* at 3:16-18; Dkt. U-210590, Notice of Opportunity to Comment, Appendix A at 4 (Dec. 11, 2025).

[124] Dkt. U-210590, Twelfth Comments of the Energy Project's on Performance-Based Regulation in Washington at 2 (Nov. 12, 2025).

[125] Dkt. U-210590, Notice of Opportunity to Comment, Appendix A at 4 (Dec. 11, 2025).

better served by clarifying what the metric is truly tracking. TEP recommends changing the title of the metric to "Low-income need spending" to better match the data the metric is reporting.

Q: Should NWN report any additional metrics beyond those in its proposal?

A: In addition to refining the above metrics, NWN should report workforce and supplier diversity metrics.[126] Workforce and supplier diversity metrics are already part of the Commission's Policy Statement and will already be part of utility performance metric reporting.[127] TEP opposes specifically carving these diversity figures out of NWN's otherwise consistent effort to report Commission-endorsed Policy Statement metrics. Refining Commission-endorsed metrics may be warranted in some circumstances, but TEP sees no value in enabling the Company to reject metrics the Commission established in its Policy Statement.

Finally, TEP supports including customer participation in assistance programs. NWN proposes to report "[t]he number and percentage of estimated low-income customers who participate in one or more customer-funded energy assistance programs that actively lowers energy burden, both aggregated and by census tract; and separately the number and percentage of estimated low-income population enrolled in a utility bill discount program and total amount of discount applied annually."[128] As noted above, TEP applauds NWN for its progress serving a large portion of the customers in its service

[126] Siores, Exh. NCS-1T at 5:4-7:2.

[127] Dkt. U-210590, Notice of Opportunity to Comment, Appendix A at 6 (Dec. 11, 2025).

[128] Siores, Exh. NCS-1T at 5, tbl.1.

territory; with the current program design, this is the most important metric to the communities TEP works with.

Q: Does TEP propose NWN take any other additional actions related to Performance-Based Ratemaking?

A: Yes. NWN should post its performance metrics in an easily accessible area of its website. Witness Siores states that NWN will provide its data as an appendix to its Commission Basis Report.[129] Performance metrics are an important source of information for both advocates and the public to assess utility performance. Solely providing these data in the Commission Basis Report hinders the public's ability to easily view and access these valuable metrics. NWN should therefore provide these data on NWN's website in an easily accessible fashion.

X. The Commission should ensure Northwest Natural's proposed Thermal Energy Network pilot project will serve low-income housing when considering the equity implications of the proposed rate base merger to pay for the project.

Q: Please summarize NWN's TEN pilot project.

A: TENs are systems that distribute noncombustible fluids (usually water) through pipes to transfer heat into and out of buildings using non-combustion energy sources, such as geothermal electric heat pumps.[130] NWN is planning to develop a TEN in downtown Vancouver, Washington, and to recover the costs of building and operating the TEN primarily from natural gas customers.[131] NWN's plans are not fully finalized, but as

[129] *Id.* at 10:12-15.

[130] *See* RCW 80.04.010(31)-(33).

[131] Braun, Exh. HJB-1CT at 8:8-8:15, 25:22-26:6; RCW 80.28.450(2); RCW 80.28.480(1).

currently planned, the TEN would supply all heating, cooling, and hot water services to three new buildings and to City Hall, all within Vancouver's Waterfront Gateway district. The new buildings would include more than 300 units of housing and about 30,000 square feet of retail space.[132]

Q: What is the legal background relevant to NWN's proposal?

A: A state law enacted in 2024 encourages utilities to develop TENs to support the state's climate goals.[133] Under the law, an IOU proposing to develop a TEN pilot program must submit its proposal to the Commission for approval.[134] Criteria for approval include labor, reliability, safety, greenhouse gas reduction, heating functionality, as well as several equity-based factors.[135] These equity factors include: (1) the percent of low-income customers the TEN would serve; (2) whether it creates public health benefits in disproportionately burdened and disadvantaged communities described in the Washington State Department of Health Environmental Health Disparities Map; (2) whether it increases affordability of thermal energy options; (3) whether it furthers the climate justice mandates of chapter 70A.02 RCW; and (4) whether it advances financial and technical approaches to equitable and affordable building electrification.[136]

Further, if an IOU intends (as NWN does here) to recover TEN costs from natural gas customers not served by the TEN, it must file a request for a rate base merger.[137] That

[132] Braun, Exh. HJB-1CT at 8:8-8:15.

[133] H.B. 2131 (2024) (codified at RCW 80.28.450-480; RCW 43.31.033).

[134] RCW 80.28.460.

[135] *Id.*

[136] RCW 80.28.460(a), (e), (g)-(h).

[137] RCW 80.28.450(2).

request is what NWN is filing in this rate case. The Commission will only approve the rate base merger NWN proposes if it finds it to be "in the public interest."[138]

Q: What does NWN propose in this rate case regarding cost recovery for its TEN project?

A: In order to recover the cost of its TEN pilot project, NWN seeks a rate base merger as provided for in RCW 80.28.480, because NWN states it cannot feasibly obtain the full expected project cost from the TEN customers, i.e., the City (City Hall) or the commercial building tenants (the housing and business units).[139]

Q: What are TEP's concerns regarding this proposal to recover the costs of the TEN from natural gas customers?

A: Because of uncertainties about the customers the TEN would serve and the funding sources for the project, TEP has concerns about the project's ability to provide tangible benefits to low-income and vulnerable communities and the cost burden it would add to natural gas ratepayers' bills. As I will explain further, TEP cannot currently take a position on the project given these uncertainties, but urges the Commission to highly prioritize equity considerations in determining whether to approve NWN's proposed rate base merger.

TEP recognizes that the Commission's decision in this rate case only technically concerns the "public interest" determination regarding the rate base merger NWN is seeking for its project. However, given that the Commission is still reviewing the project's cost assessment in docket UG-250458, the equity criteria in RCW 80.28.460 are

[138] RCW 80.28.480(1).

[139] Braun, Exh. HJB-1CT at 25:22-26:6.

relevant to the Commission's ongoing review of the proposal. Furthermore, the Commission must apply an "equity lens" to the public interest determination it will make regarding NWN's proposed rate base merger.[140]

NWN has argued the TEN's mere location in a low-income census tract (042400), which has high scores for environmental health disparities, social vulnerability, and lead exposure risk among other things, promotes equity.[141] However, in order to actually promote equity, the project needs to provide benefits to the vulnerable communities within that census tract. TEP does not see how the TEN would create direct public health benefits (RCW 80.28.460(e)) or affordability (RCW 80.28.460(g)), because the project would not remove a source of pollution, and any affordability gained through the TEN's energy efficiency could be outstripped by the project costs to customers. This includes natural gas customers, who will have to bear the costs of the project without benefitting from the TEN.

Q: What are the key uncertainties about the TEN proposal?

A: Chiefly, it is still unclear whether the TEN will indeed serve low-income customers. Additionally, given that the project design is not fully finalized and the costs natural gas customers might bear are subject to still-pending grant funding, the financial impact of the project is not clear.

[140] RCW 80.28.480(1); *see* RCW 80.28.425(1) (Commission may consider equity and other factors in determining the public interest); *see* Cascade 2021 GRC Order, ¶ 58 ("So that the Commission's decisions do not continue to contribute to ongoing systemic harms, we must apply an equity lens in all public interest considerations going forward.").

[141] Braun, Exh. HJB-1CT at 11:18-12:7.

Regarding serving low-income housing, NWN's plans appear to have changed at least twice so far during the course of project development, and TEP is concerned that they may change again. Initially, the TEN was planned to connect to an additional new building that would have consisted of low-income housing units, but that building is no longer part of the plan.[142] NWN's testimony about the TEN described it as only serving municipal government, business, and multi-family market rate housing.[143] However, more recently, NWN stated in a response to a Commission data request that the developer of the planned multi-family housing now intends to rent out 50% of the units of both buildings containing housing to low-income households (at or below 80% AMI).[144] The prospect that the TEN would be connected to low-income housing units helps with the equity considerations the Commission must consider—especially RCW 80.28.460(a) (percent of low-income customers served). However, TEP cannot be sure these current plans will not change again, given that NWN has already gone back and forth on this. Since NWN has not provided definitive information showing the amount of low-income housing, if any, the TEN would serve, TEP cannot take a position regarding the equity impacts of the project. Serving low-income housing should be a key factor in the Commission's consideration of the proposal.

Second, TEP is concerned about the costs that low-income natural gas ratepayers who would not be connected to the TEN will shoulder to support the project. Even if the TEN serves some low-income customers, the proposed rate base merger represents an

[142] *Id.* at 8:12, n.6.

[143] *Id.* at 8:8-8:15.

[144] NWN Response to WUTC DR 123.

added cost burden to all NWN's gas customers, including low-income customers. NWN seeks to recover $1.3 million from gas customers in the first year of the TEN's operation.[145] In response to a TEP data request, NWN estimated that its revenue requirement for the TEN would, in the first year of service, raise some residential gas customers' average monthly bills by as much as 10%.[146] NWN also projected that natural gas customers would continue to pay for the project throughout its useful life.[147] However, it is unclear how much grant funding NWN will ultimately have to reduce these costs. Such information would be necessary for TEP to understand the full impact of the project.

TEP understands NWN initially planned this project to be funded largely through $25 million available in Department of Commerce grant funding, which has since dwindled to $4.8 million.[148] Even if NWN receives $2.4 million (half the money available for grants across the entire state), gas customers would still pay millions, representing virtually all of the project's capital costs.[149] TEP understands the unavailability of sufficient grant funding has impacted this project, but is concerned about

[145] Braun, Exh. HJB-1CT at 29:23.

[146] Exh. SNS-6 (NWN Response to TEP DR 30). Based on the information NWN provided, bill impacts would be different depending on customers' rate schedule. By NWN's estimate, Schedule 1 Residential customers would see an average monthly bill increase of $2.90 as a result of the rate base merger in the first year of service, representing a 10.3% increase. Schedule 2 Residential customers would see a $0.84 increase, a 1.2% change. *Id.*

[147] *Id.*

[148] Braun, Exh. HJB-1CT at 24:16-24:23.

[149] *Id.* at 30:1-30:4. The estimated annual O&M costs are $61,000. *Id.* at 24:3; this is approximately equal to the $86,000 NWN plans to charge TEN customers annually for service. *Id.* at 26:8-26:12.

the distributional equity outcome of making natural gas customers shoulder the cost of a project they will not benefit from.

Q: What does TEP recommend to the Commission at this stage regarding NWN's proposed TEN?

A: As I have discussed, neither TEP nor the Commission can fully analyze the equity impacts of the proposal without further information regarding the costs of the project and how it would directly benefit low-income utility customers. This prevents a robust analysis of the proposed rate base merger and the project as a whole, because equity factors are prominent in the statute authorizing TENs and are a key part of the Commission's rate base merger public-interest determination in this rate case. The Commission should give great weight to the equity factors outlined in the statute, especially considering that most of the project would be funded by NWN's gas customers. Without additional information about costs, grants, and equity impacts, TEP cannot support the proposal.

XI. Conclusion

Q: What does TEP propose concerning rate design?

A: The Commission should reject NWN's proposed fixed charge increase for residential customers. If the Commission allows any fixed charge increase, it should limit the increase to $0.15-0.25 per year.

Q: What does TEP propose concerning ROE?

A: The Commission should reject NWN's proposed ROE increase. The Commission should give great weight to its consideration of the equity impacts of high ROEs and to the proposals of the non-company parties on this subject.

Q: What does TEP propose concerning low-income programs and energy burden assessment?

A: The Commission should order NWN to perform an energy burden assessment every two years going forward, including a stratified energy burden analysis that includes single and dual fuel burdens. The commission should also order NWN to work with its GREAT Advisory Group to develop a secure customer information access portal for community action agencies (WAGAP and Clark PUD) to implement NWN's low-income programs.

Q: What does TEP propose concerning disconnections?

A: 1. The Commission should order NWN to raise its disconnection thresholds to $300 and 60 days past-due.

2. The Commission should order NWN to modify its contracts with its collections agencies to prohibit them from sending customer information to credit bureaus.

3. The Commission should order NWN to conduct a robust equity review of its disconnection policies in consultation with the GREAT Advisory Group and the CEAG and to meet the following deadlines:

a. By September 1, 2026, present its new disconnection for nonpayment policy and procedures to a meeting of its CEAG and GREAT Advisory Group and solicit feedback on the equity impacts of its policy and procedures.

b. By February 1, 2027, incorporate the feedback it receives and make a subsequent filing (pursuant to WAC 480-07-885) with new disconnection policies and procedures. The subsequent filing will discuss any feedback received which NWN did not incorporate and the reasons why it did not incorporate that feedback.

Q: What does TEP propose concerning language access?

A: The Commission should direct NWN to take five steps:

1. By September 1, 2026, evaluate language barriers to accessing low-income programs in a draft language access plan.

2. By September 1, 2026, provide its GREAT Advisory Group and CEAG with a draft language access plan for its low-income programs and request feedback on the plan.
3. By December 31, 2026, incorporate feedback it receives, discuss any feedback received on the draft not incorporated into the final, state the reason NWN did not incorporate the feedback into the final, and make a subsequent filing (pursuant to WAC 480-07-885) with a final language access plan for its low-income program.
4. Report on its progress toward accomplishing the language access plan in its annual energy assistance report to the Commission, and
5. Maintain and revise the language access plan as needed, with approval and feedback from the advisory groups.

Q: What does TEP propose concerning COVID-19 costs and policies?

A: The Commission should decline to allow NWN to recover uncharged fees and direct costs related to the COVID-19 pandemic, but should allow NWN to recover bad debt expenses.

Q: What does TEP propose concerning performance-based ratemaking?

A: The Commission should order NWN to revise its Arrearages and Utility Assistance Program Effectiveness metrics, and to report workforce and supplier diversity metrics. The Commission should also order NWN to post its metric reports on its public-facing website.

Q: What does TEP propose concerning NWN's TEN project?

A: TEP cannot support the TEN pilot project at this time, given that key information regarding project costs and whether it would serve low-income customers is still not finalized. TEP urges the Commission to give great weight to the equity prong of its analysis of the rate base merger NWN proposes in this case to pay for the project.

Q: Does this conclude your testimony?

A: Yes, it does.

Re: AR 671/UM 2211 - Energy Justice Advocate Comments for additional metrics and reporting associated with evaluating Division 21 protections

---

Following Staff's request for comments related to tracking customer outcomes and utility compliance with the updated disconnection protections in Division 21 rules per AR 671, Oregon Citizens' Utility Board, Oregon Just Transition Alliance, Verde and Community Energy Project, collectively "the Energy Justice Advocates", offer the following:

In AR 671, Energy Justice Advocates requested the Commission ensure there were metrics put into place for accountability and compliance for utilities, regarding the implementation of updated Division 21 Rules. This was in response to Staff's desire to have reporting requirements to accompany the updated rules, which we also support.[1] In our September 23, 2025 comments we stated the following:

> *"We support Staff's suggestion that this reporting be an annual supplement to existing Energy Burden Metric Reporting (EBMR). However, we encourage Staff to be clear in its final proposal to the Commission, that this reporting is also about understanding utility compliance with these rules, in addition to customer impacts from these rules.* ***As we mentioned in prior comments, we do have concerns about compliance due to previous misunderstandings and different interpretations of both winter and summer temporary rules. Regardless of this, ensuring compliance is a very important aspect of protecting customers.****"*

It very recently came to light, via public reporting in Docket RO 16[2] - the Energy Burden Metric Reporting docket - that NW Natural, Oregon's largest gas utility, did not actually implement its temporary winter 2025

[1] Docket No. AR 671 *Energy Justice Advocates' Comments on Staff's v5 Proposal,* Sep 23, 2025: https://edocs.puc.state.or.us/efdocs/HAC/ar671hac340076036.pdf at 16.
[2] Docket No. RO 16 *NW Natural's Energy Burden Metric Report for the 4Q 2025*, Jan 29, 2026: https://edocs.puc.state.or.us/efdocs/HAQ/ro16haq343430037.pdf at 4.

disconnection moratorium. NW Natural promised legislators, the PUC, advocates and the wider Oregon community, to activate a disconnection ban for its customers enrolled in the Company's Bill Discount Program (BDP) starting at least on November 12th through January 1, 2026.

This scandal unfortunately further validates advocates' concerns about utility compliance and accountability, and begs the question on the need for Commission issued penalties for failure to adhere to the Division 21 rules and other rules by Commission order.

Lastly, it is important to raise that compliance is additionally important for community trust - not just with customers and their utilities, but with customers and community organizations that work to give impacted communities up-to-date and accurate information about their rights as it relates to energy utilities. NW Natural's actions have put our reputations with communities at risk as well. **As it is our job as advocates to continue to not only fight for stronger protections, but to ensure these protections are being followed by utilities.**

We request (1) the following items be considered for utility reporting, acknowledging there may be other important metrics we have not yet considered, (2) and additionally ask that Staff and the Commission are thoughtful about what other *compliance level* reporting will be necessary going forward, (3) including what tools for penalties are applicable to non-compliance in Division 21 and adjacent Orders, policies and promises:

- Report the dates where moratoriums were in effect within utility territories. Currently, in RO 16 reporting, moratoriums are only reported by utilities as the number of days they were in effect by month;[3]
- Count of non-payment disconnections (day before severe weather) - see RO 18 reporting;
- Count of non-payment disconnections (two days after severe weather) - see RO 18 reporting (ensure this includes wildfire displacement rules);
- Count of how many customers are calling to reconnect during qualifying extreme weather moratorium periods (ensure this includes wildfire displacement rules in 0406) and tracking this by customer type

[3] Docket No. RO 16 ELECTRIC AND GAS UTILITIES ENERGY BURDEN METRICS REPORT PURSUANT TO OAR 860-021-0408: https://apps.puc.state.or.us/edockets/docket.asp?DocketID=24721

(i.e. on a bill discount program, a medical certificate, or N/A) - see RO 18 reporting;
- Count of how many customers remain disconnected during a qualifying severe weather event and tracking this by customer type;
- By bill discount program tier, for medical certificate customers, and all other residential customers, how much it costs to reconnect, including how much is fees vs bill balance - see RO 18 reporting;[4]
- By count, how many households are calling the utility inquiring about a past due bill, disconnection, and inability to pay - more specifically, for example, how many conversations are CSRs having where Division 21 rules are explicitly discussed/asked about;
- Policy audit reporting where utilities need to provide documentation of their adherence to policies, such as copies of disconnection notices, door hangers, redacted call log transcripts, CSR training materials, and any and all materials utilities send to agencies, etc. - these could be included in the annual EBMR supplement filing;

Relatedly, we have a few questions related to compliance given recent updates and changes to Division 21 rules, where compliance reporting that provides customer copies of utility-provided materials would be warranted. These are examples where utility provided examples of customer materials help to ensure compliance and shared understanding across stakeholders and customers:

- Do disconnection notices also alert customers to their protections under OAR 860-021-0407(5)(a) and OAR 860-021-0406(2)?
- When disconnected customers call utilities during qualifying severe weather (including wildfire in 0406) are Customer Service Representative (CSRs) offering bill discount program customers and medical certificate customers the ability to reconnect with no up-front costs pursuant to OAR 860-021-0330(3)?

We thank Staff for their continued engagement and dedication to this matter and look forward to next steps.

Respectfully submitted this 24th day of February, 2026,

Data Request Response

Request No.: UG 527 CUB DR 31

Per NW Natural's Docket No RO 16 reporting from Q4 2025, the Company indicates it disconnected 139 accounts receiving a bill discount in November 2025 and 213 accounts receiving a bill discount in December 2025.

a. What dates did the Company begin and end its temporary winter moratorium on disconnections for customers enrolled in its BDP and/or medical certificate customers?

    i. Please also describe the Company's temporary moratorium policies.

b. Explain how/why 139 accounts were disconnected for non-payment in November 2025 despite the moratorium?

c. Explain how/why 213 accounts were disconnected for non-payment in December 2025 despite the moratorium?

d. When the Company instituted the limited-scale moratorium (for bill discount program customers and medical certificate customers only), did it immediately contact BDP customers who were disconnected the day, or days prior, to reconnect them? Please explain the Company's process for handling this with temporal components.

Response:

NW Natural has discovered that we did not implement the voluntary temporary winter disconnect moratorium for bill discount participants as intended. In mid- November the Company voluntarily committed to a temporary disconnect moratorium for bill discount and medical certificate customers due to the uncertainty and impacts caused by the federal government shutdown. However, a mistake was made in that an internal miscommunication caused us to continue disconnections for non-payment for these customers despite processes being put in place to do so. NW Natural regrets that its actions did not match its commitment to our customers experiencing economic hardship at this time. This mistake occurred as the Company was implementing the significant technological and process changes required with the new rules from the conclusion of AR 671 and additional actions ordered in UM 2211, which have taken place.

From November 15 through December 31, 192 bill discount participants were disconnected for non-payment. There were no medical certificate customers that were disconnected.

As of February 18, 2026, it was determined that of those 192 customers, 143 have been reconnected. Any fees that were charged with those reconnections have been refunded (approximately $4,890). Of the 49 customers that have not reconnected, 27 have a new customer at the premises with active gas service. NW Natural reached out to the remaining 22 customers that have not yet reconnected to schedule reconnections with no charges and offering extended time payment arrangements. Currently, of those 22 calls, one was reconnected the same day they were called, 11 had voicemails left to contact the Company, and the remaining 10 had either moved, stated they wanted the gas to remain off, or had phone numbers that did not work/go through.

Supplemental Response:

As explained in the response to UG 527 CUB DR 35, we have refined the number of customers impacted. This supplement provides additional detail to include the 22 additional impacted Oregon customers.

From November 15 through December 31, 214 bill discount participants were disconnected for non-payment on a system basis. On an Oregon basis, 198 customers were impacted. There were no medical certificate customers that were disconnected.

Of the 198 Oregon customers impacted, 176 have been reconnected. Any reconnection fees have been refunded. Of the 22 Oregon customers that had not reconnected by February 19, 2026, 1 was reconnected on February 19, 2026, 11 were left voicemails to contact the Company, and the remaining 10 had either moved, stated they wanted the gas to remain off, or had phone numbers that did not work/go through. Please see Supplemental Response to UG 527 CUB DR 34 for a table detailing the number of impacted customers.

Data Request Response

Request No.: UG 527 CUB DR 33

Regarding the Bill Discount Program (BDP) households who NW Natural disconnected in November and December 2025 during the winter moratorium; Please provide all responses in public and confidential versions, where applicable:

a. Provide the number of people, not just the number of accounts, in the disconnected households, based on the household size reported by each impacted account when it signed up for the Company's Bill Discount Program (BDP)

b. For each month, provide all zip codes of the impacted households;

c. Please identify, per household, protecting identifying customer information where appropriate:

    i. The bill discount tier the household was in at the time of disconnection, and if that tier has since changed and when;

    ii. The number of times, and in what months, the household was previously disconnected in 2025 and 2024;

    iii. The amounts past due at the time of reconnection, following the households' November or December 2025 disconnection;

    iv. The amount each customer paid to reconnect (including any arrearages, reconnection fees);

    v. The length of time they remained disconnected, including the dates;

    vi. If there was a qualifying severe weather event in effect during their disconnection;

    vii. Whether the customer entered the disconnection cue again in the three months following their disconnection in November or December, and if they were disconnected again since;

    viii. Indicate if they are enrolled in multi-family or single family household;

d. How many impacted customers received an arrearage relief grant from the Company, per Schedule D, since they were disconnected in November or December 2025?

Response:

See Confidential UG 527 CUB DR 33 Attachment 1, which contains distinct (randomized ID) account disconnection data with 3 tabs representing the data requested and itemized below:

a. Provide the number of people, not just the number of accounts, in the disconnected households, based on the household size reported by each impacted account when it signed up for the Company's Bill Discount Program (BDP)

***** See Confidential UG 527 CUB DR 33 Attachment 1, Tab 1, column E (Household).***

b. For each month, provide all zip codes of the impacted households;

***** See Confidential UG 527 CUB DR 33 Attachment 1, Tab 1, column B (Zip).***

c. Please identify, per household, protecting identifying customer information where appropriate:

i. The bill discount tier the household was in at the time of disconnection, and if that tier has since changed and when;

***** See Confidential UG 527 CUB DR 33 Attachment 1, Tab 1, column F, G & H.***

ii. The number of times, and in what months, the household was previously disconnected in 2025 and 2024;

***** See Confidential UG 527 CUB DR 33 Attachment 1, Tab 2 for a list by ID of each disconnection between 2024 and 2025 for accounts listed in Tab 1.***

iii. The amounts past due at the time of reconnection, following the households' November or December 2025 disconnection;

***** See Confidential UG 527 CUB DR 33 Attachment 1, Tab 1, column M. Amount represents the past due amount associated with the disconnection action and at the time of disconnection. Any amounts between $50 and $150 are related to customers on pre-existing payment plans, which are subject to disconnection at a $50 past due balance.***

iv. The amount each customer paid to reconnect (including any arrearages, reconnection fees);

***** See Confidential UG 527 CUB DR 33 Attachment 1, Tab 1, column N. Amount represents the sum of payment on the first day post-disconnection.***

v. The length of time they remained disconnected, including the dates;

***** See Confidential UG 527 CUB DR 33 Attachment 1, Tab 1, column K & L.***

vi. If there was a qualifying severe weather event in effect during their disconnection;

No weather moratorium events were declared for the weather zones of accounts in the disconnection list.

vii. Whether the customer entered the disconnection cue again in the three months following their disconnection in November or December, and if they were disconnected again since;

***** See Confidential UG 527 CUB DR 33 Attachment 1, Tab 3 for a list by ID of each disconnection between January 1st and March 11th, 2026 for accounts listed in Tab 1.***

viii. Indicate if they are enrolled in multi-family or single family household;

***** See Confidential UG 527 CUB DR 33 Attachment 1, Tab 1, column C (Dwelling Type).***

d. How many impacted customers received an arrearage relief grant from the Company, per Schedule D, since they were disconnected in November or December 2025?

9 Distinct Accounts.

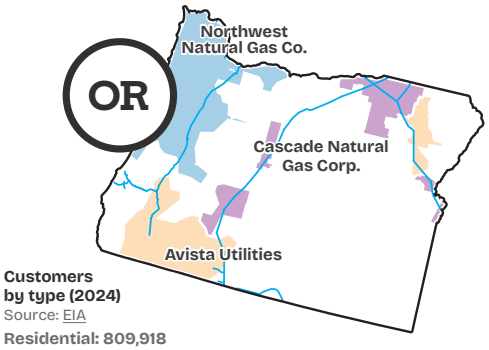
The FUTURE of HEAT INITIATIVE

Paying More for Less

Rising Gas Bills in Oregon



Customers by type (2024)
Source: EIA

Residential: 809,918
Commercial: 84,777
Industrial: 1,171

Largest investor-owned gas utilities

Northwest Natural Gas Co.
Avista Utilities
Cascade Natural Gas Corp.

Gas bills are on the rise, even though customers are using less gas.

Because of efficiency improvements and fewer heating days, gas consumption per residential customer is declining. The typical Oregon residential gas customer uses 24% less gas today compared to 2000. But the total charge for that gas (supply charge + delivery charge + surcharges) is rising. Over the last five years, residential customer **gas bills have increased ~11% year over year.**

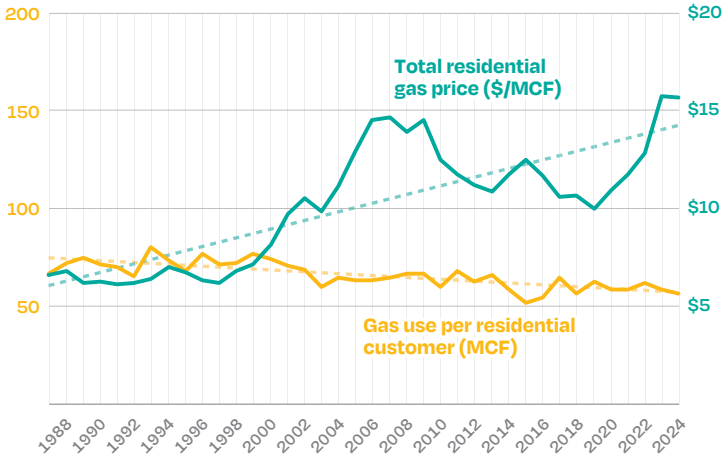


Figure 1: OR gas use per residential customer & total residential cost of gas
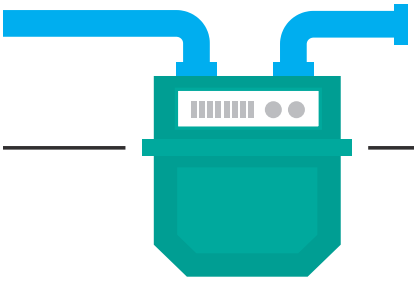
Source: EIA



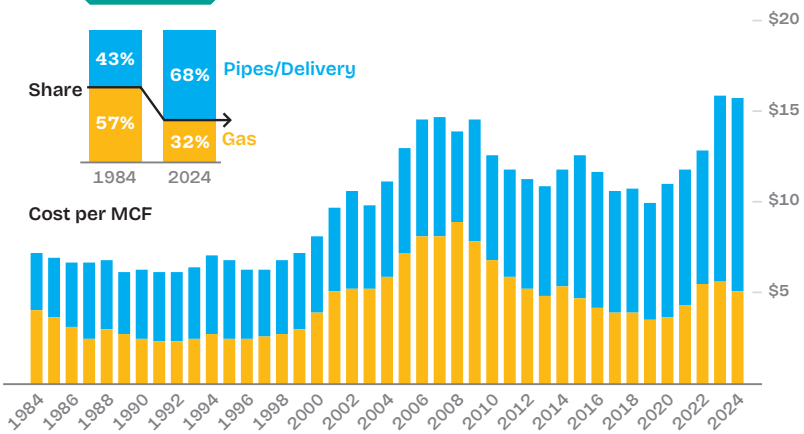


Figure 2: OR residential delivery charges & supply cost of gas
Source: EIA

Customers pay more for pipes ("delivery") than for the gas itself.

Residential gas delivery charges in Oregon have overtaken charges for the gas. In 1984, 57% of a gas bill went toward the fuel itself ("gas") and 43% toward paying for pipes and other infrastructure, utility operating costs, and taxes ("delivery"). In the early 2010s, this flipped. Today, one-third of charges are for gas and two-thirds are for delivery charges that will not fall with lower use.

Aggressive capital spending is driving up customer rates.

Oregon's gas utilities are investing hundreds of millions to excavate and replace old pipelines and install other infrastructure, often taking advantage of state policies that encourage such spending. Over the last 10 years, the three largest gas utilities grew their gas assets from about $3B to over $5B, despite homes using less gas.

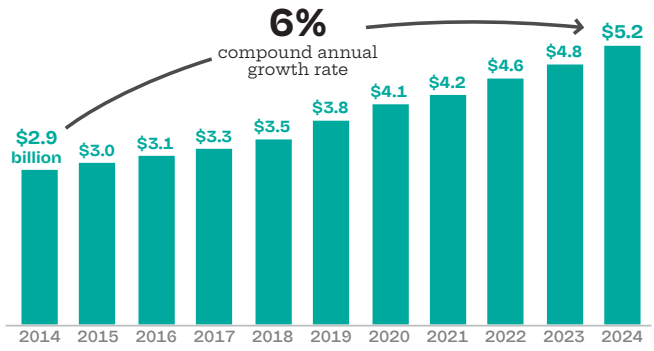

Figure 3: Growth in equipment and facilities for the three largest OR gas companies
Source: Utility annual filings for Northwest Natural, Avista, and Cascade

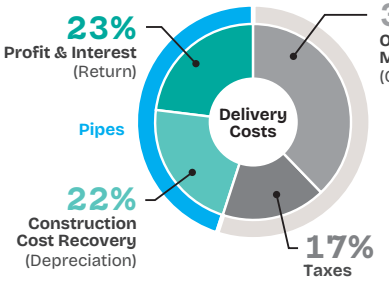

Figure 4: Cost of service breakdown for three largest OR gas utilities
Source: OR Public Utility Commission

Utilities profit from investing in pipes, not selling gas.

In Oregon, 23% of delivery charges for the three largest gas utilities go to profits and financing costs. Their authorized rate of return on these investments ranges from 7.07% to 7.17%. In addition, 22% of delivery charges go to repaying the costs of construction, including significant pipeline replacement.

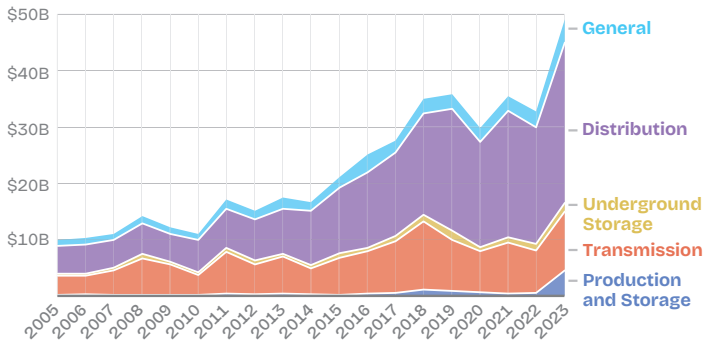
When utilities spend on pipes, they earn more — and delivery charges go up.

National Context

Oregon is not alone: Spending on gas infrastructure is up dramatically across the country.

According to the American Gas Association, "gas utility construction expenditures have been on a sustained upward trajectory since 2011, largely driven by increased investments in safety and infrastructure improvements." As a result, gas delivery rates across the country have nearly doubled since 2011, increasing at more than twice the rate of inflation.

Figure 5: National gas utility capital spending
Source: AGA



Bottom line

Gas customers in Oregon are paying more for less.

Notes and Sources

Figure 1: The Residential Price refers to the total cost paid by residential end-users inclusive of all tax, delivery, commodity, demand and other charges. Gas use per residential customer is calculated as the volume of gas used by residential customers divided by number of residential gas customers. Total residential gas price is from: U.S. Energy Information Administration (EIA), "Natural Gas Prices," Residential Price, State data on residential customers is available from EIA, "Number of Natural Gas Consumers." State data on residential gas volume consumed is available from EIA, "Natural Gas Summary".

Figure 2: The "gas" charge is equal to the Citygate Price of gas; the "delivery" charge is equal to the Residential Price minus the Citygate Price. Citygate Price is the total cost paid by gas distribution companies for gas received at the point where the gas is physically transferred to the companies. See Figure 1 notes for the definition of Residential Price. The data is from: EIA, "Natural Gas Prices," City Gate Price and Residential Price.

Figure 3: Utility annual filings of FERC Form No. 2, OR Supplement, "Gas plant in service."

Figure 4: This figure shows the regulator-approved breakdown for gas company revenue received from the delivery (or "distribution") charges paid by all customers (i.e., total "cost of service"). It excludes the supply charge for gas (which the utility passes through to the customer without markup) and all surcharges and riders. The figure is based on data from the year-end 2024 Earnings Review reports for Northwest Natural (RG 40), Avista (RG 34), and Cascade (RG 36).

The Hard Work of Challenging Gas Infrastructure Spending

By Jamie Van Nostrand, FoHI Policy Director

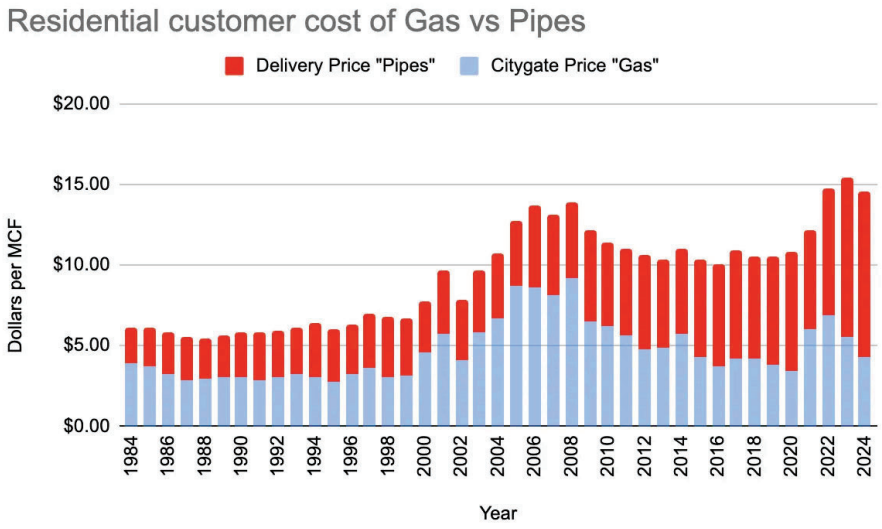
JAMIE VAN NOSTRAND
MAR 04, 2026

7 Share

The cost of delivering natural gas to customers has nearly doubled since 2011, growing at more than twice the rate of inflation.

Today, about two-thirds of a typical gas bill goes to delivery charges, not the gas itself. And unlike the commodity cost, those delivery charges don't fall when customers use less.

This is not an accident. It is the predictable result of how gas utilities are regulated, and it is why scrutinizing infrastructure spending by local gas distribution companies (LDCs) is central to our mission at the Future of Heat Initiative.



Source: EIA city-gate & residential delivery costs

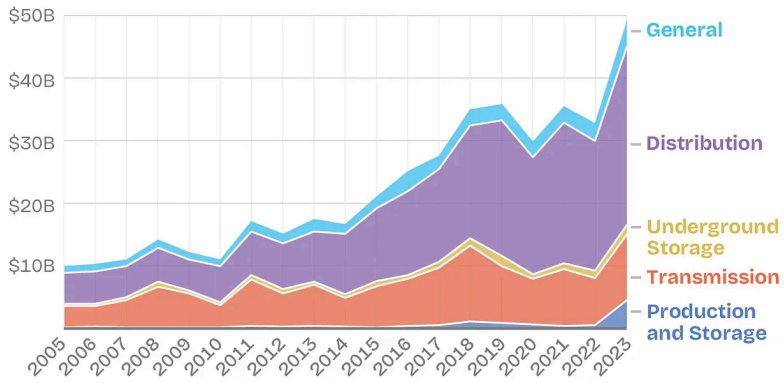
How Rate-of-Return Regulation Creates Spending Incentives

Under rate of return regulation, the money that an LDC spends on pipes gets included in its "rate base" upon which they earn a return, or profit. In other words, the more an LDC spends on pipes, the more it earns – and delivery charges for customers go up.

This creates a strong incentive to over-invest in infrastructure by ***replacing*** pipes, even when lower-cost alternatives exist. Old or at-risk pipe segments can be remediated in several ways: relining, repair, or retirement through non-

pipeline alternatives (NPAs) such as electrification (i.e., replacing the natural gas-fired appliances with electric ones in the buildings served by the pipe segment), thereby avoiding any future maintenance and infrastructure costs on the gas side. Replacement is not the only option. But it is the most profitable one for the LDC, so it has become the default.

Figure 5: National gas utility capital spending
Source: AGA



Source: FoHI's Illinois Affordability Primer, which explains the primary drivers of residential rate increases. You can find all of our state primers here.

The Role of the Regulator

LDC spending on pipe replacement is reviewed by state regulators in rate proceedings, either in general rate cases filed periodically by LDCs or, in many states, specialized infrastructure tracker filings that allow LDCs to recover these expenditures in rates more quickly. In these proceedings, regulators have an opportunity to review LDC infrastructure spending plans and investigate whether an LDC is pursuing the lowest-cost path for customers. If a state commission finds that an LDC failed to demonstrate either that a particular pipe segment needed to be remediated, or that the lowest-cost solution (e.g., relining, repair, or an NPA) was selected, the regulator can "disallow" recovery of a portion of the LDC's expenditures. Disallowed costs cannot be recovered in rates — customers should pay only for costs prudently incurred — and must be borne by the LDC and its shareholders.

In reviewing LDC infrastructure spending, regulators must closely examine three issues in particular:

1. Scope of spending. Did the LDC demonstrate that the pipe segment needed to be replaced? This typically involves a review of the prioritization process used by the LDC to identify pipe replacement projects, and an evaluation of whether the expenditure actually reduced the risk of operating the distribution system.
2. Pace of spending. Did the LDC demonstrate through its risk prioritization process that the safety issues associated with the selected projects warrant urgent attention? Pipes may not need to be remediated for several years, for example, which may provide sufficient time for consideration of NPAs.

3. Evaluation of Alternatives. Did the LDC properly evaluate lower-cost alternatives to that replacement? The LDC should be expected to demonstrate that, once the project is identified as necessary based on risk assessment, it examined all available methods of remediating the pipe and selected the solution that minimizes costs for customers.

The Information Asymmetry Challenge

Regulators need sufficient evidence in the record to perform the necessary analysis of these three issues. The task of developing that evidence typically falls on consumer advocates or or public interest organizations that intervene, or participate, in gas rate proceedings at the PUCs. It is not an easy task, as it involves extensive review of LDC filings – through discovery – and expert testimony in opposition to the LDC filing.

But even well-resourced intervenors face a structural challenge: there is simply no publicly funded, independent research entity focused on gas distribution that can compare to what exists for the electricity sector, leaving intervenors with fewer technical resources to draw on when challenging LDC spending claims.

That gap will be the subject of a future edition of Based Rates. The next edition, however, will examine two recent decisions from the Illinois Commerce Commission that illustrate how rigorous regulatory review can work in practice to reduce excessive infrastructure spending by LDCs.

Re: UG 490 – Application of NW Natural for a General Rate Revision
Reply Testimony

Northwest Natural Gas Company, dba NW Natural ("NW Natural" or the "Company"), files herewith its Reply Testimony for the above-mentioned proceeding.

Please note, this filing contains confidential and highly confidential information that represents business-sensitive, non-public information and will be provided subject to General Protective Order No. 23-132 and Modified Protective Order No. 23-480. Documents that contain highly confidential, Sensitive Security Information will be hand delivered.

Please address correspondence on this matter to me with copies to the following:

Table of Contents

I. Introduction and Summary 1

II. Update on the Rate Case 2

III. NW Natural's Current Operating Environment 5

A. The Importance of NW Natural's Winter Peaking Capacity 5

B. Decarbonizing the Natural Gas System 11

IV. Changes to Regulatory Mechanisms 20

V. Addressing Affordability Concerns 29

VI. Summary of Witnesses 46

I. INTRODUCTION AND SUMMARY

Q. Are you the same Zachary D. Kravitz who filed Direct Testimony in this proceeding on behalf of Northwest Natural Gas Company dba NW Natural ("NW Natural" or the "Company")?

A. Yes, I co-presented NW Natural/100, Palfreyman-Kravitz.

Q. What is the purpose of your Reply Testimony in this proceeding?

A. The purpose of my testimony is to provide an overview of this proceeding, including summarizing several changes that NW Natural has made in response to parties' Opening Testimony. In addition, I:

- Further explain NW Natural's current operating environment, the continuing importance of NW Natural's system, and the need for collaboration to decarbonize the energy sector;
- Describe how NW Natural's proposals to revise its line extension allowance ("LEA") and its higher fixed charge for new residential premises promote decarbonization and responsible growth while furthering equity;
- Address affordability concerns raised by the Public Utility Commission of Oregon Staff ("Staff") and the Oregon Citizens' Utility Board ("CUB"), while also explaining how multi-year rate plans can mitigate these concerns; and
- Provide a summary of NW Natural's witnesses and their Reply Testimony.

II. UPDATE ON THE RATE CASE

Q. Please summarize your Direct Testimony concerning NW Natural's overall role in Oregon's energy system.

A. In Direct Testimony, we explained how NW Natural's distribution and storage system is vital to meeting Oregon's energy needs. NW Natural provides more energy to Oregonians than any other utility—gas or electric.[1] On the coldest winter days, NW Natural's system meets 90 percent of the energy needs for its residential space and water heat customers.[2] Despite this vast amount of energy delivered, NW Natural's residential and commercial customers' use accounts for approximately five percent of the state's overall emissions, while the electric sector is at 29 percent.[3]

Q. How do the requests for cost recovery in this rate case advance this important work?

A. NW Natural continues to make substantial investments in the safety and reliability of our distribution system and operations. These investments include the Central Resource Center that satisfies the Company's need to have a centrally located resource center in Portland from which operations crews, including emergency response, can be dispatched.

[1] NW Natural/100, Palfreyman-Kravitz/6.

[2] NW Natural/100, Palfreyman-Kravitz/6.

[3] Please note that our Direct Testimony stated that NW Natural's residential and commercial customers' use accounts for less than seven percent of the state's overall emissions. In calculating this number, NW Natural inadvertently included emissions attributed to its Washington customers. NW Natural's residential and commercial customers direct use of natural gas is responsible for approximately five percent of the state's emissions.

In addition, NW Natural is addressing capacity constraints on the system and making investments to ensure the reliability of the Mist Storage Facility, which are crucial to providing reliable natural gas service, especially during the coldest days of winter, as well as pursuing pipeline safety projects to comply with the United States Department of Transportation Pipeline and Hazardous Materials Safety Administration ("PHMSA") requirements. NW Natural is also maintaining its locating and survey capabilities to further ensure the safety of its system.

Regarding information technology and services ("IT&S") systems, NW Natural continues to modernize its systems and perform work to comply with the Department of Homeland Security Transportation Security Administration's cyber security directives. Again, this work helps ensure the safe and reliable delivery of natural gas service to our customers.

Q. Please provide an overview of this rate case thus far.

A. NW Natural, Staff, CUB, the Alliance of Western Energy Consumers ("AWEC"), and the Coalition[4] have been actively working through the issues in this rate case. NW Natural has responded to over 900 data requests from the parties in their review of the filing. All of the parties have participated in constructive settlement conferences, and at this time, the parties have entered into one stipulation regarding NW Natural's proposed cost of long-term debt. That stipulation was filed with the Commission on February 26, 2024.

[4] The Coalition includes the Coalition of Communities of Color, Climate Solutions, Verde, Columbia Riverkeeper, Oregon Environmental Council, Community Energy Project, and Sierra Club.

On April 18, 2024, Staff and intervenors filed Opening Testimony. In this current round of testimony, NW Natural will respond to the positions taken by these parties in their Opening Testimony.

Q. As an initial matter, is NW Natural modifying its request in this rate case based on the process thus far?

A. Yes. There are several areas in this case where NW Natural will be revising its proposal based on the discovery process and feedback from parties in Opening Testimony. NW Natural is requesting a lower revenue requirement compared to its original filing. Specifically, NW Natural's updated revenue requirement request is $152.3 million. While this reflects a modest decrease to our request, it shows that the rate case process is a constructive process where the parties can narrow many issues as the rate case process unfolds. The Reply Testimony of Kyle T. Walker (NW Natural/3800, Walker) describes each of the revenue requirement adjustments that the Company is making in this round of testimony.

Additionally, NW Natural is modifying its LEA proposal to respond to Staff's modeling critiques of the Company's discounted cash flow model. I will summarize these modifications in my testimony. The Reply Testimony of Gregg H. Therrien (NW Natural/4000, Therrien), will discuss them in greater detail.

III. NW NATURAL'S CURRENT OPERATING ENVIRONMENT

A. The Importance of NW Natural's Winter Peaking Capacity

Q. Since NW Natural filed Direct Testimony, has there been severe winter weather in NW Natural's service territory?

A. Yes. In mid-January 2024, NW Natural's service territory experienced severe winter weather, which demonstrated the capacity, resiliency, and reliability values of the natural gas system. On January 13, 2024, as temperatures dropped to 15°F in the Portland area, NW Natural delivered 9 million therms of natural gas to homes and businesses, virtually matching our previous record set in December 2022 for a single gas day, and approximately doubling our average daily winter send out.[5] NW Natural delivered approximately 8 million therms of natural gas for each of the following three days. In addition to matching a single gas day delivery record and sustaining high volumes of natural gas delivery to our customers, NW Natural also broke previous Mist Storage Facility send out records for five consecutive days and delivered over 4.5 million therms of stored natural gas on January 13, 2024.

Q. Was NW Natural's system crucial in meeting overall energy demand during this period of severe winter weather?

A. Yes. From a reliability and resiliency perspective, NW Natural's system performed exceptionally well during this week of severe winter weather (January 13-19). Only

[5] NW Natural/2201, Kravitz/1.

266 of NW Natural customers lost service during this period compared to approximately 707,600 electric customers in our Oregon service territory.[6]

Q. Is the gas system's winter peaking capacity easily replaceable?

A. No, and it appears that the electric system in the Pacific Northwest will struggle to meet growing demand even without factoring in electrification of space-heating load.[7] For example, on May 1, 2024, the Pacific Northwest Utilities Conference Committee ("PNUCC") projected that electric demand in the region will increase by 30 percent over the next decade.[8] More specifically, the forecast projects electricity consumption could increase from about 23,700 average megawatts ("aMW") in 2024 to about 31,100 aMW in 2033 (an increase of 7,400 aMW).[9] According to PNUCC, "[a]n increase of 7,400 aMW is equivalent to having to meet the electricity demand of about seven cities the size of Seattle."[10]

[6] NW Natural/2201, Kravitz/1.

[7] *See e.g.,* Powerex, *Analysis of the January 2024 Winter Weather Event* at 2 (Mar. 6, 2024) (available at https://powerex.com/sites/default/files/2024-03/Analysis%20of%20the%20January%202024%20Winter%20Weather%20Event.pdf) ("During the January 2024 Event, the U.S. Northwest region declared reliability emergencies, experienced elevated wholesale market prices, and required substantial imports from outside the region, the majority of which were supplied from entities in the U.S. Southwest and Rockies region.").

[8] NW Natural/2202, Kravitz/4.

[9] NW Natural/2202, Kravitz/4.

Q. Does PNUCC's forecast show substantial supply deficits in meeting peak January load?

A. Yes. The table below shows that the region currently has a deficit of approximately 2,500 MW in 2025, which grows to approximately 13,700 MW in 2034.[11]

Table 3. Northwest Region Requirements and Resources – Winter Peak

The sum of the individual utilities' firm requirements and resources for the peak hour in January for each of the next 10 years are shown in this table. Firm peak requirements include a planning margin to account for planning uncertainties.

Megawatts	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034
Firm Requirements										
Load[1/]	34,658	35,633	36,761	38,033	38,940	39,932	40,763	41,411	41,900	42,377

[3/] Firm hydro for capacity is the generation expected assuming critical peaking capability as determined by the utility sponsor.

[11] NW Natural/2202, Kravitz/20.

Q. The PNUCC forecast is for the entire region. Is there any specific evidence that shows that Oregon electric utilities' loads will also grow?

A. Yes. **[BEGIN CONFIDENTIAL]** [redacted] **[END CONFIDENTIAL]**.

Q. Would electrifying NW Natural's load exacerbate these resource adequacy issues?

A. Yes. It is important to bear in mind that the period of severe winter weather the region experienced in January 2024 is not especially unique. In Direct Testimony, we referenced an analysis conducted by ICF where the Pacific Northwest experienced very cold weather on December 22, 2022.[12] Electrifying NW Natural's load during the coldest hour of that day would have increased electric consumption by over 80 percent or about 3.4 GW of new electric load. ICF estimated that it

[12] NW Natural/100, Palfreyman-Kravitz/6-7.

would cost tens of billions of dollars to electrify this load with new renewable resources. The recent January 2024 storm reinforces ICF's findings. During this time, there were serious power supply issues associated with meeting existing electric demand, let alone the increase in demand that would be caused by electrifying NW Natural's load.[13] Due to these ongoing power supply issues, the intermittency of renewable generation, and the limitations of battery technology, ICF estimated that the region would need to build approximately 14 GW of new renewables and battery storage capacity to electrify NW Natural's load.

Q. Given the seriousness of the comprehensive energy system's needs during winter peak events, is NW Natural continuing to invest in the Mist Storage Facility to ensure its reliability?

A. Yes, it is absolutely critical to NW Natural's customers. The Direct Testimony of Daniel B. Kizer[14] discussed the Mist GC500 and GC600 Turbine Compressors Cold Spare Projects. These projects involve acquiring a gas generator, a power turbine and standby spare parts from Siemens for each of the GC500 and GC600 turbine compressor units for Mist at Miller Station.[15] These compressor units are essential to the reliability of Mist because both the GC500 and GC600 compressor units have exceeded their useful life expectancy, and both are necessary to ensure that natural gas can be reliably withdrawn during the winter season.[16]

[13] *See* Powerex, *Analysis of the January 2024 Winter Weather Event* at 2.

[14] NW Natural/500, Kizer/18-27.

[15] NW Natural/500, Kizer/22-23.

[16] NW Natural/500, Kizer/21.

Q. Is the Mist GC500 and GC600 Turbine Compressors Cold Spare Project a long-term solution for reliability at Mist?

A. No. As stated in Mr. Kizer's Direct Testimony,[17] the Mist GC500 and GC600 Turbine Compressors Cold Spare Project is necessary to ensure the immediate reliability of Mist. However, it does not address the long-term viability of the GC500 and GC600 units.[18] Namely, they have exceeded their operational lives, and failures and outages have already occurred.[19] The existing turbine compressors are not supported by the original equipment manufacturer ("OEM") and there are several core components that are no longer able to be sourced globally even with the OEM's support.[20]

These issues highlight the need for a robust long-term solution. NW Natural will replace the existing GC500 and GC600 compressors with new turbine compressors with an established and active supply chain, with parts readily available to support the operational needs of NW Natural and the needs of our customers.

Q. Given the importance of Mist, when does NW Natural anticipate replacing the GC500 and GC600 units?

A. NW Natural anticipates replacing the GC500 unit in 2025 and the GC600 unit in 2026. The Company will replace the GC500 unit first because it is the older unit

[17] NW Natural/500, Kizer/27.

[18] NW Natural/500, Kizer/27.

[19] NW Natural/500, Kizer/18-27.

[20] NW Natural/500, Kizer/20-22.

and will use the GC600 unit to support injection operations during this time. During the next injection season (2026), the Company will replace the GC600 unit and will use the replacement GC500 unit to support operations during this time.

The timeline to replace both these units is one year sooner than the Company originally anticipated. NW Natural had previously planned to replace these units in 2026 and 2027. However, as stated above, NW Natural experienced five record setting Mist withdrawal gas delivery days in January 2024, further emphasizing the importance of reliable natural gas storage to ensure that NW Natural can meet its customers' energy needs on the coldest days of the year. NW Natural will provide further updates on this project in the Company's Integrated Resource Plan ("IRP") Update filed in August 2024.

B. Decarbonizing the Natural Gas System

Q. NW Natural provided Supplemental Testimony following the invalidation of the Climate Protection Plan ("CPP") to provide updates to the Company's rate request based on the invalidation. Broadly speaking, does NW Natural remain committed to the decarbonization pathways you described in your Opening and Supplemental Testimony, even though the Oregon Court of Appeals has found the CPP to be invalid?

A. Yes. NW Natural remains committed to the decarbonization pathways including cost-effective energy efficiency, decarbonized fuels, and solutions that leverage the strengths of both the natural gas and the electric systems, such as hybrid heating and ground source heat pumps. In hybrid heating, a heat pump is paired with a gas furnace to help address continuing resource adequacy and reliability

concerns on the electric grid while reducing natural gas throughput. Hybrid systems leverage the strengths of both energy systems by utilizing the electric system in milder conditions, and relying on the gas system during colder weather when the electric system may have resource adequacy challenges and cannot depend on renewable power. Hybrid systems also eliminate the need to rely on higher emitting and more costly electric resistance heating during colder weather where an air source heat pump cannot adequately heat a home.

The Company is also exploring ground source heat pumps as another decarbonization solution. Individual ground source heat pumps provide heating and cooling to a single building, whereas networked ground source heat pumps ("geothermal energy networks") connect the individual ground source heat pumps within each building via a shared network of water pipes transferring heat in and out of those buildings that, when properly designed, leads to increased energy optimization. In its Washington state service territory, NW Natural is beginning to study the feasibility of geothermal energy networks in response to the passage of HB 2131 in late March 2024. HB 2131 permits Washington natural gas utilities to build such networks to serve customers in their respective service territories.

///

///

///

///

///

///

Q. The Coalition argues that the Company is taking a business-as-usual approach to decarbonization.[21] Please respond.

A. NW Natural's approach is anything but "business-as-usual."[22] As already explained above, NW Natural is exploring ambitious decarbonization pathways that include increased energy efficiency, decarbonized fuels, and leveraging the strengths of both the natural gas and electric systems through hybrid heating and geothermal heat pumps. From a regulatory perspective, the Company is proposing a first-of-its kind LEA that supports the addition of low-use customers by providing an increasing LEA with lower anticipated natural gas use. This approach stands in clear contrast to the convention used in most states (and historically used by NW Natural) where a higher LEA is provided for higher-use customers. The inverted nature of the LEA is driven by the inclusion of incremental climate policy costs for each new customer that joins NW Natural's system. This approach balances the continued market demand for the performance and resiliency benefits of natural gas appliances in homes with the goal of reducing overall emissions.

NW Natural's pursuit of innovative decarbonization pathways coupled with new regulatory proposals to reduce throughput demonstrates that it is not pursuing a business-as-usual approach based on increasing energy demand.

[21] Coalition/100, Cebulko/17.

[22] Coalition/100, Cebulko/17.

Q. In arguing that NW Natural should focus on a single decarbonization pathway—electrification—the Coalition discusses IRPs extensively. Please summarize the Coalition's conclusions.

A. The Coalition states that the Commission did not acknowledge NW Natural's long-term plan to comply with the now invalidated CPP, citing the Commission's conclusion that the IRP's assumptions about the future cost of decarbonized fuels are optimistic.[23] Based on this Commission finding, the Coalition speculates that NW Natural will be unable to meet future Oregon greenhouse gas ("GHG") regulations without electrifying the vast majority of its current load, even though the Commission made no such conclusion in NW Natural's IRP.[24]

Q. How do you respond to the Coalition's assertions?

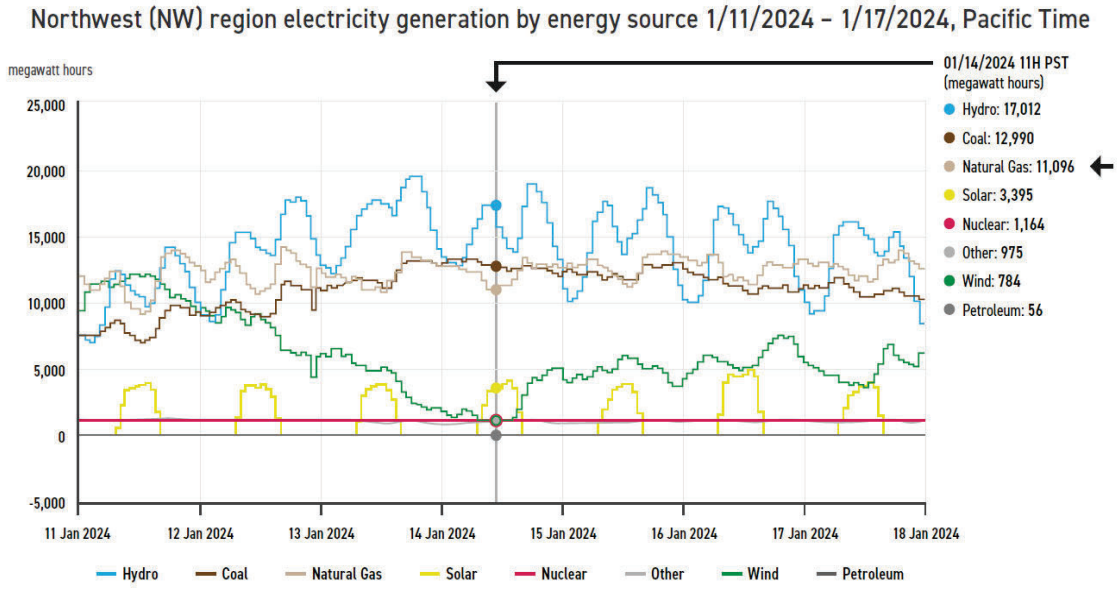
A. First, and perhaps most importantly, the Coalition ignores that there is a strong market demand for natural gas service. In other words, NW Natural's customers and prospective customers want natural gas. The Company continues to increase its customer base year-over-year. In response to that demand, home builders continue to include natural gas in new construction and, in fact, vocally supported natural gas at the Commission's public comment hearing on April 16, 2024.[25] None of this would occur if NW Natural's customers and prospective customers wanted all-electric homes.

[23] Coalition/100, Cebulko/14-15.

[24] Coalition/100, Cebulko/16-17.

[25] Staff/2200, Nottingham/3-4.

Second, the Coalition falsely equates electrification with decarbonization. As explained above, natural gas is essential to ensure the reliability of the electric grid and will be for the foreseeable future. In fact, the electric system is already struggling to decarbonize their *existing* power supply while maintaining reliability. This is why electric utilities heavily rely on natural gas use for power generation and certain Oregon utilities are extending the lives of their coal generation fleet. For example, the graph below from the United States Energy Information Administration Electric Grid Monitor for the Northwest region from January 11, 2024 through January 17, 2024 shows natural gas and coal generation remain heavily relied on in the winter.[26]



[26] U.S. Energy Information Administration, Hourly Electric Grid Monitor (last visited Jun. 2, 2024) (available at https://www.eia.gov/electricity/gridmonitor/dashboard/electric_overview/regional/REG-NW).

Simply moving the entirety of NW Natural's winter peaking load to the electric grid will not result in decarbonization. Both the invalidated CPP and HB 2021 have aggressive decarbonization targets (90 percent reduction in emissions and a 100 percent reduction in emissions, respectively). Therefore, even assuming there are future GHG regulations for Oregon natural gas utilities—which we expect there to be—moving direct natural gas service load to the electric grid only serves to transfer the compliance obligation to another entity. Any load growth on the electric system would have to be met by entirely renewable resources to meet HB 2021 targets. In other words, shifting load from one energy provider to another energy provider does not eliminate emissions or compliance with climate policies; rather, it simply "squeezes the balloon" and makes the other side's emissions profile larger.

Nonetheless, the Company does not oppose coordinating with electric utilities to decarbonize, such as through hybrid systems or geothermal heat pumps. In fact, the Company is eager to collaborate with the region's electric utilities on such efforts. However, simply assuming that electric utilities can absorb the heating load currently served by NW Natural—the largest of any electric or gas utility in the state—is not technically supported, reasonable or prudent. Moreover, it ignores the very real resource adequacy constraints that electric utilities are already facing and does not recognize the capacity, reliability, and resiliency inherent in NW Natural's system to meet customer demand in extreme winter weather.

Q. Do you believe the Coalition correctly characterized IRPs and the IRP process?

A. No. Regarding NW Natural's IRP order specifically, the Company's commitment to near-term compliance with the now invalidated CPP was never in question. Rather, the issue was simply whether NW Natural should purchase Community Climate Investment ("CCI") credits or acquire RNG. Neither of these compliance paths are building electrification. The Commission believed that NW Natural should "pursue RNG and CCIs in the most economical way possible to minimize compliance costs and risks."[27] Prior to the Commission's order, NW Natural was reluctant to rely on CCI credits because they were never actually offered for sale. Moreover, as a GHG reduction tool it was unclear how they could actually achieve the state's decarbonization goals, which suggests they were inherently high risk in terms of actual emissions reductions.

While the Commission did not acknowledge NW Natural's long-term plan to meet demand and comply with the invalidated CPP, it must be noted that ***all*** Oregon investor-owned utilities—natural gas and electric—have failed to persuade the Commission that they have adequate plans to meet long-term decarbonization goals.[28] To be clear, NW Natural is not criticizing any other utility. After all, NW Natural also lacked a Commission-acknowledged long-term plan prior to the CPP's invalidation. Instead, this point is meant to illustrate the challenges associated with

[27] *In the Matter of Northwest Nat. Gas Co., dba NW Natural, 2022 Integrated Resource Plan*, Docket No. LC 79, Order No. 23-281 at 11 (Aug. 2, 2023).

[28] Idaho Power is not subject to HB 2021, Oregon's Clean Energy Plan.

deep decarbonization that all energy utilities face. Further, even if the Commission had acknowledged these plans, it does not mean that decarbonization is certain. Conversely, non-acknowledgement does not indicate that a utility will fail to reach a decarbonization target. IRPs do not result in a "set it and forget it" 20-year plan. Within the 20-year IRP planning period, any number of things can happen that radically change the nature of a plan. For this reason, IRPs are iterative and build on previous versions with an eye towards continuous improvement. NW Natural will continue to produce IRPs to comply with all applicable legal requirements, but the Commission's decision to not acknowledge certain aspects of its IRP in the face of new regulations is hardly unique to NW Natural nor does it mean that state decarbonization targets will not be met.

More troubling than whether an IRP or Clean Energy Plan is acknowledged is the Coalition's failure to recognize the capacity value of the natural gas system, especially considering the increasing stresses on the electric grid made even more apparent since our Direct Testimony was filed. By advocating solely for electrification, the Coalition ignores both the limitations of the electric grid and the benefits of the natural gas and electric systems working in tandem in the Pacific Northwest. Specifically, the capacity value of the natural gas system can be leveraged with intermittent renewable electric power to both decarbonize and ensure reliability of the overall energy system while minimizing costs.

Q. Do the electric utilities' Clean Energy Plans include any load increases resulting from the subsequent electrification of gas utilities load?

A. To the best of NW Natural's knowledge, neither electric investor-owned utility in NW Natural's service territory has included a material amount of new load in their Clean Energy Plans resulting from the electrification of gas utilities' existing load, in particular space-heating load. Any additional load would make compliance with HB 2021 even more difficult because it would increase both utilities' winter peak loads and that demand would have to be met with 100 percent renewable energy, especially because any such electrification would be in addition to rising data center and electric vehicle demand that is forecasted to grow in the coming years.

Q. The Coalition appears to frame decarbonization as a zero-sum game where natural gas utilities' load will be completely electrified. Is there a better way to approach decarbonization?

A. Yes. Joint system planning between natural gas and electric utilities can help address many of the issues that I have discussed. It can help address resource adequacy on the electric system during the winter peak, while also ensuring that both systems decarbonize by leveraging intermittent renewable electric generation to the greatest extent practicable through hybrid heating systems. Also, joint system planning can help the broader state economy by ensuring there is an adequate supply of energy available to industries looking to locate in Oregon while minimizing costs.

IV. CHANGES TO REGULATORY MECHANISMS

Q. Please summarize NW Natural's strategy for responsible and planful growth that you discussed in Direct Testimony.

A. In my Direct Testimony,[29] I discussed our strategy for responsible and planful growth. As I described above, the energy systems—both gas and electric—are evolving in a transformative time. NW Natural expects that customers will use less of our product through hybrid space-heating systems (e.g., electric heat pumps backed-up by gas furnaces), but customers will continue to rely on the gas system for the resiliency benefits of fireplaces, water heaters, cooktops, and back-up generators. While overall gas delivery throughput will decrease, the full strength of the system, including NW Natural's three on-system storage facilities, will continue to be vital during winter peaks. As such, the Pacific Northwest will need to continue to rely on the gas system during the coldest winter days of the year.

Q. Please briefly summarize NW Natural's proposed adjustments to its tariffed services that support its responsible and planful growth strategy.

A. Under its responsible and planful growth strategy, the Company proposed two main adjustments to our tariffed services:

Updated LEA: An updated LEA for new customers that is responsive to current direction and the changing nature of how customers are using our system, which derives a higher allowance for lower-use customers.

[29] NW Natural/100, Palfreyman-Kravitz/25-28.

New Customer Fixed Charge: An increased fixed charge for new residential premises joining the system on or after November 1, 2024, to reflect new customers' lower usage compared to our existing customer base, and thereby protecting against intraclass subsidies that would otherwise occur through the decoupling mechanism.

Additionally, as described in Section V of my Reply Testimony, NW Natural intends to submit multiyear rate plans to the Commission in subsequent general rate cases to promote smaller, more predictable rate changes, and administrative efficiency.

Q. Why is it important for NW Natural to have the flexibility to adopt these types of changes?

A. As a utility, NW Natural is solely responsible for managing its business and it takes that responsibility extremely seriously, and it has for 165 years. During this recent transition to a decarbonized economy, NW Natural must have the ability to adapt to changing conditions by pursuing new policies and initiatives, such as an updated LEA and a new residential premises fixed charge. These new policies and initiatives are grounded in the same sound economic principles that have always been used in ratemaking, while also reflecting underlying changes that are occurring during these transformative times, including new premises' lower natural gas use and the impact of future Oregon GHG regulations. NW Natural's business must be able to adapt to these changing circumstances. These adaptations should ultimately be approved by the Commission because they are based on sound

economic analysis that is consistent with NW Natural's current operating environment.

Q. Please further describe changes to the LEA that NW Natural is seeking in this docket.

A. As I said above, NW Natural is proposing an LEA for new residential customers that increases with lower natural gas use. When the CPP was invalidated, NW Natural stood by this methodology and did not go back to a traditional LEA that incentivizes increased throughput. Instead, the Company estimated future compliance costs of a hypothetical GHG regulatory program and developed a LEA based on sound economics. It also committed to continue to update the LEA in future proceedings to ensure that its assumptions remain valid. In developing this LEA proposal, NW Natural followed where the economics took us to ensure that there was no cross-subsidization between new and existing customers. Combining these policy initiatives with its efforts to decarbonize its system through energy efficiency, decarbonized fuels, and hybrid electric/gas heating solutions, the Company is moving forward towards a decarbonized future in a thoughtful and innovative way that offers the greatest opportunity for energy resiliency and reliability.

Q. Does NW Natural's revised LEA promote equity?

A. Yes. According to home builders at the Commission's public comment hearing on April 16, 2024, the Company's proposed LEA "will help[] control initial construction costs, provide[] energy options to homeowners, and support[] broader housing

market goals by making homes more affordable and appealing."[30] Making homes more affordable promotes equity, particularly in the current housing market where home prices have increased rapidly in recent years. Also, the nature of the Company's LEA, which increases with less natural gas use, incentivizes the installation of high-performing and resilient natural gas appliances that can provide heating even in the event of a power outage. These widespread winter power outages are an unfortunate occurrence in our service territory. The Company's proposal will help ensure that these appliances are not just for those wealthy enough to afford line extension construction costs without any such allowance.

Q. Please describe NW Natural's modifications to the LEA proposed in its Reply Testimony.

A. In reviewing testimony from Staff, NW Natural is adjusting two inputs to its methodology to determine the LEA. First, Staff criticized the cost of the RNG assumed for the 25-year duration of the discounted cash flow ("DCF") model. The Company utilized a conservative assumption of $22.00 per dekatherm for all incremental volumes driven by new residential customers. Despite this amount being more conservative than the costs included in NW Natural's most recent IRP, NW Natural further increased the costs of RNG through the 25-year period of the DCF model from $22.00 per dekatherm to $25.00 per dekatherm. This value per dekatherm should provide any needed comfort as to the veracity of the model, and

[30] Staff/2200, Nottingham/3.

the value can be adjusted as better projections of future compliance costs become available.

Second, NW Natural is updating how it calculates the benefit that each new customer brings to the Company's fixed capital costs. Certain capital investments will be made regardless of the growth on the system, and the ability to spread those costs over a larger customer base is an important determinant when evaluating the costs and benefits that each new customer brings to the gas system. Through the rate case process, Staff challenged whether enough capital expenditures associated with permitting and meters for new construction (i.e., growth-related investments) were excluded from the non-growth capital forecast. This second update addresses this issue.

Third, while not necessarily a change currently being made in response to Staff, NW Natural intends to update the LEA to reflect the final revenue requirement in this rate case. LEA calculations are, in part, driven by the expected revenues that a customer will generate. To the extent that the revenue requirement ultimately decreases, the LEA would appropriately capture that decrease.

Q. What is the outcome of the LEA based on the two proposed changes described above?

A. As shown in the table below, the proposed changes to the forecasted price of RNG and non-growth capital expenditures reduce the LEA by several hundred dollars. The exact amount varies based on usage tier. After the final revenue requirement

is established in this rate case, NW Natural will make a further update to account for any resulting changes to the LEA, as explained above.

Revised LEA Results

UPC (Therms)	0-250	251-450	451-650	651+
Direct Testimony LEA	$3,600	$3,100	$2,600	$1,800
Supplemental Testimony Proposal	**$3,700**	**$3,300**	**$2,950**	**$2,200**
Revised LEA	**$3,400**	**$2,900**	**$2,500**	**$1,700**
Difference: Higher / (Lower)	**($300)**	**($400)**	**($450)**	**($500)**

The Reply Testimony of Gregg H. Therrien (NW Natural/4000, Therrien) further responds to parties' positions regarding the LEA.

Q. Please describe the higher fixed charge for new residential premises.

A. NW Natural is proposing a higher monthly fixed charge of $26.25 for new single family residential premises added to NW Natural's system, and a fixed charge of $24.25 for new multifamily premises.[31]

Q. Why is NW Natural proposing a higher fixed charge for new residential premises?

A. As further explained in the Reply Testimony of Robert J. Wyman (NW Natural/3900, Wyman), a new residential premises is a customer that connects to NW Natural's system after November 1, 2024. An average new premises residential customer is forecasted to use 449.4 therms on a weather normalized basis. In comparison, an average existing residential customer is forecasted to

[31] The $2 difference between new single family and multifamily residential premises is due to the comparatively lower cost of service for multifamily dwellings. NW Natural/3900, Wyman. As explained in NW Natural/3900, Wyman, the precise amount of the fixed charge is dependent on the final revenue requirement in this proceeding.

use 660.2 therms on a weather normalized basis. New premises use less natural gas because, on average, these premises are more energy efficient and have newer, more efficient appliances. This large disparity in average forecasted use is the driving force behind NW Natural's proposed higher fixed charge for new premises.

Q. Please explain how this large disparity in use between new premises and existing customers is the driving force behind NW Natural's higher fixed charge.

A. Under the Company's existing decoupling mechanism, all residential customers are decoupled to a single baseline that reflects an average existing residential customer's use on a weather normalized basis. Since new premises use less natural gas than projected in the baseline, these new premises customers do not pay the amount of money that is forecasted in the decoupling mechanism based on this current use per customer ("UPC") baseline. Instead, the shortfall must be recovered through the volumetric decoupling deferral. This amount is recovered through the volumetric rate charged to all residential customers, resulting in existing residential customers paying more than new premises residential customers because they use more natural gas.

Q. How does the Company propose to address this cross-subsidization?

A. NW Natural proposes two changes. First, NW Natural proposes to establish separate decoupling baselines for new premises and existing residential customers. The new premises decoupling baseline will be set at the expected annual weather normalized forecasted use (449.4 therms). The existing

customers' baseline will be set at 660.2 therms, reflecting their expected annual weather normalized forecasted use.

Second, NW Natural proposes a higher monthly fixed charge for new premises customers due to the lower decoupled baseline.[32] Without any modification to rate design, NW Natural will collect less money from new premises residential customers because, again, their natural gas use is lower, but their cost to serve—compared to an existing customer—is the same. This shortfall would otherwise be recovered through the volumetric decoupling deferral, which, as explained above, is disproportionally recovered from higher-use existing residential customers through the volumetric rate. NW Natural's proposed higher fixed charge, however, would prevent such a shortfall, thereby preventing higher-use existing customers from subsidizing new premises.[33]

Q. Does NW Natural's higher fixed charge for new premises promote equity?

A. Yes. As further explained in the Reply Testimony of Robert J. Wyman (NW Natural/3900, Wyman), new premises customers are generally in energy efficient homes with new appliances that already have lower gas use. Existing customers may not have these advantages and, therefore, should not be expected to subsidize new customers. More specifically, new premises customers are, on average, more likely to live in higher-income Census Tracts, are more likely to be owners of newly constructed single-family residences and are less likely to be

[32] NW Natural/3900, Wyman.

[33] NW Natural/3900, Wyman discusses these issues in greater detail.

enrolled in the Company's bill discount program compared to existing premises customers. Also, as stated above, without any change to rate design, any shortfalls in cost recovery from new premises customers will be recovered through the residential volumetric rate that will disproportionally impact higher use existing premises customers.

Q. Did NW Natural consider any other approaches besides the higher fixed charge for new premises?

A. Yes. Instead of a higher fixed charge, NW Natural considered a higher volumetric charge for new premises. However, NW Natural believes a higher fixed cost is more equitable because it spreads out the cost of natural gas over the course of the year, which reduces month-to-month volatility in bills. In arguing against the fixed charge for new premises, the Coalition states that NW Natural's proposal moves away from the existing decoupling methodology in favor of a new policy framework for fixed cost recovery that heavily relies on fixed charges.[34] However, the Coalition overlooks the seasonal variability in natural gas bills and how higher fixed charges can smooth out customers' costs over the course of the entire year, especially during cold weather events when space-heating usage can have a significant impact on bills. More importantly, however, NW Natural is moving away from its existing decoupling methodology precisely because it leads to existing customers subsidizing new premises residential customers, which the Coalition (and every other party) should seek to prevent and not minimize its importance.

[34] Coalition/100, Cebulko/49.

The Reply Testimony of Robert J. Wyman (NW Natural/3900, Wyman) further responds to parties' positions regarding the higher fixed charge for new premises.

V. ADDRESSING AFFORDABILITY CONCERNS

Q. Please explain what actions NW Natural has taken to mitigate the impact of its proposed rate increase on customers.

A. In this rate case, NW Natural proposed to enhance its bill discount program to further address the needs of our lower income customers. Specifically, we proposed to increase the discounts offered to address and mitigate the energy burden experienced by these customers. Based on the rate request filed in this rate case, the Company recalibrated the income eligibility in two of the four income tiers with the goal of minimizing a customer's energy burden to less than half of the six percent of a household's income that is commonly understood as the indicator of energy-burdened customers. This is further described in the Direct and Reply Testimony of Cecilia J. Tanaka (NW Natural/200, Tanaka and NW Natural/2300, Tanaka).

At the same time, however, NW Natural must maintain a safe and reliable system to meet customer demand. NW Natural is seeking to increase rates due to higher operating costs from inflation and to recover the costs of long planned investments. Although CUB appears to question the timing of NW Natural's seismic-related investments,[35] the Company views them as essential in order to

[35] CUB/100, Jenks/6.

provide a safe workplace for all of its employees and to be as well positioned as possible to continue to provide safe and reliable service in the aftermath of a major earthquake. Since no one knows when such an earthquake will occur, NW Natural cannot delay these crucial investments, but rather must act to protect its employees and its customers, as well as the general public.

Q. In its Opening Testimony, did Staff express concerns about the affordability of utility rates in general?

A. Yes. Staff expresses concerns regarding the impact to residential customers of both utility rate increases in general and NW Natural's proposed rate increase in particular. Staff states that it "may constitute an unreasonabl[e] energy burden for NW Natural's Oregon utility customers outpacing Oregon wages."[36]

Q. What is your initial response to Staff's concerns?

A. NW Natural takes these concerns very seriously. Staff states that food company executives have said that "shoppers will adjust over time to higher [food] prices, as they have in the past," and cautions NW Natural from adopting this type of mentality to cost control.[37] In running its business, NW Natural assures Staff that it does not subscribe to this view, nor has it managed its business assuming that customers will simply "adjust" to higher bills. In fact, even with this proposed rate increase, the average NW Natural residential customer bill is 7.7 percent lower than it was 15 years ago after adjusting for inflation. While we recognize that any

[36] Staff/100, Muldoon/8.

[37] Staff/100, Muldoon/8-9.

rate increase may be a hardship for certain customers, we must invest to ensure reliable and safe service.

Q. Did CUB also address affordability in its testimony?

A. Yes. CUB has proposed a rate shock mitigation mechanism in NW Natural's rate case.[38] This mechanism involves 1) Deferring or phasing in the rate increase—with or without carrying charges; 2) Setting the return on equity ("ROE") at a level that is not lower than the lowest reasonable rate; and 3) Requiring the utility to propose and implement other rate mitigation measures.[39]

Q. As a threshold matter, has the Commission ever implemented any of these measures in a manner suggested by CUB?

A. No. Even though a former Commissioner articulated these general principles more than 20 years ago, Mr. Jenks' testimony acknowledges that the Commission has never done what CUB is suggesting here—adopt a one-size-fits-all approach that would apply to all energy utilities.[40]

Q. How does CUB propose to determine whether to defer or phase-in a rate increase?

A. CUB recommends that the Commission adopt a similar mechanism that is used to limit rent increases in the state of Oregon for units that are more than 15 years old.

[38] CUB/100, Jenks/6-12. CUB made the same proposal in Idaho Power's recent general rate case. See *In the Matter of Idaho Power Co., Request for a General Rate Revision*, Docket No. UE 426, CUB's Opening Testimony, CUB/100, Jenks/9-15 (Mar. 25, 2024).

[39] CUB/100, Jenks/6, 8-12.

[40] CUB/100, Jenks/5.

Generally speaking, this mechanism limits rent increases for such housing to the lower of 10 percent, or 7 percent plus the Consumer Price Index.[41]

Q. Does NW Natural agree with CUB's proposal?

A. No. The proposal ignores substantial differences in how utilities are regulated compared to the rental housing market. Unlike rental housing, utilities are subject to cost-of-service regulation, which limits utilities' cost recovery to their prudently incurred costs approved by the Commission. In return for being subject to Commission regulation, utilities receive the exclusive right to serve customers in a given area. The same is not true of the rental housing market where rents are set based on supply-and-demand. In situations where the demand for rental housing exceeds supply, landlords may increase their rent, even if there is no commensurate increase in the costs they incur to make such rental housing available to the market. In such a market, landlords would have the opportunity to increase their profits to whatever the market may bear. Regulated utilities cannot take similar actions. Instead, their rates reflect the cost to serve customers, and are closely regulated by the Commission.

This distinction between utilities and rental housing (or any non-regulated market) is key to understanding why CUB's proposal is inappropriate. Deferring or delaying rate increases prevents utilities from timely recovering prudently incurred costs that are necessary to provide essential services. It is also contrary to the regulatory compact where utilities agree to economic regulation by the

[41] CUB/100, Jenks/7-8.

Commission in exchange for the opportunity to timely recover prudently incurred costs and for an exclusive service area.

Q. Are there other issues with CUB's definition of a rate mitigation trigger?

A. Yes. Under its proposal, CUB states that "if inflation is 3%, then the trigger [for rate mitigation] is 10%."[42] The problem with this approach is that it simply compares present rates with proposed rates, ignoring the fact that NW Natural's rates go up and down over time. In 2023, for example, NW Natural's residential rates declined by 9 percent. In determining whether rates should be mitigated for 2024, however, CUB's proposal would not take that 2023 rate decrease into account. Instead, it would simply compare current rates to rates that would go into effect November 1, 2024. Using CUB's example of a 10 percent rate mitigation "trigger," NW Natural's rates would be subject to mitigation if its overall 2024 rate increase is 11 percent. This result hardly constitutes "rate shock," however, because NW Natural's rate increase over the 2023-24 period would be approximately 2 percent (i.e., the 11 percent increase is offset by the 9 percent decrease the year before), below the inflation amount in CUB's example. Taking a broader view, an average residential customer's bill has decreased by 7.7 percent compared to 15 years ago after adjusting for inflation. This fact, alone, indicates that a prescriptive one-size-fits-all approach to affordability suggested by CUB is inappropriate and should be rejected by the Commission.

[42] CUB/100, Jenks/14.

Q. Is NW Natural using the stability of residential customer bills over the last 15 years as a reason to increase rates?

A. No. NW Natural does not dispute that it is seeking a substantial rate increase. Rather, we point out the Company's history of relative rate stability because it provides relevant context, especially given the concerns raised by CUB and Staff. We recognize that not all households and businesses have natural gas service, and customers have other options for serving their energy needs. This means that, even as a regulated utility, we compete for business with other energy providers, and therefore, we are always motivated to keep natural gas rates as low as possible while still being able to provide excellent customer service, comply with safety standards, and maintain financial integrity as a Company.

Q. CUB acknowledges that an issue with its proposal is that it may lead to more frequent general rate proceedings. Do you view that as another problem with the proposal?

A. Yes. CUB acknowledges that one way to mitigate the impact of its rate mitigation trigger is to file annual general rate cases.[43] For example, over a two-year timespan, a utility could file for back-to-back 7.5 percent rate increases instead of one 15 percent increase at the end of the two-year period that would likely trigger the cap. As CUB suggests,[44] it would increase the administrative burden on the Commission, the utility, and all other parties to process utility rate cases on an

[43] CUB/100, Jenks/15.

[44] CUB/100, Jenks/16-17.

annual basis. Moreover, since CUB's proposal would apply to all energy utilities in Oregon, not just NW Natural, this burden would likely be substantial.

Q. CUB proposes to move the rate effective date of this proceeding to April 1, 2025.[45] How does the Company respond?

A. This proposal should be rejected. First, CUB's proposal ignores Oregon law requiring the Commission to determine whether a public utility's proposed rates are fair, just and reasonable within 10 months of a public utility's request to change its rates.[46] This proposal also denies public utilities' cost recovery of prudently incurred costs. These issues will be further detailed in the Company's legal briefing.

Second, CUB's proposal encourages multiple rate changes in a single year, which sends confusing price signals to NW Natural's customers. CUB's position is contrary to prior statements from CUB about the timing of NW Natural's rate cases. In NW Natural's last rate proceeding, CUB stated:

> Over the past ten years, most of NW Natural's rate change due to the PGA and GRCs have occurred on November 1st. **CUB appreciates the Company's policy of minimizing the frequency of rate changes born[e] by customers, and is making that proposal to continue that policy**.[47]

NW Natural agrees with CUB's prior statements and will continue to aim to minimize rate changes throughout the year.

[45] CUB/100, Jenks/15.

[46] ORS 757.210(1)(a) (requiring rates be fair, just, and reasonable); ORS 757.215(1) (authorizing the Commission to order the suspension of rates "for a period of up to nine months").

[47] Docket No. UG 435, CUB/500, Gehrke/20 (Jul. 27, 2022) (emphasis added).

Q. Is the Company flatly opposed to rate mitigation measures?

A. No. NW Natural recognizes that there are circumstances where rate mitigation may be warranted. As mentioned above, NW Natural is proposing to increase assistance under its bill discount program to limit natural gas-related energy burden to no more than three percent. Also, in extreme situations, such as when NW Natural's bills increased 25 percent due to both a PGA adjustment and a rate case in 2022, NW Natural worked with CUB and other stakeholders to phase-in such a rate increase. But, again, CUB's proposed rate mitigation trigger would be far lower than that amount and ignores other pertinent facts that must be considered, such as NW Natural's 9 percent residential rate decrease in 2023 and that, after adjusting for inflation, customers' bills are lower than they were in 2009.

Q. CUB also suggests setting the ROE at the lowest reasonable rate.[48] Does NW Natural support this proposal?

A. No. CUB has again ignored Oregon law, which states:

> The commission shall balance the interests of the utility investor and the consumer in establishing fair and reasonable rates. Rates are fair and reasonable for the purposes of this subsection if the rates provide adequate revenue both for operating expenses of the public utility . . . and for capital costs of the utility, with a return to the equity holder that is:
>
> (a) Commensurate with the return on investments in other enterprises having corresponding risks; and
> (b) Sufficient to ensure confidence in the financial integrity of the utility, allowing the utility to maintain its credit and attract capital.[49]

[48] CUB/100, Jenks/15.

[49] ORS 756.040(1).

The Commission is required by law to ensure that a return is fair and reasonable. Each public utility will have unique circumstances that the Commission must consider when making this evaluation. The Commission should not summarily decide these issues without considering these factors. This issue will be further detailed in the Company's legal briefing.

Q. In arguing for setting the ROE at the lowest reasonable amount, CUB argues that "[m]ost businesses compete in competitive markets, where customers have other options" and that "[i]f that business sets a price that is too high for its product, then customers will go elsewhere, and profits will fall." Therefore, utilities should be subject to "similar market discipline" by setting the ROE at its lowest reasonable amount.[50] What do you think of CUB's view?

A. NW Natural disagrees with this view. While NW Natural is a public utility subject to the regulatory compact in Oregon, natural gas is a fuel of choice, and customers have other options for the provision of their energy service. Unlike electric utilities, there is no certainty that new homes will be built with natural gas appliances. In this way, natural gas utilities have always faced acute competitive pressures compared to electric utilities. Further, CUB's Opening Testimony regarding NW Natural's LEA proposal speculates, albeit without analysis, that natural gas service is becoming less cost competitive.[51] Therefore, it appears that even CUB

[50] CUB/100, Jenks/10-11.

[51] CUB/200, Garrett/19.

concedes that NW Natural is subject to competition and the "market discipline" it seeks already exists for the Company. Yet we must continue to attract capital and make investments in order to continue to offer safe and reliable natural gas service. CUB's proposal would make that more difficult, which, over time, will likely increase the cost to customers.

Q. CUB proposes a number of other requirements that it wants NW Natural to adhere to, in order to mitigate the rate increase. What are they?

A. First, CUB states that the Company should be required to submit a plan to the Commission outlining what it is doing to mitigate the rate increase, including increasing outreach efforts to educate customers about its bill discount program, equal pay, energy efficiency and other options that might help the customer deal with the impact. Second, for 12 months after the rate effective date, CUB argues that NW Natural be required to report to the Commission, by zip code, the number of customers who have 30-day arrearages, the number that have 60-day arrearages, the number that have received shut off notices, the number that have been shut off, the number that are on payment plans, and the number that are on equal payment plans. Finally, CUB suggests that a shut off moratorium should be implemented for a 6-month period (November 1 to May 1), "allowing customers some time to manage the increase."[52]

[52] CUB/100, Jenks/15.

Q. How does NW Natural respond to CUB's reporting requirements?

A. First, NW Natural has a significant outreach plan for its bill assistance programs as explained in the Reply Testimony of Cory A. Beck (NW Natural/3200, Beck) and Cecelia J. Tanaka (NW Natural/2300, Tanaka). The Reply Testimony of Cecelia J. Tanaka (NW Natural/2300, Tanaka) also explains why CUB's proposed rate mitigation reporting requirements are an inefficient use of Commission, stakeholder, and Company resources. Second, with respect to the other reporting requirements, NW Natural has provided data similar to the requested data during the COVID-19 pandemic. If this data would be useful to the Commission and stakeholders, NW Natural will explore this more with parties to the case.

Q. Does NW Natural support a shut off moratorium from November 1 to May 1?

A. No. Changes to Division 21 rules that help to mitigate energy burden and provide a safety net to prevent disconnections for non-payment implemented by NW Natural already include expansion of the cold weather moratorium parameters for all customers, limitations on field and reconnection fees and no late payment fees for low-income customers. In addition, as indicated in the Reply Testimony of Cecelia J. Tanaka (NW Natural/2300, Tanaka), NW Natural has analyzed and demonstrated our review of the current tools available to help mitigate rate changes and energy burden. That analysis showed that we are continuing to have effective mitigation tools to help reduce energy burden, thus helping to insulate the impacts of rate changes on customers most in need.

Q. CUB suggests that the Commission could order the Company to suspend or reduce the amortization of certain deferred accounts or other single issue ratemaking mechanisms, to reduce the impact of the rate increase.[53] Do you support this proposal?

A. No. NW Natural is not sure how CUB's proposal would be implemented or what deferred accounts it would affect. More importantly, however, NW Natural does not believe that its recent rate proposal results in rate shock that must be mitigated by unprecedented Commission action.

Q. Your testimony strongly pushes back against CUB's proposals. Does this mean that NW Natural is against any proposal to mitigate rate increases?

A. Not at all. NW Natural believes that many of CUB's goals can be met through multi-year rate plans, which would provide parties with a more holistic view of costs over an extended period of time. Having this type of transparency can allow parties to craft solutions to mitigate rate increases over the period of the plan, although NW Natural acknowledges that there would be some uncertainty regarding commodity costs that are recovered through the annual PGA.

Q. Please summarize your prior testimony on NW Natural's intention to propose a multi-year rate plan.

A. As is discussed in Direct Testimony, NW Natural is in the process of developing a proposal for the Commission to approve a multi-year rate plan, which would set rates for a period of two to four years in advance with rate changes set to take

[53] CUB/100, Jenks/11.

effect incrementally each year.[54] A multi-year rate plan has the potential to create predictability for customers, mitigate lumpy rate increases, eliminate strain on Commission resources, and reduce regulatory lag for the Company. Though there are many benefits to a multi-year rate plan, NW Natural anticipates that this approach will require input from Staff and intervenors, so it has introduced this concept in the current rate case as an opportunity to begin the conversation on issues that will be pertinent to adopting a functioning multi-year rate plan leading up to the Company's eventual proposal.

Q. Is NW Natural proposing a multi-year rate plan in this rate case?

A. No, the Company is not proposing a multi-year rate plan in this docket; however, the Company is planning to propose a multi-year rate plan in its next rate case.

Q. Does the Company intend that a multi-year rate plan will be based on cost-of-service ratemaking?

A. Yes. It appears there may have been confusion on this point, because in discovery, Staff referred to a "hybrid multi-year rate plan" and asked NW Natural to indicate how it is superior to cost-of-service ratemaking. However, NW Natural does not intend to propose a "hybrid multi-year rate plan" and wishes to clarify Staff's terminology. As discussed above, the Company's proposal is intended to be a multi-year rate plan that establishes incremental rate increases over a period of two to four years. In addition, the Company is not suggesting that a multi-year rate plan is superior to cost-of-service rates because these are not opposing

[54] NW Natural/100, Palfreyman-Kravitz/32-33.

concepts. Rather, the multi-year rate plan will be developed using cost-of-service ratemaking but would apply this concept to establish rates over a pre-defined period of years.

Q. What benefits do multi-year rate plans provide to customers?

A. A multi-year rate plan will benefit customers by creating rate stability over the duration of the plan, smoothing out rate impacts to customers. Additionally, with a multi-year rate plan, it is less likely that the Company would need to seek a large increase in rates in a particular year, reducing the potential for rate shock.

Q. How do the Commission, Staff, and NW Natural benefit from multi-year rate plans?

A. Without a multi-year rate plan, NW Natural anticipates it will need to file multiple rate cases in the short term to address increasing costs associated with decarbonization, modernizing network security, and maintaining a safe and reliable natural gas system. If NW Natural were permitted to establish a multi-year plan, the Commission and its Staff will be able to conduct structured review processes during the duration of the multi-year rate plan to assess prudence without conducting a time-consuming general rate case, allowing the Commission to focus its resources on other proceedings. NW Natural anticipates a multi-year rate plan will decrease the workload for the Commission and Staff.

Q. Did Staff have any other concerns reflected through its DRs?

A. Yes, Staff sought to understand the types of multi-year rate plans that NW Natural is reviewing as examples for crafting its multi-year rate plan proposal.

Q. What is NW Natural using as a reference for its multi-year rate plan proposal?

A. NW Natural expects to leverage its own experience in creating a two-year rate plan in Washington as a guide for its Oregon proposal. NW Natural also expects to learn from its Washington peer utilities in developing a fair and balanced multi-year rate plan for Oregon. For example, NW Natural is aware of Avista Corporation ("Avista"),[55] Puget Sound Energy ("PSE"),[56] and PacifiCorp[57] two-year rate plans in effect in Washington that the Company will also likely reference in constructing its Oregon rate plan. Further, Avista,[58] PSE,[59] and Cascade Natural Gas Corporation[60] have filed new two-year multi-year rate plans in 2024 currently awaiting approval by the Washington Utilities and Transportation Commission ("WUTC"). NW Natural expects its Oregon multi-year rate plan to cover a period

[55] *Wash. Utils. and Transp. Comm'n v. Avista Corp., dba Avista Utils.* and *In the Matter of the Electric Service Reliability Reporting Plan of Avista Corporation dba Avista Utilities*, WUTC Docket Nos., UE-220053, UG-220054, UE-210854, Final Order No, 10-04 at 2 (Dec. 12, 2022) (adopting a settlement providing for a two-year multi-year rate plan).

[56] *Wash. Utils. and Transp. Comm'n v. Puget Sound Energy*, WUTC Docket No. UE-220066, Final Order No. 24 at 1 (Dec. 22, 2022) (approving a settlement agreement that contains a two-year rate plan).

[57] *Wash. Utils. and Transp. Comm'n v. PacifiCorp dba Pacific Power and Light Co.*, WUTC Docket No. UE 230172, Order No. 08 at 1 (Mar. 19, 2024) (adopting a partial multi-party settlement that provides for a two-year rate plan).

[58] *Wash. Utils. and Transp. Comm'n v. Avista Corp., dba Avista Utils.*, WUTC Docket No. UE-240006, Initial Filing Cover Letter (Jan. 18, 2024) (proposing a two-year rate plan with rates to take effect in December 2024 and December 2025).

[59] *Wash. Utils. and Transp. Comm'n v. Puget Sound Energy*, WUTC Docket Nos. UE-240004, UG-240005, Initial Filing Cover Letter at 1 (Feb. 15, 2024) (requesting updates to electric and natural gas rates for its two-year multi-year rate plan).

[60] *Wash. Utils. and Transp. Comm'n v. Cascade Natural Gas Corporation*, WUTC Docket No. UG-240008, Initial Filing at 1 (Mar. 29, 2024) (proposing a two-year rate plan with proposed increase at the start of year two).

longer than two years and is developing ideas for this unique aspect of its Oregon proposal.

Q. Although the Oregon proposal is in its infancy, how does NW Natural expect the Commission would set the rate base for each year of the multi-year period?

A. NW Natural expects that rates would be set to take effect each year on November 1. For the first year of the multi-year rate plan, rates would be set as they currently are using Oregon's forward test year. Subsequent years would be set using a capital forecast with reliable categories of anticipated expenditures, such as public works, vehicles and equipment, or transmission and distribution integrity management. For larger, discrete projects, NW Natural would specifically identify and justify these projects, their projected costs, and expected in-service dates. Similarly, reductions in costs associated with capital projects would also be captured in the rate plan, including accumulated depreciation and asset retirements.

O&M expenses for subsequent years of the rate plan would be tied to inflation and increase each year. To the extent inflationary pressures were tied to an index such as the Consumers Price Index ("CPI"), the costs could be updated prior to changing rates each year based on the most recently available CPI report. If there was a known and measurable event for a particular O&M expense, NW Natural would specifically justify it, similar to larger, discrete projects.

Q. What obligation would NW Natural have to provide updates to support rate increases during the multi-year period?

A. NW Natural proposes to make an update filing on or before July 1 of each year following the first rate effective date. For capital investments, NW Natural would make a filing each year demonstrating that the anticipated projects were placed in service prior to the upcoming rate effective date. For larger, discrete projects, NW Natural will provide updates on any changes in costs, scope or timing of the project. As noted above, for O&M costs, NW Natural will update these costs for the most recent CPI report. Staff and intervenors would have several months to review and conduct discovery prior to the revised rates going into effect on November 1 for each year of the plan.

Q. Did any party submit Opening Testimony discussing multi-year rate plans?

A. Yes, CUB indicated that it could support elements of a multi-year rate plan.[61]

Q. Please summarize CUB's view of multi-year rate plans.

A. CUB expresses skepticism of a utility driven process to develop multi-year rate plans, but also indicates that it could support a multi-year rate plan "for the sake of regulatory efficiency."[62] Specifically, CUB indicates that is could support a multi-year rate plan where a revenue requirement or ROE is set during the first year of the rate plan and the Commission and parties are tasked with reviewing investments and other discrete items in a subsequent year of the rate plan.[63] CUB

[61] CUB/100, Jenks/17.

[62] CUB/100, Jenks/17.

[63] CUB/100, Jenks/17.

further states that it was supportive of automatic annual rate changes used in the 1990s and could be supportive of a similar approach to ratemaking that would limit the issues raised in a rate case.[64]

Q. What is your response to CUB's view of multi-year rate plans?

A. The Company is encouraged that CUB sees benefits in a potential multi-year rate plan and agrees that one of the major benefits of such approach is the reduction of issues that are litigated in a rate case and the frequency of major rate case filings. The Company agrees that multi-year rate plans can smooth out the volatile annual rate increases that can result from large rate cases filed every few years following the traditional rate case model. As the Company indicated in its Direct Testimony, multi-year rate plans offer benefits to the Commission and intervening parties through a more efficient regulatory process while also providing benefits to customers through more certainty as to their rates.

VI. SUMMARY OF WITNESSES

Q. Can you briefly describe the testimony provided by other witnesses in this case?

A. Twenty-one other witnesses or panels of witnesses reply to the testimony of Staff and intervenors.

Cecelia J. Tanaka, Energy Equity and Affordability Lead, responds to Staff's and intervenors' testimony regarding equity and inclusion, including concerns regarding NW Natural's proposed enhancements to the bill discount

[64] CUB/100, Jenks/16-17.

program targeting reduced energy burdens for customers most in need, the Company's Oregon Low Income Energy Efficiency Program ("OLIEE"), and the Low-Income Needs Assessment ("LINA") that the Company conducted. NW Natural/2300, Tanaka.

Brody J. Wilson, Interim Chief Financial Officer, Vice President, Treasurer, Chief Accounting Officer and Controller, provides testimony about the Company's capital structure. In response to AWEC's proposed 52 percent debt and 48 percent equity structure, Mr. Wilson explains why a 50/50 capital structure is appropriate. NW Natural/2400, Wilson.

James M. Coyne, Senior Vice President, and **Jennifer E. Nelson**, Assistant Vice President, of Concentric Energy Advisors, Inc., a firm with expertise on utility finance and required rates of return for regulated companies, respond to testimony by Staff and intervenors concerning NW Natural's cost of equity, or in other words, the return that investors in NW Natural should reasonably expect to have the opportunity to earn. Their Reply Testimony provides an analysis of Staff's and AWEC's cost of equity analysis, as well as responding to general concerns raised by CUB and the Coalition. After their review of Staff's and intervenors' testimony and updated ROE analysis, Mr. Coyne and Ms. Nelson continue to recommend that NW Natural be allowed an opportunity to earn a 10.1 percent return on equity in the revenue requirement authorized in this proceeding. NW Natural/2500, Coyne-Nelson.

Daniel B. Kizer, Engineering Senior Director, responds to Staff's and AWEC's testimony concerning the status of projects described in his Direct

Testimony,[65] and to attestation processes suggested by Staff and AWEC to ensure that certain projects (i.e., distribution and storage, facilities and IT&S) are used and useful prior to the rate effective date. NW Natural/2600, Kizer.

Wayne K. Pipes, Director of Facilities, Security and Emergency Management, provides updates on the projects discussed in his Direct Testimony.[66] Additionally, he responds to Staff's testimony, which does not question the prudence of any project, but requests attestations for those projects entering service near the rate-effective date, and responds to CUB's testimony that the Company should reconsider its plans to perform seismic resiliency and office construction projects to attempt to slow rate increases. NW Natural/2700, Pipes.

Dina L. Thompson, Director of Enterprise Applications, explains why it is appropriate to allow recovery of cost contingencies for major IT&S projects subject to a final true-up before projects enter rates, provides an update on the Company's major IT&S projects, explains why the Company's hiring of all eight new full-time equivalent ("FTE") positions necessary to fill critical gaps in IT&S staffing should be recovered in rates, and responds to Staff's other requests not associated with a specific rate adjustment. NW Natural/2800, Thompson.

Matthew P. Carlson, Cybersecurity and Compliance Director, provides an update on the Company's cybersecurity efforts. NW Natural/2900, Carlson (Sensitive Security Information).

[65] NW Natural/500, Kizer.
[66] NW Natural/600, Pipes.

Joe S. Karney, Vice President of Engineering and Utility Operations, provides updates on the Company's Meter Modernization Program and responds to Staff's testimony regarding the program. NW Natural/3000, Karney.

Melinda B. Rogers, Vice President, Chief Human Resources and Diversity Officer, responds to Staff's proposed adjustments for officer and non-bargaining unit ("NBU") employee base pay and pay-at-risk, as well as the number of FTEs. In addition, Ms. Rogers explains the terms of the Company's new collective bargaining agreement ("CBA") with its Bargaining Unit ("BU") employees. NW Natural/3100, Rogers.

Cory A. Beck, Director of Customer Experience Services, responds to Staff's and the Coalition's recommended adjustments to NW Natural's proposed test year Category A and Category B advertising expense. In addition, he responds to the Coalition's testimony regarding the Company's marketing of the bill discount program and investment in multi-lingual outreach. NW Natural/3200, Beck.

Kathryn M. Williams, Vice President, Chief Public Affairs and Sustainability Officer, provides relevant background regarding political activity or lobbying expenses and direction from Commission Order No. 22-388 in the Company's most recent general rate case, docket UG 435, as it applies to this general rate case. In addition, she responds to Staff's recommendation regarding political activity/lobbying expenses and responds to the Coalition's recommended adjustments for political activity/lobbying expenses. NW Natural/3300, Williams.

Brody J. Wilson and **Nikki R. Sparley**, Treasury and Investor Relations Director, responds to Staff's and CUB's concerns regarding the Company's proposed uncollectible rate. They describe why the Company's proposed uncollectible rate is appropriate. NW Natural/3400, Wilson-Sparley.

Tobin F. Davilla, Senior Manager of Financial Planning and Budget, responds to a number of proposed operations and maintenance adjustments proposed by Staff and intervenors. NW Natural/3500, Davilla.

Zachary D. Kravitz and **Kyle N. Griffiths**, Business Consultant, responds to Staff's proposed adjustment regarding NW Natural's five additional FTEs focused on decarbonization. They also respond to Staff's and CUB's testimony regarding the Company's renewable natural gas automatic adjustment clause. NW Natural/3600, Kravitz-Griffiths.

John J. Spanos, President of Gannett Fleming Valuation and Rate Consultants, LLC, replies to depreciation and accounting adjustments set forth by AWEC and Staff. NW Natural/3700, Spanos.

Kyle T. Walker, Senior Manager of Rates and Regulatory Affairs, responds to a number of adjustments proposed by Staff and intervenors, including forward test year capital, test year revenues and expenses, cash working capital, materials and supplies, excess deferred income taxes, Commission fees, cloud-based software capitalization, available funds used during construction, income tax flow through, decoupling, UM 2309 amortization, and removal work in progress. He also updates revenue requirement to reflect the filed cost of long-term debt stipulation with the Stipulating Parties, errors identified through Parties' opening

testimony and discovery, the updated CBA, and the removal of one FTE. NW Natural/3800, Walker.

Robert J. Wyman, Rates and Regulatory Economist, responds to Staff and intervenors regarding weather normalized use-per-customer load forecast ("UPC Forecast"), Long-Run Incremental Cost ("LRIC") study, and rate spread and rate design proposed by the Company. NW Natural/3900, Wyman.

Gregg H. Therrien, Vice President at Concentric Energy Advisors, responds to Staff and intervenors testimony concerning NW Natural's proposed LEA. Specifically, he explains why the proposed LEA is fair, is designed to support the state's decarbonization efforts (despite the invalidation of the CPP) and is a balanced and economical approach to adding new gas customers that desire service from NW Natural. NW Natural/4000, Therrien.

Jeffrey M. Zaubi, Financial Consultant, responds to the Coalition's proposed disallowance of costs associated with system investments to hook up new residential customers. He describes the Company's process for estimating the construction costs for new residential and commercial customers and demonstrates the Company's construction costs for adding new residential and commercial customers were prudently incurred and should be recovered in rates. NW Natural/4100, Zaubi.

Scott S. Johnson, Director of Gas Supply, explains why Staff's proposal to establish a sharing mechanism for gas supply hedges that exceed three years in duration is counterproductive and should not be adopted. NW Natural/4200, Johnson.

John D. Frankel, Director of Marketing, respond to adjustments related to promotional and marketing activities proposed by Staff and the Coalition. NW Natural/4300, Frankel.

As we stated in Direct Testimony, we are requesting to revise rates to reflect the critical investments we are making in our system and increasing costs. We recognize that rate increases can be difficult for our customers, but they will ultimately benefit our customers by supporting NW Natural's ability to operate a financially sound natural gas utility that will continue to provide safe and reliable gas service.

Q. Does this conclude your Reply Testimony?

A. Yes, it does.

Winter 2024 Report

Pacific Northwest and the U.S. **Rely on the Gas System**

Frigid temperatures that hit the Pacific Northwest during the week of January 13-19 resulted in record-breaking natural gas deliveries on our system. This came at a time when the electric system was experiencing widespread power outages due to the severe weather. Through careful planning, hard work and dedication, our field crews and operations teams kept the gas flowing safely for about 2 million people in the region, many of whom were without power but could still rely on direct use of natural gas in appliances like gas fireplaces, water heaters, stoves, and generators.

System Planning Delivers Results

NW Natural's customers relied on our system like never before, with 9 million therms of gas deliveries to homes and businesses on Jan. 13, 2024, virtually matching our previous record set in Dec. 2022, and about double our average daily winter send out.

9M therms

Indispensable Energy Storage

NW Natural's unique, on system storage facility in Mist, Oregon provided a new record volume of over 4.5 million therms of gas on Jan. 13, 2024 — **the equivalent of serving 630,000 residential customers in a day.** This year, we will distribute $29 million in bill credits to customers due to our Mist storage assets and pipeline capacity management.

630,000

Storm Shows Critical Need for Energy System Diversification

Hundreds of thousands in the Northwest were without power at some point during the severe weather event of Jan. 2024. While all energy systems faced challenges to mitigate, thanks to our underground energy delivery system, NW Natural was able to retain service to all but about 266 customers.

Overall Outages

Customer Perspectives

The January 2024 severe weather event reminded many of the customers and communities we serve about the critical role of natural gas for a reliable, resilient energy system.

"...has a gas stove and was able to heat up food... Other strategies that people reported using in Facebook posts included firing up gas fireplaces..."

-The Oregonian

"...Luckily for them they've got a generator and a gas stove to heat food..."

- KGW

"A gas fireplace and lots of batteries."

- A reader in response to a Pamplin Media poll about how they were handling the storm

"Our gas fireplace has kept us warm today. No power since 11:10 am. Able to eat warm food cooked on the stove and stay warm during the storm. Thanks @nwnatural!"

– A NW Natural customer on social media

Electrification is Not Decarbonization

Emissions from our residential and commercial customers account for about 5% of Oregon's total greenhouse gas emissions. Transportation and electricity use remains the largest source of emissions in Oregon.

Oregon Greenhouse Gas Emissions by Sector

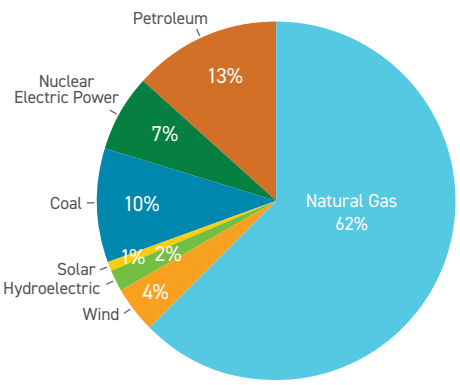
Share of Total Energy Delivered by Source Week Ending Jan. 19, 2024



Policies designed to "electrify" natural gas space heating fail to answer three key questions:

1. Why would we limit or ban natural gas use in homes and businesses only to use even more of it in electric power plants during cold weather?
2. What is the cost to ratepayers of this policy?
3. And how will it affect energy reliability?

2024 Northwest Regional Forecast

Executive Summary

From technological advancements to evolving consumer demands, electric utilities and industry partners are adapting to major shifts that are underway in the energy sector. Through collaboration, the Pacific Northwest Utilities Conference Committee (PNUCC) annually provides an assessment of the electric utility industry from a regional perspective. The effort is captured in the *Northwest Regional Forecast* (*Forecast*), a longstanding resource tracking power system trends, including shifts in demand, resource changes and emerging technologies. It is important to note that a gap between loads and resources in the *Forecast* does not necessarily mean the region will be unable to meet demand. Rather, the *Forecast* serves as a barometer for building increased awareness for how the picture is changing.

The *Forecast* anticipates a surge in demand for electricity in the Pacific Northwest over the next decade that surpasses PNUCC's previous projections. The increase is attributed to factors such as data center expansion, high-tech manufacturing growth and the trend toward electrification. Electric utilities across the nation are projecting increases in demand for similar reasons.

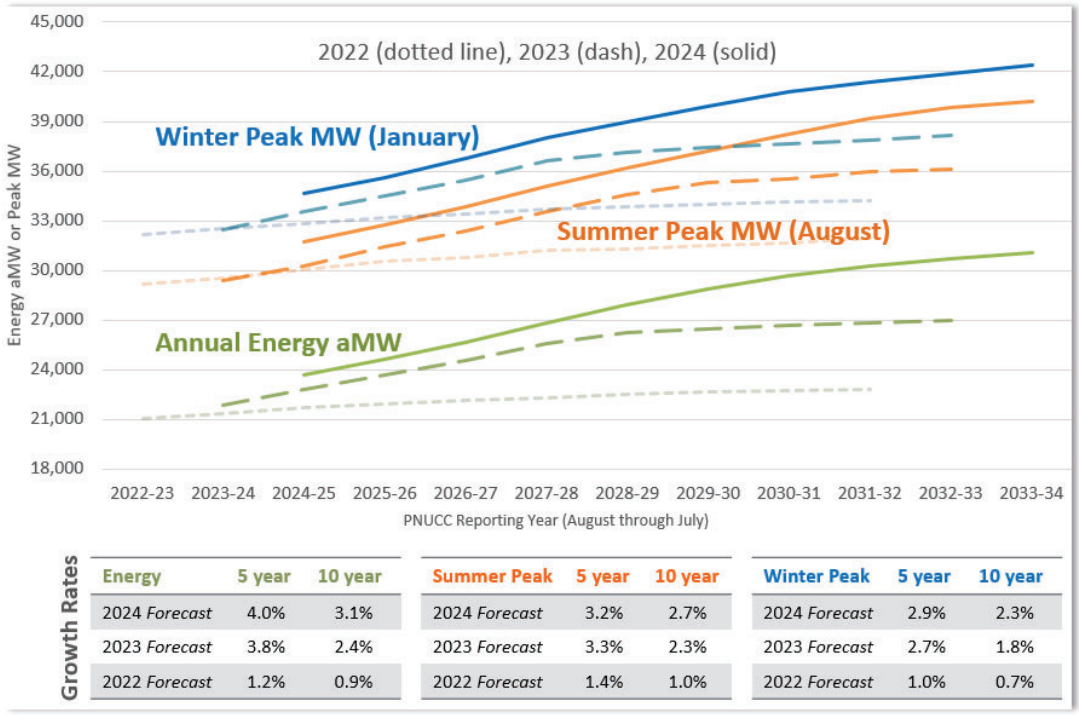
The dual challenge of extraordinary growth in demand and the transition to lower carbon-emitting generation resources translates to a tremendous and urgent need to upgrade the region's electricity infrastructure – including expanding transmission capacity and diversifying power supplies as well as accelerating the adoption of advanced grid technologies.

Surge in Projected Demand Signals End of Stagnant Growth

Demand for electricity is projected to increase from about 23,700 average megawatts (aMW) in 2024 to about 31,100 aMW in 2033 (an increase of 7,400 aMW), which is an increase in demand of over 30% in the next 10 years (as shown Figure 1). For comparison, last year's *Forecast* projected demand could rise by 24% in 10 years.

The rapid expansion of data centers is one of the reasons for the expected increased volume in the Northwest. According to a Cushman & Wakefield report that evaluates data centers by their electricity usage, the Oregon data center market ranks as the fifth largest in the nation. High-tech manufacturing and the trend toward electrification also contribute to the expected increase in demand.

Figure 1: 2024 Load Forecast Compared to 2023 and 2022



Growth Rates

Energy	5 year	10 year
2024 *Forecast*	4.0%	3.1%
2023 *Forecast*	3.8%	2.4%
2022 *Forecast*	1.2%	0.9%

Summer Peak	5 year	10 year
2024 *Forecast*	3.2%	2.7%
2023 *Forecast*	3.3%	2.3%
2022 *Forecast*	1.4%	1.0%

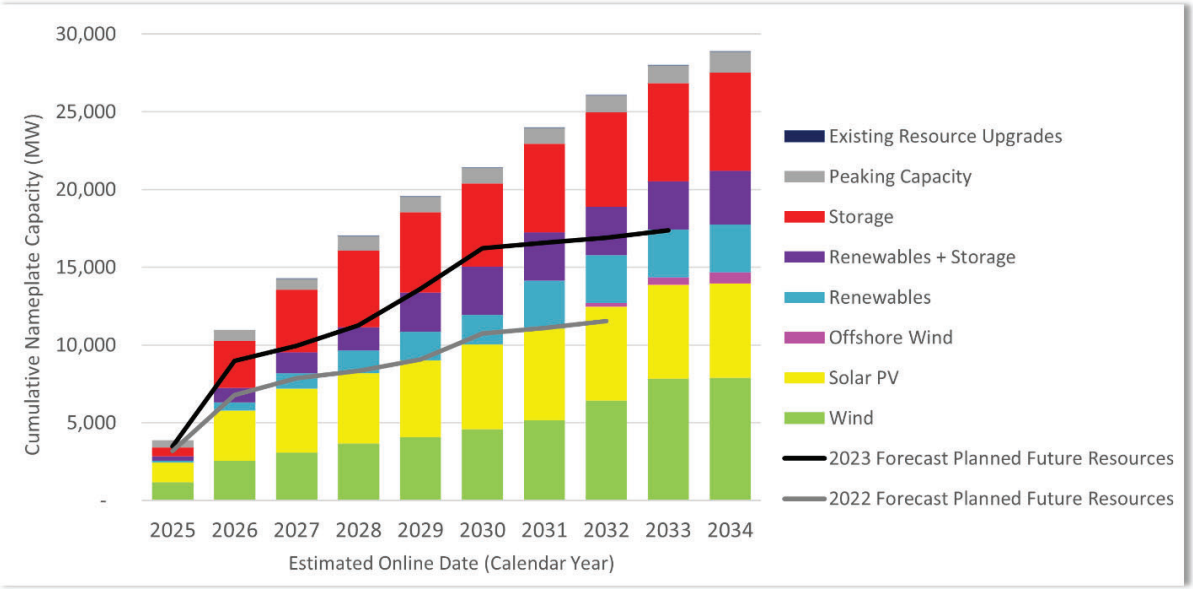
Winter Peak	5 year	10 year
2024 *Forecast*	2.9%	2.3%
2023 *Forecast*	2.7%	1.8%
2022 *Forecast*	1.0%	0.7%

Another way to measure demand is by the annual energy load growth rate. The 10-year annual energy load growth rate for the *2024 Forecast* is 3.1% (annually compounded). Utilities in aggregate have not forecast a rate of growth for annual energy load this high since the early 1980s (which is shown in Figure 9). Three years ago, the regional annual load growth rate was forecast to be 0.9%, which was more in line with the decades long trend of about 1-2% per year. Utilities are experiencing load growth due to different factors and at varying rates. For example, some utilities are experiencing increased demand from a boom in residential growth due to population shifts, while other utilities have flat or decreasing demand forecasts because of energy efficiency investments or more stringent state and local building codes and standards.

Utility Plans Include More Resources

Over the next decade, utilities have identified plans for about 29,000 megawatts (MW) nameplate capacity of new resources to meet customer energy and capacity needs. Figure 2 shows an unprecedented development of resources on a short timeline for the industry. Past *Forecasts* showed more than 17,000 MW nameplate (solid black line) were planned by 2033 and more than 11,000 MW nameplate (solid gray line) by 2032. PNUCC aggregates utility-reported planned future resources from resource planning assessments to provide a regional picture. Utility plans are reviewed and updated frequently and are developed through comprehensive analysis with input from a stakeholder process. Consequently, these plans, particularly the longer-range elements, change over time.

Figure 2: Planned Future Resources



In Figure 2 the stacked bars amount to the cumulative nameplate for planned future resources by resource type for each year of the *Forecast*. Wind, solar and battery resources make up most of the planned generation as utilities look to decarbonize their resource portfolios. For utilities that have not been specific about the kind of renewable resources included in their plans, the resources are identified as renewables.

The data in the graph does not include committed resources for 2024 and 2025 and coal to natural gas conversions. Committed resources and coal to gas conversions get combined with existing resources in the load and resource balance picture. Further, this graph does not reflect any uncommitted independent power producer resources with which utilities or customers may acquire or enter into contracts.

Storage is a big part of the solution

Hydroelectric dams are the cornerstone of the Pacific Northwest electricity system, providing over 33,000 MW of installed capacity. They generate clean power and store water in large reservoirs behind the dams that can be used to dependably meet seasonal and peak demands. Because hydroelectric dams are flexible resources that can store fuel, they have helped integrate new variable renewable resources in the region. With the growth of wind and solar power, utilities are also starting to add battery storage resources to store surplus energy and supply it to the grid during periods of high demand, or periods when wind and solar generation decreases.

Batteries co-located with renewable generation, standalone batteries and pumped hydro increase through the *Forecast*. The most commercially available battery storage technology — utility scale lithium-ion — is designed to discharge their capacity over a four-hour period before needing to recharge. In the Northwest, which is prone to prolonged peak demand and fuel limitations over multiple cold days, long duration energy storage could be a complimentary solution. Developers are making progress on longer

duration battery and compressed air energy storage technologies, but they are not yet showing up in utility planned future resources.

Energy efficiency and demand response

Energy efficiency and demand response programs have reduced the need for new resource development in the past and continue to be a critical component of an adequate power supply by helping lower energy use and peak demand.

Figure 3: Ten-year Cumulative Energy Efficiency Projections

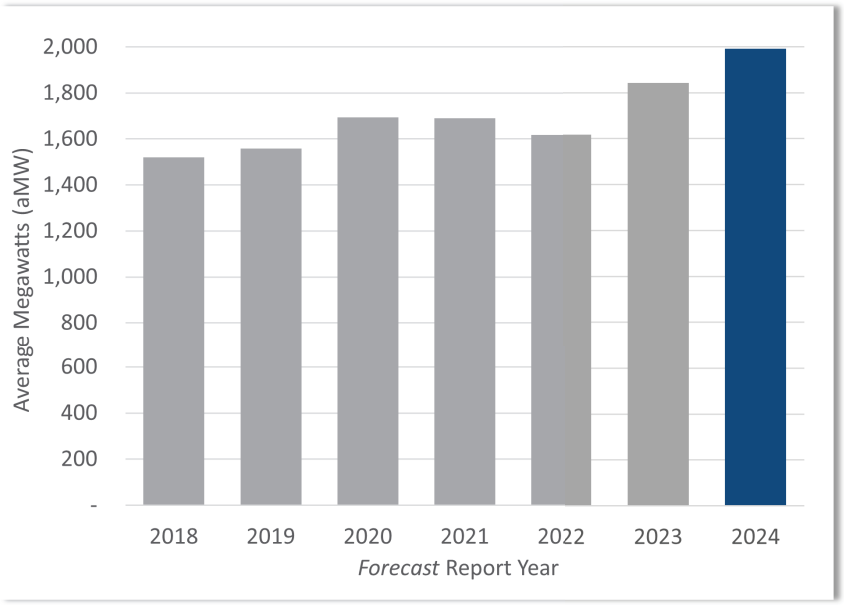


Figure 3 shows projected cumulative energy efficiency savings of around 2,000 aMW over the next 10 years – approximately 150 aMW higher this year than last year. This builds on the nearly 7,700 aMW of energy efficiency that has been acquired in the region over the past 45 years.

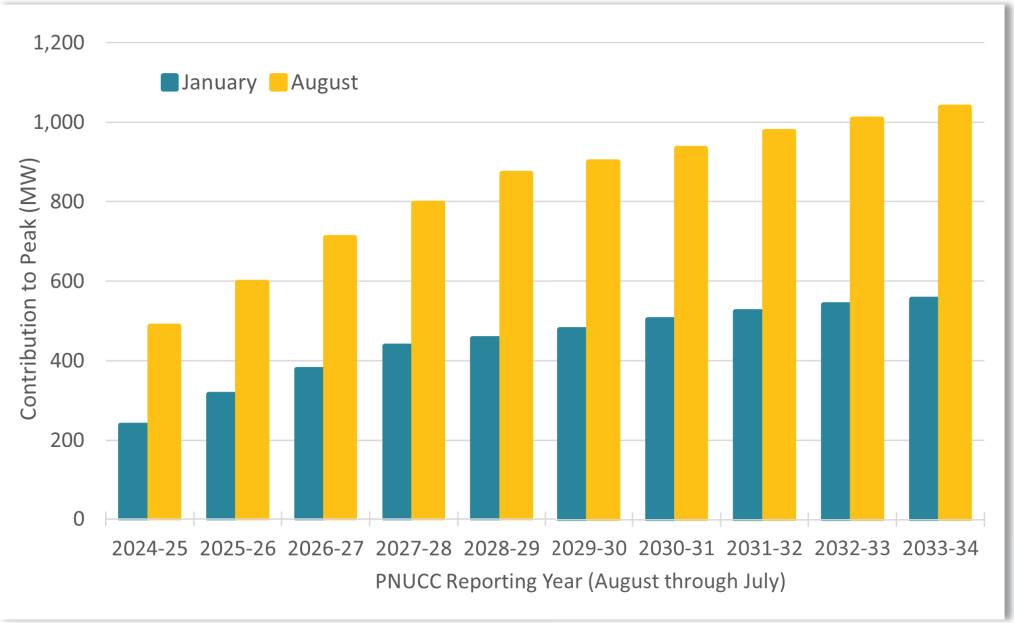
Energy efficiency is an important resource to meet demand now and in the future, as well as a strategy to mitigate risk from uncertainty. The Northwest Power and Conservation Council's (Council) *2021 Power Plan* recognized that some jurisdictions would need to invest in energy efficiency beyond the Council's target as part of a cost-effective strategy for reducing carbon emissions.

Figure 4: Demand Response Contribution to Peak



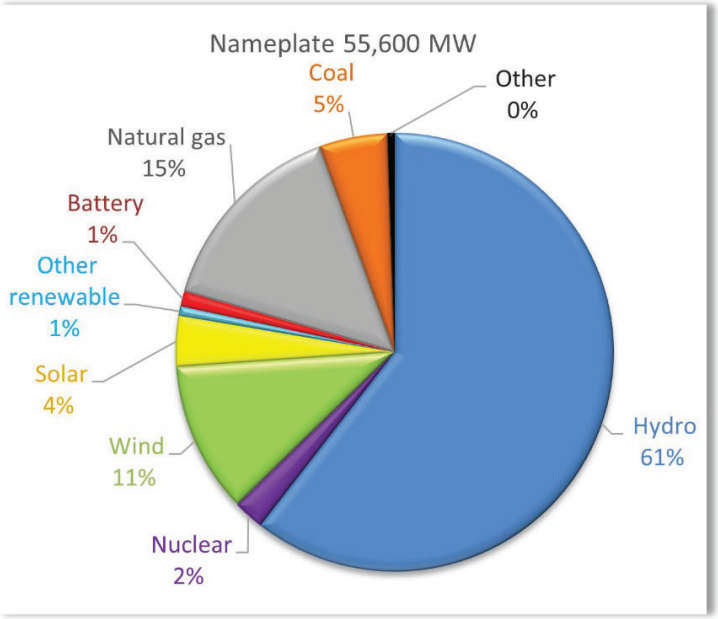
Demand response programs are an effective tool during summer and winter extreme weather events to shift consumption of electricity away from peak periods. As the grid becomes more strained, utilities are incorporating more customer demand response.

Figure 4 shows the utilities' active and projected summer and winter demand response programs. The *Forecast* projects summer demand response to double, reducing the region's one hour peak by about 500 MW in 2024 to over 1,000 MW in 2033. While summer demand response programs continue to provide almost twice the peak load reduction in comparison to winter demand response programs, the *Forecast* projects a winter demand response increase from over 200 MW in 2024 to close to 600 MW in 2033. Further, several utilities have expressed their intent to explore pilot projects and deploy new demand response programs within their service territories that are not yet showing up in the *Forecast*.

Northwest Generating Resources

The pie chart in Figure 5 shows the Northwest Utility Generating Resources for 2025. Total installed capacity for 2025 is about 55,600 MW. This year the *Forecast* includes a new category for battery storage, which has grown to 1% and is expected to quickly become an even larger share. Utilities also rely on imports from outside the region, energy efficiency and demand response to meet load.

Figure 5: Northwest Utilities Generating Resources



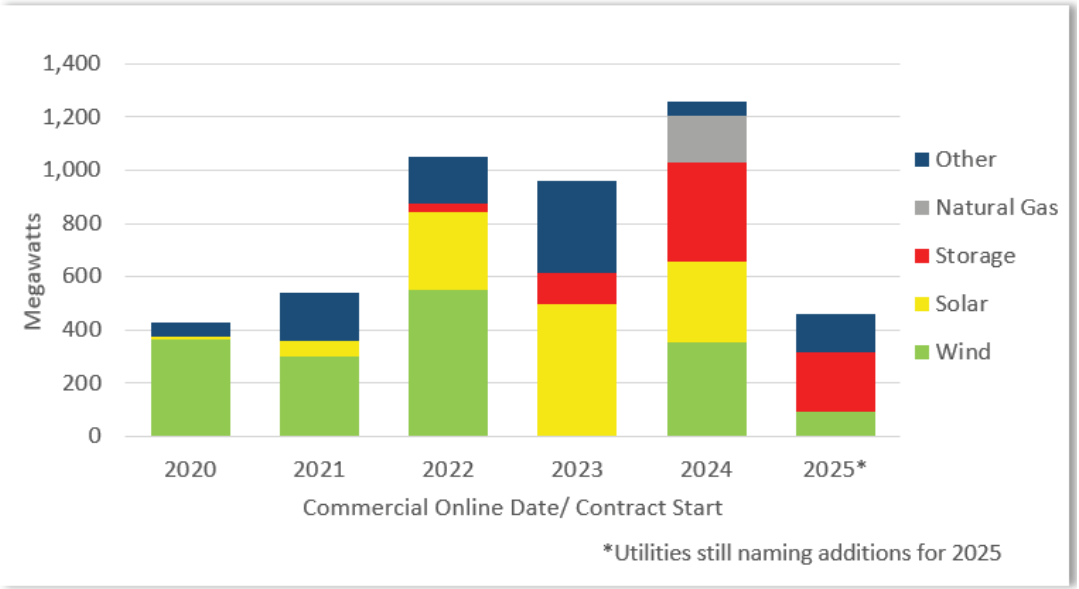
The Bar for New Resources Keeps Moving Higher

Northwest utilities have been steadily adding new resources to the regional generating mix to replace carbon-emitting resources. While the total installed capacity has increased slightly, these new resources have not significantly expanded to meet the anticipated rise in electricity demand.

Reported long-term acquisitions

Over the past five years, the majority of new generating resources have been solar and wind, with some additions of battery storage. The incremental additions reported from 2020 through 2025 are shown in Figure 6. Past *Forecasts* have not summarized this information, but the landscape is changing, and it is important to show how the picture is evolving. The data include committed resources that are named and under construction with a high degree of certainty to be added.

Figure 6: Incremental Nameplate Capacity 2020-2025 Acquisitions

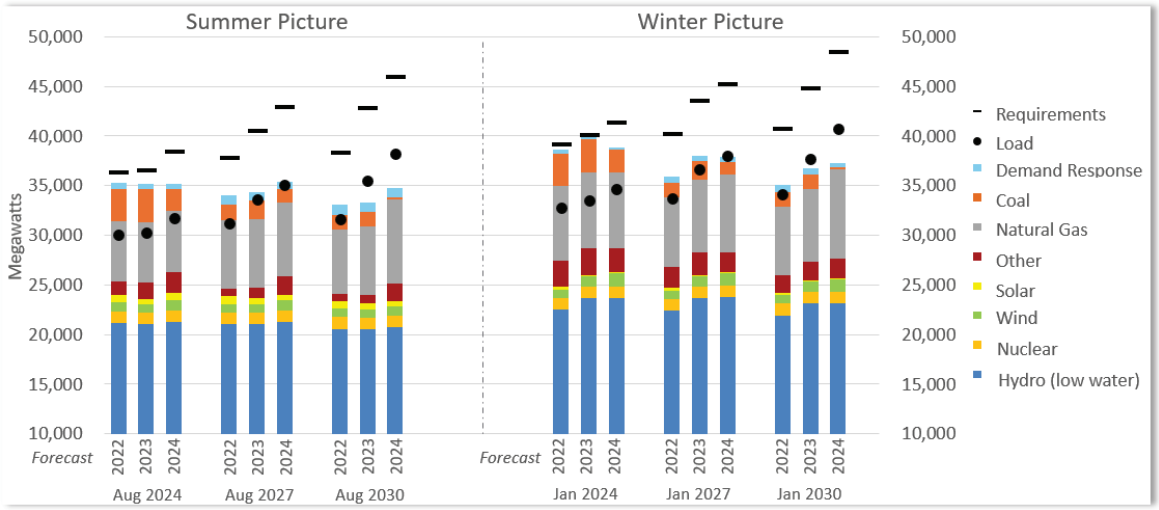


In total, utility reported resource acquisitions have increased the regional utility resource stack by approximately 4,700 MW (nameplate capacity) from 2020 through 2025. Wind additions are 1,657 MW, solar additions are 1,166 MW, storage additions are 748 MW and natural gas additions are 175 MW. The other category in Figure 6 includes imports of 335 MW, new contracts for existing regional resources of 598 MW and 12 MW of hydro upgrades. Because utilities are still naming additions for 2025, the 2025 planned future resources data in this graph appears relatively low at approximately 450 MW.

Figure 7 illustrates how the bar for future resources keeps moving higher. This graph compares the *2022 Forecast*, *2023 Forecast* and *2024 Forecast* of loads and resources for three future years in summer and winter. The colored stack bars are the utility's view of how existing and committed resources contribute to peak requirements. The stack does not include planned future resources. The black dot shows expected peak load, not extreme weather conditions. The black dash above the stack is the requirements – the sum of peak load, a 16% planning margin and export obligations. The resource contributions to peak requirements are shown based on expected operations and low water conditions. Firm imports are included in the other category, along with batteries and miscellaneous other resources that do not fit the main categories.

Tables 3 and 4 in the report provide the complete picture of 10 years of growing deficits. By the end of the forecast the projected summer and winter peak deficits are more than 13,700 MW in both seasons and utilities are forecasting that it will take about 29,000 MW of installed nameplate capacity (Table 9) to fill these gaps.

Figure 7: 2024 Load and Resource Forecast Compared to 2023 and 2022



This load and resource balance is not a resource adequacy assessment for the region. Rather, it is tracking the trend of the forecat load and resource balance to help understand how the picture is changing and to build awareness. To fill the gap, the region will need an unprecedented amount of new generation in the next 10 years that will significantly change the Pacific Northwest resource mix. Utilities are evaluating how existing and new generating resources can be counted on. The Western Resource Adequacy Program (WRAP) is helping utilities understand how much power the region will need to have an adequate system.

Projected demand driven by data center expansion

Compared to this time last year, there is a noticeable nationwide increase in awareness about the rapid expansion of data centers that are essential for advancing Artificial Intelligence (AI) and its incredible appetite for electricity. The use of AI is becoming increasingly important to the nation's economy. During a keynote address at a recent energy industry conference, Microsoft co-founder Bill Gates emphasized electricity is the critical factor determining the profitability of data centers and he expressed astonishment over the staggering amount of power AI will consume. It is challenging to forecast the extent of the potential increase and when it might show up in the region. Some companies developing new data centers are making plans that are not included in the *Forecast*.

Meeting this demand will be quite an undertaking, especially considering the evolving electricity supply. Many companies developing data centers are committed to minimizing their carbon footprints and prefer to power their facilities with carbon-free resources. Clean hydropower, affordable electricity and business incentives have attracted investment in this region, but finding enough power in the future will be a significant challenge. These companies are willing to pay to procure carbon-free, reliable power products to meet their corporate goals and are also exploring solutions that could help reduce power consumption.

Finding even more generating resources for meeting the demand from increased electrification will only increase the bar.

Electrification still to come

Utilities are trying to better understand how much energy and capacity could be needed for the electrification of buildings, transportation, and commercial and industrial applications. The overall effect of electrification is expected to increase over the next several years. Utilities are examining the implications of increased electrification in their load forecasts and updating their plans, a trend that cannot yet be fully captured in PNUCC's annual forecast.

Electric vehicle (EV) adoption among consumers has been increasing. Based on information PNUCC received from utilities, increased demand from charging EVs is projected to approach 4% of total load at the end of the 10-year period. Some utilities are expecting a higher percentage. Seattle City Light for example forecasts EV load could be 10% of their total load at the end of the 10-year period.

Electrification of buildings and industry is expected to lead to a significant increase in electricity consumption, but it will not impact utilities uniformly. Washington, for example, is incorporating building electrification mandates into statewide energy codes. Recent updates to Washington energy codes require builders to install electric heat pumps for space and water heating in most new commercial buildings and multi-family residences. Energy efficiency efforts may offset some of these increases and new load management technologies entering the market that are more controllable could help reduce peak demand when grid capacity is constrained.

Capacity concerns and transmission challenges create risk

Utilities need capacity, not just energy. The capacity contribution of wind and solar resources are dependent on several factors and actual generation can be less than installed nameplate capacity. The ability for a resource to provide power during a peak load event depends on the time of year, type of generating resource, its geographic location, access to fuel, access to transmission, and other factors that impact the capability to generate and deliver power at any given time. To maintain sufficient system resource adequacy, Pacific Northwest utilities rely heavily on the dependable capacity of hydro, nuclear, coal and natural gas. Battery storage increases dependability by storing surplus energy and supplying it later in the day when the energy is needed more, however, current commercial utility scale batteries have limits for meeting demand during multi-day events, like a cold snap in the Pacific Northwest.

While recent federal incentives have supercharged the market for clean energy and storage development and improved economic certainty for projects, other uncertainties – like grid interconnection, supply chain delays and project approvals – remain challenging. Project developers say grid interconnection is the leading cause of project delays and cancellations. Submitting an interconnection request and completing grid studies is only one of many steps in the development process; developers are also running into delays in getting agreements with landowners and experiencing increased equipment costs and delivery delays.

A good representation of how big the utility resource acquisition challenge could be is that the *2024 Forecast* shows utilities could add about 1,250 MW nameplate capacity by the end of 2024. Compared to the *2023 Forecast,* that number is about 50% less than projected last year.

The ability to build enough generation and acquire enough capacity is one thing; the ability to deliver it is another. Expanding the capacity of the transmission system will be critical for reliably serving the growing load and delivering more power from where it is produced to where it is needed. PNUCC members strongly believe the region should work across the Western Interconnection to develop a coordinated approach to grid planning that will identify transmission upgrades and expansion to address transmission constraints and reliably and affordably meet the needs of the future electric grid. Utilities, industry partners, states and others are actively engaged in building a coalition across the Western region to improve coordination in transmission planning through the Western Transmission Expansion Coalition (WestTEC). This initiative aims to identify and build support for transmission solutions that reduce reliability risks and facilitate the interconnection of new electricity generation to meet future load requirements.

Based on experience, utilities say planning is essential, but permitting new transmission lines is the biggest hurdle to expanding the electric transmission system, especially in the West. Existing permitting and siting rules and regulations foster perpetual legal challenges that have created decadal delays in the construction of new transmission projects.

Prioritizing Resource Adequacy and Reliability

Utilities are concerned about ensuring sufficient and reliable supply to meet demand, particularly during extreme weather events that are increasing in frequency due to climate change. The region needs a power and transmission system that is bigger than the weather because the region's customers demand a system that is both adequate and reliable.

The Pacific Northwest region will continue to rely on imports and West-wide collaboration is crucial for accessing diverse resources. Utilities are making commitments to broader regional wholesale electricity markets that would help make more efficient use of the existing and newly added resources and optimize transmission across a broader footprint. Organized electricity markets centrally optimize the least-cost dispatch of resources for utilities on the day-ahead through real-time operating timeframe to meet load. This allows for a centrally optimized system of matching buyers and sellers of wholesale electricity. Many Pacific Northwest utilities voluntarily participate in the Western Energy Imbalance Market (WEIM), which has become a valuable tool on a real-time interval that has delivered significant financial benefits to regional participants and improved grid reliability. Utilities are advancing efforts to develop and participate in day-ahead markets.

Extreme weather tests the system

The multi-day cold snap in January 2024 is an example of coming dangerously close to having an inadequate supply. The severe weather from January 12-16, 2024 pummeled the Pacific Northwest. Freezing temperatures were lower on the westside than they were on the eastside at the beginning of the event, which meant balancing authorities experienced system peaks at different times. Demand could have been significantly greater if temperatures across the region had dropped at the same time. The Pacific Northwest relied heavily on imports from the Desert Southwest and Rocky Mountain regions to maintain reliability due to high demand and low water conditions. Natural gas system constraints also reduced fuel supplies to gas-fired power plants, which impacted capacity and forced some utilities to rely more on imports.

The Western Power Pool, the program administrator for WRAP, provided an assessment of the January 2024 cold weather event. WPP found peak load consistently exceeded historical peaks or at or near historical peak load in many areas. “The amount of inter-regional support necessary to manage Balancing Authority (BA) operations through the cold weather event is indicative of the pressing need to address resource adequacy and potential capacity shortfalls as soon as practicable, highlighting the value of a resource adequacy program with a broad geographic footprint and diversity of load and resources,” WPP wrote. WPP is calling on utilities to use the January experience to enhance preparedness and help improve the resource adequacy program.

The region’s pursuit of solutions for ensuring resource adequacy includes extending the usefulness of existing infrastructure, like converting coal plants to natural gas plants, ensuring a stable natural gas supply to run natural gas plants and exploring emerging technologies.

As coal declines, natural gas is expected to increase and provide reliable supply

The regional coal and natural gas picture is shifting. Utilities continue to exit their positions in coal plants as required by state laws. On the other hand, some utilities have found it is cost-effective to repurpose existing infrastructure to reduce emissions and are planning to convert from coal to natural gas-fired generation. Natural gas can provide a bridge to meet peak demand and fill in during potential low water years until sufficient capacity and transmission infrastructure can be added.

Figure 8: NW Utility Coal and Natural Gas Plant Availability

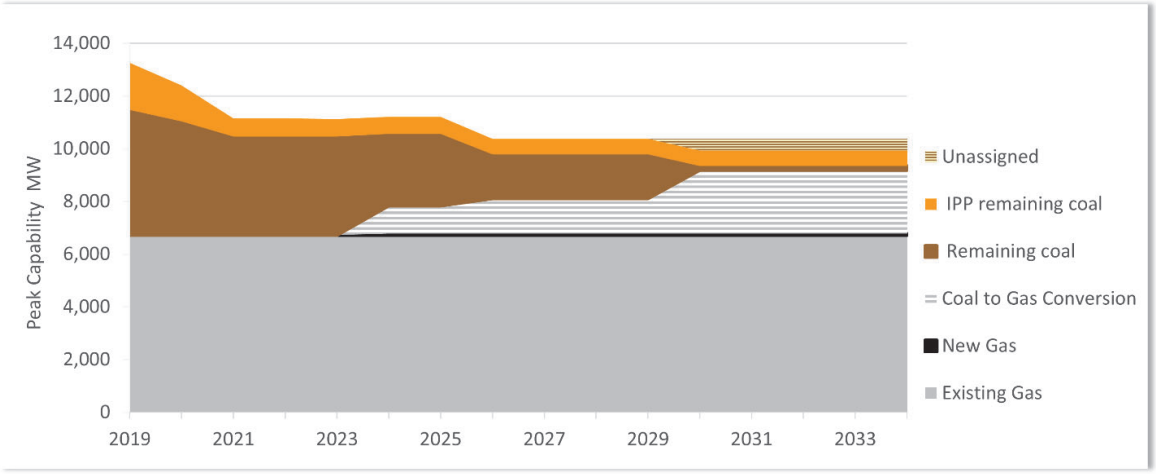


Figure 8 shows expected changes for coal and natural gas resources in the region. It begins with the picture in 2019. Looking ahead, regional coal availability declines gradually. State law requires that coal-fueled resources are eliminated from Oregon's electricity resources by January 1, 2030. Washington's Clean Energy Transformation Act (CETA) requires utilities to eliminate coal-fired resources from Washington rates by December 31, 2025. This decline shows up as retirements and coal-to-natural gas conversions. There is a remaining amount of coal that will be owned by Independent Power Producers and is not assigned to any load. A small amount of regional coal remains unassigned with no future owner identified.

Existing gas plant capability shown in the darker gray shaded area has remained steady. There is a small uptick in natural gas due to the anticipated addition of a new gas plant in 2024. Planned conversions from coal to natural gas are shown in the lighter gray area. (Figure 8 shows Jim Bridger Units 3-4 as coal to gas conversions in 2030. The picture does not reflect PacifiCorp's recently announced plans to retrofit these units with carbon capture technology by 2028 and continue operating them through 2039.)

Gas-electric coordination

Electric and natural gas system infrastructure is vital to the reliable operation of the power system. Electric energy and natural gas systems provide reliable energy to millions of people in the Pacific Northwest. The region depends on natural gas supply, storage and pipelines to fuel electric generating plants and heat homes. The interdependence of the two energy sources continues to grow as the region experiences extreme weather events more frequently and relies more on natural gas resources to meet peak demand. Building understanding and awareness of these systems and improving coordination between the electric and natural gas sectors is critical to ensure the necessary investments are made to keep the systems reliable as both sectors decarbonize.

Emerging technologies on the horizon

Regional utilities are actively exploring emerging technologies to meet future demands. Of particular interest to utilities are long duration energy storage, clean hydrogen, advanced nuclear and offshore wind. Puget Sound Energy (PSE) has announced it is partnering with Form Energy to evaluate multi-day energy storage solutions. The partnership allows both companies to collaborate on the development of a 10 MW, 100-hour iron-air battery pilot in PSE's service area. Long duration energy storage can provide power over several days as compared to most commercially available batteries that supply about four hours of energy storage. The pilot project will help PSE determine if a future utility-scale project could be deployed as early as the end of 2026.

Investor-owned and public power utilities are actively involved in the Pacific Northwest Hydrogen Hub (PNWH2), one of seven Regional Clean Hydrogen Hubs across the nation selected to receive federal funding to kick start clean hydrogen production. The PNWH2 Hub spans Washington, Oregon and Montana, and anticipates leveraging renewable resources to produce clean hydrogen exclusively via electrolysis. The economics and reach of this nascent technology will be impacted by the outcome of federal tax credit rulemaking.

There is a resurgence of interest and growing support for advanced nuclear reactors because of the role the non-emitting resource can play in supporting the transition to clean energy in a reliable way. Energy Northwest and X-Energy are jointly developing a next-generation nuclear plant in Washington. Energy Northwest has partnered with public power and investor-owned utilities to study the feasibility of building small modular nuclear reactors near the Columbia Generating Station, the state's only commercial nuclear energy facility. This year, Washington state legislators and Governor Jay Inslee supported allocating $25 million from state funds to study the pros and cons. Energy Northwest anticipates the first reactor could come online by 2031. Furthermore, PacifiCorp's 2023 IRP Update continues to show the value associated with TerraPower's nuclear demonstration project in Kemmerer, Wyoming. The nuclear power company, which is backed by Bill Gates, plans to break ground on the project this year.

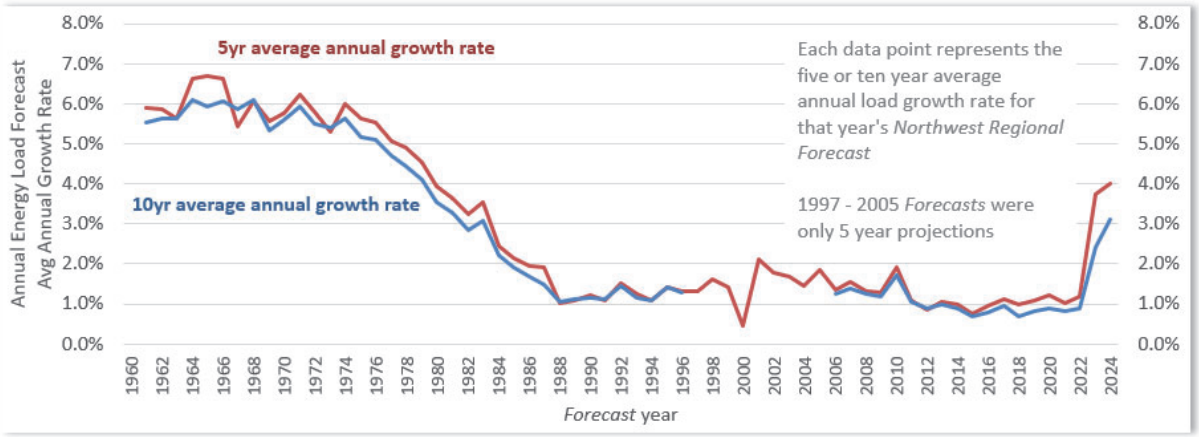
Except for offshore wind, emerging technologies such as long duration energy storage, clean hydrogen, advanced nuclear and others do not show up in the *Forecast*, but they could profoundly reshape the future regional energy landscape.

Utilities are also deploying and finding new ways to partner with customers to reduce energy use at peak times. Some utilities are exploring Virtual Power Plants (VPPs) as a way of managing customer-side resources. In general, a VPP is a portfolio of actively controlled distributed energy resources (DER). Operation of DERs is optimized to provide benefits to the power system and consumers. To a degree, VPPs have existed for decades as demand response programs. But VPPs are rapidly evolving to leverage the expanding mix of DER technologies. A VPP that reliably leverages residential load flexibility could contribute to resource adequacy.

Conclusion

Utilities in aggregate have not forecast a rate of growth for annual energy load this high since the early 1980s. This represents quite a change from the past 40 years of relatively modest growth rates of about 1-2%.

Figure 9: Historical Load Forecast Growth Rates



To accommodate the forecasted surge in demand, the region is planning to add an unprecedented 29,000 MW of new resources in 10 years while decarbonizing the electricity supply. This is an extraordinary number of new resources to develop in 10 years. A more connected grid would provide access to a wider range of resources and allow for the sharing of energy over larger distances. This would help balance the fluctuations in demand and supply, while also enhancing the resilience of the grid. Collectively, Pacific Northwest utilities are building deeper awareness of the crucial need to optimize the system, expand transmission capacity and rapidly integrate additional generating resources. By working together, the region can unlock the solutions that will keep the grid reliable and affordable.

Overview

Each year the *Northwest Regional Forecast* compiles utilities' 10-year projections of electric loads and resources which provide information about the region's need to acquire new power supply. The *Forecast* is a comprehensive look at the capability of existing and new electric generation, long-term firm contracts, expected savings from demand side management programs, and other components of electric supply and demand in the Northwest.

This report presents estimates of annual average energy, seasonal energy and winter and summer peak capability in Tables 1 through 4 of the Northwest Region Requirements and Resources section. These metrics provide a multidimensional look at the Northwest's need for power and underscore the growing complexity of the power system. The information is intended to identify regional trends and general themes based on utilities' resource planning assessment results, rather than provide a precise metric of resource adequacy.

Northwest new and existing generating resources are shown by fuel type. Existing and committed resources are listed in Tables 5, 6 and 10. Table 5, Recently Acquired Resources, highlights projects and supply that became available most recently. Table 6, Committed New Supply, lists projects where construction has started or supply is firmly committed, as well as contractual arrangements that have been made for providing power at a future time. Table 10, Northwest Utility Generating Resources, is a comprehensive list of generating resources that make up the electric power supply for the Pacific Northwest that are utility-owned or utility-contracted.

In addition, utilities have demand side management programs in place to reduce the need for generating resources. Table 7, Demand-Side Management Programs, provides a snapshot of expected savings from these programs for the next ten years. Lastly, Tables 8 and 9, Planned Future Resources, compile what utilities have reported in their individual resource planning assessments to meet future need.

Planning Area

The Northwest Regional Planning Area is the area defined by the *Pacific Northwest Electric Power Planning and Conservation Act*. It includes: the states of Oregon, Washington, and Idaho; Montana west of the Continental Divide; portions of Nevada, Utah, and Wyoming that lie within the Columbia River drainage basin; and any rural electric cooperative customer not in the geographic area described above but served by BPA on the effective date of the *Act*.

Northwest Region Requirements and Resources

Table 1. Northwest Region Requirements and Resources – Annual Energy shows the sum of the individual utilities' requirements and firm resources for each of the next 10 years. Expected firm load and exports make up the total firm regional requirements.

Average Megawatts	2024-25	2025-26	2026-27	2027-28	2028-29	2029-30	2030-31	2031-32	2032-33	2033-34

Table 6. Committed Resources details firm contracts and generating projects that are committed to come online. All supply listed in this table is included in the regional analysis of power needs.

Project	Year	Fuel/Tech	Nameplate (MW)	Utility/Owner
Yellowstone County Generating Station	2024	Natural Gas	175	NorthWestern Energy
Bakeoven	2025	Solar	60	Portland General Electric
Constable	2024	Li Ion Storage	75	Portland General Electric
Daybreak	2025	Solar	140	Portland General Electric
Seaside	2025	Li Ion Storage	200	Portland General Electric
Troutdale	2024	Li Ion Storage	200	Portland General Electric
Vantage Wind	2025	Wind	90	Puget Sound Energy
Total (Nameplate)			**1,134**	

Table 7. Demand-Side Management Programs is a snapshot of the regional utilities' efforts to manage demand. The majority of the energy efficiency savings are from utility programs and included in the regional analysis of power needs. This table also shows cumulative existing plus new demand response programs reported by utilities.

	2024-25	2025-26	2026-27	2027-28	2028-29	2029-30	2030-31	2031-32	2032-33	2033-34
Energy Efficiency (aMW)										
Incremental	183	189	196	204	214	213	216	206	190	180
Cumulative	183	372	568	772	986	1,199	1,416	1,621	1,811	1,991
Demand Response (MW) existing + forecast[1]										
Winter	237	315	378	436	456	479	503	523	540	555
Summer	385	516	629	717	807	882	879	910	936	954

[1] Values are program effectiveness, nameplate values are higher.

Table 8. Planned Future Resources catalogues future resources that utilities have identified to meet their own needs. These resources are subject to change and are not included in the regional analysis of power needs.

Report Description

This report provides a regional firm needs estimate over the ten-year study period for annual energy (August through July, *Table 1*), monthly energy (*Table 2*), winter peak-hour (*Table* 3) and summer peak-hour (*Table 4*). The monthly energy picture is provided to underscore the variability of the power need within an average year. The peak need reflects information for January and August, as they present the greatest need for their respective seasons. These metrics provide a multi-dimensional look at the Northwest's need for power and underscore the growing complexity of the power system.

This information reflects the summation of individual utilities' load forecasts and generating resources expected to meet their load, as well as the total of utilities committed and planned resources to meet future needs and policy requirements. The larger utilities, in most cases, prepare their own projections for their integrated resource plans and planning studies. Bonneville Power Administration (BPA) provides much of the information for its smaller customers. This section includes procedures used in preparing the load resource comparisons, a list of definitions, and a list of the utilities summarized by this report (*Table 11*).

Load Estimate

Regional loads are the sum of demand estimated by the Northwest utilities and BPA for its federal agency customers and certain non-generating public utilities. Direct service industrial customers are no longer a significant part of regional load. Utilities are asked to provide their native load forecast. Load projections include network transmission and distribution losses and are net of existing and forecasted energy efficiency savings (including codes & standards). Demand response program savings are not reflected in loads, rather they are included on the supply side in this report. Since the *Forecast* is completed annually, utilities may provide load forecasts that are updated and out of sync with their last resource plan.

Energy Loads

Northwest firm energy loads are provided for each month of the ten-year forecast period. This forecast reflects normal (1-in-2) weather conditions.

Peak Loads

Northwest regional peak loads are provided for each month of the ten-year forecast period. The tabulated loads for winter and summer peak are the highest estimated hourly loads for that month, assuming normal (1-in-2) weather conditions. The regional firm peak load is the sum of the individual utilities' peak loads and does not account for a utility potentially experiencing a peak load at a different day/hour than other Northwest utilities. Hence the regional peak load is considered non-coincident. The federal system (BPA) firm peak load is adjusted to reflect a federal coincident peak among its many utility customers.

Federal System Transmission Losses

Federal System (BPA) transmission losses for both firm loads and contractual obligations are embedded in federal load. These losses represent the difference between energy generated by the federal system (or delivered to a system interchange point) and the amount of energy sold to customers. System transmission losses are calculated by BPA for firm loads utilizing the federal transmission system.

Planning Margin

In the derivation of regional peak requirements, a planning margin is included. The planning margin is set to 16 percent of the total peak load for every year of the planning horizon.[1]

This planning margin is intended to cover, for planning purposes, operating reserves and all elements of uncertainty not specifically accounted for in determining loads and resources. These include forced-outage reserves, unanticipated load growth, temperature variations, hydro maintenance, and project construction delays.

Demand-Side Management Programs

Savings from demand-side management (*Table 7*) are for the ten-year study period and include data provided by utilities such as utility energy efficiency programs, some market transformation, and other efforts that reduce the demand for electricity. These estimates reflect savings from programs that utilities fund directly, or through a third-party, such as the Northwest Energy Efficiency Alliance and Energy Trust of Oregon.

Demand response programs are also tallied on *Table 7* showing the programs' winter peak and summer peak contributions to need. The regional demand response data is from the cumulative sum of all utilities' agreements with their customers (for both existing and future programs). Each program has its own characteristics and limitations that are reflected in the data provided.

Generating Resources

This report catalogues existing resources, committed new supply (including resources under construction), and planned future resources. For the assessment of need, only the existing and committed resources are reflected in the regional tabulations. In addition, only those generating resources (or shares) that are firmly committed to meeting Northwest loads are included in the regional analysis. A list of all resources included in the report load/resource tabulations is in *Table 10*.

[1] When making comparisons to *Northwest Regional Forecasts* prior to 2018, be aware that the planning margin was previously set at 12 percent for the first year of the report and grew a percent a year until it reached 20 percent and remained at 20 percent thereafter. This escalation was in part to address uncertainty of planning for generating resources with long planning and construction lead times.

Hydro

Major hydro resource capabilities are estimated from a regional analysis using computer models that simulate reservoir operation of past hydrologic conditions with today's operating constraints and requirements. The historical stream flow record used covers the 90-year period from August 1928 through July 2018. The bulk of the hydro modeling used in this report is provided by BPA, the US Army Corps of Engineers, and/or project owners/sponsors.

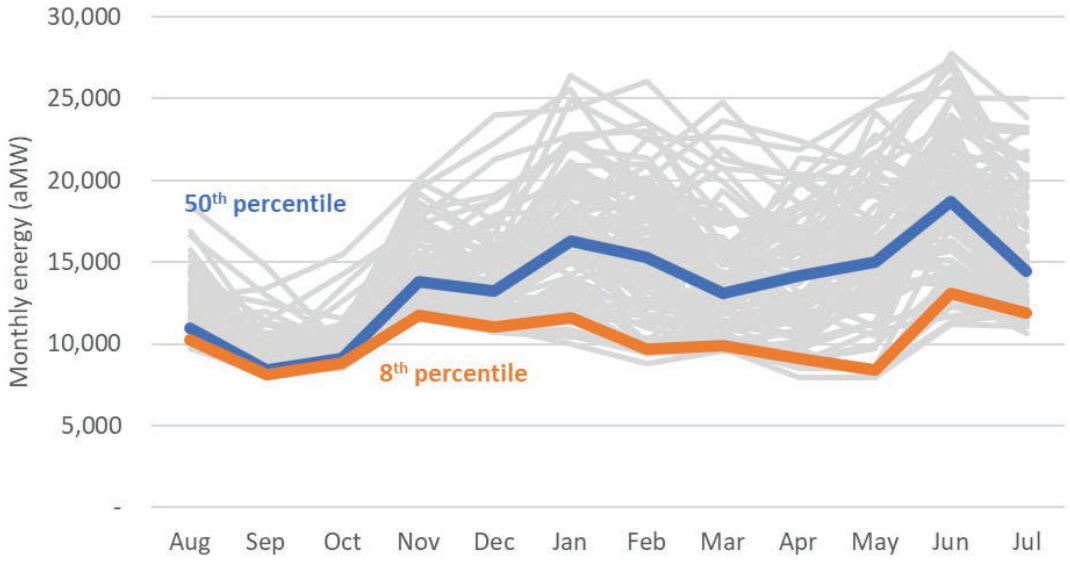
Annual and Monthly Energy

The bulk of the hydro energy data in this report comes from the US Army Corps of Engineers. Generation for projects that are influenced by downstream reservoirs reflects the reduction due to encroachment. New this year, the firm energy capability of hydro plants is the amount of energy produced using the 8th percentile monthly energy production from the 90-year historical river flow given today's river operating criteria. This provides an updated view of the critically low value for planning. The firm annual energy capability is the average of the 8th percentile monthly generation for the 90-year period. This synthetic water year ensures each month and year are evaluated similarly and under critically low streamflow.

Variability of Hydro

The variability of hydro generation is due to the hydrology of the river systems in the Northwest. Monthly hydro energy generation estimates from the major developments in the coordinated hydro system are shown for each of the 90 different river flow conditions using current system operating criteria in Figure 10. For perspective, the 50th percentile and 8th percentile. The 8th percentile monthly energy difference is indistinguishable between the 80-year and 90-year historical river flows.

Figure 10. Monthly Hydro Generation Across 90-year historical record



Peak Capability

For this report the peak capability of the hydro system represents maximum sustained hourly generation available to meet peak demand during the period of heavy load. Hydro-project owners submit a sustained peak capability for each project.[2] The bulk of the peak data in this report come from BPA. BPA has updated its critical peak planning from 1936-37 to the 10th percentile from the most recent 30-year historical record for water conditions. This increased the Federal system winter hydropower peaking capability and slightly reduced summer peaking capability.

The peaking capability of the hydro system maximizes available energy and capacity associated with the monthly distribution of streamflow. The peaking capability is the hydro system's ability to continuously produce power for a specific time period by utilizing the limited water supply while meeting power and non-power requirements, scheduled maintenance, and operating reserves.

Columbia River Treaty

Since 1961 the United States has had a treaty with Canada that outlines the operation of U.S. and Canadian storage projects to increase the total combined generation. Hydropower generation in this analysis reflects the firm power generated by coordinating operation of three Canadian reservoirs, Duncan, Arrow and Mica with the Libby reservoirs and other power facilities in the region. Canada's share of the coordinated operation benefits is called Canadian Entitlement. BPA and each of the non-Federal mid-Columbia project owners are obligated to return their share of the downstream power benefits owed to Canada. The delivery of the Entitlement is reflected in this analysis and makes up the bulk of the region's exports in this year's report.

Downstream Fish Migration

Another requirement incorporated in the hydro modeling are modified river operations to provide for the downstream migration of anadromous fish. These modifications include adhering to specific flow limits at some projects, spilling water at several projects, and augmenting flows in the spring and summer on the Columbia, Snake and Kootenai rivers. Specific requirements are defined by various federal, regional and state mandates, such as project licenses, biological opinions and state regulations.

Thermal and Renewable Resources

Thermal resources are reported in a variety of categories including coal, natural gas, nuclear and other. Other includes cogeneration, diesel and oil.

Renewable resources other than hydropower are categorized as solar, wind and other renewables and are each totaled and reported separately. Other renewables include energy from biomass, geothermal, municipal solid waste projects, and other projects.

[2] Historically, a 50-hour sustained peak (10 hours/day for 5 days) was reported. Project owners/sponsors use a variety of peak capability metrics today.

All existing generating plants, regardless of size, are included in amounts submitted by each utility that owns or is purchasing the generation. The energy and peaking capabilities of plants are submitted by the projects' owners and take into consideration scheduled maintenance (including refueling), forced outages, and other expected operating constraints. Some small thermal plants and combustion turbines are included as peaking resources and their reported energy capabilities are only the amounts necessary for peaking operations. Additional energy may be available from these peaking resources but is not included in the regional energy load/resource balance.

Battery Storage

In recent years battery storage resources have made their way into the region's resource mix, with a relatively large amount planned in the next 10 years. Battery storage is showing up as a standalone resource and in combination with solar and wind generation. It is reflected as supply during the peak hour of the month.

New and Future Resources

The latest activity with new and future resource developments, including expected savings from demand-side management actions, are tabulated in this report. These resources are reported as recently acquired, committed new supply, and planned future resources to reflect the different stages of development.

Recently Acquired Resources

The Recently Acquired Resources reported in *Table 5* have been acquired and will be serving Northwest utility loads as of December 31, 2023. They are reflected as part of the regional firm needs assessment.

Committed New Supply

Committed New Supply reported in *Table 6* includes projects under construction or firmly committed to meet Northwest load that are not delivering power as of December 31, 2023. These resources are included in the regional load-resource analysis. Future energy efficiency and demand response programs are included in the load-resource analysis as well (see *Table 7*).

Planned Future Resources

Planned Future Resources presented in *Table 8* includes specific resources and/or blocks of generic resources identified in utilities' most current integrated resource plans and planning studies. Projects in *Planned Future Resources* are not yet under construction, are not part of the regional analysis, and are subject to change until the time for acquiring them is closer. As the resource build date nears, more information about these resources will likely become available, and they typically move into the *Committed New Supply* category prior to coming online. Often, the utility will undergo a request for

proposal process before moving a resource from *Planned* to *Committed.* Resources in this category are *referred to as Potential Resources* in some previous *Northwest Regional Forecasts*.

Contracts

Imports and exports include firm arrangements for trade with systems outside the region, as well as with third-party developers/owners within the region. These arrangements comprise firm contracts with utilities to the East, in California and Canada. Contracts to and from these areas are amounts delivered at the area border and include transmission losses associated with deliveries.

Long-term intraregional contracts between Northwest utilities net to zero in the regional picture and consequently are not tallied for this report. In addition, short-term and/or spot purchases from Northwest independent power producers and from out-of-region are not reflected in the tables that present the firm load resource comparisons in this report.

Non-Firm Resources

The *Northwest Regional Forecast* omits from the load/resource balance non-firm power supply that may be available to utilities to meet needs. These non-firm sources include generation from uncommitted Northwest independent power producers (IPPs), imports from power plants located outside the region, uncommitted hydro generation owned by Northwest utilities, and hydro generation likely available when water supply is greater than the assumed critical levels. Power from these resources may be available to the Northwest from the market, during high need hours, or it may have been already sold to a higher bidder outside the Northwest.

Non-firm imports depend on several factors including availability of out-of-region resources, availability of transmission, and market friction. The trend of large thermal resource retirements in the Western Interconnection could impact power available for import into the Northwest in the coming years. Looking at hydropower, the *Forecast* assumes low water (8%) during peak hours for the monthly peak calculations. Most months the water supply for the hydro system is not at critical levels. During a median water month, the region will have more water available for energy and peak needs.

Climate Change

More utilities and organizations are incorporating the impacts of a changing climate into their long-range planning. Two areas where climate change may impact utility planning is the influence of temperatures on loads and water supply for hydrogeneration. As more utilities account for changing temperature trends in their forecasting models the impact on utility loads becomes incorporated into the *Northwest Regional Forecast*. Increasing temperatures in the summer can result in higher summer load (due to air conditioning, for example) and moderately warmer temperatures in the winter can reduce winter load (reduced need for heating loads), on average across the region. The differences in geography for utilities across the Northwest means individual utilities can have varying degrees of climate change effects.

The *2024 Forecast* does not explicitly include the impact of climate change on hydroelectric generation. It is only included to the extent that it is included in a hydro-project owner/sponsor's submittal of its peak capability for the project. The report's hydroelectric data for the bulk of the hydro data rely on the historical river flows.

Definitions

Annual Energy

Energy value in megawatts that represents the average output over the period of one year. Expressed in average megawatts.

Average Megawatts

(aMW) Unit of energy for either load or generation that is the ratio of energy (in megawatt-hours) expected to be consumed or generated during a period of time to the number of hours in the period.

Batteries

Batteries are some of the newest technologies being added to the regional picture. See storage definition.

Biomass

Any organic matter which is available on a renewable basis, including forest residues, agricultural crops and waste, wood and wood wastes, animal wastes, livestock operation residue, aquatic plants, and municipal wastes.

Canadian Entitlement

Canada is entitled to one-half the downstream power benefits resulting from Canadian storage as defined by the Columbia River Treaty. Canadian entitlement returns estimated by Bonneville Power Administration.

Coal Resource

This category of generating resources includes the region's coal-fired plants.

Cogeneration

Cogeneration is the technology of producing electric energy and other forms of useful energy (thermal or mechanical) for industrial and commercial heating or cooling purposes through sequential use of an energy source.

Combustion Turbines

These are plants with combined-cycle or simple-cycle natural gas-fired combustion turbine technology for producing electricity.

Committed Resources

These projects are under construction and/or committed resources and supply confirmed to meet Northwest load, but not delivering power as of December 31, 2023.

Conservation

Any reduction in electrical power consumption as a result of increases in the efficiency of energy use, production, or distribution. For the purposes of this report used synonymously with energy efficiency.

Demand Response

Control of load through customer/utility agreements that result in a temporary change in consumers' use of electricity.

Demand-side Management

Peak and energy savings from conservation/energy efficiency measures, distribution efficiency, market transformation, demand response, fuel conversion, fuel switching, energy storage and other efforts that that serve to reduce electricity demand.

Dispatchable Resource

A term referring to controllable generating resources that are able to be dispatched for a specific time and need.

Direct Service Industries (DSI)

Large electricity-intensive industries such as aluminum smelters and metals-reduction plants that purchase power directly from the Bonneville Power Administration for their own use. Very few of these customers exist in the region today.

Distribution Efficiency

Infrastructure upgrades to utilities' transmission and distribution systems that save energy by minimizing losses.

Emerging Technologies

A term used to describe future resource technologies such as advanced nuclear, offshore wind, renewable hydrogen, and long-duration storage.

Encroachment

A term used to describe a situation where the operation of a hydroelectric project causes an increase in the level of the tailwater of the project that is directly upstream.

Energy Efficiency

Any reduction in electrical power consumption as a result of increases in the efficiency of energy use, production, or distribution. For the purposes of this report used synonymously with conservation.

Energy Load

The demand for power averaged over a specified period of time.

Energy Storage

Technologies for storing energy in a form that is convenient for use at a later time when a specific energy demand is greater.

Exports

Firm interchange arrangements where power flows from regional utilities to utilities outside the region or to non-specific, third-party purchasers within the region.

Federal System (BPA)

The federal system is a combination of BPA's customer loads and contractual obligations, and resources from which BPA acquires the power it sells. The resources include plants operated by the U.S. Army Corps of Engineers (COE), U.S. Bureau of Reclamation (USBR) and Energy Northwest. BPA markets the thermal generation from Columbia Generating Station, operated by Energy Northwest.

Federal Columbia River Power System (FCRPS)

Thirty federal hydroelectric projects constructed and operated by the Corps of Engineers and the Bureau of Reclamation, and the Bonneville Power Administration transmission facilities.

Firm Energy

Electric energy intended to have assured availability to customers over a defined period.

Firm Load

The sum of the estimated firm loads of private utility and public agency systems, federal agencies and BPA industrial customers.

Firm Losses

Losses incurred on the transmission system of the Northwest region.

Fuel Conversion

Consumers' efforts to make a permanent change from electricity to natural-gas or other fuel source to meet a specific energy need, such as heating.

Fuel Switching

Consumers' efforts to make a temporary change from electricity to another fuel source to meet a specific energy need.

Historical Streamflow Record

A database of unregulated streamflows for 90 years (August 1928 to July 2018). Data is modified to take into account adjustments due to irrigation depletions, evaporations, etc. for the particular operating year being studied.

Hydro Maintenance

The amount of energy lost due to the estimated maintenance required during the critical period. Peak hydro maintenance is included in the peak planning margin calculations.

Hydro Regulation

A study that utilizes a computer model to simulate the operation of the Pacific Northwest hydroelectric power system using the historical streamflows, monthly loads, thermal and other non-hydro resources, and other hydroelectric plant data for each project.

Imports

Firm interchange arrangements where power flows to regional utilities from utilities outside the region or third-party developer/owners of generation within the region.

Independent Power Producers (IPPs)

Non-utility entities owning generation that may be contracted (fully or partially) to meet regional load.

Intermittent Resource (a.k.a. Variable Energy Resource)

An electric generating source with output controlled by the natural variability of the energy resource rather than dispatched based on system requirements. Intermittent output usually results from the direct, non-stored conversion of naturally occurring energy fluxes such as solar and wind energy.

Investor-Owned Utility (IOU)

A privately owned utility organized under state law as a corporation to provide electric power service and earn a profit for its stockholders.

Market Transformation

A strategic process of intervening in a market to accelerate the adoption of cost-effective energy efficiency.

Megawatt (MW)

A unit of electrical power equal to 1 million watts or 1,000 kilowatts.

Nameplate Capacity

A measure of the approximate generating capability of a project or unit as designated by the manufacturer.

Natural Gas-Fired Resources

This category of resources includes the region's natural gas-fired plants, mostly single-cycle and combined-cycle combustion turbines. It may include projects that are considered cogeneration plants.

Non-Firm Resources

Electric energy acquired through short term purchases of resources not committed as firm resources. This includes generation from hydropower in better than critical water conditions, independent power producers and imports from outside the region.

Non-Utility Generation

Facilities that generate power whose ownership by a sponsoring utility is 50 percent or less. These include PURPA-qualified facilities (QFs) and non-qualified facilities of independent power producers.

Nuclear Resources

The region's only nuclear plant, the Columbia Generating Station, is included in this category.

Operating Year

Twelve-month period beginning on August 1 of any year and ending on July 31 of the following year. For example, operating year 2024 is August 1, 2024 through July 31, 2025.

Other Publics (BPA)

Refers to the smaller, non-generating public utility customers whose load requirements are estimated and served by Bonneville Power Administration as referred to in Table 10.

Peak Load

In this report the peak load is defined as one-hour maximum demand for power.

Planned Future Resources

These resources include specific resources and/or blocks of generic resources identified in utilities' most current integrated resource plans and planning studies. These projects are not yet under construction, are not part of the regional analysis, and are in some ways speculative.

Planning Margin

A component of regional requirements that is included in the peak needs assessment to account for various planning uncertainties. In the 2018 *Forecast* the planning margin changed to a flat 16% of the regional load for each year of the study. Earlier reports included a growing planning margin that started at 12% of load, increasing 1% per year until it reached 20%.

Private Utilities

Same as investor-owned utilities.

Publicly-Owned Utilities

One of several types of not-for-profit utilities created by a group of voters and can be a municipal utility, a public utility district, or an electric cooperative.

PURPA

Public Utility Regulatory Policies Act of 1978. The first federal legislation requiring utilities to buy power from qualifying independent power producers.

Renewables - Other

A category of resources that includes projects that produce power from such fuel sources as geothermal, biomass (includes wood, municipal solid-waste facilities), and pilot level projects including tidal and wave energy.

Requirements

Include for each year, a utility's projected loads, exports, and contracts out. Peak requirements also include the planning margin.

Small Thermal & Miscellaneous Resources

This category of resources includes small thermal generating resources such as diesel generators used to meet peak and/or emergency loads.

Solar Resources

Resources that produce power from solar exposure. This includes utility scale solar photovoltaic systems but does not include distributed solar generation.

Storage

Storage resources (i.e., batteries, pumped hydro, liquid air) store energy for release at a later time. They can help shift energy from low value to high value hours. Due to efficiency losses, they are a net consumer of energy. They are usually defined by their maximum discharge rate in MW, and their total storage capacity in MWh.

Thermal Resources

Resources that burn coal, natural gas, oil, diesel or use nuclear fission to create heat which is converted into electricity.

Variable Energy Resource (a.k.a. Intermittent Resource)

An electric generating source with output controlled by the natural variability of the energy resource rather than dispatched based on system requirements. Intermittent output usually results from the direct, non-stored conversion of naturally occurring energy fluxes such as solar and wind energy.

Wind Resources

This category of resources includes the region's utility-scale wind powered projects.

Western Energy Imbalance Market (WEIM)

A real-time energy market launched in 2014, operated by the California Independent System Operator.

Western Resource Adequacy Program (WRAP)

A regional reliability and compliance program in the West. It delivers a region-wide approach for assessing and addressing resource adequacy.

I. INTRODUCTION

Q. Are you the same Cecelia Tanaka who presented Direct Testimony in this proceeding on behalf of Northwest Natural Gas Company dba NW Natural ("NW Natural" or the "Company")?

A. Yes, I presented NW Natural/200, Tanaka.

Q. What is the purpose of your Reply Testimony?

A. In my Reply Testimony, I respond to the Opening Testimony of Public Utility Commission of Oregon Staff ("Staff"), the Oregon Citizens' Utility Board ("CUB"), and the Coalition regarding the Company's bill discount program, the Low-Income Needs Assessment ("LINA"), and Oregon Low Income Energy Efficiency Program ("OLIEE"). I also address other issues raised in Staff and intervenor Opening Testimony that directly or indirectly relate to energy justice.

Q. Please provide a summary of your testimony.

A. NW Natural requests the Commission approve its bill discount program as presented in my Direct Testimony, as the program updates have been thoughtfully designed to provide deeper discounts and more meaningful energy burden relief for NW Natural's low-income customers. Staff and the Coalition criticize the bill discount program for not providing deep enough discounts for low-income customers, though at the same time, Staff also expresses concern about program costs and the impact of these discounts on customer rates. In my Reply Testimony, I explain how the Company has structured the bill discount program to provide relief within each of discount tiers, provide analysis of the energy burden mitigation offered by the current program in comparison with the proposed program, and

provide data illustrating the impact of the bill discount program on the other customer classes who will collectively pay for the program and explain the Company's position on a fixed per-bill charge for cost recovery. I also respond to Staff and the Coalition's comparison of NW Natural's bill discount levels with those of Cascade and Avista, and explain that unlike those utilities, NW Natural's bill discount program is part of a suite of offerings, including the Oregon Low-Income Gas Assistance Program ("OLGA") and the Gas Assistance Program ("GAP"), that also provide relief to energy burdened customers.

I also respond to the Coalition's testimony addressing the Company's LINA and describe the Company's plans to complete a new Energy Burden Assessment ("EBA") by fall 2024 that is informed by the lessons learned from the Company's first LINA.

In addition, my Reply Testimony discusses the OLIEE program, and responds to Staff and the Coalition's assertions that the Company should increase enrollment in the program and corrects the Coalition's misunderstandings as to OLIEE funding. I also address the Coalition's recommendations that funds be disbursed for electrification efforts and explain that this is an inappropriate use of funds collected from NW Natural's customers, particularly so when there is an entirely separate pool of federal funding available to support projects such as electric heat pump installations.

I also respond to the Coalition's arguments that the Company is not doing enough to advertise the availability of its discount programs and describe the

targeted outreach the Company is undertaking to ensure that eligible customers are aware of the programs and how to apply.

Finally, I respond to Staff's comments on the Company's Community Equity Advisory Group ("CEAG") and reiterate how the CEAG is guiding equitable collaboration on energy justice issues.

II. BILL DISCOUNT PROGRAM

Q. Please describe Staff's and intervenors' Opening Testimony discussing the bill discount program.

A. Staff appreciates the Company's work to respond to stakeholders' concerns in updating the bill discount program to adjust to customer needs. However, Staff also raises a number of concerns with the structure of the bill discount program, seeking changes to increase the discount levels and recalculations of the tiers targeting the lowest income levels instead of the midpoint.[1] Staff is concerned that using the midpoint of the tier to structure discounts does not capture enough of the energy burden for customers in that tier.[2] Staff also seeks to have the Company increase enrollment of the bill discount program[3] and discusses a desire to understand which customer classes will bear the burden of funding the cost recovery for this program through Schedule 335.[4]

[1] Staff/1200, Lockwood/24-26.

[2] Staff/300, Scala/9; Staff/1200, Lockwood/25-26.

[3] Staff/300, Scala/22.

[4] Staff/300, Scala/10-12; Staff/1200, Lockwood/26.

The Coalition testifies that it seeks to improve the program by deepening discounts, adding offerings to the bill discount program, and modifying the enrollment process.[5] Specifically, the Coalition suggests that NW Natural increase discounts for Tier 0, Tier 1, and Tier 2 customers, pointing to Cascade and Avista bill discount programs as examples.[6] The Coalition also testifies that the bill discount program should include an arrearage forgiveness element for Tier 0 customers that is "on par with its peer utilities."[7] The Coalition additionally recommends that the Commission "encourage" the Company to use the self-sufficiency standard ("SSS") in conjunction with the state median income ("SMI") index, require the Company to identify low-income customers that can benefit from the bill discount program in its next EBA, and ensure that the Company enroll at least 75 percent of bill assistance eligible households in the Test Year.[8] The Coalition also alleges the Company of failing to advertise its bill discount program, recommending the Commission require the Company to prepare a "communication strategy" to increase customer recognition of the bill discount program.[9] The Coalition also recommends the Commission require the Company to eliminate post-enrollment verifications, prohibit the Company from suspending

bill discounts pending income verification, and stop the Company from making customers "re-apply" for bill discounts after verifying income.[10]

Although CUB does not testify directly about the structure of the bill discount program, it does suggest that the Commission require the Company to provide a report on how it is mitigating rate shock in part through the bill discount program.[11]

A. Bill Discount Program – Program Design

Q. Please provide a brief overview of the Company's proposed changes to the bill discount program that were proposed in this case.

A. In my Direct Testimony,[12] I describe the Company's proposal to improve upon the original design of the approved bill discount program by increasing the bill discount percentages for Tiers 0 and 1 by using the midpoint of incomes within tiers to evaluate and target an appropriate assumed energy burden. Specifically, the Company proposed to increase the deepest discount available to the lowest income customers, Tier 0, from 40 percent to 80 percent.[13] The Company also proposed to increase available discounts for the second-lowest income tier, Tier 1, from 25 percent to 40 percent.[14] These changes are intended to target and reduce the program participants' gas usage-related energy burden to three percent of income or less.[15]

[14] NW Natural/200, Tanaka/23-24, Tables 2 and 3.

[15] NW Natural/200, Tanaka/24.

Q. Do Staff and the Coalition support the customer tiers the Company proposed in the bill discount program?

A. No. Staff testifies that it is unsure whether the new proposed tiers ranging from 25 – 80 percent discounts are deep enough discounts, potentially failing to serve the customers with the highest energy burden.[16] Staff also questions the Company's decision to target the midpoint of a tier when calculating the discount needed to reduce that tier's energy burden and whether there is a normal income distribution of participants within the tier.[17] Staff suggests that the bill discount's impact on household energy burden may be overestimated if actual incomes fall towards the lower end of the tier (rather than the midpoint of the tier) and/or if actual household energy usage is higher than what the data show.[18]

For these reasons, Staff and the Coalition suggest that the discounts in the Company's proposed bill discount program do not go far enough to protect the lowest-income customers.[19]

Q. Why did the Company target the midpoint of the income tiers for the bill discount program?

A. This approach is an improvement upon the original design of the bill discount program by providing additional coverage for the members of the tier than the prior bill discount program, which used the maximum income of a tier to estimate energy

[16] Staff/300, Scala/9.

[17] Staff/300, Scala/7; Staff/1200, Lockwood/25.

[18] Staff/300, Scala/7-9; Staff/1200, Lockwood/25.

[19] Coalition/300, Fain-Segovia Rodriguez-Daryanani/4-5.

burden. Using the midpoint estimation method is a common statistical approach used to reduce the impact of extreme outliers; by using the midpoint of an income tier to assign meaningful bill discount levels and estimate energy burden, we can get values that are more representative of the average customer within each income tier. Further, as detailed in my Direct Testimony,[20] when estimating the impact of discounts on energy burden, using the midpoint ensures that the discounts are calibrated to the needs of the "average" household rather than the highest or lowest incomes, which aligns better with our shared goals of delivering resources where they are needed most, as well as providing discounts that can have meaningful impacts on household finances and energy burden.

Absent more granular data about the distribution of customer incomes within the bill discount tiers, which we hope to obtain through the EBA[21] that is currently underway, use of the midpoint of income within a tier is a reasonable way to improve energy burden relief in comparison with the existing design that uses the maximum income within a tier. Once more granular data are known, design of the tiers can be better evaluated for further changes.

[20] NW Natural/200, Tanaka/22-23.

[21] Please note that in NW Natural/200, Tanaka, we used the term Low-Income Needs Assessment ("LINA") to refer to the study that provides insight into customer and community characteristics, eligible populations, participation in current Energy Assistance offerings, and barriers and opportunities for current or future Energy Assistance offerings. Going forward, we will be referring to this study with the preferred term Energy Burden Assessment ("EBA"). During this terminology transition, the terms LINA and EBA may be used interchangeably.

Q. How did the Company arrive at the proposed tier discounts?

A. As discussed in my Direct Testimony,[22] the income tiers were designed in a collaborative manner among the Company, Staff, and low-income advocates through a series of workshops and comments in docket ADV 1390. During the time of the ADV 1390 docket, no stakeholder raised an issue regarding the use of max income to design the discount tiers. To create the current proposal in this case, NW Natural reviewed the discount tiers of the bill discount program using experience and data gained since the launch of the program and guidance from the LINA to arrive at the proposed changes intended to better reduce the energy burden of those customers most in need.

Q. Please explain the Company's evaluation of whether new income tiers are likely to benefit low-income customers.

A. The increase in bill discounts will benefit low-income customers. The Company updated the income tiers to capture more customers within the income tier and target their energy burden to reduce it to below three percent.[23] As provided in my Direct Testimony,[24] the tables below provide a comparison of program discount impacts using the max-point income (current approach) versus the midpoint (new approach).

[22] NW Natural/200, Tanaka/22.

///

///

///

///

///

///

Q. Staff testifies it is concerned that the Company's targeting the midpoint of the income tier may underestimate the amount of discount needed for the average income customer in any given tier.[25] How does the Company respond?

A. The midpoint of an income tier means that half of all households within that tier earn more than, and half earn less than, the midpoint. Using Staff's own logic, targeting the midpoint of the income tier could just as easily *overestimate* the amount of discount needed within a given tier. Using the midpoint to estimate energy burden provides a representative value that lies between the lower and upper bounds of any income tier—effectively excluding extreme outliers at both ends of the distribution. The approach that NW Natural is taking results in a more balanced and representative estimate of energy burden for the incomes that fall within each tier.

Q. How does the Company respond to Staff's concern that the bill discount program will be less effective for the highest energy burdened and lowest income households?[26]

A. It is true that there is a range of effectiveness inherent when using a tiered design. However, NW Natural's proposal to increase the bill discount for Tiers 1 and 0 are improvements in the existing effectiveness of the bill discount program on the highest energy burdened and lowest income households. This can be illustrated

[25] Staff/1200, Lockwood/25.

[26] Staff/300, Scala/7.

by expanding Table 2 from Staff's own testimony to include a comparison of the Company's proposal and the existing design.[27] Table 3 below includes the first four columns of Staff's Table 2, to which two additional columns are added to illustrate the energy burden impacts under the current Tier 0 design. In addition, the two added columns include shading consistent with Staff's shading of after-discount energy burdens of 4.8 percent and higher. As demonstrated in Table 3 below, relief for energy burdened customers is greatly enhanced under the Company's proposal.

Table 3 – Tier 0 Impacts on Estimated Energy Burden

		Proposed Tier 0 Design Energy Burden		Current Tier 0 Design Energy Burden	
% SMI	Income	Before Discount	After Discount	Before Discount	After Discount
15%	$14,061.50	8.0%	1.6%	8.0%	4.8%
14%	$13,124.07	8.6%	1.7%	8.6%	5.1%
13%	$12,186.63	9.2%	1.8%	9.2%	5.5%
12%	$11,249.20	10.0%	2.0%	10.0%	6.0%
11%	$10,311.77	10.9%	2.2%	10.9%	6.5%
10%	$9,374.33	12.0%	2.4%	12.0%	7.2%
9%	$8,436.90	13.3%	2.7%	13.3%	8.0%
8%	$7,499.47	15.0%	3.0%	15.0%	9.0%
7%	$6,562.03	17.1%	3.4%	17.1%	10.3%
6%	$5,624.60	20.0%	4.0%	20.0%	12.0%
5%	$4,687.17	24.0%	4.8%	24.0%	14.4%
4%	$3,749.73	30.0%	6.0%	30.0%	18.0%
3%	$2,812.30	40.0%	8.0%	40.0%	24.0%
2%	$1,874.87	60.0%	12.0%	60.0%	36.0%
1%	$937.43	120.0%	24.0%	120.0%	72.0%

[27] Staff/300, Scala/8 – Table 2.

For those bill discount participants whose income falls under the midpoint of the SMI tier, NW Natural and federal energy assistance programs described in my Direct Testimony[28] can help fill those gaps. The level of relief that these income-based programs have is displayed in Table 4 (which is an extension of Table 1 from my Direct Testimony). Note that over the last five program years, the average Low Income Home Energy Assistance Program ("LIHEAP") grant was $345 and the average OLGA grant was $415. These average grant levels translate into an effective discount of 30.7 percent and 36.9 percent, respectively, on an average annual bill. In this way – by participating in LIHEAP and/or OLGA and the bill discount program – customers at the lower ends of the income tiers can secure a meaningful reduction of their energy burden.

Table 4 – Impact of Income-Based Assistance Programs

Energy Assistance Program	Average Benefit last 5 program years	Total Benefits 2022-23 program year	Customers served 2022-23 program year
LIHEAP	$345	$1,130,831	2,504
OLGA	$415	$3,688,238	7,553
GAP (OR & WA #s)	$116	$195,588	1,525
OLIEE	N/A	$1,836,123	175

[28] NW Natural/200, Tanaka/15.

Q. The Coalition points to Cascade and Avista discount programs to state NW Natural should increase its Tier 0 discounts over 80 percent.[29] Specifically, the Coalition suggests that the Company increase discount rates for Tiers 0-2 customers to 90 percent, 70 percent, and 50 percent respectively.[30] How do you respond?

A. Generally, utilities have autonomy in designing, refining and delivering programs best suited to their customers' needs and own capabilities to safely and affordably meet those needs. In 2022, pursuant to direction provided in docket UM 2211, several utilities brought forward bill discount programs. These programs were designed specifically for each utility's customer base and capabilities, and thus each utility's program differed from the other utilities' programs. As was frequently pointed out during the approval process for NW Natural's bill discount program in ADV 1390, NW Natural's bill discount program was proposed as an incremental, additional assistance program to complement its existing income-based assistance programs OLGA, GAP and OLIEE. This differed from the proposals made by Avista and Cascade, which both proposed a comprehensive reorganization of their low-income bill assistance program into a bill discount program along with other features to **replace** their existing low-income bill assistance grant programs. While I have no direct knowledge of the choices those companies made when designing their bill discount programs, it stands to reason

[29] Coalition/300, Fain-Segovia Rodriguez-Daryanani/22.

[30] Coalition/300, Fain-Segovia Rodriguez-Daryanani/20.

that discontinuing a bill assistance program would result in higher bill discount percentages in the design of the bill discount program. As was discussed throughout the workshops and comments in the ADV 1390 process, any comparison of NW Natural's bill discount program to these programs must take these significant differences into consideration. Table 5 below provides a comparison of the program offerings from the three Oregon gas local distribution companies ("LDCs") and includes the impact of NW Natural's OLGA program.[31] As can be seen in the table, when the impact of NW Natural's bill assistance grant program is included in the comparison, NW Natural's programs offer comparable, if not higher, levels of relief in comparison with the other utilities at every income tier.

Table 5 – Comparison of Utility Programs' Level of Relief

Max income Tier levels	NW Natural Bill Discount	NW Natural OLGA impact	NW Natural Total	Avista Bill Discount	Cascade Bill Discount
60% SMI	15%	37%	52%	15%	15%
45% SMI	20%	37%	57%	15%	45%
40% SMI	20%	37%	57%	25%	45%
30% SMI	40%	37%	77%	25%	70%
20% SMI	40%	37%	77%	60%	70%
15% SMI	80%	37%	117%	60%	95%
5% SMI	80%	37%	117%	90%	95%

[31] Note that customers can, and do, participate in both OLGA and LIHEAP; however, for simplicity this table takes only OLGA into account.

Q. The Coalition suggests that the bill discount program is not complete without an arrearage forgiveness component available to Tier 0 customers that is "on par with its peer utilities."[32] Why did the Company not include arrearage forgiveness as a component of the bill discount program?

A. As discussed above, the bill discount programs implemented by the Oregon LDCs are unique to each utility's capabilities and customer needs. Avista and Cascade both proposed a comprehensive reorganization of their low-income bill assistance program into a bill discount program along with other features such as an arrearage management program to **replace** their existing low-income bill assistance grant programs; they no longer have a company-supported grant-based bill assistance program. NW Natural's bill discount program was added as an **incremental** program to complement its other low-income offerings, which include our grant-based bill assistance program OLGA. As mentioned in my Direct Testimony,[33] NW Natural will learn more about the needs of customers through the upcoming EBA that is currently underway. Through this process we may learn more about the efficacy of other assistance programs that would work for our customers.

NW Natural notes that as part of our last LINA, customers were asked to rank three types of potential Energy Assistance programs in order of preference: 1) A discount program that provides a percentage discount on their monthly NW

[32] Coalition/300, Fain-Segovia Rodriguez-Daryanani/30.

[33] NW Natural/200, Tanaka/12-13.

Natural bill; 2) A forgiveness program that eliminates or reduces their prior unpaid bills to NW Natural; and 3) A time payment arrangement program where they negotiate a contract with NW Natural to pay a fixed amount for natural gas service over a specific period of time (one to two years). Customers overwhelmingly chose a discount program, and then time-payment arrangements over a forgiveness program.

Q. Are there practical concerns with further increasing discount levels or adding an arrearage forgiveness element to the bill discount program?

A. Yes. As an initial matter, proposing major changes to the bill discount program or adding additional assistance programs would be premature due to the EBA that is currently underway and the significant policy exploration taking place in the UM 2211 docket. As discussed in my Direct Testimony,[34] we evaluated the effectiveness and reach of the current tools NW Natural offers that help to mitigate energy burden as part of our preparation of this general rate case to determine if current tools were adequate to help mitigate the impact of any resulting rate changes. As illustrated in my Direct Testimony,[35] this analysis shows that NW Natural's current energy burden mitigation tools such as the bill discount program, OLGA, LIHEAP and GAP remain effective for customers. Even so, NW Natural looks forward to having the results of the current EBA, as well as policy guidance from the UM 2211 docket, to further enhance its offering of energy burden

[34] NW Natural/200, Tanaka/29.

[35] NW Natural/200, Tanaka/29-32.

mitigation tools as we look ahead. The ongoing balancing of cost and benefit is always under consideration. NW Natural is confident in its current allocation of resources and priorities based on the information we have; that said, this may change with new information available only after the completion of the 2024 EBA.

Q. The Coalition also recommends that the Commission require the Company to increase enrollment in the bill program to reach 75 percent of eligible households significantly throughout the next year.[36] Before turning to the Coalition's specific recommendation, is the Company seeking to increase enrollment in the bill discount program?

A. Yes. The Company continues to increase enrollment in the bill discount program. We share this priority and are dedicating meaningful resources to this end. However, and as mentioned in my Direct Testimony,[37] since the number of eligible households within NW Natural's territory is unknown at this time, calculating enrollment percentages and milestones related to eligible customers is not possible yet. And while we can commit to increasing enrollment (both in numbers and percentage of all households), the Company raises concern over the recommendation of a 75 percent goal–this is far beyond most enrollment rates of other long-standing and well-known programs, including Medicare (51 percent),[38]

[36] Coalition/300, Fain-Segovia Rodriguez-Daryanani/30.

[37] NW Natural/200, Tanaka/12.

[38] Nany Ochieng, et al, *Medicare Advantage in 2023: Enrollment Update and Key Trends*, KFF (Aug. 9, 2023)(available at https://www.kff.org/medicare/issue-brief/medicare-advantage-in-2023-enrollment-update-and-key-trends/).

WIC (51 percent),[39] Temporary Assistance for Needy Families (20 percent),[40] Social Security Income (57 percent) [41] and LIHEAP (15 percent).[42]

Q. Is the Company preparing to use the next LINA or EBA to target these eligible households for enrollment?

A. Yes. The next EBA will develop reliable data on NW Natural's customers who qualify as energy-burdened and where they reside. This data or inventory will serve as a baseline for the energy assistance needs of NW Natural's residential customers—as well as identify underserved customers, assess existing income-based programs and develop concrete recommendations for modifications to improve access and participation. Findings will also help to identify gaps in program participation, uncover areas of unmet need and inform marketing and outreach strategies to reach customers who are not receiving any form of energy assistance for which they are eligible. As reported in my Direct Testimony,[43] one of the deliverables of NW Natural's first EBA was a basic energy burden analysis that included a mapping tool to identify energy burdened customers at the census block level. But it did not identify how many NW Natural customers resided in each

[39] Zoë Neuberger, Lauren Hall, and Linnea Sallack, *WIC's Critical Benefits Reach Only Half of Those Eligible*, CENTER ON BUDGET AND POLICY PRIORITIES (Feb. 21, 2024) (available at https://www.cbpp.org/research/food-assistance/wics-critical-benefits-reach-only-half-of-those-eligible).

[43] NW Natural/200, Tanaka/12.

census block. The next EBA will take this analysis a step further and will uncover the pool of program-eligible customers specifically among NW Natural's customer base (as opposed to general statistics for residents in the service area).

Q. Turning now to the Coalition's specific recommendation, is its proposed 75 percent mandatory enrollment threshold realistic?

A. No. As discussed above, 75 percent far exceeds most enrollment rates of other long-standing and well-known programs.

Q. The Coalition also claims that according to NW Natural's own data, 75 percent of Oregonian respondents had not heard of the bill discount program.[44] Is this statement correct?

A. No. The Coalition makes this inference based on a misunderstanding of the LINA data and what was reported in my Direct Testimony. The LINA was conducted prior to the bill discount program so it is not reflective of the number of customers who are aware of the program since its launch. Specifically, the LINA stated,

> A quarter of respondents in both states are aware of NW Natural programs that can lower monthly bill payments or connect customers to free weatherization services, while only 23% of Oregon and 13% of Washington respondents had participated in a program in the past.

This LINA question was referring to assistance programs like OLGA and GAP. Despite the Coalition's using this statement to claim that the Company has failed to inform customers of the bill discount program, the Coalition ignores that the bill discount program did not exist at the time of this survey. The Coalition also ignores

[44] Coalition/300, Fain-Segovia Rodriguez-Daryanani/26.

language in my Direct Testimony[45] (that also has been supplied through other channels) that clearly details the robust outreach strategy the Company executed in raising awareness of and participation in the bill discount program. In fact, the Company's outreach efforts have been commended and well-received by a wide swath of constituents—including community-based organizations, customers, advisory groups, and regulatory bodies. Other important indicators of the strategy's innovative and creative qualities are that our peer utilities have modeled their own outreach efforts after ours and have called upon the expertise of Company staff to present on outreach recommendations.

Q. How does the Company respond to the Coalition's recommendation that it prepare a "communication strategy" to increase knowledge of the bill discount program?

A. The Company prepares multiple integrated communications planning documents to guide communications each year. The bill discount program is included in those plans.

Q. How can customers enroll in the bill discount program?

A. Customers can enroll in the bill discount program easily and quickly. The application takes a few minutes to complete, and discounts appear on the next bill. Several steps were taken to ease program access and streamline enrollment, including:

[45] NW Natural/200, Tanaka/17-21.

- Auto-enrolling customers who received energy assistance and weatherization services. Customers who received either of these resources in the two years preceding the program launch date (November 1, 2022) were automatically enrolled. Indeed, this practice is ongoing—any customer who receives these services is auto-enrolled.
- The application is simple and can be completed online, or filled in and emailed or printed and mailed. Financial documents are not required: self-reported figures on household size and annual income verify eligibility. There are no enrollment deadlines or enrollment windows; customers can apply over the phone, and as mentioned above, online or by US mail.

Q. The Coalition additionally suggests the Company adopt the "self-sufficiency standard" to define "low income" for purposes of the bill discount program participants.[46] How do you respond?

A. Household energy costs are not an individual consideration for the SSS defined in The Self-Sufficiency Standard for Oregon 2021 report[47] (the "Oregon Report") as a measure of income adequacy that is "based on the costs of basic needs for working families: housing, childcare, food, health care, transportation, and miscellaneous items, as well as the cost of taxes and the impact of tax credits." In fact, nowhere in the Oregon Report are energy or utility expenses mentioned. The

[46] Coalition/300, Fain-Segovia Rodriguez-Daryanani/13.

[47] Univ. of Wash. Center for Women's Welfare, *The Self Sufficiency Standard for Oregon 2021* (Sept. 2021) (available at oregon.gov/workforceboard/data-and-reports/Documents/The-Self-Sufficiency-Standard-For-Oregon-2021.pdf).

SSS may be a useful tool to evaluate employment and workforce development programs–as detailed by the authors of the Oregon Report–but it is not a relevant or sufficient replacement for the conventional poverty measure for the Company's bill discount program. The Company uses energy burden as a key indicator to gauge, analyze and evaluate the effectiveness of the bill discount program given the metric's hyperfocus on the costs of energy —the service NW Natural provides.

Additionally, there are assistance programs in place for Oregonians targeting housing, childcare, food, health care, transportation, and other needs. To the extent our customers may already be receiving this assistance, it is unclear how that assistance would be factored into bill discount levels and allocations.

A secondary factor in the Company's position is the reality that what makes the SSS so valuable (e.g., accounting for indicators beyond income and household size, like county, fair market housing costs, age of children, taxes, etc.) is also what makes it much harder to accurately calculate, utilize, and evaluate. The map on page 6 of the Oregon Report[48] provides one example of this trade-off.

Q. The Coalition suggests the Company eliminate income verification for the bill discount program.[49] How do you respond?

A. The Company is proud to offer a bill discount program that utilizes self-attestation for enrollment. As reported in the March 13, 2024 update workshop (attended by two of the Coalition's witnesses supporting Coalition/300, Fain-Segovia

[48] *Id.* at 6.

[49] Coalition/300, Fain-Segovia Rodriguez-Daryanani/29-30.

Rodriguez-Daryanani), and at the April 25, 2024 UG 490 Environmental Justice Issues workshop, NW Natural has not yet begun post-enrollment verification. Post-enrollment verification will be the process by which a sample of bill discount program participants who self-attested their income will be contacted to demonstrate the income eligibility they self-attested. In addition to ensuring that program participants are enrolled in the correct tier, it is envisioned that the verification will also provide a means for customers to connect to additional energy assistance services. Post-enrollment verification of a sample of self-attested participants is not a strategy to remove participants from the program. It is necessary for the continued support of customer-funded dollars being used for this purpose and to promote the integrity of the program.

Q. How does the Company respond to the suggestion of eliminating post-enrollment verification?

A. To be clear, the Company's position to conduct post-enrollment verification is not a strategy to shame, penalize or limit access—the Company is not seeking to remove customers from this meaningful resource that eases energy burden. Conducting income verification for a small pool of program participants safeguards program integrity, strengthens public trust and demonstrates prudent management of customer funds. Auditing everyone would be resource-intensive and burdensome. Focusing on a sample strikes a balance between rigor and efficiency. It minimizes administrative overhead while still achieving the desired level of scrutiny. The practice ensures accountability and signals to our customer base that NW Natural is a diligent steward of these funds and that funds are being

used for their intended purpose. Asking ratepayers to pay for a program that has a specific purpose without any oversight or income verification compromises the sustainability and support of the program.

It should also be noted that income verification is required for most other federal and state programs in which eligibility for benefits is based on income. One report from the US Government Accountability Office found that agencies administering six of the country's largest federal programs used over 30 data sources to verify income and assets.[50]

The Company also points to recommendations from the U.S. Department of Energy on post-enrollment verification for programs that rely on self-attestation for entry:

> When allowing households to self-attest their income status, programs should independently verify each household's self-attested income prior to delivering rebate funds. If over time the program identifies that most applicants are adequately and accurately representing their income, programs may reduce the rate of income verification checks over time.[51]

[50] U.S. Gov't Accountability Office, *Federal Low-Income Programs: Use of Data to Verify Eligibility Varies Among Selected Programs and Opportunities Exist to Promote Additional Use*, GAO-21-183 (Mar. 29 2021) (available at https://www.gao.gov/products/gao-21-183).

[51] U.S. Dept. of Energy, *Serving Low-Income Households with Home Energy Rebates: Streamline Income Eligibility Processing* (Mar. 2024) (available at https://www.energy.gov/scep/slsc/home-energy-rebates-program/serving-low-income-households-home-energy-rebates).

Q. The Coalition further recommends the Commission prohibit NW Natural from suspending bill discounts for households that cannot or do not verify their income because there are a number of reasons customers may not respond to the Company's various attempts to verify income.[52] How do you respond?

A. This recommendation is premature, as any details of the verification process have yet to be determined.

Q. The Coalition also asks the Commission to prohibit NW Natural from having customers "re-apply" for bill discounts if they have been removed from the program for failing to verify income and then are subsequently able to demonstrate eligibility.[53] Is it true that the Company requires customers to re-apply for discounts upon verifying their income?

A. No. The Coalition is incorrect. No customer has been removed from the bill discount program for failing to verify income.

Q. The Coalition argues that "concerns of fraud and dishonesty do not outweigh the risk of eliminating assistance" for households that do not respond to requests to verify income.[54] Do you agree?

A. No. The Company takes issue with the allegation of Coalition that the "basis for income verification" is to uncover cases of "fraud and dishonesty." This is untrue and misrepresents the Company's ethos. Income verification of a small sample of

[52] Coalition/300, Fain-Segovia Rodriguez-Daryanani/29-31.

[53] Coalition/300, Fain-Segovia Rodriguez-Daryanani/29-31.

[54] Coalition/300, Fain-Segovia Rodriguez-Daryanani/29.

program participants serves as a strategic approach to maintain program integrity and public confidence while signaling responsible use of customer dollars.

Q. The Coalition states that NW Natural "puts the onus on the customer to re-apply for the bill discount program after being found ineligible and subsequently verifying eligibility."[55] Is the Coalition correct?

A. No. There is no re-application requirement for participants with verified income eligibility. In this scenario, a customer would be automatically and immediately enrolled once eligibility was verified. There would not be an additional step to "re-apply."

Q. The Coalition is concerned that the bill discount program does not go far enough to alleviate energy burden and instead that it merely mitigates some of the rate increase the Company is seeking.[56] How do you respond?

A. Once again, the Company points to a clear calculation of how the bill discount program reduces the energy burden of eligible participants across all tiers to below the industry standard of affordability of 3 percent.[57]

[55] Coalition/300, Fain-Segovia Rodriguez-Daryanani/29.

[56] Coalition/300, Fain-Segovia Rodriguez-Daryanani/17.

[57] Table 2 - Proposed Bill Discount Tiers.

B. Bill Discount Program - Cost Recovery

Q. Please describe Staff's concerns regarding cost recovery associated with the Company's bill discount program.

A. Staff is concerned about impacts of the changes to the bill discount program on the customer classes that will bear the cost recovery.[58] In particular, Staff is "uncertain" about cost projections of proposed changes to the bill discount program and "specifically concerned with the potential increase in costs due to the increase[d] discounts offered in Tier 0 and Tier 1."[59] Staff indicates that cost recovery is unequal between customer classes, and that industrial customers have a lower Schedule 335 impact on average.[60] Staff recommends that the Commission reject the bill discount program until the Company presents a cost analysis and projected changes to Schedule 335.[61] Alternatively, Staff proposes that NW Natural should withdraw the bill discount program from the rate case and put it into its own docket so that these questions can be explored.[62]

Q. How does the Company respond to the request for a cost analysis of the impacts of the proposed bill discount program?

A. The Company appreciates the sensitivity toward all customer classes that will be impacted by the expansion of the bill discount program. As noted in my Direct

[58] Staff/300, Scala/6; Staff/1200, Lockwood/25-26.

[59] Staff/1200, Lockwood/27.

[60] Staff/300, Scala/12.

[62] Staff/1200, Lockwood/27.

Testimony,[63] NW Natural's last LINA did not provide detailed income information about our customers that could help us identify an estimated number of our income-eligible customers. Our upcoming EBA, which is currently in flight, will identify an estimate of our income-eligible customers. As a result, any cost analysis completed before the EBA is completed will necessarily need to focus on cost impacts of assumed participation levels without being informed by the participation rate of eligible customers.

Q. Has the Company prepared additional analysis regarding bill discount program costs as part of your Reply Testimony?

A. Yes. To be responsive to the concerns raised in Staff's testimony, the following tables provide cost and rate impacts of NW Natural's proposal to increase the bill discount percentage for Tier 1 and Tier 0. The first table (Table 6) begins with the current level of funding included in rates today, as approved in docket ADV 1562, which is $7.9 million. Next, we have calculated the impact of the proposed increase in the bill discount percentages for Tier 1 and Tier 0 as if the change had been in place at the time of ADV 1562 – this resulted in a total of $11.1 million, which is an increase of $3.2 million. Lastly, we have calculated the impact on costs as the percentage of residential customers participating in the bill discount program increases in 1.5 percent increments (Table 7). Note that as reported in docket RG 102, NW Natural has 47,121 participants in the bill discount program through March 2024, which is about 7.17 percent of all residential customers.

[63] NW Natural/200, Tanaka/8-13.

Table 6 - Cost Impact of Increased Discount at Increased Participation Levels

	Cost	Number of Participants	% of Residential Customers
Costs of 2024 estimate in rates (ADV 1562) (excludes previous year true-up)	$7,930,984	41,391	6.5%
Estimated cost with increased discounts for Tier 1 and 0	$11,123,836	41,391	6.5%
Estimated cost with increased discounts for Tier 1 and 0 at 8% participation	$12,521,654	50,943	8.0%
Estimated cost with increased discounts for Tier 1 and 0 at 9.5% participation	$13,919,472	60,495	9.5%
Estimated cost with increased discounts for Tier 1 and 0 at 11.0% participation	$15,317,290	70,046	11.0%
Estimated cost with increased discounts for Tier 1 and 0 at 12.5% participation	$16,715,108	79,598	12.5%

Table 7 - Rate Comparison of Increased Discount at Increased Participation Levels

	RS 2 Charge per Bill	RS 3 Charge per Bill	RS 27 Charge per Bill	RS 31 Charge per Bill	RS 32 Charge per Bill
Current costs in rates (ADV 1562)	$0.94	$3.24	$0.61	$25.90	$62.77
Estimated cost with increased discounts for Tier 1 and 0	$1.23	$4.26	$0.80	$34.03	$82.46
Estimated cost with increased discounts for Tier 1 and 0 at 8% participation	$1.36	$4.70	$0.89	$37.59	$91.08
Estimated cost with increased discounts for Tier 1 and 0 at 9.5% participation	$1.49	$5.15	$0.97	$41.14	$99.69
Estimated cost with increased discounts for Tier 1 and 0 at 11.0% participation	$1.62	$5.59	$1.05	$44.70	$108.31
Estimated cost with increased discounts for Tier 1 and 0 at 12.5% participation	$1.75	$6.04	$1.14	$48.26	$116.93

Q. Is Staff's concern regarding cost recovery potentially at odds with the Coalition's suggestions for deeper discounts?

A. Likely yes. Providing deeper discounts will necessarily create additional expense for the program. Also, as explained above, the Coalition's suggestion for deeper

discounts, similar to the other Oregon LDCs, fails to consider the availability of NW Natural's other bill assistance programs, which the other LDCs do not have.

Q. Are cost caps currently in place for each customer class, and what is the Company's rationale for capping cost recovery?

A. To be clear, the current recovery of costs for the bill discount program does not include cost caps, per se. As Staff indicates, NW Natural's cost recovery for the bill discount program "is set up as a fixed dollar charge for all general service schedules. This structure effectively caps recovery from each customer type at the level of the fixed dollar charge."[64] The fixed charge cost recovery in Schedule 335 is the direct result of stakeholder feedback during the ADV 1390 proceeding, where NW Natural heard a clear preference for fixed charge recovery.

Q. Staff expresses concern about the Company's decision to structure cost recovery for the bill discount program as a fixed dollar charge.[65] Please explain the Company's decision to structure the program as a fixed charge per bill.

A. This approach came directly from stakeholder feedback. Back in February 2022, before NW Natural filed its bill discount program proposal, several opportunities for stakeholder feedback were offered, including a workshop, follow-up call and available office hours for stakeholders. We heard a clear preference for a per-bill charge. As a result, we adopted the per-bill charge and included it in our initial

[64] Staff/300, Scala/11.

[65] Staff/300, Scala/11-12.

filing in April 2022. During the four workshops and comments that followed in the docket ADV 1390 procedural schedule, we did not get any feedback that disagreed with that approach.

Further, NW Natural finds a fixed-bill cost recovery design to be appropriate for the bill discount program, which is a program offered to residential customers and is recovered from all residential, commercial, and industrial customers. Importantly, costs of the bill discount program are allocated on an equal-percentage-of-margin basis to each customer rate schedule, using the current approved rate structure. From there, per-bill rates are derived at the rate schedule level for Rate Schedules 2, 3, 27, 31, and 32.

We find this cost recovery to be appropriate, as costs are appropriately allocated to customer classes commensurate with the current approved rate design that was informed by the last long-range incremental cost study. In addition, the per-bill charge smooths the impact of the cost to customers and removes the impact of the seasonality of gas usage and mitigates the potential for under- or over-collecting the costs of the program. Further, any potential for cost-shifting is minimized because the costs of the bill discount program are tracked in a balancing account, so any under- or over-collected costs are taken into account during the annual update to rates for the program's cost recovery.

Q. Could shifting to a volumetric rate for funding the bill discount have consequences for low-income, high-use customers?

A. Yes. Research from the American Council for an Energy-Efficient Economy ("ACEEE") found that low-income households pay 15 percent more per square foot

for energy compared to the average household ($1.41/ft² and $1.23/ft², respectively). A 2021 study reported in *Proceedings of the National Academy of Sciences*[66] supported these findings and showed that when evaluating annual energy use, on average, homes in the lowest income neighborhoods had 25-60 percent higher energy use per square foot compared to the highest income neighborhoods. The study also found that even within income groups, predominantly non-white neighborhoods had higher energy use intensity (per square foot) compared to predominantly white neighborhoods. In light of these concerns, the Company prefers to employ caution in structuring a per therm charge where the impact on energy burden could be lower for those low-income/high usage customers. Further, a volumetric charge would lead to overcollection during cold weather and under-collection in warm weather, but a fixed charge makes it more predictable for customers.

Q. Please respond to Staff's recommendation that the Commission reject the changes to the bill discount program until the Company provides more detailed information regarding cost recovery.[67]

A. As explained above and in my Direct Testimony,[68] NW Natural's proposal to improve the current design of the bill discount program by increasing the discounts for Tier 1 and 0 will provide meaningful benefit to program participants, mitigate

[66] Kangkang Tong et al, *Measuring social equity in urban energy use and interventions using fine-scale data*, 118 PNAS 24 (Jun. 15, 2021) (available at https://www.pnas.org/doi/10.1073/pnas.2023554118).

[67] Staff/1200, Lockwood/27-28.

[68] NW Natural/200, Tanaka/22-23.

energy burden by targeting 3 percent and is well-supported. And as discussed above, the rate design of the Company's current cost recovery of the bill discount program through per-bill charges remains an efficient and equitable methodology. Finally, in response to Staff's request, NW Natural prepared an analysis of potential program costs assuming different participation levels, as shown above in Tables 6 and 7.

Q. How do you respond to CUB's suggestion to require a report on rate shock mitigation through the bill discount program?[69]

A. As indicated in my Direct Testimony, NW Natural has analyzed and demonstrated our review of the current tools available to help mitigate rate changes and energy burden. That analysis showed that we are continuing to have effective mitigation tools to help reduce energy burden, thus helping to insulate the impacts of rate changes on customers most in need. The Company opposes a formal requirement to file a plan on rate shock given that it already provides periodic reports on its existing rate mitigation tools.[70] Adding another filing is unnecessary because it is an inefficient use of Commission, stakeholder, and Company resources and creates barriers to access for those who cannot get involved in a rate case or other Commission proceeding.

[69] CUB/100, Jenks/15.

[70] NW Natural's OLGA Annual Report is filed in docket RG 10, the OLIEE Annual Report is filed in docket RG 13, and the quarterly bill discount report is filed in docket RG 102.

III. 2022 LINA / 2024 EBA

Q. Please describe Staff's and the Coalition's testimony about the LINA.

A. Staff notes that the Company should make use of the LINA to identify households that may be eligible for programs such as the OLIEE.[71]

The Coalition testified that the LINA uses too small a sample size and does not include granular, customer-specific data.[72] It took issue with the Company's reliance on census tract data and averaged data estimates, arguing that the Company should instead gather customer demographics from Community Action Partner ("CAP") agencies or credit bureaus to create a dataset of customer addresses that includes detailed information such as household income, age of occupants, and homeownership status.[73] The Coalition states that the SSS is a superior form of measurement of customer's energy burden because it determines the amount of income a household needs to afford a variety of basic expenses. The Coalition argues that the SSS provides better insight into the level of income a household needs to avoid being burdened by energy costs.[74]

[71] Staff/1200, Scala/12-15.

[72] Coalition/300, Fain-Segovia Rodriguez-Daryanani/10-11.

[73] Coalition/300, Fain-Segovia Rodriguez-Daryanani/11-13.

[74] Coalition/300, Fain-Segovia Rodriguez-Daryanani/14-15.

Q. Has the Company been able to use the data from the LINA to identify zip codes of low-income customers who may be eligible for bill discounts or OLIEE funds?

A. As discussed above, while it was not a deliverable of the first LINA, we plan for the 2024 EBA to provide granular information about energy burdened customers, by zip code and/or census tract.

Q. Please respond to the Coalition's assertion that the LINA sample size was too small.

A. AEG, the expert on this matter, detailed its multi-stage recruitment effort to get as large as a set of survey responses as possible. This included:

1. A postcard survey invitation was mailed to 4,520 Oregon customers (3,900 urban and 620 non-urban) and 1,233 Washington customers (1,000 urban and 233 non-urban) based on the established quotas.
2. A week after the initial mailing, a second invitation postcard was sent to the same sample.
3. AEG mailed the invitation to an additional 1,000 Washington customers in the sample frame to increase the sample pool.
4. Finally, AEG emailed the survey to Oregon and Washington NW Natural Residential Insight Panel members, regardless of whether they were likely to qualify for the survey. A total of 1,616 customers completed the screening portion of the survey. Of those, nearly **25 percent (370)** of respondents were income qualified.

Q. Does the Company have any concerns about the Coalition's recommendation that it gather customer demographics from CAP agencies or credit bureaus to create a dataset of customer addresses that includes detailed information such as household income, age of occupants, and homeownership status?[75]

A. Yes. The Company does have concerns about this recommendation, such as:

- Privacy Concerns: Collecting personal information without explicit consent can raise privacy issues and legal risks.
- Utility Overreach: Gathering detailed customer demographics at this level may be invasive.
- Trust Erosion: Data collection can erode trust between utilities and customers—especially vulnerable communities and harder to reach households who may become wary of sharing information and further disengage from utility programs.
- Operational Complexity: Managing large datasets requires significant resources and storing detailed demographics increases the risk of data breaches.

Q. What are the Company's plans for improving the next EBA?

A. As reported in the March 13, 2024, workshop mentioned above, NW Natural is working with Empower Dataworks to conduct an EBA that will collect and aggregate data related to energy bills, program participation and customer

[75] Coalition/300, Fain-Segovia Rodriguez-Daryanani/11-13.

demographics to support our understanding of energy burden among residential customers, building a data foundation to evaluate program performance, inform program design and improve marketing and research. The EBA will be completed by the fall of 2024.

IV. OLIEE

Q. Please describe Staff's and intervenors' testimony regarding the OLIEE program.

A. Staff acknowledges that the Company has been working to expand spending on its OLIEE program and has recently removed project caps for projects that meet its qualifications.[76] However, Staff encourages the Company to increase enrollment of its OLIEE program with targeted design and outreach and to close the gaps it observes between OLIEE projections and completions.[77]

The Coalition provides a number of suggestions related to OLIEE spending, including increasing spending and eliminating restrictions on funding.[78] Specifically, the Coalition recommends the Commission require NW Natural to change the structure of its OLIEE program to (1) remove financial caps on spending per dwelling to "encourage spending of existing program funds"; (2) increase the budget for health and safety repairs to $10,000 per home to enable CAP agencies to make repairs for home weatherization and appliance upgrades;

[76] Staff/300, Scala/14.

[77] Staff/300, Scala/13.

[78] Coalition/300, Fain-Segovia Rodriguez-Daryanani/31-32, 38.

and (3) remove the requirement to replace gas appliances with new gas appliances and instead permitting OLIEE fund recipients to choose electric heat pumps.[79]

The Coalition also indicates that the Company should use the revised LINA to identify customers eligible for OLIEE funds, testifying that the Company has not reached enough customers and has failed to disburse funding appropriately.[80] The Coalition recommends that the Commission require the Company to "improve [OLIEE] administration" by (1) using OLIEE funds to target customers with high energy burden; (2) developing a communications plan to advertise the OLIEE program; and (3) spending at least $2.5 million of existing OLIEE funds on the Open Solicitation Program ("OSP").[81]

Further, the Coalition recommends the Commission prohibit NW Natural from making changes to the OLIEE program through tariff filings and instead require that the Company make any changes in a rate case.[82]

Q. How do you respond to the Coalition's statement that the Company allowed OLIEE funding to build up and then "cut funding completely" to OLIEE?[83]

A. This is a mischaracterization of the Company's work on expanding OLIEE. The Company has remained forthcoming and transparent about the build-up of OLIEE funds with our Advisory Committee and in our annual OLIEE reports. The timing

[79] Coalition/300, Fain-Segovia Rodriguez-Daryanani/47.

[80] Coalition/300, Fain-Segovia Rodriguez-Daryanani/40.

[81] Coalition/300, Fain-Segovia Rodriguez-Daryanani/47-48.

[82] Coalition/300, Fain-Segovia Rodriguez-Daryanani/32.

[83] Coalition/300, Fain-Segovia Rodriguez-Daryanani/37.

of the funding pause was consistent with when we typically update the public purpose charge. The Company previewed this with the OLIEE Advisory Committee several times during 2023. Additionally, NW Natural provided information about the OLIEE funding balance in its last rate case, docket UG 435, NW Natural/2200, Moerlins/15-16.

Much of the OLIEE build-up is due to the Company increasing the surcharge on customer bills earmarked for OLIEE in early 2020 immediately prior to COVID restrictions falling into place. Then, although the Company had expected to collect and spend a higher amount of funds that year, COVID restrictions and related supply chain issues limited the amount of work that could be done and funds that could be spent. Since then, the Company has taken targeted action to spend those funds down without over-collecting from customers.

Q. Please explain how the Company works with CAPs to disburse OLIEE funds.

A. CAP agencies have multiple sources of funding and they blend these funds to maximize the energy efficiency upgrades that a client receives. Once a project is completed, a CAP agency will provide NW Natural the necessary information to receive reimbursement for the weatherization project. NW Natural notes that the funding sources for weatherization projects are not transparent to the customer; customers are unable to choose the funding sources with which to work. The agencies have waitlists for customers to receive these services, and once a customer is able to access the program, an audit is done to determine the best mix of services and funding sources for that specific customer.

Q. Keeping in mind these limitations, how has the Company attempted to address underspending of OLIEE funds?

A. As further described below, NW Natural has worked with its OLIEE Advisory Committee on tariff changes that broadened the reach of funding to customers and for measures, restored delivery of the OSP, and leveraged enhanced outreach for the Company's low-income programs. Additionally, NW Natural is working with OSP partners to address some of the gaps observed in specific service areas like Coos Bay and Hood River.

Q. The Coalition recommends that NW Natural remove financial caps on spending per dwelling and increase the limit for health and safety repairs performed with OLIEE funds to $10,000.[84] How do you respond?

A. These recommendations are moot. As discussed in the April 25, 2024 UG 490 Environmental Justice Issues Workshop, and as signaled in my Direct Testimony,[85] NW Natural worked with our OLIEE Advisory Committee to develop changes to Schedule 320 to expand the reach to customers and provide more support for projects and to ease the administrative burden of the agencies that administer OLIEE projects. The tariff filing was docketed as ADV 1593 and approved by the Commission at its March 19, 2024 Public Meeting, and the revised tariff pages

[84] Coalition/300, Fain-Segovia Rodriguez-Daryanani/39.

[85] NW Natural/200 Tanaka/28.

became effective March 20, 2024.[86] The approved changes removed the project reimbursement caps.

Q. The Coalition states "NW Natural does not perform any outreach to the public regarding its OLIEE program."[87] Is the Coalition's statement true?

A. No, the Coalition's statement is incorrect and misrepresents the information provided. The statement incorrectly assumes that the examples presented in my Direct Testimony[88] are the only methods of outreach the Company performs regarding the OLIEE program. In contrast, as detailed in my Direct Testimony, those instances are merely demonstrations of how our partner CAP agencies effectively utilize energy education funds.

NW Natural further detailed outreach for its OLIEE Program in response to Coalition data requests. Below are additional examples of outreach material that have been produced by NW Natural to promote partnerships with community action agencies across the service territory, as well as for cross promotion of the bill discount program. These educational outreach materials are distributed at community events and through a trusted network of community partners.

[86] See *NW Natural Advice No. 24-02, Schedule 320 OLIEE Programs*, Docket No. ADV 1593, Staff Memo (Mar. 19, 2024).

NW Natural®

Q. How does the Company respond to the Coalition's recommendation that the Commission require the Company to prepare a communication plan to inform customers about OLIEE?

A. The Company currently is working on such a communication plan. We have developed several pieces of outreach that our customers interact with at different events or through our partners and we are working on mapping these communication pieces.

Q. Has the Company dedicated funds to reaching customers who qualify for OLIEE?

A. Yes, we have committed $2.5 million of the built-up OLIEE funds for use in the OSP. As indicated in my Direct Testimony,[89] OSP serves as a funding vehicle or

[89] NW Natural/200, Tanaka/25.

tool to unlock, expedite, and streamline the delivery of energy efficiency projects that help low-income customers reduce energy usage, save money and live in healthier homes. The OSP was introduced to Schedule 320 in 2013 as a supplemental, complementary resource to increase and accelerate the delivery of weatherization services to income-eligible households while adhering to the spirit of the OLIEE program.

Since the relaunch of the program, OSP has delivered nearly $3 million in energy efficiency and weatherization funding and served roughly 630 low-income households and families. Spending reached this level after the program was dormant for several years to refine reporting and process document practices, enable higher transparency and establish staffing capacity to lead the program.

Q. Is the Company performing targeted outreach of communities that could benefit from OLIEE funds?

A. Yes, the Company is actively pursuing targeted outreach of communities that could benefit from OLIEE through bill inserts and through other wide-reaching mechanisms, such as a billboard in Washington County.

Q. The Coalition recommends that OLIEE funds be used for a different purpose, such as electrification. How does the Company respond?

A. The Company does not believe it is proper to require customers to pay into a public purpose fund for a very specific use, and then unilaterally change that use after collection of those monies. The purpose of OLIEE is to promote energy equity, energy affordability and health outcomes for income-eligible customers through energy efficiency upgrades. OLIEE finances weatherization projects and energy

literacy for income eligible customers such that: energy savings are maximized; customers are warm, empowered and healthy; and low-income housing stock is increasingly durable. In addition, OLIEE funds typically only upgrade appliances while full electrification of a household will require additional funding from a source intended to undertake such large projects.

Second, there are federally-funded rebate programs available for heat pump installations, and low-income customers can qualify for a rebate of up to $8,000 for a heat pump—likely covering the entire cost. As a matter of principle, it does not make sense to redirect funds paid for by natural gas customers to fund electric appliance installation. However, the fact that there is a separate funding pool for heat pumps makes this proposal even more unreasonable.

Finally, the Company questions the use of customer funds to remove gas infrastructure and limit investment in future gas customers. Instead, the Company is actively exploring energy efficiency solutions that leverage hybrid heating and cooling solutions leveraging the strengths of both the gas and electric systems. This is evidenced by NW Natural's participation in an HVAC pilot with all other Oregon investor-owned utilities administered by the Energy Trust of Oregon and the Company's support of a hybrid heat solution being implemented by the partner Homes For Good.

Q. Do you agree with the Coalition that electrification "promotes energy equity for low-income and other marginalized communities"[90]?

A. No. The statement that electrification promotes energy equity is an oversimplification to an issue that is much more complicated and nuanced. Electrification is not inherently a more equitable energy solution across multiple assessments of energy equity.

First, electrification is not more affordable. In 2022, the U.S. Department of Energy reported that natural gas is 3.4 times more affordable than electricity and significantly more affordable than several other residential energy sources for the same amount of energy delivered. [91] January 2024 data show that natural gas heat costs in Oregon are roughly 40 percent of the price of electric heat, on a per unit heat basis.[92]

Second, electrification is not more energy efficient. In 2023, 38 percent of Oregon's total net generation of electricity was provided by natural gas fired power plants.[93] And during the process of burning gas to generate electricity, more than

[90] Coalition/300, Fain-Segovia Rodriguez-Daryanani/42.

[91] U.S. Dept. of Energy, 87 Fed. Reg. 12681, Table 1 (Mar. 2, 2022).

[92] Anne Lauer, *Natural Gas Heat vs Electrical Heat – Which is Cheaper – 2024*, SHRINK THAT FOOTPRINT (Jan. 2024) (available at https://shrinkthatfootprint.com/natural-gas-heat-vs-electrical-heat/) (compiling data prepared by the U.S. Energy Information Administration).

[93] U.S. Energy Info. Admin., *Oregon State Profile and Energy Estimates: Electricity* (Apr. 18, 2024) (available at https://www.eia.gov/state/analysis.php?sid=OR#:~:text=Natural%20gas%20fuels%20the%20second,the%20state's%20total%20net%20generation).

half of the heat energy in the fuel is lost[94]–a far more inefficient process than direct gas use.

Third, electrification does not boost resiliency efforts. Rather than make our networks and critical systems more resilient and less vulnerable to disruptions, electrification concentrates our dependence on a single network.

Q. The Coalition recommends the Commission prohibit NW Natural from making changes to the OLIEE program through tariff filings and instead require that the Company make any changes in a rate case to ensure participation by environmental justice groups.[95] How do you respond?

A. First, it is difficult to square that recommendation with the Coalition's statement that "rate cases deny low-income Oregonians meaningful participation in the rate-making process and conflict with the principles of procedural equity and justice."[96] Second, NW Natural already facilitates an existing process with its OLIEE Advisory Committee, which includes members from community action agencies, Staff, and CUB, to discuss any potential changes and suggestions to the OLIEE program. The OLIEE Advisory Committee meets regularly to discuss the status of the OLIEE program and to vet any needed changes or improvements to OLIEE. We find that this existing process is far more inclusive and collaborative and furthers the principles of procedural equity and energy justice.

[94] Karin Kirk, *Energy loss is single-biggest component of today's electricity system*, YALE CLIMATE CONNECTIONS (Oct. 24, 2022) (available at https://yaleclimateconnections.org/2022/10/energy-loss-is-single-biggest-component-of-todays-electricity-system/).

[95] Coalition/300, Fain-Segovia Rodriguez-Daryanani/32.

[96] Coalition/300, Fain-Segovia Rodriguez-Daryanani/49.

V. MISCELLANEOUS ENERGY JUSTICE ISSUES

A. Messaging and Advertising Program Availability

Q. Please describe the Coalition's testimony regarding Company advertising of the availability of the bill discount program and OLIEE to customers.

A. The Coalition testifies that Company failed to educate customers regarding the availability of its bill discount program.[97] The Coalition also testifies the Company has not sufficiently advertised its OLIEE program.[98] The Coalition takes issue with this as the reason for its assertion that the enrollment is low at this time.[99] As the Company testified in Direct Testimony, the Company has informed customers about its programs through a variety of avenues, including targeted outreach, direct engagement, and paid ads.[100] In addition, the Coalition's criticism seems to be based on the LINA survey results conducted by AEG. That LINA survey was conducted many months before the bill discount program was even finalized and implemented.

Q. What steps has NW Natural taken to communicate the availability of the bill discount program to customers?

A. NW Natural has spent countless hours refining and amplifying its bill discount program offerings. Its outreach strategy and materials are often duplicated and modeled by other utilities. To state that the Company failed to advertise the bill

[97] Coalition/200, Apter-Connolly/35-36.

[98] Coalition/200, Apter-Connolly/36.

[99] Coalition/300, Fain-Segovia Rodriguez-Daryanani/26.

[100] NW Natural/200, Tanaka/17.

discount program or the OLIEE is false. Please also refer to NW Natural/3200, Beck for additional details regarding the robust outreach related to the Company's bill discount program.

B. CEAG

Q. Did parties comment on NW Natural's CEAG?

A. Yes, Staff testifies generally in support of the CEAG and its role in providing diverse, equitable and inclusive input for the Company and its makeup of community members. Staff indicates that it can envision improvement regarding the visibility of the CEAG, the Company's level of accountability to the CEAG, and Company's commitment to expanding the CEAG's influence.[101]

Q. How do you respond to Staff's comments on the CEAG?

A. The Company is encouraged by Staff's positive reaction to the CEAG and is open to collaborating on avenues for developing the CEAG. In developing the CEAG, the Company and CEAG members developed guidelines and a charter that govern CEAG meetings and its relationship with the Company. These guidelines and charter documents limit the ability of the Company to open meetings up to other participants or add meetings to the CEAG's schedule.

However, the Company is interested in an ongoing dialogue with Staff to provide updates regarding work with the CEAG when appropriate. For example, the Company can envision having Staff meet with the core internal CEAG group periodically to provide updates and answer questions.

[101] Staff/300, Scala/15-17.

NW Natural is committed to an authentic and effective process: a core tenet of the group is to solicit ideas and encourage engagement from new perspectives, voices, and lived experiences in an authentic way—avoiding the pitfalls of diversity, equity and inclusion work that can be transactional and performative. Examples of how we are fulfilling this commitment include:

- Center meetings on actionable asks of group.
- Hire third party consultants.
- Compensate groups.
- Formalize feedback and accountability measures (also formalized in CEAG charter).
- Source meeting topics based on feedback from CEAG members.

Q. What actions is the Company taking to ensure transparency on the CEAG and its recommendations?

A. The Company has held numerous meetings to share information and updates on the CEAG rollout. We have also emphasized and encouraged feedback and follow-up from stakeholders.

Q. Does this conclude your Reply Testimony?

A. Yes, it does.

COST OF CAPITAL
EXHIBIT 2400

REDACTED

June 4, 2024

EXHIBIT 2400 – REPLY TESTIMONY – COST OF CAPITAL

Table of Contents

I. Introduction and Summary 1

II. Capital Structure 2

III. Credit Ratings 8

I. Introduction and Summary

Q. Are you the same Brody Wilson who provided Direct Testimony on NW Natural Gas Company dba NW Natural's ("NW Natural" or "the Company") cost of capital?

A. Yes, I presented NW Natural/300, Wilson.

Q. Please summarize your Reply Testimony.

A. NW Natural continues to request a capital structure of 50 percent equity and 50 percent debt for ratemaking purposes, which Public Utility Commission of Oregon Staff ("Staff") supports. The Company works to keep its actual capital structure at or near 50/50, but the capital structure always fluctuates over time. The Alliance of Western Energy Consumers' ("AWEC") argument for a capital structure of 48 percent equity and 52 percent debt is based on a single point in time and ignores these natural fluctuations. AWEC also misrepresents the reasons for the Company's recent debt issuances. With respect to the Company's credit rating, S&P Global updated NW Natural's outlook from negative to stable, but concerns about the Company's credit metrics persist.

Q. Do you include any exhibits with your testimony?

A. Yes, I am presenting the following exhibits: NW Natural/2401, Wilson (Long- and Short-Term Interest Rates); NW Natural/2402, Wilson (AWEC's Response to NW Natural Data Request No. 11); and NW Natural/2403, Wilson (S&P Global Ratings Research Update).

II. Capital Structure

Q. Do you have any updates to NW Natural's requested capital structure for ratemaking purposes in this proceeding?

A. No. The Company continues to request that the Commission adopt for NW Natural a 50/50 capital structure for ratemaking purposes. I would note that the parties settled the embedded cost of long-term debt at NW Natural's requested 4.712 percent, and the rest of NW Natural's requested capital structure remains unchanged from my Direct Testimony. The following table presents the proposed capital structure along with the calculation of the Company's rate of return for the Test Year:

Table 1. Requested Capital Structure and Rate of Return

Component	Ratio	Cost	Weighted Cost
Long-term Debt	50%	4.712% (settled)	2.356%
Common Equity	50%	10.1%	5.050%
Total	**100%**		**7.406%**

Q. Does Staff support the Company's proposed 50/50 capital structure?

A. Yes. Staff recommends that the Commission adopt NW Natural's proposed 50/50 capital structure, consistent with the capital structures adopted for Cascade Natural Gas and Avista.[1] Staff notes that while the Company's actual capital structure has fluctuated a bit over the past five years, the Company has maintained

[1] Staff/1600, Pileggi/3.

a capital structure near 50/50 over that period.[2] Regarding the fluctuations, Staff explained that they "are expected as issuances, redemptions, and maturations on financial instruments are not in perfect sync" and further that it is not "always beneficial for the company to maintain a perfectly uniform capital structure."[3]

Q. Why has the Company maintained a capital structure at or near 50/50?

A. The Company works to keep its capital structure at or near 50/50 to balance the twin goals of keeping rates low and ensuring access to capital markets on favorable terms.

Q. Does any party oppose NW Natural's proposed capital structure?

A. Yes. AWEC argues NW Natural did not justify the reasonableness of its proposed capital structure relative to its actual capital structure and recommends that the Commission adopt a capital structure for NW Natural of 52 percent debt and 48 percent equity to align with NW Natural's actual capital structure expected at the beginning of the rate-effective period.[4]

Q. Is AWEC's proposal reasonable?

A. No. As I noted in my Direct Testimony, and as understood by Staff, NW Natural's capital structure—indeed, the capital structure of any company—will naturally fluctuate over time.[5] Confidential Figure 1 below shows the fluctuation in the Company's percent equity over time and projected future fluctuations.

[2] Staff/1600, Pileggi/3.

[3] Staff/1600, Pileggi/2.

[4] AWEC/100, Mullins/2, 15.

[5] NW Natural/300, Wilson/3.

[BEGIN CONFIDENTIAL]

Figure 1. Equity Percentage Fluctuation Over Time

[END CONFIDENTIAL]

Given the natural variation in equity and debt percentages, it is simply unreasonable to set capital structure based on a single point in time as AWEC proposes.

Q. Can you provide more insight into some of the timing issues that result in fluctuations in NW Natural's capital structure, specifically?

A. Yes. NW Natural receives equity contributions on a regular basis from the parent company consistent with the parent company's at-the-market ("ATM") program, which issues smaller amounts of equity during open trading windows for the Company. In contrast, the Company makes its debt issuances episodically, based on both its overall needs and market conditions. Therefore, the Company can be above or below the targeted 50/50 capital structure due to the timing and size of the financings. If the Company makes a significant debt issuance in order to take

advantage of a favorable debt market, it can take us more than 12 months to catch back up through the issuance of equity through our ATM. Nevertheless, NW Natural is and historically has been committed to the goal of a 50/50 capital structure and is always working to move toward that target.

Q. AWEC points out that the Company's expected average actual capital structure over the 12-months ending October 31, 2025 is 51 percent debt, 49 percent equity.[6] Is AWEC correct and if so, should the Commission consider setting the Company's capital structure at 51/49 debt/equity instead of 50/50?

A. AWEC is correct that the Company's expected actual capital structure over that time period is 51 percent debt, 49 percent equity. However, the Commission should not depart from the Company's 50/50 capital structure for ratemaking purposes based on that calculation. First, just as NW Natural targets a 50/50 actual capital structure in order to balance low rates with favorable market access, I understand that the Commission has stated that it also views a 50/50 capital structure as representing an optimum balance for ratemaking purposes.[7] I understand that it is the Commission's policy to maintain that balance when setting rates, even where the utility's actual capital structure may vary from 50/50. Second, as I have explained above, NW Natural has always stayed and will continue in its goal to stay at or near a 50/50 capital structure and expects to

[6] AWEC/100, Mullins/14-15.

[7] *In re PacifiCorp Request for a General Rate Revision*, Docket No. UE 374, Order No. 20-473 at 22-25 (Dec. 18, 2020).

achieve that target in 2025. There is no reason for the Commission to depart from a 50/50 capital structure for ratemaking purposes simply because a Company's actual structure might be slightly different.

Q. AWEC notes NW Natural has issued a significant amount of debt in the past year—more than double prior years.[8] Is AWEC correct?

A. Yes, early last year the Company accelerated $100 million of debt issuances planned for 2024 in order to take advantage of favorable market conditions. As context, in 2022 and 2023, the market saw a consistent rise in interest rates, making borrowing increasingly expensive. However, March 2023 saw an inversion in the yield curve, which made borrowing short-term commercial paper more expensive than long-term debt. Given the rising interest rate environment, the Company decided to take advantage of less expensive long-term debt in order to de-risk future issuances. This was also a period that followed a volatile gas price market in winter 2022 and ensured sufficient liquidity for the utility through the winter. In short, after a long period of interest rate hikes and uncertainty in the macroeconomic picture, March 2023 offered a window of stable interest rates. Therefore, the Company determined that it was in the Company's and customers' best interests to issue the $100 million of debt at that time. See Exhibit NW Natural/2401, Wilson, which shows the short and long-term interest rates between January 2022 and December 2023.

[8] AWEC/100, Mullins/15.

Q. AWEC claims that NW Natural is diluting its own capital structure to finance water company acquisitions at the holding company level.[9] Has AWEC explained what it means by this allegation?

A. Yes. In response to NW Natural Data Request No. 11, which inquired about the facts underlying AWEC's claims, AWEC explained that "NW Natural appears to have acquired a large volume of water companies in 2022 and 2023," and that "the timing of these acquisitions corresponds to the timing of the major increase in annual debt issuances by NW Natural."[10] Based on this response, it appears that AWEC believes the gas company has been using utility debt to acquire water companies.

Q. What is your response?

A. The notion that NW Natural is using debt issuance proceeds to acquire water companies is patently false. NW Natural Water Company, LLC ("NW Natural Water"), a separate subsidiary of Northwest Natural Holding Company ("NW Natural Holdings"), is the entity that acquires water companies. All payments for such water companies are made by the appropriate subsidiary within the water company structure. NW Natural, as a ring-fenced entity, operates separately from other corporate entities within the NW Natural Holdings family that are not subject to ring-fencing. Books, records, bank accounts and other aspects of NW Natural and NW Natural Water's businesses are kept separate. Additionally, under ring-

[9] AWEC/100, Mullins/15.

[10] NW Natural/2402, Wilson/1.

fencing provisions imposed on NW Natural by the Commission, no transaction between NW Natural and NW Natural Water is permitted without regulatory approval. Transactions between NW Natural and NW Natural Water are limited to those that are regulatorily permitted and are included on annual filings with the Commission. Examples of such transactions include shared services pursuant to NW Natural's Commission--approved Shared Services Agreement.

III. Credit Ratings

Q. What are NW Natural's current debt ratings?

A. The table below and NW Natural/301, Wilson show the Company's current ratings for each type of debt security from Moody's Investor Service ("Moody's") and Standard and Poor's Ratings ("S&P"), as well as the outlook issued by each agency.

Table 4. Current Ratings

	Moody's	S&P
Corporate	n/a	A+
Secured	A2	AA-
Commercial Paper	P-2	A-1
Outlook	Stable	Stable

Q. Has any of the information in Table 4 changed since your Direct Testimony was filed in December 2023?

A. Yes. In April 2024, S&P issued a report updating the Northwest Natural Gas Company outlook from negative to stable.[11] NW Natural sees this as a positive development. That said, concerns persist about NW Natural's credit metrics, as discussed in detail in NW Natural/2500, Coyne-Nelson. Over the past few years, NW Natural's earned return on equity ("ROE") has been modestly weaker than its authorized ROEs, reflecting a potential weakening of its ability to earn its authorized ROE. Additional concerns related to the energy transition risks in Oregon and Washington could be increasing if not managed appropriately by policymakers, regulators, and the Company.

Q. Does this conclude your Reply Testimony?

A. Yes.

NW NATURAL DATA REQUEST 11 TO AWEC:

AWEC/100, Mullins/15 states: "The timing and amount of major debt issuances appears to correspond generally to certain water company acquisitions."

a. Please identify each debt issuance and water company acquisition relied on to support this statement.
b. Please produce all documents relied on to support this statement.

AWEC RESPONSE:

AWEC objects to this request on the basis that it requests information about the timing and cost of water company acquisitions which NW Natural possesses and which it declined to provide AWEC in discovery. In AWEC Data Request 36, AWEC requested information about water company acquisitions, which NW Natural did not provide, claiming that such information was irrelevant. Notwithstanding said objection, AWEC responds as follows:

Based on the information AWEC reviewed and had available to it, NW Natural appears to have acquired a large volume of water companies in 2022 and 2023. In 2023, NW Natural closed Hiland Water, Truxton Canyon Water Company, Cerbat Water Company. In 2022 NW Natural closed seven water and wastewater utility transactions , including its largest water and wastewater acquisition ever in Yuma, Arizona. While NW Natural did not provide information about these acquisitions in discovery, AWEC's understanding is that NW Natural has spent over one hundred million on these acquisitions. As the quote states, the timing of these acquisitions corresponds to the timing of the major increase in annual debt issuances by NW Natural.

Research Update:

Northwest Natural Holding Co. Downgraded To 'A'; Outlook Negative; Subsidiary Ratings Affirmed, Outlook To Stable

April 19, 2024

Rating Action Overview

- We concluded our review of the insulating measures in place and determined that they are sufficient to potentially rate Northwest Natural Holding Co. (NWNH) subsidiary Northwest Natural Gas Co. (NWNG) up to two notches higher than its parent's group credit profile (GCP). We also assess the cumulative value of these insulating measures as increasing risk for parent NWNH because they limit or even materially restrict NWNH's access to NWNG's cash flows.
- Consequently, we lowered our rating on parent NWNH to 'A' from 'A+'. The outlook is negative.
- At the same time, we revised our outlook on subsidiary NWNG to stable from negative and affirmed our ratings on NWNG, including the 'A+' long-term issuer credit rating (ICR), the 'A+' unsecured debt rating, the 'AA-' senior secured debt rating, and the 'A-1' short-term rating. The recovery rating on the senior secured debt remains '1+'.
- The stable outlook on NWNG reflects our assessment that the insulating measures in place are sufficient to potentially rate NWNG up to two notches above NWNH's GCP and as such a downgrade to NWNH would not directly lead to a downgrade at NWNG. The stable outlook also reflects our expectations that NWNG's stand-alone financial measures will consistently remain above our downgrade threshold. Specifically, we expect stand-alone funds from operations (FFO) to debt of 15%-18% through 2026.
- The negative outlook on NWNH reflects its weak consolidated financial measures for the current rating. FFO to debt in 2023 was around 12%, significantly below our 15% downgrade threshold. We expect financial performance in 2024 will remain weak but improve in 2025, primarily reflecting our expectations for a fair Oregon rate case order.

Rating Action Rationale

Our downgrade of NWNH to 'A' from 'A+' reflects higher risks because of material restrictions of cash flows within the company's corporate group. NWNG accounts for about 95% of NWNH's consolidated cash flows. We assess the cumulative value of the insulation measures in place as sufficient to rate NWNG up to two notches above NWNH's GCP. However, these insulating measures limit and could materially restrict NWNH's full access to NWNG cash flows. These insulating measures include dividend restrictions, a non-consolidation opinion, and independent directors on NWNG's board of directors that have effective influence on decision-making and whose vote is required for a voluntary bankruptcy filing.

The negative outlook on NWNH reflects its historical weak financial measures and our expectation that financial performance will remain weak for 2024. Since 2020, NWNH's FFO to debt has been consistently below our 15% downgrade threshold. The company's historical financial underperformance reflects its rising capital investments, including multiple acquisitions of water utilities, which increased its leverage and weakened its financial measures. More recently, NWNH's financial measures have been negatively affected by higher interest rates, higher cash taxes, and inflationary pressures, including higher operating costs.

We expect the company's financial measures will remain challenged in 2024 due to its elevated capital spending plan, including water utility acquisitions, investments in renewable natural gas (RNG) projects, and ongoing infrastructure investments. We expect financial improvement beginning in 2025, primarily reflecting a fair Oregon rate case order. However, financial measures could remain weak for the current rating if elevated capital investments and cash flow deficits are primarily debt funded or the company's rate case order is significantly below expectations.

We affirmed our 'A+' rating on subsidiary NWNG. Our rating largely reflects NWNG's low-risk regulated gas distribution operations in Oregon and Washington. NWNG provides natural gas service to approximately 800,000 customers with 65% of its margin generated from residential customers, 25% from commercial customers, and 7% from industrial customers. The company benefits from stable and supportive regulatory environments in both jurisdictions where it operates, with purchased gas adjustments and environmental cost recovery, decoupling and a forward-looking test year in Oregon, and multiyear rate case fillings in Washington. We view these mechanisms as supportive to its financial measures, allowing the company to largely mitigate regulatory lag. However, over the past few years, the company's earned return on equity (ROE) has been modestly weaker than its authorized ROEs, reflecting a potential weakening of management's ability to manage regulatory risk.

We also view the energy transition risks in Oregon and Washington as potentially increasing business risk. Washington has implemented decarbonization mandates and Oregon is contemplating various decarbonization initiatives. Furthermore, several cities are contemplating the implementation of a gas ban for new gas connections. We assess these evolving risks as potentially negative for credit quality and will continue to monitor future developments.

We assess NWNG's financial risk profile using our low-volatility benchmarks, reflecting the low-risk nature of its natural gas distribution operations and its track record of effective management of regulatory risk. We assume continued use of regulatory mechanisms and rate riders to effectively manage regulatory risk, annual capital spending averaging of about $330 million, and annual dividends averaging of about $75 million. We expect NWNG's stand-alone financial measures to remain in the middle range of its financial risk profile category such that FFO to debt is 15%-18% through 2026.

We consider NWNG to be insulated from its parent NWNH. Based on the strength of the insulating measures, NWNG could potentially be rated up to two notches higher than NWNH's GCP. Currently, NWNG is rated only one notch higher than its GCP, limited by its 'a+' standalone credit profile.

The key insulating measures include:

- NWNG's financial performance and funding prospects are independent from those of the group.
- NWNG issues its own debt and has its own credit facility.
- NWNG is regulated by Oregon and Washington regulatory commissions.
- NWNG has dividend restrictions.
- NWNG's board is highly independent with 11 out of 12 board of directors being independent.
- Independent directors on NWNG's board have effective influence on decision making, and their votes are required for a voluntary bankruptcy filing.
- NWNG is unlikely to be drawn or forced into a NWNH bankruptcy.
- There is an independent third party which is the holder of the "golden share" whose vote is required to file for bankruptcy.

We revised our outlook on NWNG to stable reflecting the insulation measures and the strength of its stand-alone credit profile. The stable outlook reflects our view that NWNG, because of the cumulative value of the insulating measures, could potentially be rated up to two notches above its parent's NWNH GCP. Because of the insulating measures, a downgrade to parent NWNH would not directly lead to a downgrade at NWNG. In addition, the stable outlook reflects our expectation that the company will continue to effectively manage regulatory risk and maintain financial measures consistent with the middle range for its financial risk profile category. Specifically, we expect stand-alone FFO to debt of 15%-18% through 2026.

Outlook

Northwest Natural Holding Co. (NWNH)

The negative outlook on NWNH reflects its current weak financial measures and the possibility that financial measures could remain weak. Our base case assumes continued weak financial performance in 2024 and then for financial performance improvement in 2025. This improvement primarily reflects a fair Oregon rate case order, such that FFO to debt is consistently greater than 15%.

Downside scenario

We could lower our ratings on NWNH over the next 12 to 24 months if FFO to debt remains below 15%. We could also lower our ratings on NWNH if business risk increases. This could reflect an unfavorable rate case outcome, higher risks due to decarbonization mandates and potential gas bans, a weakening of the company's management of regulatory risk, or an inability to consistently earn its authorized ROE.

Upside scenario

We could affirm ratings and revise our outlook on NWNH back to stable over the next 12 to 24 months if FFO to debt improves to consistently greater than 15%, with no increase of business risk.

Outlook

Northwest Natural Gas Co. (NWNG)

The stable outlook on NWNG reflects our base-case assumption that NWNG will generate sufficient cash flows to maintain appropriate consolidated financial measures for the current rating, including FFO to debt of 15%-18% through 2026. The stable outlook also reflects our expectation of strong operating performance and effective management of regulatory risk.

Downside scenario

We could lower our rating on NWNG over the next 24 months if the company's consolidated financial performance weakens such that FFO to debt remains consistently below 15%.We could also lower our rating on NWNG if the company's business risk increases. This could reflect a higher risks due to decarbonization mandates and potential gas bans, a weakening of the company's management of regulatory risk, or an inability to consistently earn its authorized ROE.

Upside scenario

We could raise our rating on NWNG over the next 12 to 24 months if the company's financial performance improves such that FFO to Debt is consistently above 21%, with no weakening of business risk.

Company Description

NWNH is the holding company of NWNG, NWNR and NW Natural Water Co. LLC (NWWC). NWNG operates as a regulated natural gas distribution company, providing natural gas service to approximately 800,000 residential, commercial, and industrial natural gas customers in Oregon and Southwest Washington through 14,200 miles of pipeline systems. Approximately 90% of customers are in Oregon and 10% are in southwest Washington. NWNR is engaged in investing competitive RNG operations while NWWC owns and operates several regulated water utilities. Together, NWNR and NWWC contribute about 5% of NWNH's revenues while NWNG contributes the remaining 95% revenues.

Our Base-Case Scenario

- Modest customer growth and continued use of regulatory mechanisms.
- Continued negative discretionary cash flow.
- Annual capital spending averaging about $370 million over our forecast period.

- Small tuck-in regulated water utilities acquisitions funded in a credit supportive manner.
- Annual dividends averaging about $77 million.
- All debt maturities refinanced.

Liquidity

We assess NWNH's liquidity as adequate, with sources covering uses by 1.1x over the coming 12 months, and that its sources cover uses even if forecasted consolidated EBITDA declines by 10%. We believe the predictable regulatory framework for NWNH provides a manageable level of cash flow stability for the company even in times of economic stress, supporting our use of slightly lower thresholds to assess liquidity. In addition, NWNH has the ability to absorb high-impact, low-probability events, reflecting that the company maintains about $600 million in committed credit facilities through 2026, and our belief that the company can lower its high capital spending (averaging about $370 million annually) during stressful periods, indicative of a limited need for refinancing under such conditions.

Furthermore, our assessment reflects the company's generally prudent risk management, sound relationships with its banking group (which includes over four well-established banks). Overall, we believe the company can withstand adverse market circumstances over the next 12 months with sufficient liquidity to meet its obligations. The company has no large long-term debt maturity coming due, and we expect the company to proactively address any maturities well in advance of its scheduled due dates.

Principal liquidity sources

- Cash and cash equivalents of about $33 million;
- Credit facilities of about $600 million; and
- Cash FFO estimated of about $275 million.

Principal liquidity uses

- Debt maturities, including commercial paper outstanding of about $241 million;
- Capital expenditure (capex) of about $400 million; and
- Dividend payments of about $75 million.

Environmental, Social, And Governance

ESG factors have no material influence on our credit rating analysis of NWNH.

Issue Ratings - Subordination Risk Analysis

Capital structure

The short-term rating on NWNG is 'A-1', based on our 'A+' issuer credit rating on the company. As on Dec 31, 2023, NWNG's capital structure consists of approximately $1.4 billion first mortgage bonds. The company also maintains a medium-term note program which is currently not utilized.

Analytical conclusions

We rate NWNG's medium-term notes program 'A+', equal to its issuer credit rating, because we view any debt issued under this program as debt issued by a qualifying investment-grade utility.

Issue Ratings - Recovery Analysis

Key analytical factors

NWNG's first-mortgage bonds benefit from a first-priority lien on substantially all of the utility's real property, owned or subsequently acquired. Collateral coverage of more than 1.5x supports a recovery rating of '1+ and an issue-level rating one notch above the issuer credit rating.

I. INTRODUCTION AND SUMMARY

Q. Mr. Coyne, please state your name, affiliation, and business address.

A. My name is James M. Coyne. I am a Senior Vice President at Concentric Energy Advisors, Inc. ("Concentric"). My business address is 293 Boston Post Road West, Suite 500, Marlborough, Massachusetts 01752.

Q. Ms. Nelson, please state your name, affiliation, and business address.

A. My name is Jennifer E. Nelson. I am an Assistant Vice President at Concentric. My business address is 293 Boston Post Road West, Suite 500, Marlborough, Massachusetts 01752.

Q. Are you the same James M. Coyne and Jennifer E. Nelson who filed Direct Testimony in this proceeding?

A. Yes. We filed Direct Testimony on behalf of Northwest Natural Gas Company dba NW Natural ("NW Natural" or "the Company") regarding the cost of capital (NW Natural/400, Coyne-Nelson).

Q. What is the purpose of your Reply Testimony?

A. The purpose of our Reply Testimony is to respond to the following intervenor witnesses (collectively, "Intervenor Witnesses") as their testimonies relate to the Company's Return on Equity ("ROE") and capital structure:

- Mr. Matt Muldoon, who testifies on behalf of the Oregon Public Utilities Commission ("Commission") Staff;
- Mr. Bradley G. Mullins, who testifies on behalf of the Alliance of Western Energy Consumers ("AWEC");

- Mr. Brad Cebulko, who testifies on behalf of the Coalition of Communities of Color, Climate Solutions, Verde, Columbia Riverkeeper, Oregon Environmental Council. Community Energy Project, and Sierra Club ("Coalition"); and
- Mr. Bob Jenks, who testifies on behalf of the Oregon Citizens' Utility Board ("CUB").

Positions not addressed in our Reply Testimony should not be inferred as agreement with those positions.

Q. How is the remainder of your Reply Testimony organized?

A. The balance of our Reply Testimony is organized as follows:

- Section II provides a summary of our recommendations and our response to the Intervenor Witnesses' positions and cost of capital recommendations;
- Section III addresses trends in authorized ROEs and capital market conditions;
- Section IV responds to the Intervenor Witnesses' capital structure recommendations;
- Section V responds to Staff Witness Muldoon;
- Section VI responds to AWEC Witness Mullins;
- Section VII summarizes our updated ROE analyses that incorporates market data through the end of April 2024; and
- Section VIII summarizes our conclusions and recommendations.

II. SUMMARY OF REPLY TESTIMONY

Q. Please summarize your recommendations presented in your Direct Testimony.

A. In our Direct Testimony, we concluded that a reasonable ROE range for NW Natural is 9.80 percent to 10.40 percent that was developed by using a combination of models and alternative input assumptions.[1] Within that range, we recommended an ROE at the midpoint of the range, or 10.10 percent. Our ROE recommendation is based on the results from the Discounted Cash Flow ("DCF") model, the Bond Yield Plus Risk Premium method ("Risk Premium"), the Capital Asset Pricing Model ("CAPM"), and the Expected Earnings approach, as the use of multiple models enables a more robust evaluation of investors' return requirements and is consistent with industry and investor practice.

Our recommendation also considered the Company's capital expenditure program, the risks associated with electrification and energy transition, and NW Natural's significantly smaller size relative to a group of proxy companies to assist with determining the appropriate ROE. To be clear, however, our recommendation did not include an explicit ROE adjustment to account for these risk factors. Therefore, as our updated analysis further demonstrates, 10.10 percent is a conservative estimate of the Company's cost of equity.

[1] NW Natural/400, Coyne-Nelson/4-5.

As to the Company's requested capital structure, consistent with our recommendation in Direct Testimony, we continue to support NW Natural's requested capital structure of 50.00 percent common equity and 50.00 percent long-term debt as reasonable.

Q. Please summarize the results of your updated ROE analyses.

A. As discussed below in Section VII, applying updated market data through the end of April 2024 to the same estimation models described in our Direct Testimony produces an updated recommended range of 10.10 percent to 10.60 percent for our Gas Proxy Group, with a midpoint of 10.35 percent. Thus, our 10.10 percent ROE recommendation now reflects the bottom of our recommended range, providing further support as to the conservative nature of our recommendation.

Q. Based on your updated ROE analyses, do you change your ROE recommendation in this proceeding?

A. No. We continue to recommend 10.10 percent as a reasonable and conservative estimate of the Company's cost of equity.

Q. Please now summarize the ROE and capital structure recommendations made by the Intervenor Witnesses.

A. Staff Witness Muldoon recommends an ROE range of 8.9 percent to 9.3 percent; however, he does not make an ROE point estimate in this proceeding, which Staff

notes "is a departure from its typical practice."[2] Staff accepts the Company's proposed capital structure of 50 percent common equity and 50 percent total debt.[3]

AWEC Witness Mullins recommends the Commission authorize an ROE of 9.20 percent, within a range of 6.35 percent to 9.55 percent, and a capital structure consisting of 48 percent common equity and 52 percent total debt.[4]

Witnesses for CUB and the Coalition do not make specific ROE or capital structure recommendations; instead, they make general comments regarding the ROE.[5] It is important to note that the determination of an appropriate ROE should be grounded in rigorous financial analysis that considers the subject company's relative risk profile. We address CUB's and Coalition's specific comments regarding the ROE later in this section.

Q. What is your response to Staff Witness Muldoon's and AWEC Witness Mullins' ROE recommendations?

A. Staff Witness Muldoon's and AWEC Witness Mullins' recommendations to reduce NW Natural's authorized ROE fail to reflect the higher capital cost environment faced by the Company. Neither witness has provided any evidence that the Company's capital costs have declined or that its risk has declined since its last rate case such that a reduction in the authorized ROE is appropriate. Instead, both Staff Witness Muldoon and AWEC Witness Mullins disregard the effect of higher

[2] Staff/100, Muldoon/17.

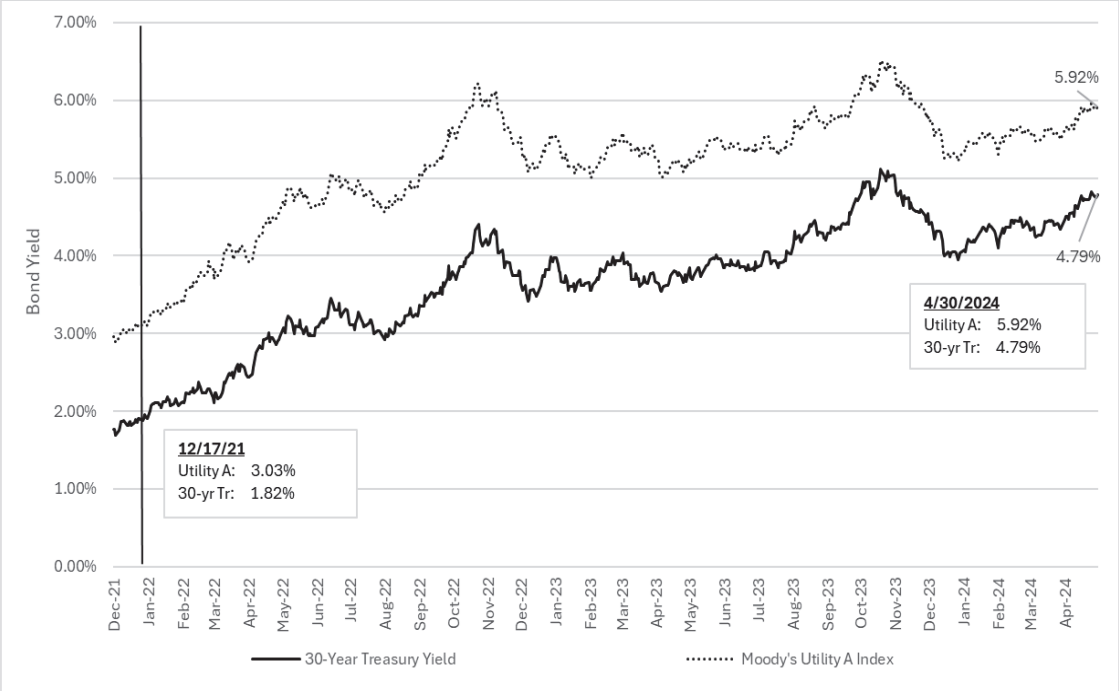
[3] Staff/1600, Pileggi/3.

[4] AWEC/100, Mullins/2.

[5] CUB/100, Jenks/14-15; Coalition/100, Cebulko/13-14; Coalition/200, Apter-Connolly/12-13, 16.

inflation and interest rates on the Company's cost of equity. As shown in Figure 1 below, capital costs have increased by nearly 300 basis points since the Company filed its last rate case on December 17, 2021.

Figure 1: 30-year Treasury Yields and A-Rated Utility Bond Index (December 2021 – April 2024)[6]



Staff Witness Muldoon points to expectations of rate cuts by the Federal Reserve "in the next two years";[7] however, members of the Federal Reserve Board of Governors have been tempering those expectations in recent weeks and emphasizing that they are waiting for sufficient evidence that inflation is moving persistently toward its 2 percent target before considering rate cuts. After its May Federal Open Market Committee ("FOMC") meeting, the Federal Reserve

[6] Source: Bloomberg Professional and Federal Reserve Bank of St. Louis.

[7] Staff/100, Muldoon/35.

emphasized: "The Committee does not expect it will be appropriate to reduce the target range until it has gained greater confidence that inflation is moving sustainably toward 2 percent."[8] At his press conference after the FOMC meeting, Chair Powell reiterated that higher than expected inflation thus far in 2024 is prompting the central bank to hold interest rates higher for longer.[9] Further, he stated that "inflation is still too high, further progress in bringing it down is not assured, and the path forward is uncertain."[10] In short, inflation remains elevated and the timing and magnitude of any interest rate cuts by the Federal Reserve is uncertain.

Q. How do the Staff's and AWEC's ROE recommendations compare to recently authorized returns for other gas utilities?

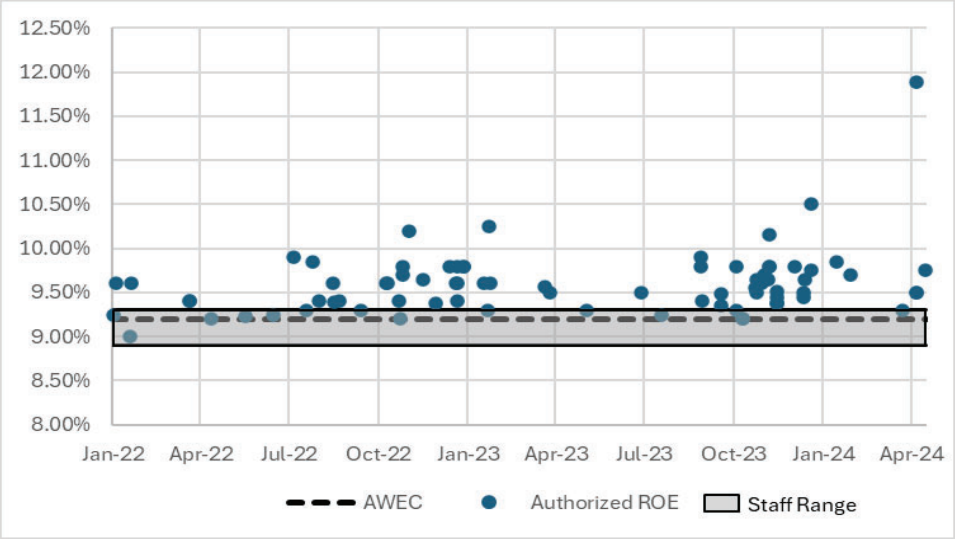
A. As shown in Figure 2 below, Staff's and AWEC's ROE recommendations are at the bottom end of the range of ROEs recently authorized for other natural gas utilities. In fact, an ROE of 9.3 percent (the high end of Staff's recommended range), or lower, is in the bottom 12 percent of ROEs authorized between January 2022 and April 2024.

[8] Federal Reserve Board of Governors Press Release, *Federal Reserve issues FOMC Statement* (May 1, 2024) (accessible at https://www.federalreserve.gov/newsevents/pressreleases/monetary20240501a.htm).

[9] Transcript of Chair Powell's Press Conference at 3 (May 1, 2024) (accessible at https://www.federalreserve.gov/mediacenter/files/FOMCpresconf20240501.pdf).

[10] *Id*. at 1.

Figure 2: Authorized Natural Gas Utility ROEs (2022-2024)[11]



The average authorized ROE for natural gas utilities decided in 2024 is 9.93 percent, which is well above Staff's and AWEC's recommendations but within our recommended range filed in our Direct Testimony. Moreover, the average authorized equity ratio for natural gas utilities in 2024 is 52.35 percent, more than 200 basis points higher than the Company's request in this proceeding. Multiplying the average authorized ROE in 2024 with the average authorized equity ratio in 2024 produces an average authorized weighted common equity rate of 5.20 percent, which is higher than the Company's requested weighted common equity rate of 5.05 percent that is based on our 10.10 percent ROE and 50 percent equity ratio. In other words, the Company's request is *below* the average weighted common equity cost authorized for natural gas utilities in 2024, which demonstrates the reasonableness of our 10.10 percent ROE recommendation.

[11] Source: Regulatory Research Associates.

Staff's and AWEC's recommendations simply would not provide a return that is comparable to returns available to enterprises having corresponding risk (i.e., other natural gas utilities), and thus are inconsistent with the *Hope* and *Bluefield* standards that require a risk comparable return.

Q. How would the investment community perceive Staff's and AWEC's ROE and capital structure recommendations?

A. The investment community would likely perceive a reduction in the authorized ROE and a more leveraged capital structure adversely, particularly during a period of rising capital costs and market uncertainty. The Commission has consistently found a 50/50 capital structure to be balanced for Oregon's regulated utilities, and a departure from that finding would likely be perceived as introducing unpredictability in Oregon's regulatory environment, thereby increasing the Company's risk.

Emphasizing the importance of a constructive outcome in this proceeding, on April 19, 2024, S&P revised NW Natural's outlook from "Negative" to "Stable." S&P explained that the upward revision in its outlook assumes that the Company will generate sufficient cash flows to earn its authorized ROE, which depends on a constructive outcome in this proceeding.

> The stable outlook on NWNG reflects our base-case assumption that NWNG will generate sufficient cash flows to maintain appropriate consolidated financial measures for the current rating, including FFO to debt of 15%-18% through 2026. The stable outlook also reflects our expectation of strong operating performance and effective management of regulatory risk.[12]

S&P noted that the Company's earned ROE has "been modestly weaker than its authorized ROE"[13] over recent years. Reducing both its authorized ROE and equity ratio would constrain NW Natural's ability to maintain its credit metrics within S&P expectations.

Q. Does Staff acknowledge that NW Natural's credit metrics are under pressure?

A. Yes. At Staff/100, Muldoon/35, Staff acknowledges that the Company's credit ratings are "under pressure based on financial metrics." Staff further observes the importance of the regulatory environment in the rating agencies' credit assessments.

Q. CUB Witness Jenks recommends that the Commission "reduce the ROE to the lowest that is allowable" as a means of mitigating rate shock.[14] What is your response?

A. As noted earlier, CUB has not performed an independent analysis to estimate the appropriate ROE or the range of ROEs that is "reasonable." Therefore, his

[12] S&P Global Ratings, *Research Update: Northwest Natural Holding Co. Downgraded to 'A'; Outlook Negative; Subsidiary Ratings Affirmed, Outlook to Stable* at 1 (Apr. 19, 2024).

[13] S&P Global Ratings, *Research Update: Northwest Natural Holding Co. Downgraded to 'A'; Outlook Negative; Subsidiary Ratings Affirmed, Outlook to Stable* at 2 (Apr. 19, 2024).

[14] CUB/100, Jenks/12, 15.

recommendation has limited value. To the extent that CUB believes that a reduction in the Company's current authorized ROE would reflect investors' "lowest allowable" ROE given the significantly higher interest rate environment, we disagree. CUB's position that an increase in the authorized ROE is not "reasonable" due to the level of the Company's rate request[15] suggests that the ROE is discretionary, and that investors' return requirements are dependent upon a company's revenue requirement. Neither of these assumptions is reasonable. As explained in Section III, the return is part of the cost of service and utilities are entitled by law to receive a fair rate of return sufficient to attract needed capital at reasonable rates. The level of a utility's rate request, or its revenue requirement, is not a factor that affects the cost of equity; therefore, it should have no bearing on the ROE determined in this proceeding.

As discussed earlier, the ROE models show that the cost of equity has risen. Our 10.10 percent ROE recommendation now falls at the bottom of our recommended range based on our analyses that have been updated for more recent data through the end of April 2024.

[15] CUB/100, Jenks/14.

Q. Coalition Witness Cebulko asserts that the Company is "seeking a higher return on equity due to the risk of decarbonization policies."[16] Is his characterization of your ROE recommendation correct?

A. No, it is not. As noted earlier, our ROE recommendation does not include a premium due to decarbonization risk, or any of the Company's other risk factors. The recommended range reflects our four-model average using various combinations of inputs, and 10.10 percent reflected the midpoint of the range using market data as of September 29, 2023. As discussed earlier, 10.10 percent now reflects the low end of the range using data as of April 30, 2024.

Although we have identified certain business risks that distinguish NW Natural from its peers, our recommendation reflects the return NW Natural must offer to equity investors to attract capital, as estimated by reference to the proxy group average.

III. TRENDS IN AUTHORIZED ROES AND CAPITAL MARKET CONDITIONS

Q. Staff asserts that we are not in a rising interest rate environment and points to trends in interest rates and authorized ROEs over the last 30 years as support for its position.[17] What is your response?

A. Staff appears to believe that investors are ignoring the significant increase in capital costs over the last two years simply because interest rates and ROEs have fallen from their levels 30 years ago. If so, that premise is misguided.

[16] Coalition/100, Cebulko/17.

[17] Staff/100, Muldoon/35.

Capital costs are at their highest levels in nearly 15 years. To deny NW Natural a compensatory return that appropriately recovers its capital costs, as is required by *Hope*[18] and *Bluefield*,[19] would be contradictory to the foundational principles of the regulatory compact. Although Staff and CUB appear to suggest otherwise,[20] the recovery of capital costs, including the ROE, is not discretionary. The cost of equity is a cost faced by the Company just like any other component in the Company's cost of service, including the cost of debt, O&M costs, taxes, and depreciation expense.

Failure to allow the Company to sufficiently recover its capital costs has real consequences not just for the Company but for customers as well. Customers require safe and reliable service, and NW Natural's ability to meet its obligation to serve requires continuous access to the debt and equity markets in all market environments. To the extent that the Company is viewed as having a less predictable opportunity to sufficiently recover its capital costs, investors will choose less risky investment alternatives that provide better return opportunities, leaving the Company with fewer funding alternatives at higher costs. In the end, customers would be harmed through higher capital costs and/or less capital available to invest in the infrastructure required to maintain safe and reliable service.

[18] *Fed. Power Comm'n v. Hope Nat. Gas Co.*, 320 US 591 (1944).

[19] *Bluefield Water Works & Improvement Co. v. Pub. Serv. Comm'n*, 262 US 679 (1923).

[20] Staff/100, Muldoon/12-13; CUB/100, Jenks/12, 15.

Contrary to Staff's position, Figure 1 shown in Section II above illustrates the significantly higher capital cost environment faced by the Company. Since the Company filed its last rate case in December 2021, the 30-year Treasury yield has increased by nearly 300 basis points from 1.82 percent to 4.79 percent. Moody's A-rated Utility Bond Index increased almost 290 basis points from 3.03 percent to 5.92 percent. These bond yield levels reflect investors' current expectations and incorporate the market's expectations of FOMC actions.

Although Staff refers to expectations that the Federal Reserve will lower interest rates, those expectations have recently been tempered by persistent elevated inflation. The Federal Reserve has signaled its intent to keep interest rates "sufficiently restrictive" until they have confidence that inflation is moving toward the 2 percent target.[21] Federal Reserve officials have adjusted their expectations for future rate cuts and the timing and pace of any future rate change is highly uncertain.[22]

Q. Is Staff's depiction of recent authorized ROEs and interest rates accurate?

A. No. Staff's chart on page Muldoon/36 is more than two years old and omits authorized ROEs and Treasury bond yields since January 2022. To suggest that ROEs and interest rates have trended downward while omitting more than two

[21] Transcript of Chair Powell's Press Conference at 6.

[22] See, e.g., Federal Reserve Governor Michelle W. Bowman, *Brief Remarks on the Economy and Monetary Policy* at the Massachusetts Bankers Association Annual Convention (May 3, 2024) (available at https://www.federalreserve.gov/newsevents/speech/bowman20240503a.htm); Reuters News, "Fed's Barr: Inflation data 'disappointing,' tight policy needs more time," (May 20, 2024) (available at https://www.reuters.com/markets/us/feds-barr-inflation-data-disappointing-tight-policy-needs-more-time-2024-05-20/).

years of recent data showing otherwise is disingenuous. As noted earlier, Staff's and AWEC's recommendations are at the bottom end of ROEs recently authorized for other natural gas utilities, with the average authorized ROE for natural gas utilities in 2024 standing at 9.93 percent as of April 30, 2024.

Q. Why are authorized ROEs in other jurisdictions relevant?

A. As explained in our Direct Testimony, authorized ROEs in other jurisdictions are a significant part of the market information that investors consider when evaluating their investment alternatives. Therefore, they are a measure of returns available to other natural gas utilities, consistent with the *Hope* and *Bluefield* decisions. The level of authorized ROE also provides a signal to investors about the level of regulatory support that a company can expect with regard to its ability to compete for capital and to ensure its financial integrity. An insufficient ROE is an impediment to the Company's ability to attract capital and invest in the infrastructure necessary to provide safe, reliable service to its customers. As explained earlier, our 10.10 percent ROE recommendation, taken together with NW Natural's requested capital structure, is *below* the weighted common equity rate authorized for natural gas utilities on average thus far in 2024, and is therefore conservative.

IV. CAPITAL STRUCTURE

Q. Does Staff support the Company's proposed capital structure?

A. Yes, Staff accepts the Company's proposed capital structure that consists of 50 percent common equity and 50 percent long-term debt.[23]

[23] Staff/1600, Pileggi/3.

Q. Please now summarize AWEC's capital structure recommendation.

A. AWEC Witness Mullins recommends a capital structure of 48 percent common equity and 52 percent long-term debt based on NW Natural's actual capital structure expected at the beginning of the rate-effective period.[24] As discussed below, the Company's proposed capital structure is reasonable and should be approved.

Q. Is the Company's proposed capital structure reasonable?

A. Yes. As explained by Company Witness Wilson, the Company targets a capital structure consisting of 50 percent common equity and 50 percent long-term debt over the long-term, which allows it to access capital at reasonable terms.[25] The Commission has determined that a 50/50 capital structure is reasonable and balanced for Oregon utilities for at least a decade or more. Specifically, in its recent order for Pacificorp, the Commission stated:

> We find that a more balanced capital structure serves to reduce the cost of equity to customers, without jeopardizing the financial integrity of the company. We find that a capital structure of 50 percent equity achieves that balance.[26]

Importantly, the capital structure adopted by the Commission in this proceeding will need to support the Company's financial integrity and capital needs to meet its obligation to serve on a going forward basis. For that reason, a forward-looking perspective of the debt and equity required to provide customers with safe

[24] AWEC/100, Mullins/2, 15.

[26] *In re PacifiCorp Request for a General Rate Revision*, Docket No. UE 374, Order No. 20-473 at 22-25 (Dec. 18, 2020).

and reliable service is a reasonable approach that is consistent with utility financing practices.

Q. Before responding directly to AWEC Witness Mullins' capital structure recommendation, please explain the factors utilities generally consider in developing a target capital structure.

A. Companies (including subsidiary companies) are financed based on the specific risks and funding requirements associated with their unique individual operations. Capital structure management is dynamic and complex because it must satisfy multiple objectives subject to multiple constraints. It is therefore important to understand utility financing practices, including the principles and constraints that drive utility financing decisions, and how those practices are reflected in the cost of capital. As explained below, utility financing practices reflect the nature of regulation and utilities' investments made under the regulatory compact.

In many respects, the nature of regulation determines the nature of utility assets, and how they are financed. In exchange for the obligation to serve, equity investors expect utilities to have a reasonable opportunity to earn a risk-comparable return on prudent investments over the life of the investments. It is the nature of regulation, therefore, that enables utilities to finance large, essentially irreversible, investments that are recovered over decades. Moreover, because the obligation to serve must be fulfilled regardless of capital market conditions, utility capital structures (and the financial strength they support) are established to ensure capital access not only during normal markets, but when markets are constrained as well. When markets are constrained, only those utilities with

sufficient financial strength can attract capital at reasonable terms to the benefit of customers. That financial strength provides utilities with critical financing flexibility. Utilizing a capital structure for ratemaking purposes that relies more heavily on debt, as AWEC Witness Mullins proposes, increases the risk of refinancing maturing obligations during less accommodating market environments at higher costs. Financing flexibility, therefore, has a cost. As Moody's explains:

> Liquidity and access to financing are of particular importance in this sector. Utility assets can often have a very long useful life – 30, 40 or even 60 years is not uncommon, as well as high price tags…Utilities are among the largest debt issuers in the corporate universe and typically require consistent access to the capital markets to assure adequate sources of funding and to maintain financial flexibility.[27]

The requirement to access capital markets in all market conditions contrasts with the financial needs of other entities without the legal obligation to serve. Because of that obligation, the financial flexibility required to access both long-term capital and short-term liquidity is critical for utilities' ability to continually attract capital to meet the obligation to serve. Unregulated companies can adjust the timing and amount of major capital expenditures to align with economic cycles and defer investments to better match market conditions, whereas utilities have limited options to do so. Reduced financial flexibility, therefore, must be compensated for by ensuring utilities have sufficient financial strength to provide safe and reliable service to customers at all times.

[27] Moody's Investor Service, Rating Methodology: Regulated Electric and Gas Utilities at 25 (Jun. 23, 2017).

Q. Why is AWEC Witness Mullins' recommendation to set the ratemaking capital structure based on the Company's actual capital ratios at a single point in time inappropriate?

A. As noted earlier, capital structure management is dynamic and complex in which utilities must balance multiple objectives with multiple constraints. As Company Witness Wilson explains, NW Natural's actual capital structure fluctuates due to the seasonality of earnings, the timing of capital investments and financings, and the Company's ability to access the market.[28] This is true for all utilities, as debt and equity issuances are lumpy, and the timing of these issuances often do not coincide perfectly to match the ratemaking capital structure authorized by the regulator. Measuring the capital components using a snapshot as of a specific date as AWEC Witness Mullins recommends may result in a skewed interpretation due to the specific circumstances of a particular period. For example, a utility may issue debt to ensure liquidity during constrained capital market environments or take advantage of a lower-priced market window, which may not reflect the utility's long-term capital structure objectives.

Q. Is NW Natural's test year capital structure skewed by period-specific circumstances that do not reflect its longer-term capital structure objectives?

A. Yes. As Company Witness Wilson explains, in 2023, NW Natural pulled forward its 2024 long-term debt needs into 2023 to take advantage of the inversion in the

[28] NW Natural/2400, Wilson/4-5.

yield curve that made borrowing short-term commercial paper more expensive than long-term debt. Further, the Company determined that, given the consistent rise in interest rates through 2022 and 2023, it would be beneficial to mitigate interest rate risk of future issuances. This was also a period that followed a volatile gas price market in the winter of 2022 and doing so ensured sufficient liquidity for the utility through the winter 2023.[29] Customers benefitted from the Company's actions by locking in lower debt costs than they would have otherwise faced and ensuring sufficient liquidity during a volatile market environment. The Company should be encouraged to proactively manage its capital needs to customers' benefit even if that results in short term capital structure deviations from the authorized capital structure.

Q. Are there other variables unique to NW Natural's circumstances that affect the timing of its debt and equity issuances?

A. Yes. As a smaller company,[30] NW Natural is more limited in its ability to access the capital markets than larger companies. As Company Witness Wilson explains, the Company accesses the debt market episodically and receives equity contributions on a regular schedule from the parent company consistent with its at-the-market program that issues smaller amounts of equity during open trading windows.[31] A larger company will have access to a greater number of potential investors and may have more funding opportunities available to it than a smaller

[29] NW Natural/2400, Wilson/6.

[30] See, e.g., NW Natural/410.

[31] NW Natural/2400, Wilson/4-5.

company like NW Natural has. This places an additional constraint the Company must manage when determining an optimal capital funding plan, recognizing that an "optimal" capital structure balances many objectives and constraints that change with the market.

Q. Does Staff acknowledge the dynamic nature of a utility's actual capital at a point in time?

A. Yes, it has. Staff Witness Pileggi acknowledges that capital structure "fluctuations are expected as issuances, redemptions, and maturations on financial instruments are not in perfect sync nor is it always beneficial for the company to maintain a perfectly uniform capital structure."[32]

Q. How does AWEC Witness Mullins' proposed 48 percent equity ratio compare to other natural gas utilities?

A. AWEC Witness Mullins' proposed capital structure is significantly more leveraged than is typical for other natural gas utilities, which would increase NW Natural's financial risk. One approach to evaluating the reasonableness of the Company's proposed capital structure is to review how other regulated natural gas operating utilities generally finance their operations, recognizing that each utility has unique capital needs. As shown in NW Natural/411, Coyne-Nelson/1, five of the six natural gas utility proxy companies have an average equity ratio of at least 54.48 percent, or higher, between 2020 and 2022[33], which is nearly 450 basis points above the

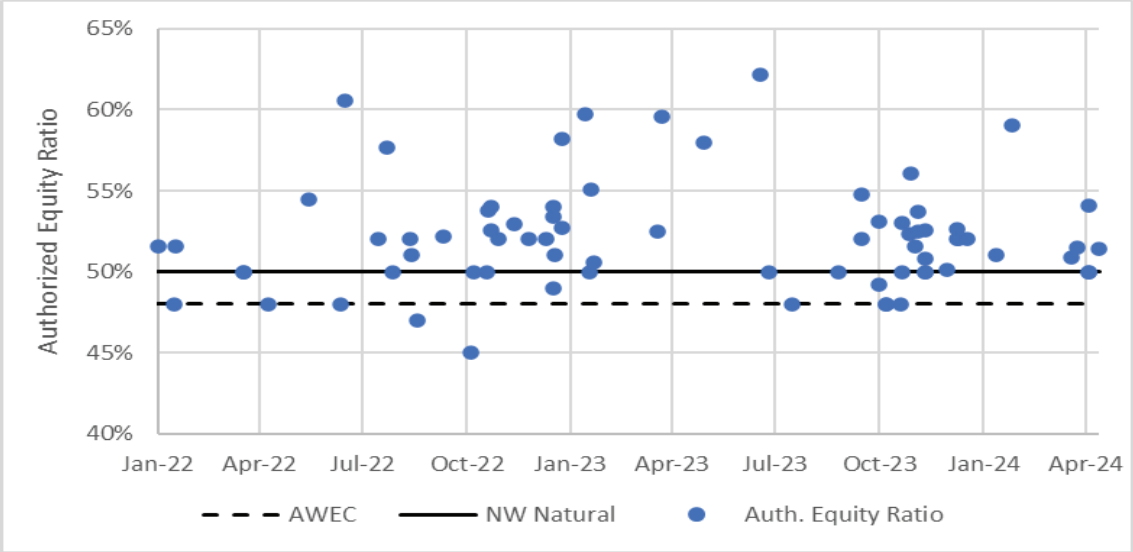
[32] Staff/1600, Pileggi/2-3.

[33] Actual capital structure data for 2023 is not yet available for all utilities in the Gas Proxy Group as of the time of filing.

Company's requested equity ratio. Only one company, Southwest Gas Company, has an equity ratio near AWEC Witness Mullins' recommendation.

For another perspective, we also reviewed the common equity ratios authorized by regulatory commissions across the U.S. over the last three years. As shown in Figure 3 below, AWEC Witness Mullins' equity ratio proposal is significantly below those recently authorized for other natural gas utilities. In fact, more than 89 percent of decisions since January 2022 authorized an equity ratio above AWEC Witness Mullins' 48 percent recommendation.

Figure 3: Authorized Equity Ratio – Natural Gas Utilities (2022-2024)[34]



Further, Figure 3 also demonstrates the reasonableness, if not conservative nature, of the Company's requested 50 percent equity ratio; nearly 68 percent of

[34] Investor-supplied capital components only. Arkansas, Florida, Indiana, and Michigan include non-investor supplied capital (e.g., customer deposits, Accumulated Deferred Income Taxes, etc.) in the ratemaking capital structure, rendering the authorized equity ratios as a percentage of total capital that is reported by Regulatory Research Associates in these jurisdictions not comparable to the equity ratios authorized in Oregon that includes only investor-supplied capital.

natural gas utilities were authorized an equity ratio above NW Natural's requested 50 percent since 2022. AWEC Witness Mullins has not demonstrated that NW Natural's requested capital structure of 50 percent equity and 50 percent long-term debt is unreasonable or deviates substantially from sound utility practice; therefore, the Company's request should be approved.

Q. What is your response to AWEC Witness Mullins' accusation that the Company is "diluting its own capital structure in order to finance water company acquisition at the holding company level"[35]?

A. Despite providing no evidence to support his belief, AWEC Witness Mullins' position appears to be inappropriately focused on the debt issued by NW Natural's parent rather than NW Natural itself, the entity at issue in this proceeding. NW Natural is its own legal entity that issues its own debt, and, as Company Witness Wilson explains, the funds from those issuances are not used to acquire water utilities.[36]

V. RESPONSE TO STAFF WITNESS MULDOON

Q. Please summarize Staff's recommendation in this proceeding.

A. Staff recommends an ROE range of 8.90 percent to 9.30 percent. Although Staff states that it does not have an ROE point estimate, Staff observes that the mean of its recommended range is 9.10 percent.[37] Staff's recommended ROE range is developed using two Three-Stage DCF analyses. Staff also performs a Single

[35] AWEC/100, Mullins/15.

[36] NW Natural/2400, Wilson/7.

[37] Staff/100, Muldoon/17.

Stage DCF analysis and a CAPM analysis to check the reasonableness of its Three-Stage DCF results.

Q. Do you have concerns with Staff's recommended ROE range?

A. Yes, we do. As Staff recognizes, the authorized ROE and capital structure in this proceeding will directly affect the Company's ability to attract capital at a reasonable cost.[38] As discussed earlier, even the top end of Staff's recommended ROE range, 9.3 percent, would reflect a reduction from the current authorized ROE, making it more difficult for the Company to maintain credit coverage metrics within the ranges necessary to retain its credit rating that enable it to access long term debt at a reasonable cost. S&P has noted NW Natural's difficulty in earning its authorized return and weakening financial profile; Staff's recommendation would further exacerbate this condition.

Q. What are the primary areas of disagreement between you and Staff?

A. The primary areas of disagreement with Staff's ROE analyses include (1) its primary reliance on a single model, (2) its exclusion of New Jersey Resources and inclusion of Northwest Natural Holding Company in the proxy group, (3) the application of its Three-Stage (or "Multi-Stage") and Single Stage (or "Constant Growth") DCF analyses, and (4) the application of its CAPM analysis, in particular Staff's market risk premium ("MRP").

Lastly, we note that there are errors and inconsistencies in Staff's analyses that diminish the reliability of its analyses and the ROE recommendation upon

[38] Staff/100, Muldoon/35.

which it is based. Should Staff provide corrections, we reserve the right to review these corrections and respond accordingly. We discuss these in more detail below.

A. Primary Reliance on a Single Model

Q. Does Staff's recommendation rely primarily on a single methodology?

A. Yes. Although Staff considers a Single Stage DCF analysis and a CAPM analysis as a "check" on the reasonableness of his Multi-Stage DCF analysis, its recommended ROE range is based on the results of its two Multi-Stage DCF analyses.

Q. Why is it important to consider the results of multiple methodologies when estimating the cost of equity?

A. As explained in our Direct Testimony, each model is based on a set of limiting assumptions, and changes in market conditions will affect each model differently. Further, each model provides a unique perspective on investors' return requirements. Therefore, it is important to consider a variety of methodologies to ensure that the cost of equity estimate is not biased by a particular model's results that may be unduly influenced by certain inputs or market data at the time. Although we understand that the Commission in the past has given weight to the Multi-Stage DCF approach, relying on multiple methodologies is consistent with investor practice and enables a more robust and reliable ROE estimate.

B. Proxy Group Composition

Q. Is Staff's Peer Utility screening process used to develop his Proxy Group clear and consistent?

A. No, it is not. There are several inconsistencies in Staff's testimony and its exhibits that make it difficult to understand its Peer Utility screening process. For example, there are several references to electric utilities or regulated electric operations; however, Exhibit Staff/101, Muldoon/2 includes only natural gas utilities in the group of companies initially considered and does not appear to consider electric utilities. Additionally, in Exhibit Staff/101, Muldoon/2, Staff appears to have excluded natural gas utilities that have a Beta coefficient greater than 1.0, however, this screening criterion is not listed in the seven screening criteria described at Staff/100, Muldoon/19. Further, Staff's screening criterion #2 explains that the proxy companies must have a positive dividend growth rate forecast by Value Line; however, as explained in more detail later, Exhibit Staff/101, Muldoon/3, two companies - NiSource Inc. and Southwest Gas Holdings – are projected to have a decline in dividends between 2025 and 2026.[39]

Q. Does Staff's analysis correctly reflect your Gas Utility proxy group?

A. No. As described in our Direct Testimony, our Gas Utility proxy group consisted of six companies and excluded NW Natural's parent company due to the circular logic that would occur. NW Natural/403, Coyne-Nelson/1 shows that NW Natural is

[39] For Southwest Gas Holdings, this is more clearly seen in the Excel version of Staff's exhibits when shown to three decimal places.

excluded from the Company's proxy group. However, Exhibit Staff/101, Muldoon/2 includes NW Natural's parent company in its depiction of our proxy group.

Q. Do you agree with Staff's exclusion of New Jersey Resources Corporation from the proxy group?

A. No. Staff explains that New Jersey Resources Corporation was excluded "based on how much of its operational cash flows are regulated and that the credit rating coverage for the Company was withdrawn by Moody's and Standard & Poor's." [40] However, there is no reference to a cash flow evaluation in Staff's description of the selection criteria on Staff/100, Muldoon/19 or in Staff/101, Muldoon/2.

In terms of the credit rating, New Jersey Resources Corporation's primary subsidiary, New Jersey Natural Gas ("NJNG"), is rated A1 by Moody's Investors Service. New Jersey Natural Gas's regulated gas distribution operations reflected more than 61 percent of New Jersey Resources Corporation's operating income and more than 65 percent of its assets. As such, investors likely give significant weight to New Jersey Natural Gas's credit rating in assessing New Jersey Resources Corporation's risk. For example, Fitch Ratings currently rates New Jersey Natural Gas as "A-", but does not rate the publicly traded parent New Jersey Resources Corporation, and notes "NJNG is the primary driver of earnings for the parent New Jersey Resources (NJR), so the rating also takes into consideration NJR's relatively higher risk, albeit conservatively managed, non-utility businesses, comprising Federal Energy Regulatory Commission regulated midstream assets,

[40] Staff/100, Muldoon/19.

a portfolio of commercial and residential solar projects, energy trading and energy services business."[41]

For these reasons, it is reasonable to use New Jersey Natural Gas's A1 rating by Moody's as a proxy for the credit rating of New Jersey Resources Corporation and New Jersey Resources should be included in the proxy group.

Q. Staff does not think an alternative Combined Proxy Group that supplements the Natural Gas Proxy Group by adding combination electric and natural gas utilities with substantive natural gas operations is "informative for the Commission."[42] What is your response?

A. We disagree. First, Staff appears to agree that the relatively small group of publicly traded natural gas companies is a potential issue that may need to be addressed in the future and it suggests that it will perform "sensitivity modeling" on a group of water utilities in its rebuttal testimony for the Commission's consideration.[43] As explained in our Direct Testimony, to address that concern, we added 11 companies classified as electric utilities by Value Line that had operating income from natural gas distribution operations of at least 15 percent on average over the last three years. Therefore, we include only those combination electric and natural gas utilities that have a meaningful proportion of natural gas operations. Although Staff seems concerned with "divergent risk profiles" between electric and natural

[41] Fitch Ratings, *Rating Report: New Jersey Natural Gas Company* (Apr. 29, 2024) (available at https://www.fitchratings.com/research/corporate-finance/new-jersey-natural-gas-company-29-04-2024).

[42] Staff/100, Muldoon/21.

[43] Staff/100, Muldoon/20-21.

gas utilities,[44] screening utilities for meaningful proportions of natural gas operations mitigates this concern, and we rely on the Natural Gas Proxy Group in reaching our recommendations.

C. Application of the DCF Model

1. Multi-Stage DCF Model

Q. Does the Multi-Stage DCF model produce reasonable estimates of the Company's cost of equity?

A. No, it does not. Due to the model's limiting assumptions that may be questionable at the current time, Staff's Multi-Stage DCF approaches produce results that range from 8.20 percent to 9.13 percent.[45] The low end of this range is 50 basis points below the lowest ROE authorized for a natural gas utility in more than 40 years, and the high end of this range is in the bottom 2 percent of ROEs authorized for natural gas utilities since 1980. Even looking to a more recent time period, Staff's highest Multi-Stage DCF result of 9.13 percent is in the bottom 1 percent of ROEs authorized for natural gas utilities since 2022. In fact, there is only one decision in the last three years in which a natural gas utility was authorized an ROE of 9.13 percent or lower. This is why it is important to rely on multiple methodologies, rather than a single model. The *Hope* and *Bluefield* decisions require the authorized return to be comparable to other returns available to investors in companies with similar risk. The Multi-Stage DCF results violate this standard.

[44] NW Natural/2513, Coyne-Nelson, Staff Response to NWN Data Request No. 20.

[45] Staff/103, Muldoon/1.

Q. What are your concerns with the Multi-Stage DCF analyses employed by Staff?

A. Although we also consider a Multi-Stage DCF analysis given the Commission's past preference for the model, we recognize the model's limitations and therefore do not rely on it exclusively. Additionally, we have identified certain issues with Staff's Multi-Stage DCF analysis. Specifically, we are concerned with (1) the accuracy of, and Staff's method for, calculating the current stock price, (2) the accuracy of the dividend forecasts, and (3) the terminal value.

Q. Please describe your concerns with Staff's development of its average stock price.

A. First, it appears that Staff may not have entered the correct prices for the first trading day of each month. Staff/100, Muldoon/28 at line 6, states the analysis uses the "average of closing prices for each utility from the first trading day in February 2024, March 2024 and April 2024." However, as shown in Figure 4 below, (see also Exhibit NW Natural/2508, Coyne-Nelson), the prices from Yahoo! Finance for each utility from the first trading day of the corresponding months do not match Staff's prices on Exhibit Staff/101, Muldoon/4. In fact, except for NW Natural Holdings, the three-day average prices reported by Yahoo! Finance are lower than what Staff used in its analysis. The result of Staff's errors is that the dividend yield in Staff's DCF analysis is lower, biasing its DCF estimate downward.

A bigger concern, however, is Staff's reliance on three spot prices to determine the dividend yield. Reliance on a very small sample of spot prices is arbitrary and can be unduly influenced by anomalous trading patterns on a single day, as stock prices can be highly variable due to factors that may be unrelated to the stock's intrinsic value. Simply, there is no evidence that investors would rely on stock prices from three arbitrarily chosen dates at the beginning of the month as being reflective of expectations going forward. A more common and prudent approach is to develop an average price over a longer period as we have done by reviewing averaging periods of 30-, 90-, and 180-trading days. This approach smooths out volatility and mitigates the risk that anomalous data biases the results.

Q. Please describe your concerns with Staff's forecasted dividends used in its Multi-Stage DCF analysis.

A. A foundational assumption of the Multi-Stage DCF model is that a company's dividend grows each year. In fact, as identified in Staff's own proxy screening criteria, companies that have cut their dividend are typically excluded from the

[46] NW Natural/2508, Coyne-Nelson.

proxy group. It is therefore illogical to forecast a dividend cut in the Multi-Stage DCF model. However, Exhibit Staff/101, Muldoon/3 projects a dividend cut in 2026 for NiSource and Southwest Gas Holdings.[47] It is unclear why Staff is forecasting a dividend cut, violating its own screening criteria, as well as the theoretical assumption of the model.

Moreover, in a Three-Stage DCF model, the transition stage should apply a consistent yearly dividend change to bridge the end of the initial stage to the beginning of the final stage. However, as demonstrated in Exhibit Staff/102, Muldoon/1, the growth in dividends through the transition period is inconsistent. For example, Staff projects that Atmos Corporation's dividend will increase by 24 cents in 2025, 7 cents in 2026, 34 cents in 2027, 38 cents in 2029, 35 cents in 2030 and 37 cents in 2031. These illogical assumptions directly impact the ROE recommendation, rendering Staff's analysis questionable. Unreliable modeling and inputs create unreliable ROE recommendations.

Q. Please describe your concerns with Staff's Price-to-Earnings multiple approach in Model Y.

A. For context, Staff states that the objective of Model Y is to model an approach in which an investor is assumed to hold the stock until it reaches a specific Terminal Value based on an assumed P/E" ratio.[48] Importantly, the model assumes that the Terminal Value that occurs in Year 30 is the goal, and the investor sells.

[47] As noted earlier, the projected decline in the annual dividend in 2026 is more easily seen in Staff's Excel file when the dividends are shown to three decimal places.

[48] Staff/100, Muldoon/26.

To forecast the terminal value within Model Y, Staff multiplies the 2024 current Price-to-Earnings ("P/E") multiple to a forecasted earnings per share ("EPS") in 2054. However, in reviewing Staff's exhibits, it appears that Staff applied the 2025 EPS forecast from Staff/101, Muldoon/3 as the 2024 EPS in Model Y. It is unclear if this is an error or was intentional; however, if Staff is trying to use a forward P/E multiple, then the terminal value EPS used in its calculation should be adjusted accordingly. Additionally, using the current P/E multiple does not consider whether the current P/E ratio is stable and consistent with expectations going forward. It would be more appropriate to apply a long-term P/E multiple to the forecasted EPS.

Q. Staff asserts that "relying on a long-term GDP growth rate" can "overstate [the] required ROE."[49] Do you agree?

A. No, we do not. Despite providing no evidence supporting its position, Staff states that "it is possible that Staff modeling anticipates greater growth than may be realized and so overstates required ROE to attract investors" on the basis that electric demand growth is linked to GDP growth.[50]

GDP is the sum of all private industry and government output in the United States, and its growth rate is an approximate average of the value of those industries. As such, some sectors will grow faster than the average, and some will grow slower. As shown in Exhibit NW Natural/2509, since 1947, the utility sector

[49] Staff/100, Muldoon/31.

[50] Staff/100, Muldoon/31. We recognize Staff may be referring to electric utility sales in error rather than natural gas utility sales.

as a component of GDP has grown at a faster compound annual average rate (6.55 percent) than the overall GDP growth rate (6.37 percent). If anything, the use of a GDP growth rate as the terminal growth rate in the Multi-Stage DCF analysis places a low ceiling on long-term growth and biases the model's ROE estimates downward.

Q. Does your Multi-Stage DCF analysis use an expected GDP growth rate as the terminal growth rate?

A. Yes, we have presented the Multi-Stage DCF model in deference to the Commission's past practice. However, we recognize this limiting assumption in the model and thus have not given exclusive or primary weight to its results. Relying exclusively on this model presents significant model risk in the sense that the cost of equity estimate, and Staff's ROE recommendation, depends substantially on whether GDP growth is an accurate estimate of the proxy group's long-term growth expectations. As discussed above, GDP growth could be a poor measure of utility growth.

Q. Please discuss Staff's application of a Hamada adjustment to the results of their recommended range.

A. Staff applies a Hamada adjustment to its DCF results to normalize differences in the proxy group capital structure and the Company's proposed capital structure in this case. However, the resulting effect on Staff's ROE recommendation is unclear as once again there are inconsistencies between Staff's exhibits and the testimony.

Exhibit Staff/101, Muldoon/4 shows the adjustment as a 12-basis point[51] reduction to the recommended ROE range, while in testimony, Staff/100, Muldoon/34 describes the adjustment as a 24-basis point reduction.

Q. Do you have general concerns over the application of the Hamada adjustment?

A. Yes. A Hamada adjustment is typically reserved for companies that have a materially different capital structure than their peers. In this instance, the Company's capital structure is relatively consistent with industry standards, although it is somewhat more leveraged than the regulated operating companies within the Gas Proxy Group. Furthermore, Staff has already screened its proxy group using a debt leverage screening criterion to ensure the proxy group consists of companies with comparable risk profiles to NW Natural. Incorporating a further Hamada adjustment unnecessarily over weights any perceived differences in financial risk.

The Hamada adjustment has been occasionally used in the rare case in which a company's capital structure is not deemed to be "optimal" or represented by the proxy companies. However, as discussed earlier in Section III above, the determination of an "optimal" capital structure is dynamic and complex and each utility's unique circumstances and financing needs factor into the determination of what is "optimal." A 50/50 capital structure may be "optimal" for NW Natural in the

[51] This is more easily seen in Staff's Excel exhibits when the Hamada adjustment result is shown to two decimal places.

current environment, but it may not be optimal for Atmos Corporation, or any other company. Further, a utility's "optimal" capital structure requires sufficient flexibility for varying market environments. While a 50/50 capital structure may be optimal today, it may not be optimal tomorrow under constrained market circumstances. Applying the Hamada adjustment to all proxy companies based on a debt ratio of 50 percent, therefore, implicitly presumes that this capital structure is "optimal" for all companies, which is a false and misleading conclusion.

Lastly, there are additional inconsistencies in Staff's Hamada adjustment analysis. First, Staff uses an equity risk premium of 4.20 percent, but offers no explanation regarding the basis of this equity risk premium, as it differs from the 5.35 percent equity risk premium applied in its CAPM analysis. Further, the tax rates for Atmos, ONE Gas, and Spire do not match Value Line's 2024 estimated tax rates as cited by Staff. While we have not attempted to reconcile these inconsistencies and their effect on Staff's results, they raise questions as to the reliability of Staff's analysis and its ultimate ROE recommendation.

Q. After your review of Staff's application of the Hamada adjustment, do you believe the results can be relied upon for setting an authorized ROE in this case?

A. No. The application of a Hamada adjustment is inappropriate in this case as the Company's capital structure is not materially different than its peers, nor should it be presumed that all the proxy companies should be financed with the same capital structure as NW Natural. Additionally, there are inconsistencies with Staff's analysis and testimony, rendering the analysis unreliable.

2. Constant Growth DCF Analysis

Q. Does Staff use any alternative ROE methodologies to test the reasonableness of the Multi-Stage DCF model results?

A. Yes. Staff has considered the Constant Growth DCF model and the CAPM analysis to test the reasonableness of its Multi-Stage DCF model results.[52] However, Staff has not placed any weight on the results of these alternative methodologies in establishing its range of results or its ROE recommendation. As noted earlier, each ROE estimation model has its own strengths and shortcomings. When the results of one model cannot be corroborated by the results of alternative models, it is reasonable and appropriate to consider the individual and collective results of multiple methods to establish the return on equity.

Q. Please summarize Staff's position with respect to the Constant Growth DCF model.

A. Staff has performed a Constant Growth DCF analysis to test the reasonableness of its Three-Stage DCF model. As shown in Exhibit Staff/105, Muldoon, Staff's Constant Growth DCF model produces a proxy group average ROE estimate of 7.70 percent for our proxy group and 7.50 percent for Staff's proxy group. However, Staff contends that the Constant Growth DCF model "cannot incorporate known, measurable, and material information about the future usually built into Three-Stage DCF analysis."[53]

[52] Staff/100, Muldoon/17-18, 25.

[53] Staff/100, Muldoon/38.

Q. Does the Three-Stage or Multi-Stage DCF analysis better incorporate "known, measurable, and material information about the future" relative to the Constant Growth DCF analysis?

A. No. Staff's position appears to be that the Three-Stage DCF model is somehow superior, or more accurate, than the Constant Growth or Single Stage DCF model. This is a false premise. There is no basis for Staff's claim that its judgment and input selection regarding the timing and growth of annual dividends over the three stages, the P/E ratio, and Terminal Value is any more "known, measurable, and material information about the future" than the inputs applied in the simpler Constant Growth DCF model. Both Staff's Multi-Stage and Constant Growth DCF analysis rely on the same stock prices and the dividends and growth rates are from Value Line. Therefore, if these inputs are not "known, measurable, or material" enough for the Constant Growth DCF model, then it is curious why Staff relies on them in its Multi-Stage analysis. If anything, Staff's reliance on inputs from a single source (Value Line) exposes it to potential bias, whereas our use of three projected growth rate sources (including Value Line as one of three sources) mitigates the potential for bias from any one source.

Q. Do you have any additional concerns with Staff's Single Stage DCF model?

A. Yes, we do. Staff's unreasonably low results are driven primarily by its use of Value Line's dividend growth rate projections instead of earnings growth rate projections. Further, although Staff attempted to replicate Value Line's methodology for calculating its five-year dividend growth rate, the results do not reconcile with the five-year dividend growth rates Value Line reports for the proxy companies and are

lower, thus biasing Staff's ROE results downward. Inserting the correct dividend growth rate projections from Value Line increases Staff's Single Stage DCF growth rates for both Staff's and our proxy groups by 90 basis points (see Exhibit NW Natural/2510, Coyne-Nelson). While Staff's Constant Growth DCF results are unreasonably low even when corrected, applying Value Line's correct dividend growth rates demonstrates the significant effect Staff's error has on its model results.

Q. Please explain why earnings growth rates are the most appropriate for use in the DCF model.

A. As explained in our Direct Testimony, the DCF model assumes that earnings, dividends, and book value grow at the same constant rate. Further, dividend growth can only be sustained by earnings growth, as earnings are the fundamental determinant of a company's ability to pay dividends. Further, management's strategies regarding dividend policies can be influenced in the short term by other objectives, such as cash flow management practices. Additionally, academic research has found that earnings growth rates are better predictors of stock prices than other measures of growth. In addition to the Carleton and Vander Weide study referenced in our Direct Testimony, a 2002 study in the *Journal of Accounting Research*, examined "the valuation performance of a comprehensive list of value drivers" and found that "forward earnings explain stock prices remarkably well" and

were generally superior to other value drivers analyzed.[54] A 2012 study from the journal *Contemporary Accounting Research* found that the sell-side analysts with the most accurate stock price targets were those whom the researchers found to have more accurate earnings forecasts.[55]

Additionally, Value Line is the only source we are aware of that publishes dividend and book value growth rate projections. The fact that dividend and book value growth rate projections are not widely reported by other sources further supports the conclusion that earnings growth is the most meaningful measure of growth among the investment community. In other words, if investors relied heavily on projections of dividend growth, more sources would offer that data.

Lastly, when providing guidance to investors regarding the overall total return targets in their investor presentations, companies define the return as the sum of the dividend yield and *earnings* growth, not dividend growth.[56] In doing so, they recognize that investors consider earnings growth to be the primary driver of stock values.

D. CAPM Analysis

Q. As a check on its Multi-Stage DCF model, Staff also develops a CAPM analysis.[57] Please describe that analysis.

A. Staff's CAPM analysis produces an ROE estimate of approximately 9.2 percent for its proxy group, which it claims supports the reasonableness of the "middle to high end" of its Multi-Stage DCF model of 9.3 percent.[58] Staff relies on a spot risk-free rate of 4.555 percent as of April 5, 2024, a market risk premium ("MRP") of 5.35 percent, and Value Line Beta coefficients.[59]

Q. What are your primary concerns with Staff's CAPM analysis?

A. Although Staff only uses the CAPM as a check on its Multi-Stage DCF results, our primary concern is with Staff's market risk premium estimate. While we also disagree with the use of a spot risk-free rate, it is relatively close to our current 30-day average 30-year Treasury yield, so at this time we do not address Staff's risk-free rate.

Q. How does Staff develop its MRP?

A. Staff's 5.35 percent MRP is calculated by taking the difference between Staff's 9.90 percent market return and its 4.555 percent risk free rate.

Q. What is the basis for Staff's 9.90 percent market return estimate?

A. Staff's 9.90 percent market return estimate appears to be based on the return on the S&P 500 between 1993-2023 (i.e., the last 31 years). In response to NWN

[57] Staff/104, Muldoon/1.

[58] Staff/100, Muldoon/17.

[59] Staff/100, Muldoon/23-24; Staff/104, Muldoon/1.

Data Request No. 22[60], Staff states it calculated a market return between 1993 to 2023 of 9.85 percent, which it rounded to 9.90 percent. According to Staff's workpaper provided in NWN DR 22 Attachment A, 9.85 percent appears to reflect the average of Staff's calculation of the arithmetic average annualized price return of the S&P 500 Index, and the arithmetic average annualized total return of the S&P 500 Index.

Q. Is it reasonable or appropriate to rely on the price appreciation return as a measure of investors' expected market return?

A. No. If a historical average market return is to be used, only the total return on the market should be used. The total annual return is the sum of three components: (1) the capital appreciation (or price) return, (2) the income return, and (3) the reinvestment return.[61] As explained by Kroll, for a single month the reinvestment return is zero, but over a longer period of time it is non-zero.[62] Staff's historical annualized price return only includes one of these three components (i.e., the capital appreciation return) and does not include the income return (i.e., return from dividends) or the reinvestment return (i.e., reinvestment of dividend income), and is thus significantly lower than the total return. For the S&P 500 Index companies that pay dividends, investors undoubtedly incorporate the income generated from dividend payments, and the reinvestment of those dividends, into their return calculations and forward-looking market return expectations. Therefore, basing an

[60] NW Natural/2514, Coyne-Nelson.

[61] Kroll, 2023 SBBI Yearbook, at 54.

[62] Kroll, 2023 SBBI Yearbook, at 54.

expected market return solely on the price appreciation return is not reflective of actual investor theory and practice, which biases Staff's market return estimate. The use of the total return is supported by Kroll that calculates its reported historical equity risk premium as the difference between the *total return* on the S&P 500 Index and the income return on long-term government bonds.[63]

Adjusting Staff's CAPM analysis for its 10.83 percent historical arithmetic annualized total market return estimate in NWN DR 22 Attachment A raises its CAPM results by 80 basis points to a range of 9.99 percent to 10.10 percent,[64] which overlaps our recommended ROE range and our point recommendation of 10.10 percent (see Exhibit NW Natural/2511, Coyne-Nelson).

Q. Is the use of a geometric average market return appropriate for estimating the forward-looking market return estimate?

A. No, it is not. Staff recommends at Staff/100, Muldoon/41 that "market returns be calculated based off the historic long-run growth rates of stocks"; in its response to NWN Data Request No. 24[65], Staff clarifies that "[t]he appropriate long-run calculation in this context is the geometric market risk premium." Although Staff does not appear to use the geometric average market return in calculating its 9.90 percent market return, we nonetheless address Staff's position that the geometric

[63] Kroll, 2023 SBBI Yearbook, at 190.

[64] For the reasons discussed below, the entire history of available market return data should be used when relying on a historical market return. Therefore, we do not agree with Staff's 31-year subset of historical market return data. Nonetheless, we apply Staff's historical arithmetic annualized total market return to demonstrate the significant effect that applying the price appreciation return has on Staff's CAPM results.

[65] NW Natural/2515, Coyne-Nelson.

average market return, or market risk premium, is appropriate for the cost of equity estimation purposes.

The arithmetic mean assumes that each observation is independent from another and, therefore, incorporates uncertainty into the calculation of the long-term average. The geometric mean, on the other hand, is backward-looking, equating a beginning value to an ending value. Although geometric averages provide a standardized basis to assess past performance across investments or investment managers, they do not reflect forward-looking uncertainty. Lastly, investment volatility (i.e., risk), is typically measured based on the standard deviation, which is a function of the arithmetic mean, not the geometric mean.

Many financial textbooks and investor publications advise against the use of geometric averages as a basis for a forward-looking estimate of expected returns in the CAPM.[66] For example, Ibbotson explains:

> The geometric average is more appropriate for reporting *past performance*, since it represents the compound average return…The argument for using the arithmetic average is quite straightforward. In looking at projected cash flows, the equity risk premium that should be employed is the equity risk premium that is expected to actually be incurred over the future time periods. The best estimate of the expected value of a variable that has behaved randomly in the past is the average (or arithmetic mean) of its past values.[67]

Dr. Roger Morin adds,

[66] *See, e.g.,* Roger A. Morin, Ph.D., New Regulatory Finance 133-138 (2006); Kroll, 2023 SBBI Yearbook, at 193.

[67] Ibbotson Stocks, Bonds, Bills, and Inflation, 2005 Yearbook, Valuation Edition, at 75 (emphasis added).

> Because valuation is forward looking, the appropriate average is the one that most accurately approximates the expected future rate of return. The best estimate of expected returns over a given future holding period is the arithmetic average. Only arithmetic means are correct for forecasting purposes and for estimating the cost of capital. There is no theoretical or empirical justification for the use of geometric mean rates of returns as a measure of the appropriate discount rate in computing the cost of capital or in computing present values.[68]

Because the cost of equity is forward-looking, if a historical average is used, the arithmetic mean is the correct estimate for use in the CAPM. Contrary to Staff's position, a long-term historical arithmetic average market return is not "extreme."[69]

Q. Do you agree with Staff's use of a 30-year historical period to calculate the market return?

A. No, we do not. Staff seems to be concerned with certain economic periods influencing the expected market return going forward. However, Staff's self-selected historical market return period is subjective in nature and unrepresentative of long-term trends in market data. As explained by Kroll:

> The estimate of the equity risk premium depends on the length of the data series studied. A proper estimate of the equity risk premium requires a data series long enough to give a reliable average without being unduly influenced by very good and very poor short-term returns. When calculated using a long data series, the historical equity risk premium is relatively stable. Furthermore, because an average of the realized equity risk premium is quite volatile when calculated using a short history, using a long series makes it less likely that the analyst can justify any number he or she wants.

***

[68] Roger A. Morin, Ph.D., New Regulatory Finance, at 116-117 (2006).

[69] Staff/100, Muldoon/24.

> Some analysts estimate the expected equity risk premium using a shorter, more recent period on the basis that recent events are more likely to be repeated in the near future; furthermore, they believe that the 1920s, 1930s, and 1940s contain too many unusual events. This view is suspect because all periods contain unusual events. Some of the most unusual events of the last 100 years took place quite recently, including the inflation of the late 1970s and early 1980s, the October 1987 stock market crash, … the attacks of September 11, 2001, the global financial crisis of 2008-2009, and most recently, the market crash in the first quarter of 2020 that was precipitated by the spread of the COVID-19 virus.[70]

Whereas Staff suggests that our historical average MRP that is based on data between 1926 to 2022 may be biased because it includes post-World War II "boom time" returns, it also includes nine years of negative returns due to the Great Depression and World War II. Therefore, our long-term historical arithmetic average return includes returns over many economic cycles and interest rate and inflation cycles and is the least biased because we have not arbitrarily selected a subset of return data. This approach is consistent with investor practice and is promoted by Ibbotson. As Dr. Morin explains:

> Because risk premiums based on short time periods can be particularly volatile, changing with capital market conditions, inflationary expectations, and fiscal-monetary forces, they should be ignored. One should rely instead on the long-term results, since periods of such length are long enough to smooth out short-term aberrations, and to encompass several business and interest rate cycles. In their comprehensive study of historical returns, Ibbotson Associates recommend the use of the entire study period in estimating the appropriate market risk premium, so as to minimize subjective judgment and to encompass as many diverse regimes of inflation, interest rate cycles, and economic cycles as possible.[71]

[70] Kroll, 2023 SBBI Yearbook, at 193-194.

[71] Roger A. Morin, Ph.D., New Regulatory Finance at 114 (2006).

Further, our approach does not attempt to guess what types of economic cycles are likely to be repeated[72] since the entire return history available to us is used.

Q. Staff asserts that "expectations should mirror the recent 30-year returns".[73] Do you agree?

A. No. There is no evidence that expectations should mirror a recent 30-year period. Annual market returns are largely random, highly volatile, and driven by a variety of factors. While investors' expectations are influenced by recent history, those expectations can change at a moment's notice as new data arise and events occur. There is no basis to support the position that a 30-year history is any more superior than nearly 100 years of history that accounts for economic booms and busts, very high and very low inflation, wars, and times of government and monetary policy intervention.

Despite substantial volatility in annual returns year to year, the long-term arithmetic average historical market return is surprisingly stable. Interestingly, the average arithmetic market return between 1926 and 1994 was 12.17 percent, exactly equal to the average market return between 1926 and 2023 that adds 30

[72] Staff/100, Muldoon/24.

[73] Staff/100, Muldoon/25.

more years of history.[74] This evidence contradicts Staff's premise that stock returns experienced in the last 30 years have been lower.

Q. Staff Witness Muldoon suggests that your Market Return is "an extreme input" and "inflated".[75] Do you agree?

A. No. First, as a preliminary matter, we developed several CAPM estimates, applying various combinations of risk-free rates (both current and projected), Beta coefficients from two sources, and MRP estimates using both a historical average and forward-looking market return estimates. The low end of our recommended ROE range is based on our four-model average that relies on the most conservative CAPM inputs (the historical average MRP and projected risk-free rate). The high end of our recommended ROE range is based on our four-model average that relies on a blend of our forward-looking and historical MRP and current interest rates. In other words, we have given more weight to the most conservative MRP estimate in developing our recommended ROE range. To be clear, the market return presented in our Direct Testimony assumes market returns of 13.31 percent and 11.59 percent.

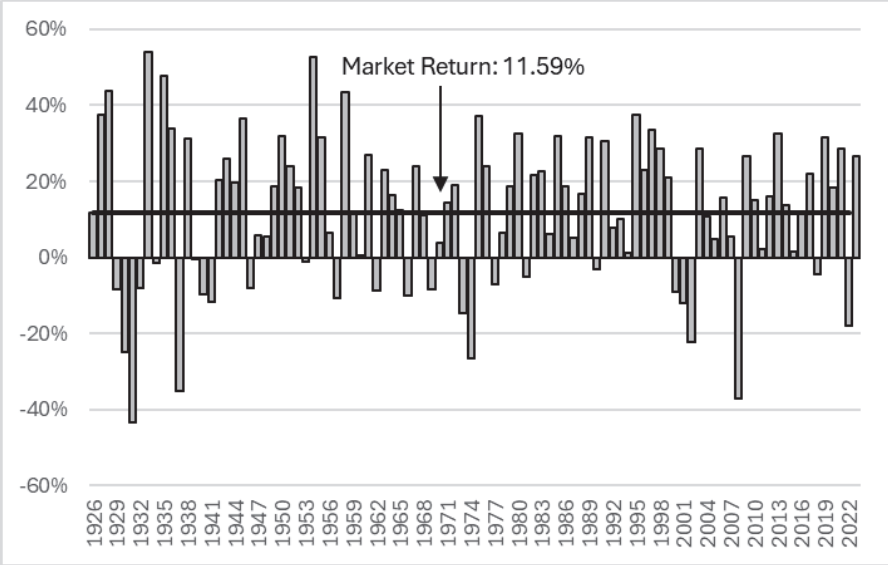
To assess the reasonableness of a market return of 11.59 percent and higher, we reviewed the 98 annual market returns between 1926 and 2023 and compared how often a market return of 11.59 percent and higher occurred. As

[74] We note that in 2024 Kroll revised its methodology for calculating the long-term average market return and market risk premium. Under Kroll's revised methodology, the average arithmetic average total market return from 1926 to 2023 is 12.04 percent, highly consistent with the 12.17 percent long-term average noted here that uses Kroll's previous methodology.

[75] Staff/100, Muldoon/23.

shown in Figure 5 below (see also Exhibit NW Natural/2512), a market return of 11.59 percent and higher has occurred in 55 of 98 years, or more than 56 percent of the time. In the last 30 years (the period that Staff believes is relevant), a market return of 11.59 percent and higher has occurred in 18 of 30 years, or 60 percent of the time. By these measures, a market return of 11.59 percent and higher is reasonable.

Figure 5: Frequency of Annual Market Returns (1926 – 2023)[76]



VI. RESPONSE TO AWEC WITNESS MULLINS

Q. Please summarize AWEC Witness Mullins' ROE recommendation.

A. AWEC Witness Mullins recommends an ROE of 9.2 percent based solely on a CAPM analysis.[77] Although we agree with AWEC Witness Mullins that the CAPM is a methodology widely used by investors and should be considered by the

[76] Source: Kroll, 2023 Classic Yearbook, Appendix A-1; Kroll Cost of Capital Navigator.

[77] AWEC/100, Mullins/2.

Commission, we disagree with his input selection and his sole reliance on this single model. We continue to recommend the use of multiple methodologies as the basis of a sound cost of equity estimate.

Q. AWEC Witness Mullins asserts that market conditions do not justify an increase in the Company's ROE.[78] What is your response?

A. AWEC Witness Mullins is incorrect. As shown in Figure 1 above in Section II, capital costs have increased nearly 300 basis points since the Company filed its last rate case in December 2021. A 70-basis point increase in the authorized ROE would incorporate less than 25 percent of the overall increase in capital costs. The evidence does not support that the cost of equity has fallen, justifying a lower authorized ROE.

Q. AWEC Witness Mullins asserts that your "high" ROE estimate is due to "underweighting" the Multi-Stage DCF analysis and "overweighting" the CAPM modeling results.[79] Is he correct?

A. No, he is not. AWEC Witness Mullins misunderstands the development of our recommendation. To be clear, our recommended ROE range is based on an average of four model results in which each model (DCF, CAPM, Risk Premium, and Expected Earnings) is given equal weight. We do present multiple CAPM approaches, however, and the four-model average that is the basis of the low and high ends of our recommended range reflects just one of those CAPM approaches

[78] AWEC/100 Mullins/5.

[79] AWEC/100, Mullins/6.

in the average. As explained earlier, the low end of our recommended ROE range is based on our four-model average that relies on the CAPM approach that uses the most conservative CAPM inputs (the historical average MRP and projected risk-free rate). The high end of our recommended ROE range is based on our four-model average that relies on the CAPM approach that uses a blend of our forward-looking and historical MRP and current interest rates.

Q. What is your response to AWEC Witness Mullins' comparison of Beta coefficients reported by Value Line, Bloomberg, and Yahoo! Finance?

A. On AWEC/100, Mullins/8, AWEC Witness Mullins presents Beta coefficients for the gas proxy companies from three sources: Value Line, Bloomberg, and Yahoo! Finance. No witness in this proceeding supports the use of Yahoo! Finance Beta coefficients, including AWEC Witness Mullins.[80] As AWEC Witness Mullins observes, the difference in the timing of the return calculation (i.e., weekly vs. monthly) can have a considerable effect on the Beta coefficient. By their nature, Beta coefficients calculated using monthly returns rather than weekly returns do not capture inter-month return volatility and thus tend to be lower. As AWEC Witness Mullins acknowledges in response to NW Natural's Data Request 7 to AWEC, this is not unique to utility stocks. The fact that monthly Beta coefficients are lower than weekly Beta coefficients, however, should not be interpreted as an indication of lower risk. As discussed below, Beta coefficients calculated using

[80] See NW Natural/2516, Coyne-Nelson, AWEC's Response to NW Natural Data Request No. 7.

monthly returns obscure relevant intermonth volatility, leading to flawed and misleading conclusions.

Consider, for example, stock prices for two utilities – Utility A and Utility B – over a 60-trading day period (approximately three calendar months), illustrated in Figure 6 below. Both utilities start trading at a price of $100 per share. Both utilities report a total return of 11.69 percent at the end of three months. At the end of every month (the 20th trading day), both stocks have the same price. However, Utility B's stock is clearly more volatile (and therefore riskier) than Utility A's. If the Beta coefficient for Utility B was calculated using monthly returns, it would not capture intermonth stock price volatility and Utility B's Beta coefficient would be the same as Utility A's. On the other hand, if the Beta coefficients are calculated using weekly returns (every five trading days), Utility B's Beta coefficient would be higher than Utility A's, all else equal, better reflecting its higher volatility.

Figure 6: Illustrative Example of Weekly vs. Monthly Stock Volatility

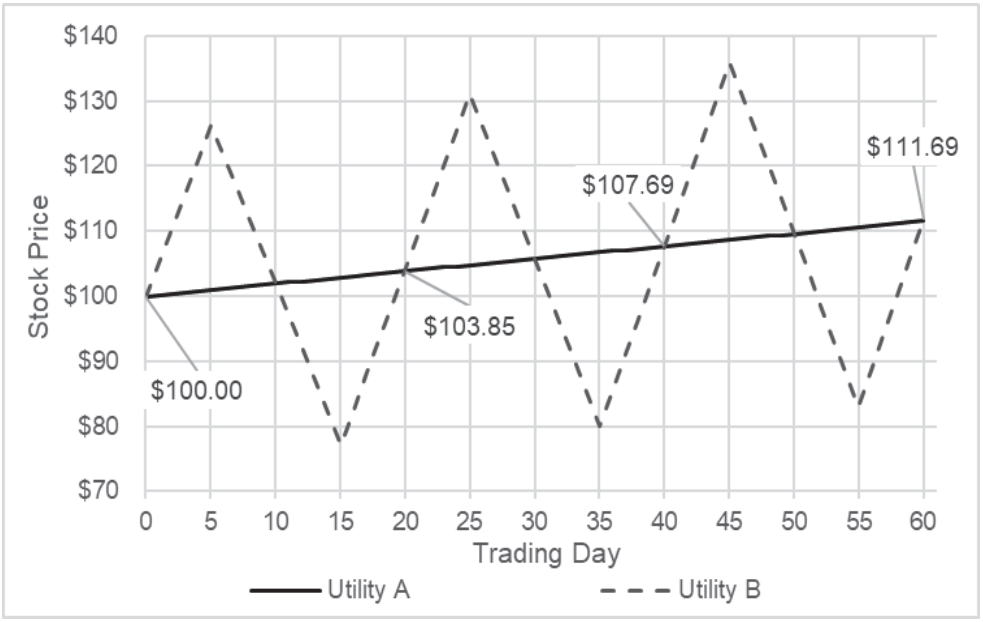


Figure 6 above demonstrates why it is inappropriate to compare Beta coefficients calculated using weekly returns with those that are calculated using monthly returns. Calculating Beta coefficients using weekly return data as Value Line and Bloomberg do is a reasonable and balanced approach to measuring stock volatility.

Q. AWEC Witness Mullins asserts that you "selectively ignore the poorly performing stocks" in your forward-looking market return estimate.[81] Is he correct?

A. No. AWEC Witness Mullins mischaracterizes our response to AWEC DR 44, which is provided as AWEC/102, Mullins/8. We do not exclude S&P 500 companies that were "operating at a loss" or "had a negative price to earnings ratio" such that "it was impossible to produce a meaningful growth figure from the data" as AWEC Witness Mullins asserts.[82] As shown in Exhibit NW Natural/407, pages 2-15, the analysis includes companies with a zero percent growth rate or negative growth rates, so we have included companies with poor growth rates. The companies without a growth rate are those for which there are no analyst consensus earnings growth rates, whatever the reason (the reasons are not disclosed). As explained in our response to AWEC DR 44, a market-cap growth weighted rate simply cannot be developed with companies that lack a growth rate estimate. Because the

[81] AWEC/100, Mullins/10.

[82] AWEC/100, Mullins/10.

purpose is to develop a market-cap weighted dividend yield and growth rate, we can only use companies for which earnings growth rates are published.

Q. AWEC Witness Mullins suggests that applying the Constant Growth DCF model to the S&P 500 is contrary to the Commission's preference for the Multi-Stage DCF model.[83] What is your response?

A. AWEC Witness Mullins fails to understand the fundamental difference in applying the Constant Growth DCF model to develop a cost of equity estimate for a single utility, or group of utilities, versus developing an estimate for the S&P 500 Index as the expected market return component in the CAPM. The FERC addressed the difference in Opinion 531-B, explaining:

> The rationale for incorporating a long-term growth rate estimate in conducting a two-step DCF analysis of a specific group of utilities does not necessarily apply when conducting a DCF study of the companies in the S&P 500. That is because the S&P 500 is regularly updated to include only companies with high market capitalization. While an individual company cannot be expected to sustain high short-term growth rates in perpetuity, the same cannot be said for a stock index like the S&P 500 that is regularly updated to contain only companies with high market capitalization, and the record in this proceeding does not indicate that the growth rate of the S&P 500 stock index is unsustainable.[84]

Q. What is your response to AWEC Witness Mullins' position that the use of a historical MRP is "not an accepted method"?[85]

A. AWEC Witness Mullins is incorrect. As discussed in response to Staff, when properly developed and when current and expected market conditions are largely

[83] AWEC/100, Mullins/10.

[84] 149 FERC ¶ 61,032, Opinion No. 531-B at ¶113.

[85] AWEC/100, Mullins/10-11.

consistent with historical data, a historical MRP is an acceptable estimate of the forward-looking MRP. That said, we agree that cost of equity is forward looking, and thus forward-looking inputs should be given weight; therefore, we have used both a historical and a forward-looking MRP in our CAPM analysis.

We agree that equity risk premiums change over time and with market conditions[86] and that is the underlying premise of our Bond Yield Plus Risk Premium analysis. This analysis shows that the equity risk premium is inversely related to changes in interest rates. As interest rates increase, the equity risk premium decreases and vice versa.

Q. What is your response to AWEC Witness Mullins' position that your Risk Premium analysis does not "have merit"?[87]

A. AWEC Witness Mullins misunderstands the analysis. First, as previously noted, the analysis addresses AWEC Witness Mullins' concern that the equity risk premium moves in response to market conditions. Further, the analysis does not "merely [peg] a utility's ROE at a certain number of basis points above the risk-free interest rate" nor does it "assume that a gas utility should earn a premium equal to 5.95 percent above the risk free rate, regardless of any other circumstances in equity or debt markets" as AWEC suggests.[88] As shown in Exhibit NW Natural/408, the estimated risk premium resulting from the analysis changes with the bond yield. At a yield of 4.42 percent, the implied risk premium is 5.95 percent;

[86] AWEC/100, Mullins/11.

[87] AWEC/100, Mullins/12.

[88] AWEC/100, Mullins/12.

however, at bond yields of 4.18 percent and 3.80 percent, the risk premium is 6.09 percent and 6.30 percent, respectively.

Q. What is your response to AWEC Witness Mullins' reference to MRP estimates from Kroll and NYU professor Dr. Aswath Damodaran?[89]

A. As explained in more detail below, we do not agree that the MRP estimates reported by Kroll and Dr. Damodaran are reasonable estimates in the current circumstances. Further, because these estimates rely on subjective judgment and inputs that are at odds with those routinely used in utility regulatory proceedings, it is difficult to consider these sources as "unbiased."

Turning first to Kroll's estimates, one concern is that Kroll recommends using the 20-year Treasury bond yield as the risk-free rate, rather than the 30-year Treasury bond yield that is typically used in utility regulatory proceedings, which affects the MRP. A second and more important concern is that it is not clear that Kroll develops its expected MRP in relation to its risk-free rate. The MRP is calculated as the difference between the expected market return and risk-free rate; therefore, it is a function of the expected market return and risk-free rate at a point in time. In other words, the MRP and risk-free rate are not independent of each other; rather, they are interrelated, and should be developed concurrently. In fact,

[89] AWEC/100, Mullins/12-13.

and as explained earlier, academic studies have shown that the two are inversely related.[90] As the risk-free rate decreases, the MRP increases and vice versa.

However, as shown in Figure 7 below, Kroll's recommended Equity Risk Premium does not appear to move in relation to the risk-free rate, contrary to AWEC Witness Mullins' concern that the equity risk premium moves with changes in the market environment. Whereas academic studies indicate that the two lines should move in opposite directions, Figure 7 below shows that they do not.

Figure 7: Kroll Recommended Equity Risk Premium and Risk-Free Rate (2008-2024)[91]

[90] See, e.g., Robert S. Harris and Felicia C. Marston, *Estimating Shareholder Risk Premia Using Analysts' Growth Forecasts*, Financial Management, at 63-70 (Summer 1992); Eugene F. Brigham, Dilip K. Shome, and Steve R. Vinson, *The Risk Premium Approach to Measuring a Utility's Cost of Equity*, Financial Management, at 33-45 (Spring 1985); and Farris M. Maddox, Donna T. Pippert, and Rodney N. Sullivan, *An Empirical Study of Ex Ante Risk Premiums for the Electric Utility Industry*, Financial Management, at 89-95 (Autumn 1995).

[91] Source: Kroll Cost of Capital Navigator.

The conclusion that there is no clear relationship between Kroll's variables supported by statistical analysis. To assess whether there is a relationship, we performed a linear regression in which Kroll's recommended Equity Risk Premium was the dependent variable and the recommended risk-free rate was the independent variable. The R-square was 0.30 percent, which indicates that Kroll's risk-free rate explains only 0.30 percent of the change in the Equity Risk Premium. This runs counter to the fundamental principle that the MRP is a function of the risk-free rate, as noted earlier. Moreover, the slope coefficient is positive which indicates that the two are positively related (*i.e.*, move in the same direction) and not inversely related (*i.e.*, move in opposite directions), again contrary to academic literature. However, the slope coefficient was not statistically significant, which means there is little confidence in the statistical results. This is not to suggest that Kroll is not a valid or credible source of data. Rather, it suggests that the usefulness of Kroll's Equity Risk Premium recommendation at the current time is questionable given that it runs counter to academic and financial theory.

Turning to Dr. Damodaran's implied equity risk premium model, the model is complex and highly dependent upon the inputs and assumptions in that model. In our opinion, it is important to understand all the inputs and assumptions into Dr. Damodaran's model to vet the reasonableness of those assumptions before relying substantially on the outputs of that model. Our simplified understanding of Dr. Damodaran's model is that it applies a two-stage DCF analysis for the S&P 500 Index in which the first stage of growth relies on an estimate of analysts' projected earnings growth for the S&P 500 Index for the first five years, and a terminal stage

of growth equal to the 10-year Treasury bond yield for years six through perpetuity. We also understand that Dr. Damodaran assumes the 10-year Treasury bond yield as the discount rate. The assumed terminal growth rate is an especially critical input because it represents a significant portion of the terminal value and the ultimate valuation. In our opinion, Dr. Damodaran's assumptions are not reasonable or consistent with the Cost of Equity analyses that we see typically applied in utility regulatory proceedings. These concerns should not be construed to suggest we are criticizing Dr. Damodaran's model for academic purposes; rather, Dr. Damodaran's Implied Equity Risk Premium model is not useful for utility ratemaking purposes given its underlying assumptions. Moreover, we do not believe that it is appropriate to simply accept the inputs and assumptions used in Dr. Damodaran's Implied Equity Risk Premium model for Cost of Equity applications.

Q. Have observed MRP been consistent with the MRP estimates produced by Dr. Damodaran's implied equity risk premia model?

A. No, they have not. As shown in Figure 8 below, Dr. Damodaran's annual Implied Equity Risk Premium estimates have been far removed from actual observed MRP in recent years. In fact, on average, the actual MRP has been more than double the estimates from Dr. Damodaran's model.

Figure 8: Dr. Damodaran's Annual Implied Equity Risk Premium vs. Observed MRP[92]

Year	Dr. Damodaran's Implied Equity Risk Premium	Actual MRP
2010	5.20%	10.81%
2011	6.01%	-1.71%
2012	5.78%	13.54%
2013	4.96%	29.51%
2014	5.78%	10.28%
2015	6.12%	-1.09%
2016	5.69%	9.66%
2017	5.08%	19.16%
2018	5.96%	-7.20%
2019	5.20%	28.94%
2020	4.72%	16.98%
2021	4.24%	26.98%
2022	5.94%	-20.72%
2023	4.60%	22.44%
Average	**5.38%**	**11.26%**

Q. AWEC Witness Mullins points to your Multi-Stage DCF results as evidence to support his conclusion that show that "while interest rates might have risen, the cost of equity for NW Natural has not."[93] What is your response?

A. There are several logical flaws with AWEC Witness Mullins' conclusions. First, it is important to remember that interest rates are not a direct input into the DCF model; therefore, the DCF model does not directly measure how changes in interest rates affect the cost of equity. Second, AWEC does not compare how the Multi-Stage DCF results have changed as interest rates have risen. As shown in

[92] Sources: https://pages.stern.nyu.edu/~adamodar/New_Home_Page/home.htm; Kroll, 2023 SBBI Yearbook, Appendix A-1 and A-7, Kroll Cost of Capital Navigator.

[93] AWEC/100, Mullins/13.

Exhibit NW Natural/2501, Coyne-Nelson/2 compared to Exhibit NW Natural/403, Coyne-Nelson/2, our Gas Proxy Group mean Multi-Stage DCF results increased 22-basis points between September 2023 and April 2024. As another comparison, Staff's ROE range that is based on its Multi-Stage DCF models increased from its analysis filed in the Company's last rate case, further supporting the conclusion that the Cost of Equity has increased.[94]

VII. UPDATED ANALYSIS

Q. Have you updated your analysis to incorporate more recent data?

A. Yes, we updated our analyses to incorporate market data through April 30, 2024, using the methodologies described in our Direct Testimony.[95] As shown in Exhibit NW Natural/2501, Coyne-Nelson/1, the recommended range produced by our models for the Gas Proxy Group increased to 10.10 percent to 10.60 percent. However, at this time, we maintain our point ROE recommendation of 10.10 percent.

Q. Has your proxy group changed from your Direct Testimony?

A. We have not changed our Gas Proxy Group, which is the proxy group on which our recommendation relies. In our Direct Testimony, we also presented a Combined Proxy Group as an alternative given the relatively small number of publicly traded natural gas utilities. One company, MGE Energy, no longer meets

[94] In Staff's testimony filed in Docket No. UG 435, Staff's ROE ranged from 8.6 percent to 9.2 percent, which indicates that the low end of Staff's range increased by 30 basis points and the high end of its range has increased by 10 basis points in this proceeding. See Docket No. UG 435, Staff/100, Muldoon/22 Table 6.

[95] See Exhibits NW Natural/2501 to NW Natural/2507, Coyne-Nelson.

our screening criteria because it does not have positive earnings growth rates from two sources. Therefore, we removed MGE Energy from the Combined Proxy Group. However, our recommendation is ultimately based on the results from the Gas Proxy Group and, therefore, removing MGE Energy does not affect our recommendation.

VIII. SUMMARY AND CONCLUSIONS

Q. Please summarize your conclusions and recommendations.

A. Based on our updated analyses using market data as of April 30, 2024, we maintain our conclusion that 10.10 percent is a reasonable, if not conservative, estimate of NW Natural's cost of equity. Additionally, we continue to support NW Natural's requested capital structure of 50.00 percent common equity and 50.00 percent long-term debt as reasonable relative to the range of capital structures for the operating companies held by the proxy group companies, as well as recently authorized capital structures for natural gas utilities. As explained in our testimony, the Company's requested ROE and equity ratio combined produce a weighted equity return that is below the average authorized ROE and equity ratio for natural gas utilities in 2024.

Neither Staff's nor AWEC's analyses support a reduction in the Company's cost of equity, as their analyses apply flawed inputs that bias their recommendations downward. Their recommendations cannot be reconciled with the fact that capital costs have risen nearly 300 basis points since the Company filed its last rate case. Lastly, neither has considered the adverse effects on the Company's credit profile that their recommendations would cause.

Q. Does this conclude your Reply Testimony?

A. Yes.

Historical Market Return 1926-2023

	# Occurrences	
11.59%	55	56.12%
	98	

Note:

Kroll revised its methodology in 2024 for calculating the long-term historical average return on large-cap stocks, the income return on long-term government bonds, and the resulting long-term historical average market risk premium. Thus the average based on annual data shown above does not precisely match Kroll's revised long-term arithmetic average market risk premium.

Kroll's revised historical average market risk premium between 1926-2023 is shown below:

Based on the new equity and bond series discussed above, here is the U.S. Historical ERP for 1926−2023 and its respective components:

Equities	Bonds	ERP
CRSP S&P 500 Total Returns Average Annual Return (1926−2023)	Synthetic 20-Year U.S. Treasury Bond Income Returns Average Annual Return (1926−2023)	U.S. Historical ERP (1926−2023)

OREGON PUBLIC UTILITY COMMISSION
Docket No. UG 490 – NWN Data Request No 20.

Data Request No 20:
Referring to Staff/100, Muldoon/20 lines 9-14 and Muldoon/21, lines 10-11:
a. Please explain why Staff does not think that the consideration of electric utilities with natural gas utilities is "informative for the Commission" but consideration of water utilities would be informative.

Staff Response No 20:

Re: Staff/100, Muldoon/20 lines 9-14 and Muldoon/21, lines 10-11:

a. Electric and natural gas utilities have divergent risk profiles in part due to the nature of their operations. This can be seen by reviewing credit rating report and SEC filings including Annual Reports posted on the U.S. Security and Exchange Commission's Edgar resource, accessible to the public at: https://www.sec.gov/edgar/search-and-access .

It is uncertain whether publicly traded water utilities have close enough characteristics to merit future inclusion in ROE modeling for Commission jurisdictional natural gas utilities. That is why Staff proposes to track water utilities in its natural gas ROE modeling to acquire over time more information for which to make such an assessment. While Staff was informed by NW Natural leadership that there is significant overlap in operational profiles for the Company and water utilities when NW Natural was forming a holding company in part for the acquisition of water utilities, Staff will need to acquire significantly more data over time before making any recommendation to the Commission in this regard.

FROM: Matt Muldoon, Mgr. Accounting and Finance

OREGON PUBLIC UTILITY COMMISSION
Docket No. UG 490 – NWN Data Request No 22.

Data Request No 22:
Referring to Staff/100, Muldoon/23 and Staff/104, Muldoon/1.
a. Please explain whether Staff's risk-free rate of 4.555% is a spot yield as of April 5, 2024, or an average yield. If it is an average yield, please explain over what period the average was calculated and provide all underlying data to support the average calculation.
b. Please explain why Staff relied on an S&P 500 market return between 1993 through 2023 to develop its market risk premium. Provide any analyses and studies relied on by Staff that support the use of a 31-year historical period to develop a forward-looking expected market return.
c. Please provide the underlying data used to calculate the 9.90% market return between 1990-2023 and include the source of the data.
d. Please explain whether the 9.90% market return between 1993 and 2023 represents an arithmetic average or a geometric average.
e. Please explain whether the 9.90% market return reflects the total return, income return, or price appreciation.

Staff Response No 22:

Re: Staff/100, Muldoon/23 and Staff/104, Muldoon/1:

a. Staff's risk-free rate is a spot yield, consistent for this model. This is sourced as shown in Staff testimony from the Wall Street Journal.

b. Staff applies the fundamental accounting and finance "matching principle" within a given model. Note that the modeling periods match the periods herein.

c. Data to calculate a 9.9% market return between 1990 to 2023 is provided as Staff Response to **NWN DR 22 Attachment A**. This spreadsheet shows Staff's highlighted values.

d. The return from 1993 to 2023 was 9.85% which Staff rounded up slightly. Staff did not adjust this downward to account for inflation. For comparison, see the 9.08 geometric return for this period, and the overall average of approached of 9.75%. Staff understands that its use of 9.90 vs. a clearer 9.85% could create confusion.

e. Making the narrowing distinction between stock Price Return only or (PR) vs. stock Total Return (TR), Staff believes the Company is asking if Staff relies on the standard S&P 500 index (SPX) or the less used S&P 500 Total Return index (SPTR). Please see Staff response in **NWN DR 22 Attachment A** for the values Staff considered.

OREGON PUBLIC UTILITY COMMISSION
Docket No. UG 490 – NWN Data Request No 24.

Data Request No 24:
Please refer to Staff/100, Muldoon/41-42.
a. Referring to Muldoon/41 at lines 21-23, please explain whether Staff is referring to a historical arithmetic or geometric average market risk premium in this reference.
b. Referring to Muldoon/42 lines 4-7, please explain why Staff has relied on Morningstar's 2015 Classic Yearbook, and why it is reasonable to exclude return data for the last 9 years (i.e., 2015-2023).

Staff Response No 24:

Re: Staff/100, Muldoon/41-42, Muldoon/41 at lines 21-23, Muldoon/42 lines 4-7

a. The appropriate long-run calculation in this context is the geometric market risk premium. However, the Company makes reference to Morningstar's / Ibbotson yearbooks in this DR and so should be careful to refer back to specific elements within yearbooks to capture correctly any arithmetic references, which depending on context can use Morningstar publication defaults.

b. The 2015 Classic Yearbook is a common benchmark. This is regularly used because of the sale of the Ibbotson Yearbooks to Morningstar and the increase in price after acquisition caused many libraries to discontinue bringing new editions into their collection. Where practicable, Staff tries to use reference material that is generally available to intervenors such as at the Portland, OR Public Library or Oregon Library. That is consistent with Oregon government's goals of transparency and access.

   The other issue is that Morningstar may not necessarily have the same approach to independent unbiased analysis that characterizes the goals of Roger Ibbotson in his time as a University of Chicago professor. For example, the Wall Street Journal has been critical of Morningstar and its assessment and indications of relative risk. For a discussion of this concern regarding the "sell side" tendencies of Morningstar, see "The Morningstar Mirage" by Kirsten Grind, Tom McGinty and Sarah Krouse published in the Wall Street Journal. NW NATURAL DATA REQUEST 7 TO AWEC:

Please refer to AWEC/100, at Mullins/9:

a. Referring to lines 1-3, Please provide all studies, documentation, and analysis that Mr. Mullins has performed that supports his position that Beta calculations for "other stocks" based on monthly returns are "not necessarily" lower than Beta calculations for "other stocks" using weekly returns.

b. Referring to lines 7-11, please quantify how much weight Mr. Mullins gave to his CAPM estimates using Yahoo Finance Beta coefficients.

AWEC RESPONSE:

a. AWEC objects to this request on the basis that it does not accurately characterize Mr. Mullins testimony. Mr. Mullins never stated that the "that Beta calculations for 'other stocks' based on monthly returns are "not necessarily" lower than Beta calculations for "other stocks" using weekly returns. AWEC also objects to this request on the basis that it overly vague. Notwithstanding said objections, AWEC responds as follows:

The referenced testimony was pointing out that there are a variety of ways that a beta can be calculated and that the Yahoo method, which uses monthly returns, resulted in materially lower betas for the gas proxy group than did the Value Line and Bloomberg calculations. The Yahoo method, however, does not uniformly result in lower betas for all securities. Consider the following securities:

	Beta	
Security	Value Line	Yahoo
AAPL	1.000	1.260
CAT	1.100	1.180
GS	1.300	1.390
HD	1.000	1.010
INTC	0.900	1.090
MMM	1.000	1.040
NKE	1.080	1.200
CRM	0.900	1.300
DIS	1.100	1.390
DOW	1.100	1.290

These securities had a higher Yahoo beta as compared to Value Line, although there are many other securities, such as the gas proxy group, where the opposite is true. Therefore, Mr. Mullins testimony was simply stating that there may be some characteristic of gas stocks that causes them to be less risky based on monthly beta, as opposed to a weekly beta. This commentary, however, is not consequential to Mr. Mullins analysis, as he applied zero practical weight to the yahoo betas.

b. While Mr. Mullins did not apply specific weighting percentages in deriving his recommendation, the Yahoo finance betas were not used to inform his recommendation. As he noted on Page 9, lines 7-8, he was not able to verify the accuracy of the Yahoo Finance beta calculations.

EXHIBIT 2600 – REPLY TESTIMONY – DISTRIBUTION SYSTEM AND STORAGE FACILITY PROJECTS

Table of Contents

I. Introduction and Summary.....1

II. Response to Staff Witness Ms. Anderson.....2

III. Response to Staff Witness Mr. Abraham.....6

IV. Response to Staff Witness Mr. Hennessy.....12

V. Response to AWEC Witness Mr. Mullins.....20

I. INTRODUCTION AND SUMMARY

Q. Are you the same Daniel B. Kizer who filed Direct Testimony in this proceeding on behalf of Northwest Natural Gas Company dba NW Natural ("NW Natural" or the "Company")?

A. Yes, I presented NW Natural/500, Kizer.

Q. What is the purpose of your Reply Testimony in this proceeding?

A. The purpose of my Reply Testimony is to respond to testimony filed on April 18, 2024, by Public Utility Commission of Oregon Staff ("Staff") and Alliance of Western Energy Consumers ("AWEC") related to the Company's major transmission and distribution system projects, storage facility projects and safety-driven system projects. I will respond to issues presented in the Opening Testimony of Staff witnesses David Abraham (Staff/500, Abraham), Laurel Anderson (Staff/600, Anderson and Staff/2300, Anderson), and Kevin Hennessy (Staff/2100, Hennessy), and AWEC witness Brad Mullins (AWEC/100, Mullins).

Q. Please summarize your Reply Testimony.

A. *First*, I respond to Staff's Opening Testimony addressing Ms. Anderson's Issue 6 (Attestations and Proposed Project Adjustments). As part of my response, I provide an update of the distribution system projects included for recovery in this case, including those projects that Ms. Anderson recommends be the subject of an officer attestation or be removed from rate base.

Second, I respond to Staff's Opening Testimony addressing Mr. Abraham's Issue 3 (New Plant – Major Storage Projects). As part of my response, I provide an update of the storage facility projects included for recovery in this case.

Third, I respond to Staff's Opening Testimony addressing Mr. Hennessy's Issue 1 (NW Natural Safety and Inspection Programs). As part of my response, I provide an update of the safety-related projects and programs included for recovery in this case.

Fourth, I respond to AWEC's Opening Testimony addressing Mr. Mullins's recommended attestation process.

II. RESPONSE TO STAFF WITNESS MS. ANDERSON

Q. Which distribution system projects specifically discussed in your Direct Testimony does Staff recommend be the subject of an officer attestation?

A. Staff recommends an officer attestation for the following distribution system projects specifically discussed in my Direct Testimony:[1]

- North Coast Feeder Uprate Project – Section A
- Public Works Project – Tualatin-Sherwood Road Grading Project
- P30 Willis Creek Horizontal Directional Drilling ("HDD") Install Project
- SE Gate Station Rebuild Project

[1] Staff/600, Anderson/18-19.

Q. Why does Staff recommend that the above-listed distribution system projects be the subject of an officer attestation?

A. Staff recommends officer attestations for several stated reasons. For the North Coast Feeder Uprate Project – Section A, Staff notes that this project is expected to be placed in service "just prior to the rate effective date of October 31, 2024."[2] I will address Staff's position regarding North Coast Feeder Uprate Project – Section B later in my Reply Testimony. Staff comments that the Tualatin-Sherwood Road Grading Project was completed in October 2022, so "[a]ctual costs to place the project in service should be available to replace estimates."[3] The P30 Willis Creek HDD Install Project is in the planning stage and scheduled for construction in Summer 2024, so Staff believes that there is "a risk that the project will not be in service prior to the rate effective date, and the estimated cost is a rough order of magnitude estimate."[4] Finally, the SE Gate Station Rebuild Project is expected to be placed in service "just prior to the rate effective date," so Staff has the same concerns as it expressed about the P30 Willis Creek HDD Install Project.[5]

[2] Staff/600, Anderson/18.

[3] Staff/600, Anderson/18.

[4] Staff/600, Anderson/18-19.

[5] Staff/600, Anderson/19.

Q. Please provide an update of the above-listed distribution system projects that Staff recommends be the subject of an officer attestation.

A. The following is an update of the above-listed distribution system projects, in light of Staff's stated concerns and its recommendation that they be the subject of an officer attestation.

- **North Coast Feeder Uprate Project – Section A.** The scope and timing of this project have not changed. The total expected cost of the project has increased to approximately $9.1 million from approximately $8.2 million to reflect more refined cost data as the project lifecycle has progressed.
- **Tualatin-Sherwood Road Grading Project.** The final actual cost to place the project in service is approximately $8.6 million.
- **P30 Willis Creek HDD Install Project.** This project is in the bidding phase, with construction expected to start early July 2024 and the project expected to be in service by the end of September 2024. The total cost to complete the P30 Willis Creek HDD Install Project has not changed from the approximately $3.5 million identified at NW Natural/500, Kizer/12.
- **SE Gate Station Rebuild Project.** The scope and timing of this project have not changed. The total expected cost of the project has increased to approximately $4.4 million from approximately $2.3 million to reflect final vendor pricing for the new check meter, line heater, coalescing filter and separator, additional piping modifications needed to ensure the station can be

kept online during the entire rebuild construction phase, and the replacement of transmission piping that lacked adequate documentation.

Q. Turning now to North Coast Feeder Uprate Project – Section B, what is Staff's recommendation?

A. For the North Coast Feeder Uprate Project – Section B, Staff recommended that this phase "be removed from revenue requirements and rate base for this general rate case" because "this phase of the project will not be 'used and Useful' prior to the prior to the [sic] rate effective date."[6]

Q. Did you agree with Staff witness Anderson that the Company should remove North Coast Feeder Uprate Project – Section B from revenue requirements and rate base for this general rate case?

A. No. My Direct Testimony noted that Section B of the North Coast Feeder Uprate Project is expected to be completed in December 2025, after the end of the Test Year, at an expected total cost of approximately $6.4 million[7] to transparently inform the Commission and relevant stakeholders regarding the Company's mission critical efforts and investment. The Company did not include the expected cost of Section B of the North Coast Feeder Uprate Project in its revenue requirements or rate base for this general rate case.

[6] Staff/600, Anderson/18; *see also* Staff/600, Anderson/4-5, 7.

[7] NW Natural/500, Kizer/8.

Q. Did Staff witness Anderson subsequently acknowledge that the Company did not include the expected cost of Section B of the North Coast Feeder Uprate Project in its revenue requirements or rate base for this general rate case?

A. Yes. On May 17, 2024, Staff filed Exhibit 2300, Supplemental Corrected Testimony of Laurel Anderson. In the Supplemental Corrected Testimony, Staff witness Anderson stated that she had "been informed that NW Natural did not include costs for Section B of the North Coast Feeder [Uprate] Project in its rate case proposal."[8] Ms. Anderson concluded, therefore, that Staff's $6.4 million downward "adjustment" of capital investment "was not necessary."[9]

Q. Do you agree that Staff's $6.4 million downward "adjustment" of capital investment "was not necessary"?

A. Yes, for the reasons I stated earlier.

III. RESPONSE TO STAFF WITNESS MR. ABRAHAM

Q. What is Staff's position regarding the Company's major storage facility projects in this general rate case?

A. After summarizing the Company's major storage facility projects in this general rate case, Staff recommended "no proposed adjustments for gas storage projects included in this rate case at this time."[10]

[8] Staff/2300, Anderson/6-7.

[9] Staff/2300, Anderson/7.

[10] Staff/500, Abraham/14.

Q. Can you please provide an update of the Company's major storage facility projects in this general rate case?

A. Yes. I first will provide an update of projects at the Mist Storage Facility, specifically the Mist GC500 and GC600 Turbine Compressor Cold Spare Projects, Electrical Upgrades Project (Phase 2), Mist Upgrade Methanol Injection at Injection/Withdrawal ("I/W") Wells Project and Mist Instruments & Controls Project (Phase 3). I then will provide an update of projects at the Company's Portland Liquefied Natural Gas ("LNG") storage facility ("PLNG"), specifically the PLNG Valve and Controls Replacement Project, the PLNG Boil-Off Compressor Project and the PLNG Pretreatment Improvements Project. Finally, I will provide an update of a Newport LNG storage facility ("NLNG") project, specifically the T-1 Tank Improvements Project.

Q. Please provide an update of the Mist GC500 and GC600 Turbine Compressor Cold Spare Projects.

A. The total cost estimate of the Mist GC500 Turbine Compressor Cold Spare Project remains at approximately $4.1 million, or approximately $3.7 million on an Oregon-allocated basis, and the expected October 2024 in-service timing remains the same as presented in my Direct Testimony.[11] The Company has purchased the gas generator and power turbine rotor. The gas generator has been received and the power turbine rotor will be delivered by October 2024. Since my Direct Testimony, the Company has determined that it does not need to purchase the

[11] NW Natural/500, Kizer/23-24.

spare exhaust collector as a result of refined scoping during the project lifecycle progression.

Turning to the Mist GC600 Turbine Compressor Cold Spare Project, its expected in-service time has shifted from January 2024 to October 2024 and its estimated total cost has increased incrementally from approximately $1.2 million for core utility service, which is approximately $1.1 million on an Oregon-allocated basis, to approximately $1.6 million for core utility service, which is approximately $1.4 million on an Oregon-allocated basis. The expected in-service time has shifted and the estimated total cost has increased because Siemens Energy, the original equipment manufacturer (OEM), determined that it needed to replace additional parts of the power turbine assembly after it arrived at the Maintenance Repair and Overhaul Center (MROC) in Houston, Texas for disassembly, cleaning and inspection, and to purchase additional miscellaneous spares such as new and rebuilt fuel control valves, bleed controllers, vane cases, and vibration probes.

The Mist GC500 and GC600 Turbine Compressor Cold Spare Projects, and a longer-term solution to address the underlying problems with the GC500 and GC600 units, are addressed in the Reply Testimony of Zachary D. Kravitz (NW Natural/2200, Kravitz).

Q. Please provide an update of the Mist Electrical Upgrades Project (Phase 2).

A. The scope and estimated total cost of the Mist Electrical Upgrades Project (Phase 2) remains the same as presented in my Direct Testimony.[12] The expected in-

[12] NW Natural/500, Kizer/28-30.

service timing of the project has moved up a few months to August 2024 from October 2024.[13]

Q. Please provide an update of the Mist Upgrade Methanol Injection at I/W Wells Project.

A. The expected August 2024 in-service timing remains the same as presented in my Direct Testimony.[14] The scope of the Mist Upgrade Methanol Injection at I/W Wells Project has expanded, as follows. In January 2024, the Company added extra pumps operating in parallel at four high-volume I/W wells. A singular pump did not provide the required injection rates, and the next-sized pump would have been too large. The Company determined that a dual parallel pump option was the best value option due to cost, standardization of parts, and ergonomics.

Also in January 2024, the Company identified the need to install an additional 15 feet of buried power gas piping at each of the methanol injection sites (13 sites) with poly pipe sleeves. This additional work included the removal of spoils associated with each site excavation and additional O-let fittings installed at each location for the new power gas feed. The work also ensured that the supply of power gas would not stop if hydrates were to form in the power gas feed pipe. Further, relocating the power gas feed to be downstream of the methanol injection and buried will significantly reduce the chances of hydrates forming in the power gas feed supply pipe.

[13] NW Natural/500, Kizer/29.

[14] NW Natural/500, Kizer/32.

Other additional work included the replacement of the junction boxes on the methanol injection shed at seven sites, additional methanol disposal, and the installation of concrete pads.

As a result of this expanded scope, the Company's most recent cost estimate for this project has increased incrementally from $4.6 million for core utility service, which is approximately $4.1 million on an Oregon-allocated basis, to approximately $5.4 million for core utility service, which is approximately $4.8 million on an Oregon-allocated basis.

Q. Please provide an update of the Mist Instrument & Controls Project (Phase 3).

A. The scope, estimated total cost and expected October 2024 in-service timing remain the same as presented in my Direct Testimony.[15]

Q. Please provide an update of the PLNG Valve and Controls Replacement Project.

A. The scope of the PLNG Valve and Controls Replacement Project remains the same as presented in my Direct Testimony,[16] and the Company accelerated the January 2024 in-service timing of the project to ensure that the Portland LNG storage facility was available to serve our customers on the Company's record daily send out of January 13, 2024, and during the entire severe winter weather event from January 13-19, 2024.[17] The accelerated timeframe slightly increased

[15] NW Natural/500, Kizer/32-33.

[16] NW Natural/500, Kizer/33-34.

[17] NW Natural/2200, Kravitz.

the cost of the PLNG Valve and Controls Replacement Project from approximately $4.3 million, or approximately $3.8 million on an Oregon-allocated basis, to approximately $4.5 million, or approximately $4.0 million on an Oregon-allocated basis.

Q. Please provide an update of the PLNG Boil-Off Compressor Project.

A. The scope of the PLNG Boil-Off Compressor Project remains the same as presented in my Direct Testimony,[18] and the expected in-service timing of the project has moved up a few months to August 2024 from October 2024.[19] The Company's most recent cost estimate for the Portland LNG Boil-Off Compressor Project has increased incrementally from $4.8 million, or approximately $4.2 million on an Oregon-allocated basis, to approximately $6.4 million, or approximately $5.7 million on an Oregon-allocated basis, to reflect higher structural and mechanical installation costs than estimated prior to the bidding phase, and subsurface explorations resulting in higher than anticipated structural engineering and foundation costs.

Q. Please provide an update of the PLNG Pretreatment Improvements Project.

A. The scope and expected October 2024 in-service timing of the PLNG Pretreatment Improvements Project remain the same as presented in my Direct Testimony.[20] The Company's most recent cost estimate for the Portland LNG Pretreatment Improvements Project has increased slightly from approximately $2.6 million, or

[18] NW Natural/500, Kizer/35.

[19] NW Natural/500, Kizer/35.

[20] NW Natural/500, Kizer/37-39.

approximately $2.3 million on an Oregon-allocated basis, to approximately $2.7 million, or approximately $2.4 million on an Oregon-allocated basis, to reflect more refined cost data as the project lifecycle has progressed.

Q. Please provide an update of the NLNG T-1 Tank Improvements Project.

A. The scope and expected October 2024 in-service timing of the NLNG T-1 Tank Improvements Project remain the same as presented in my Direct Testimony.[21] The Company's most recent cost estimate for the Newport LNG T-1 Tank Improvements Project has increased a bit from approximately $3.5 million, or approximately $3.2 million on an Oregon-allocated basis, to approximately $3.9 million, or approximately $3.5 million on an Oregon-allocated basis, to reflect higher contractor pricing than was forecast at the time of my Direct Testimony.

IV. RESPONSE TO STAFF WITNESS MR. HENNESSY

Q. What is Staff's position regarding the safety-related projects that the Company is performing on its transmission and distribution systems and at its storage facilities?

A. After indicating that it has reviewed the Company's investments being made for safety-related programs, Staff states that it does "[n]ot generally" have any concerns regarding the approach being taken with these programs.[22] Staff does indicate that "certain programs warrant further mention"[23] and that Staff's

[21] NW Natural/500, Kizer/39-41.

[22] Staff/2100, Hennessy/2.

[23] Staff/2100, Hennessy/2.

recommendations and issues "may change when informed by new data and after reviewing testimony and analysis by other parties."[24]

Q. As Staff's recommendations and issues "may change" after its Opening Testimony, can you please provide an update of the Company's safety-related projects in this general rate case?

A. Yes. I first will provide an update of the Company's In-Line Inspection ("ILI") Conversion Projects for 2024, specifically S36 Mid-Willamette Valley Feeder ILI Project, S24 Granger Trans ILI Project, and S22 Albany Trans ILI Project. I then will provide an update of the Company's Underground Storage Facilities – Well Integrity Program, Seismic Projects, Proactive Excess Flow Valve ("EFV") Installation Program, and Probabilistic Distribution Risk Model Project.[25]

Q. Please provide an update of the S36 Mid-Willamette Valley Feeder ILI Project.

A. The scope of the S36 Mid-Willamette Valley Feeder ILI Project remains the same as presented in my Direct Testimony,[26] and the expected in-service timing of the project has moved up a few months to June 2024 from October 2024.[27] The Company's most recent total cost estimate for the S36 Mid-Willamette Valley Feeder ILI Project has increased slightly from approximately $2.1 million to approximately $2.2 million, to reflect more refined cost data as the project lifecycle has progressed.

[24] Staff/2100, Hennessy/1.

[25] NW Natural/500, Kizer/41-53.

[26] NW Natural/500, Kizer/46.

[27] NW Natural/500, Kizer/46.

Q. Please provide an update of the S24 Granger Trans ILI Project.

A. The expected October 2024 in-service timing of this project remains the same as presented in my Direct Testimony.[28] The project's estimated total cost has increased, from approximately $2.2 million to approximately $3.0 million, to reflect higher than expected costs of performing a field investigation of potential unpiggable fittings on this pipeline and addressing jurisdictional permit work conditions such as the need to perform work at night.

Q. Please provide an update of the S22 Albany Trans ILI Project.

A. The scope and expected total cost estimate for the S22 Albany Trans ILI Project remain the same as I presented in my Direct Testimony.[29] The expected in-service timing of the project has moved up a few months to July 2024 from October 2024.

Q. Please provide an update of the Company's Underground Storage Facilities – Well Integrity Program.

A. The scope, estimated total cost and expected June 2024 in-service timing of this project remain the same as presented in my Direct Testimony.[30]

Q. Please provide an update of the Company's Seismic Projects.

A. The Company completed its risk analysis in March 2024 and is currently reviewing it for future implementation.

[28] NW Natural/500, Kizer/46.

[29] NW Natural/500, Kizer/46.

[30] NW Natural/500, Kizer/48.

Q. Please provide an update of the Company's Proactive EFV Installation Program.

A. To date, the Company has installed more than 304,000 EFVs on residential and commercial services (up from the 296,000 amount provided in my Direct Testimony[31]).

Q. Please provide an update of the Company's Probabilistic Distribution Risk Model Project.

A. NW Natural last month successfully kicked off this project with the risk model vendor and will be coordinating with the vendor throughout 2024 to gather distribution system data to develop the model.

Q. Earlier, you mentioned that Staff indicates that "certain programs warrant further mention."[32] To which Company programs is Staff referring?

A. Staff provides comments and recommendations regarding the Company's ILI Conversion Projects, the Underground Storage Facilities – Well Integrity Program and Non-Hazardous Leakage Projects.[33]

Q. What is Staff's comment with the Company's ILI Conversion Projects, and what is Staff's recommendation related to that comment?

A. Staff is "concerned" that the Company incurred significant costs for the P31/P75 McMinnville Trans ILI Project after it went into service. In response, Staff recommends that the Commission require the Company to "keep additional

[31] NW Natural/500, Kizer/50.

[32] Staff/2100, Hennessy/2.

[33] Staff/2100, Hennessy/2-4.

records and perform research in advance of construction to mitigate such construction overruns or surprises."[34]

Q. How do you respond to Staff's concern and recommendation regarding the Company's ILI Conversion Projects?

A. The Company agrees with Staff that it is good practice to document lessons learned from the P31/P75 McMinnville Trans ILI Project. For that project, one of the lessons learned was that our legacy as-built drawings and mapping information do not always completely show unpiggable fittings utilized for pipe relocation projects. After the P31/P75 McMinnville Trans ILI Project, the Company has expanded the pre-construction review process by field investigating (i.e., potholing) locations where pipeline records indicate that pipeline replacement has occurred. For example, if a particular pipeline was replaced during our cast-iron and bare-steel replacement program, it is possible that the fittings installed during that process are not ILI compatible. The potential need to remediate these fittings will add potential cost to the project, which can be known earlier in the planning process for ILI projects.

Another lesson learned by the Company through the P31/P75 McMinnville Trans ILI Project relates to six-inch and smaller pipeline projects constructed by NW Natural between the mid-1990s and mid-2000s that utilized floating ball valves for main line blocking valves. The floating ball valve used on our six-inch transmission main has been found to be unpiggable. The ball of that valve is

[34] Staff/2100, Hennessy/3.

documented in as-built drawings as a fully open ball valve by the manufacturer, but because the ball is "floating" within the body of the valve it can easily become misaligned during the pigging process, causing damage to the ILI tools. This situation happened with the P31/P75 McMinnville Trans ILI Project. The valve was documented in as-built drawings as a full port ball valve that is piggable. However, that turned out to not be true after the ILI tool became damaged. The P31/P75 McMinnville Trans ILI Project was the Company's first attempt to pass an in-line inspection tool through this type of valve. For future six-inch ILI runs, as-built drawings and records will be reviewed for this era of installation and floating ball valves will be removed prior to attempting to pig the line.

Q. What is Staff's recommendation related to the Company's Underground Storage Facilities – Well Integrity Program?

A. Staff recommends that the Commission require the Company to "develop clear cost estimates 'for the life of the facility' and that the Company include these cost estimates in the Company's annual Oregon Safety Project Plan ("SPP") filed in docket UM 1900."[35]

Q. How do you respond to Staff's recommendation regarding the Company's Underground Storage Facilities – Well Integrity Program?

A. The Company's position is that it is best to continue its current practice of forecasting next year's costs and showing historical spend amounts. The Company's ten-year Underground Storage Facilities – Well Integrity Program will

[35] Staff/2100, Hennessy/3.

be used to forecast improvements, inspections, and operations and maintenance ("O&M") work for our underground storage reservoirs and wells.

The Company does not agree with Staff's recommendation that the Company develop "life of the facility" cost estimates. The Company currently provides in its SPP filings a cost estimate for safety-related work that it intends to perform in the current calendar year, and summarizes the safety-related work that was performed the previous year. Estimating the cost for the "life of the facility" would require forecasts for costs and variables that are mostly unknown and unmeasurable over the entire facility's lifecycle, including but not limited to:

- The actual useful life of the facility;
- The depreciation schedule of the facility;
- The maintenance required during the actual useful life of the facility;
- The cost to perform the well integrity compliance inspections for the life of the facility;
- The cost to make repairs to address well integrity issues discovered during any future well compliance inspections over the remaining useful life of the facility; and
- The cost to comply with any new, future regulations.

Q. What is Staff's comment with the Company's Non-Hazardous Leakage Projects, and what is Staff's recommendation related to that comment?

A. Staff's "concern" is that it is "not clear" from the Company's SPP and Initial Testimony "how many facilities have such leaks."[36] In response, Staff recommends that the Commission require the Company to "capture and provide more detail in the Safety Project Plan, showing starting or prior counts and severity of leaks, the reduction in the count and severity, the estimated methane reduction, and the costs for the year."[37]

Q. How do you respond to Staff's concern and recommendation regarding the Company's Non-Hazardous Leakage Projects?

A. I provide three points in response to Staff's recommendation. First, the Company annually submits updates to its O&M manuals, including its Distribution Integrity Management Program Plan ("DIMP Plan"). The DIMP Plan discusses the Company's leak management program in Section 8.2. In Section 9, the Company discusses performance measures, monitoring of performance and how the Company tracks the number of eliminated or repaired hazardous and non-hazardous leaks, per Code of Federal Regulations (CFR) 192.703, categorized by cause and material. Appendices D and E of the DIMP Plan contain the leakage repair data.

[36] Staff/2100, Hennessy/3-4.

[37] Staff/2100, Hennessy/4.

Second, estimating the volume of methane reduction would be problematic, as the leak flow rates and the specific length of time the leaks have occurred before repair or elimination are unknown. Gas utilities are not required to provide leakage flow rates in our Annual Gas Distribution System Report filings with the United States Department of Transportation Pipeline and Hazardous Materials Safety Administration, where hazardous and non-hazardous leaks are reported.

Third, quantifying costs of leakage repairs would be problematic, as the Company's leakage repair costs are blended with costs for other capital and maintenance work when leaks are eliminated or repaired.

V. RESPONSE TO AWEC WITNESS MR. MULLINS

Q. Are you replying to any recommendations made by AWEC witness Mr. Mullins?

A. Yes. Mr. Mullins recommends an attestation process for projects in excess of $1 million and that the filing occur at least 15 days before the rate effective date.[38] "If any project is not in service, or has a capital cost less than NW Natural had forecast, NW Natural would be required to reduce the ultimate rate increase approved in the Commission's final order."[39] The costs of any projects not in service by October 31, 2024, would be removed from the Company's revenue requirement approved by the Commission. Mr. Mullins indicated that "NW Natural

[38] AWEC/100, Mullins/19, 21-22.

[39] AWEC/100, Mullins/22.

provided the specific funding projects included in revenue requirement in the confidential attachment provided in response to AWEC Data Request 39."[40]

Q. Do you agree with Mr. Mullins' recommendation?

A. I agree with the concept of an attestation process, but the process should be limited to attestations of the particular projects identified in Staff witness Ms. Anderson's Direct Testimony, specifically North Coast Feeder Uprate Project, Tualatin-Sherwood Road Grading Project, P30 Willis Creek HDD Install Project, and SE Gate Station Rebuild Project.[41] If the Commission were to determine that a broader attestation process is needed beyond the process recommended by Staff, then the Company would be amendable to using an attestation process for projects in excess of $1 million, as recommended by Mr. Mullins. Any required attestation process, however, should follow the two-step process that the Commission approved in the Company's last general rate case, UG 435.[42]

Q. Does this conclude your Reply Testimony?

A. Yes, it does.

[40] AWEC/100, Mullins/22.

[41] Staff/600, Anderson/18-19.

[42] *In the Matter of Northwest Natural Gas Company, dba NW Natural, Request for a General Rate Revision*, Docket No. UG 435, Order No. 22-388, Appendix A, Stipulation, Paragraph 3 ("Attestation of Capital Projects") (Oct. 24, 2022).

III. Reply to Staff Opening Testimony 6

IV. Reply to CUB Opening Testimony 7

I. INTRODUCTION AND SUMMARY

Q. Are you the same Wayne K. Pipes who filed Direct Testimony in this proceeding on behalf of Northwest Natural Gas Company dba NW Natural ("NW Natural" or the "Company")?

A. Yes, I presented NW Natural/600, Pipes.

Q. What is the purpose of your Reply Testimony in this proceeding?

A. The purpose of my Reply Testimony is to 1) provide an update on the facilities projects included in this case, 2) respond to Public Utility Commission of Oregon Staff ("Staff") concerns as stated in the Opening Testimony of Laurel Anderson, and 3) respond to Oregon Citizens' Utility Board ("CUB") concerns as stated in the Opening Testimony of John Garrett.

Q. Please summarize your Reply Testimony.

A. My testimony provides updates regarding the projects discussed in my Direct Testimony—all of which are on track to be completed within budget and by October 31, 2024. Additionally, I respond to Staff's testimony, which does not question the prudence of any project, but requests attestations based on uncertainty about the reliability of projected costs for those projects entering service near the rate-effective date. Finally, I respond to CUB's position that the Company should reconsider its plans to perform seismic resiliency and office construction projects to attempt to slow rate increases.

II. PROJECT UPDATES

Q. Are all the facilities projects previously described in your testimony on-track to be placed in service before the November 1, 2024 rate effective date?

A. Yes, each of the projects are on schedule to be completed this year before the rate effective date.

A. Central Resource Center Phase 2

Q. Please briefly summarize the Central Resource Center ("RC") Phase 2 project.

A. The Central RC construction addressed needs for the Company to have a centrally located resource center from which operations crews, including emergency response, can be dispatched. Phase 2 of this project included building a one-story office building with a warehouse attached to house workspace for emergency crews. The new buildings constructed in Phase 2 will comply with modern seismic requirements.[1]

Q. Please provide an update on the Central RC Phase 2 construction.

A. The Central RC Phase 2 construction was completed on November 15, 2023.

Q. What cost recovery is NW Natural requesting for the Central RC Phase 2 construction project?

A. NW Natural is continuing to seek to recover its capital investment of $9.2 million to complete Phase 2 of the Central RC for our Oregon customers.

[1] NW Natural/600, Pipes/6-7.

B. Sunset RC

Q. Please briefly summarize the Sunset RC project.

A. NW Natural is making seismic upgrades to the Sunset RC to address the resiliency of critical equipment and known seismic vulnerabilities and to install a new decanter system and truck scale.[2]

Q. Please provide an update on the Sunset RC project.

A. The construction at the Sunset RC began in May 2024 and is on schedule to be completed by October 31, 2024.

Q. What cost recovery is NW Natural requesting for the Sunset RC project?

A. We continue to project the Sunset RC construction will be completed within the budget of $4.1 million. NW Natural continues to seek the most cost-effective way to complete these necessary construction and upgrades while minimizing impacts on rates.

C. Miller Station Tenant Improvements

Q. Please briefly summarize the Miller Station tenant improvements.

A. The Company expanded and improved the office space at Miller Station to house more employees and retrofitted to address seismic deficiencies and other safety issues. The improvements address electrical, mechanical, and plumbing systems that were past their usable life and provide safety upgrades to the office space by installing new lighting fixtures, branch circuits, data cabling, heating and cooling

[2] NW Natural/600, Pipes/13.

systems, water supply and drain lines, sinks, toilets, and showers.[3] The construction at Miller Station will improve employee safety and the structural integrity of the building.

Q. Please provide an update on the Miller Station tenant improvements.

A. The Company completed construction on November 9, 2023.[4]

Q. What cost recovery is NW Natural requesting for the Miller Station tenant improvements?

A. The Company is continuing to seek $3.2 million for the renovations at Miller Station, or to recover $2.8 million on an Oregon-allocated basis.

D. Sherwood Data Center

Q. Please briefly summarize the upgrades NW Natural is making at the Sherwood Data Center.

A. NW Natural upgraded the electrical system, the HVAC system, and the fire alarm system at the Sherwood Data Center to improve reliability and make the Data Center less vulnerable to failure. NW Natural is also adding a remote monitoring system and performing seismic upgrades.[5]

Q. Please provide an update on the Sherwood Data Center upgrades.

A. The Company completed the Sherwood Data Center upgrades to the electrical, mechanical, and alarm system as of April 2024. The remaining Sherwood Data Center upgrades are on schedule to be completed in July 2024.

[3] NW Natural/600, Pipes/18.

[4] NW Natural/600, Pipes/23.

[5] NW Natural/600, Pipes/24.

Q. What cost recovery is NW Natural requesting for the Sherwood Data Center project?

A. The Company is continuing to seek $3 million, or to recover $2.7 million on an Oregon-allocated basis. NW Natural continues to seek the most cost-effective way to complete the necessary upgrades while minimizing impacts on rates.

E. Physical Security Upgrades

Q. Please briefly summarize the physical security upgrades the Company is performing.

A. NW Natural is undertaking a comprehensive, multi-year effort to enhance the physical security at the Company's facilities and field infrastructure in response to increasing threats and new direction from the Transportation Security Administration. The security upgrades were performed beginning with a pilot program for 2023 and expanding to additional sites in 2024. The upgrades include a combination of new fencing, anti-climb fencing, lighting, video surveillance systems, intelligent intrusion detection systems, enhanced gates, gate alarms, and/or radar stations,[6] though the exact security system installed varies depending on the evaluation of the site.

Q. Please provide an update on the security upgrades.

A. The pilot program concluded at the end of 2023, and additional upgrades are on schedule to be completed by October 31, 2024.

[6] NW Natural/600, Pipes/34.

Q. What cost recovery is NW Natural requesting for the security upgrades?

A. The pilot program cost $1.8 million in Oregon, as projected in my Direct Testimony. The additional upgrades conducted in 2024 were originally projected to be $5 million (predominantly in Oregon), and we remain within that budget.

III. Reply to Staff Opening Testimony

Q. Please summarize Staff's testimony regarding the projects discussed above.

A. Staff reviewed each of the projects described in the Company's Direct Testimony and agreed that they were necessary and that the costs are prudently incurred.[7] Staff recommended the Commission require an attestation from the Company describing the cost and in-service date for the Sunset RC specifically and for projects expected to be placed into service near the rate effective date generally.[8]

Q. Did Staff indicate the reason for recommending the Company provide an attestation?

A. Staff indicated in its testimony that it is interested in attestations because it is concerned about the reliability of the Company's cost projections.[9]

Q. How does NW Natural determine its estimates for cost projections?

A. The Company uses a robust process to reach estimates and has sought the most cost-effective ways to complete necessary construction and upgrades while minimizing impacts on rates. The final costs are provided once the project is in-service and costs are known. The process NW Natural follows to prepare and

[7] Staff/600, Anderson/17.

[8] Staff/600, Anderson/15, 17.

[9] Staff/600, Anderson/17.

update its cost estimates results in reliable amounts that become increasingly focused as the project progresses.

Q. Which projects are affected by Staff's request for an attestation?

A. Both the Sunset RC and the Company's 2024 security enhancements have a projected completion date of October 31, 2024. NW Natural is confident that these projects will be placed into service on or before this date and is willing to submit officer attestations regarding the projected completion of these projects and their forecasted final cost.

Q. Did Staff have any other recommendations regarding the projects you discussed above and in your Direct Testimony?

A. No.

IV. Reply to CUB Opening Testimony

Q. Please describe CUB's Opening Testimony regarding the projects discussed in your Direct Testimony.

A. CUB does not specifically question the prudence or cost of any of the Company's ongoing projects, nor does CUB make any recommendations regarding the projects currently underway.

Q. Does CUB nevertheless raise general concerns regarding facilities projects?

A. Yes, CUB testifies that it is "evaluating" and will discuss in future testimony whether the Company is "appropriately prioritizing investments in accordance with their importance and immediate need."[10] CUB mentions "earthquake contingency

[10] CUB/200, Garrett/1.

planning" and "office construction" as potential areas of "overspend."[11] CUB states that "ensuring regional centers are built to withstand earthquakes may seem reasonable," but CUB questions the timing of such projects.[12] CUB testifies that it is uncertain whether the Company appropriately responded to economic conditions and "reprioritized" such investments to avoid "unreasonable" rate increases.[13]

Q. How do you respond?

A. I disagree both with CUB's general suggestion that the Company does not appropriately consider rate impacts when determining whether to proceed with facilities projects and with CUB's specific suggestion that seismic upgrades are the type of project that should be delayed to avoid "overspend." As I discussed in detail in my Direct Testimony, the planned seismic upgrades are necessary to protect the Company's employees who staff the relevant buildings and the critical infrastructure within the buildings to ensure that NW Natural can respond promptly and effectively and maintain the safety and reliability of its system in the event of a major earthquake. While we cannot and have not sought to address every known seismic vulnerability at the Company's facilities all at once, we have and will continue to prioritize seismic upgrades and complete them in a methodical way. It would not be prudent for the Company to simply delay addressing known seismic concerns when there is a significant chance that a major earthquake will occur in

[11] CUB/200, Garrett/1.

[12] CUB 100, Jenks/6.

[13] CUB/200, Garrett/1, 32.

the region in the next 50 years.[14] While the Company is sensitive to CUB's concern about rising rates, NW Natural disagrees that delaying construction aimed at the health and safety of its employees and the safety and reliability of its system is the proper avenue to explore to cut costs.

Q. Does NW Natural consider the impact to rates when evaluating projects and project costs?

A. Yes, rate impact is a major component of the overall evaluation of any project. We are constantly prioritizing and budgeting to balance the need to complete critical projects with our desire to keep customer rates as low as possible.

Q. How does NW Natural endeavor to complete these essential projects in a way that minimizes the rate impact?

A. NW Natural uses phasing of major projects to mitigate the rate impact of essential improvements, such as the Central RC project and the physical security upgrades. Construction phasing is a strategic approach where a project is completed in distinct phases, rather than all at once. It involves careful planning and execution to ensure that each phase complements the next to keep the project on track without compromising operations. Spacing out the construction in phases benefits customers by spreading the rate impact of the project over time rather than having the full cost of the project enter rates all at once while promptly completing necessary upgrades.

[14] *See* Oregon Office of Emergency Management, "Cascadia Subduction Zone," *available at* https://www.oregon.gov/oem/hazardsprep/pages/cascadia-subduction-zone.aspx ("Currently, scientists are predicting that there is about a 37% chance that a megathrust earthquake of 7.1+ magnitude in this fault zone will occur in the next 50 years. This event will be felt throughout the Pacific Northwest.").

In addition, the Company carefully manages the projects it undertakes to ensure construction is completed in a timely and cost-effective manner, despite the current economic conditions that continue to push costs higher. Projects are identified by the business unit (in this case, the facilities department) for consideration. The facilities projects steering committee reviews all requests, validates the potential need for the projects and determines if the project should be added to the facilities 5-year roadmap for further evaluation. Forecasts for each project are updated quarterly and reviewed by the steering committee, finance team, and officers.

In sum, CUB's concerns about the Company's approach to prioritizing projects and mitigating rate impact are unfounded.

Q. Does this conclude your Reply Testimony?

A. Yes.

I. INTRODUCTION AND SUMMARY

Q. Please state your name and position at Northwest Natural Gas Company dba NW Natural ("NW Natural" or "Company").

A. My name is Dina L. Thompson. My title is Director of Enterprise Applications. I am responsible for managing NW Natural's information technology and services ("IT&S") applications, including resource planning, project management and oversight, strategy development, audit compliance, and policy implementation.

Q. Please describe your education and employment background.

A. I received a Master of Business Administration with a focus on information technology management and finance from Portland State University in 2002. I earned my Information Technology Infrastructure Library credential in 2018 and my Project Management Professional certification from the Project Management Institute in 2010. I have worked on financial and IT&S matters in the utility sector since 1999, including for the Bonneville Power Administration and PacifiCorp. Since joining NW Natural in 2006, I have held roles of increasing responsibility concerning NW Natural's IT&S environment, including Senior IT Project Manager, Applications Development Manager, and Interim Chief Information Officer.

Q. Are you adopting the Direct Testimony of Jim R. Downing, NW Natural/700, Downing?

A. Yes.

Q. What is the purpose of your Reply Testimony?

A. The purpose of my Reply Testimony is to respond to the Opening Testimony filed on April 18, 2024, by the Public Utility Commission of Oregon Staff ("Staff")

concerning the Company's IT&S initiatives. Staff is the sole party proposing adjustments concerning the Company's IT&S costs and investments.[1]

Q. Please summarize your Reply Testimony.

A. My Reply Testimony is organized into four parts:

- **First,** I explain why it is appropriate to allow recovery of cost contingencies for major IT&S projects, subject to a final true-up before projects enter rates. Cost contingencies for major projects are generally set at approximately 10 percent of overall project costs,[2] and reflect reasonable allowances for uncertainties in project execution. Contrary to Staff's statement that contingency amounts not yet used in the final months of implementation are unlikely to be needed,[3] projects are more likely to make use of contingency funds in the final stage of implementation and testing. NW Natural commits to update the final costs for all major IT&S projects to reflect the actual amount of contingency costs used before projects are placed in rates.
- **Second,** I provide an update on the Company's major IT&S projects. As part of this update, I respond to Staff's concerns and proposed adjustment regarding the Genesys Re-platform Project. As I explain below, NW Natural prudently moved to re-platform the Genesys software by October 2024 to avoid

[1] I note that the Alliance of Western Energy Consumers filed testimony concerning the depreciation of IT&S accounts. This issue is addressed by Mr. John Spanos, NW Natural/3700, Spanos.

[2] While the Company's contingency guideline for IT&S projects is approximately 10 percent of project costs, this amount may vary depending on the risks associated with an individual project.

[3] Staff also proposes removing contingency funds for the TSA Project, described in NW Natural/800, Downing. The TSA Project is addressed by Company witness Mr. Matt Carlson, NW Natural/2900, Carlson.

exposing this critical infrastructure system to unacceptable security and outage risks. Delaying the project as Staff suggests would have (a) substantially increased project costs, including by forfeiting early contracting incentives; (b) created undue pressure on NW Natural staff resources by overlapping the project with the Company's high-volume call period during the winter months; and (c) increased project risks, including through increased competition for system integrators.

- **Third,** I provide a status update on the Company's hiring of eight new full-time equivalent ("FTE") positions necessary to fill critical gaps in IT&S staffing. One of the eight new positions has already been filled; four more positions are expected to be filled in June and July 2024; and the final three positions are expected to be filled in August and September 2024. I also respond to Staff's proposed adjustment removing the costs associated with four FTEs needed to enable the planned Horizon 2: Vista ("H2: Vista") project and support the current customer information system ("CIS"). As I explain below, prior staffing shortages are not a basis for disallowing necessary FTEs. Each of the new FTEs is crucial to enable successful planning and development of the H2: Vista project and to support the current CIS, and such costs will not be fully encompassed by the Company's planned deferred accounting application.

- **Finally,** I respond to Staff's other IT&S-related requests not associated with a specific rate adjustment:[4]
    1. Software Testing/Training: The Company's policy is to train and test IT&S projects before projects are placed in service. NW Natural has recently instituted a new virtual training environment to help facilitate high-impact software deployments going forward.
    2. IT&S Provider Selection and Consultants: Significant IT&S projects' suppliers are generally identified and sourced through competitive request for proposal ("RFP") processes, unless they are subject to enumerated exceptions in the Company's procurement policy.
    3. Asset Retirements: Following communications with Staff during the discovery process, the Company's asset retirements have been updated to reflect a modified characterization of the Genesys and UI Planner projects.
    4. H2: Vista Deferral: The Company plans to file a deferred accounting application for H2: Vista program costs in the latter half of this year.[5]

[4] Each of the following requests were subsequently also submitted to NW Natural via data requests, numbers UG 490 OPUC DRs 495-498. Staff's question concerning the capitalization of cloud software hosting and licensing costs is addressed in the Reply Testimony of Kyle T. Walker, NW Natural/3800, Walker.

[5] Staff/1000, Dyck/21.

II. COST CONTINGENCIES

Q. Please summarize NW Natural's approach to determining appropriate cost contingencies for IT&S projects.

A. Cost contingencies are designed to address potential cost-related uncertainties in major projects. Some degree of uncertainty is inevitable in any major IT&S effort. NW Natural therefore prudently seeks to account and plan for such uncertainty in developing final project budgets. NW Natural generally uses a cost contingency amount of approximately 10 percent of overall project costs on major IT&S projects, with some variation (either more or less) depending on specific project-related risks. This cost contingency assessment is included in the Company's project planning phase and is incorporated into a project's final projected budget.

Q. What is Staff's proposal concerning the Company's cost contingencies?

A. Staff proposes to remove the contingency funds for five of the Company's major IT&S projects, on the basis that such projects either already have entered service or will be entering service in September or October 2024—and thus, "if the contingency funds have not been used yet, they are unlikely to be used."[6] The specific projects for which Staff proposes to disallow the contingency funds are: (1) the Composition 2.0 Project, (2) the Identity Governance and Administration ("IGA") Automation Project, (3) the Clevest Optimization Project, (4) the

[6] Staff/1000, Dyck/11.

Transportation Security Administration ("TSA") Security Directive 2 Project,[7] and (5) the MapFrame Replacement Project.[8]

Q. Do you agree with Staff that projects in the final months of implementation are unlikely to use their contingency funds?

A. No. On the contrary, it is during the final months of a project's implementation that contingency funds are more likely to be used. Cost contingencies are designed to cover project uncertainties associated with actual implementation. For instance, if issues are discovered during the final testing stage, then additional resources may be required to resolve such issues before the project is fully deployed. While the Company works hard to control costs, some degree of uncertainty in a project's actual deployment is inevitable. NW Natural prudently plans for and manages such uncertainty with limited contingency funds.

Q. Of the four non-TSA projects that Staff identifies, have any of these projects used their contingency funds?

A. Yes. At this time, the Composition 2.0 Project has used its contingency funds. The three remaining projects are still underway, meaning that the use of these projects' contingency funds is not yet certain.

[7] The TSA Security Directive 2 Project is addressed by NW Natural witness Mr. Matthew P. Carlson, NW Natural/2900, Carlson.

[8] Staff/1000, Dyck/9.

Q. Does NW Natural commit to updating the final project costs to include only actually used contingency amounts in rates?

A. Yes. As with prior rate cases, the Company commits to updating final project costs prior to the rate effective date. To the extent that any contingency amounts are included for cost recovery, only contingency amounts that actually get used will go into rates.

III. MAJOR PROJECT UPDATES

Q. Are all major IT&S projects previously described in testimony on track to be placed in service before the November 1 rate effective date?

A. Yes. All eleven major IT&S projects previously described in Direct Testimony have either already been placed in service or are on track to enter service in a timely manner. These projects are also proceeding largely in-line with expected budgets, including contingencies. While I provide additional status and cost updates on each project, below, the Company commits to updating final rate base amounts with actual in-service costs—including any used contingency amounts—prior to the rate effective date.

A. IQGeo Upgrade Project

Q. Please briefly summarize the IQ Geo Upgrade Project.

A. The IQGeo Upgrade Project is a multi-part effort that builds on the new system by (a) upgrading to a newer, fully supported version of IQGeo, (b) re-platforming IQGeo to Azure's enterprise-wide cloud environment, and (c) establishing automated testing for the IQGeo application.

Q. Please provide an update on the IQGeo Upgrade Project.

A. The IQGeo Upgrade Project was placed in service in January 2024.

Q. Are there any cost updates for the IQGeo Upgrade Project in this case?

A. No. This project was placed in service in line with budget parameters.

Q. Does Staff or any other party propose an adjustment related to the IQGeo Upgrade Project?

A. No. Staff witness Ms. Dyck reviewed and analyzed the Company's investment and proposed no adjustment.[9]

B. MapFrame Replacement Project

Q. Please briefly summarize the MapFrame Replacement Project.

A. The MapFrame Replacement Project transitions the Company away from an existing end-of-life software system and develops equivalent functionality in the Company's IQGeo platform.

Q. Please provide an update on the MapFrame Replacement Project.

A. The MapFrame Replacement Project is still on track to be placed in service by September 2024.

Q. Are there any cost updates for the MapFrame Replacement Project?

A. Yes. By refining the project in the planning process, NW Natural was able to significantly reduce overall project complexity, thereby reducing the project timeline and third-party costs. This refinement reduced overall project costs from

[9] Staff/1000, Dyck/12.

$5.5 million to approximately $3.7 million on a system basis ($3.3 million on an Oregon-allocated basis).

Q. Does Staff or any other party propose an adjustment related to the MapFrame Replacement Project?

A. No. Staff witness Ms. Dyck reviewed and analyzed the Company's investment and proposed no adjustment, other than the contingency fund proposal that I discussed earlier in my Reply Testimony.[10]

C. Composition 2.0 Project

Q. Please briefly summarize the Composition 2.0 Project.

A. The Composition 2.0 Project modernizes the Company's electronic and printed documents for customers, including bills, notices, letters, welcome packages, and refund checks. Composition 2.0 is the second stage in the Company's broader modernization effort for customer-facing documents and will create more accessible and consistent documentation across the Company's electronic and printed materials.

Q. Please provide an update on the Composition 2.0 Project.

A. The Composition 2.0 Project is well underway and remains on track to be placed in service in September 2024. Indeed, portions of the project are already complete, including updates to customer letters and refund checks, which are now in production. Other portions of the project are in the user acceptance testing phase, which is one of the final stages of project development.

[10] Staff/1000, Dyck/12.

Q. Are there any cost updates for the Composition 2.0 Project in this case?

A. Yes. The expected cost of the Composition 2.0 Project has increased from $4.4 million to $5.7 million. This cost increase is the result of several factors: (1) additional time required for project development and testing to accommodate the project's complexity; (2) additional digital storage costs for the new documents; and (3) upgrading the underlying software platform to improve system stability and performance. By way of context, the project addresses nine document types with a total of 162 document variations—resulting in close to 1,000 test cases that must be adequately verified and tested, as well as a high volume of documentation that must be reliably stored. As a result, the project entailed greater resources than originally anticipated, raising the total project costs to $5.7 million in capital investment ($5.0 million Oregon-allocated). The incremental ongoing O&M remains at $87 thousand ($77 thousand Oregon-allocated) for hardware and software licensing.

Q. Does Staff or any other party propose an adjustment related to the Composition 2.0 Project?

A. No. Staff witness Ms. Dyck reviewed and analyzed the Company's investment and proposed no adjustment, other than the contingency fund proposal that I discussed earlier in my Reply Testimony.[11]

[11] Staff/1000, Dyck/13.

D. Genesys Re-platform Project

Q. Please briefly describe the Genesys Re-platform Project.

A. The Genesys Re-platform Project migrates the Company's advanced call routing software from the current on-premises Genesys PureConnect platform to the cloud-based Genesys Cloud CX platform. This re-platforming project is necessary to maintain the integrity and reliability of the Company's communications with customers, as the software provider is terminating support for the on-premises solution on July 31, 2025. As I explain below in response to Staff's question regarding IT&S asset retirements, the current on-premises asset is being retired by December 31, 2024.

Q. What is the status of the Genesys Re-platform Project?

A. This project began in 2023, with the initial system integrator ("SI") RFP issued in July 2023. The main SI contract was finalized in January 2024, after which the Company commenced full project implementation. The project is expected to be placed in service in October 2024. As discussed below, this timeline is necessary to (a) constrain overall project costs; (b) minimize impacts on the Company's customer service and essential communications; and (c) limit project implementation risks.

Q. Are there any cost updates for the Genesys Re-platform Project in this case?

A. No. The Genesys Re-platform Project remains on track to be placed in service within budget parameters, including contingency.

Q. Has Staff or any other party proposed an adjustment to the Genesys Re-platform Project?

A. Yes. Staff questions the timing of the Genesys Re-platform Project and proposes a full disallowance of project costs.[12] Specifically, Staff expresses concern that the project "was completed earlier than it need to be" because vendor support terminates on July 31, 2025, whereas the Genesys Re-platform Project will be placed in service by October 2024.[13] Staff asserts that NW Natural should have delayed the project to minimize near-term rate impacts,[14] and suggests that the Company should have continued to use the unsupported software after the July 31, 2025, end-of-support deadline.[15] To support this position, Staff claims that "other software that NW Natural is replacing"—namely IQGeo, MapFrame, and UI Planner—"has been unsupported for years."[16]

Q. As an initial matter, Staff states that "it is unclear what the Company means by 'fully ceasing support and operation of the system'[.]"[17] Please explain.

A. The phrase "fully ceasing support and operation of the system" means that the Genesys vendor will no longer be providing *any* technical support for the on-premises software after July 2025—including security fixes or responses to cyber-

[12] Staff/1000, Dyck/14.

[13] Staff/1000, Dyck/13.

[14] Staff/1000, Dyck/14.

[15] Staff/1000, Dyck/22 (asking whether the existing on-premises Genesys system could "continue to operate after July 31, 2025"). Staff also submitted a separate data request (DR 494) to ask the same question.

[16] Staff/1000, Dyck/14.

[17] Staff/1000, Dyck/14.

attacks. Functionally, this means that, even if the Genesys vendor knows about cybersecurity weaknesses, it will not create security updates, provide mitigations, or even notify customers of those weaknesses after July 2025—posing a significant cybersecurity risk to NW Natural and its customers.

Q. Could NW Natural continue to use the current Genesys platform to serve customers after July 31, 2025?

A. No. It would be extraordinarily imprudent for NW Natural to continue to use the current Genesys platform to serve customers after the system is no longer supported. As explained in Direct Testimony,[18] Genesys is a mission critical system that must be available 24 hours per day, 365 days per year. Consistent up-time for such mission critical applications is essential to protect public health and safety because the system serves to support emergency reporting functions, as well as the full suite of telephonic customer-service communications. Operating such a critical system on a vulnerable platform would be unacceptable from a safety and cybersecurity perspective.

Q. Please respond to Staff's assertion that "other software that NW Natural is replacing has been unsupported for years."[19]

A. None of the three software systems highlighted by Staff—MapFrame, IQGeo, and Utilities International ("UI") Planner—has been "unsupported for years." NW Natural has indeed managed to extend its use of the MapFrame software

[18] NW Natural/700, Downing/24.

[19] Staff/1000, Dyck/14.

despite the software not receiving a software update since 2015. However, the software has continued to have access to essential defect and security fixes in the intervening years. This basic level of support ended on November 30, 2023—less than a year before the MapFrame Replacement Project will be completed. Importantly, this timeframe has been driven by the multifaceted and interdependent transitions associated with the Company's field and web mapping program. In this case, NW Natural could not phase out MapFrame without first upgrading IQGeo—an upgrade which is now complete.

Similarly, the UI Planner Re-platform Project involves a system that became unsupported on January 1, 2024; NW Natural began the project to transition away from the end-of-life system in mid-2023, and expects to place the project in service in August 2024—mere months after support is expected to end. Nor did the Company rely on an unsupported version of IQGeo: the prior IQGeo version had lost full support in 2022, but still had basic support (i.e., essential or security fixes) until June 2024. The IQGeo upgrade was completed in January 2024—six months *before* basic support was lost.

Moreover, none of these projects involves a mission critical application. Minor outages in these programs, while potentially disruptive, would not immediately interfere with the essential provision of service or disaster response. For instance, with respect to the MapFrame Replacement Project, the Company agrees that the current system is considerably outdated. However, the map viewing and correcting functions—while critical to long-term operations—do not require 24x7x365 up-time for public safety. Thus, these upgrade and re-platform

timelines were reasonable given the nature and role of the underlying applications. The Genesys Re-platform Project, in contrast, could not wait.

Q. How did moving forward with the Genesys Re-platform Project in early 2024 reduce costs for customers?

A. Moving forward with the project in early 2024 allowed the Company to reduce project costs in several ways. First, Genesys was providing financial incentives for companies that pursued re-platforming in a timely manner. These incentives were included in the Company's system integrator ("SI") contract. If the Company had not executed the SI contract by January 31, 2024, then $206,479 in incentives were set to expire.

Second, by moving expeditiously to negotiate an SI contract, NW Natural was better able to negotiate discounts. The longer the Company waited to execute an SI contract, the less leverage NW Natural would have had in such negotiations because fewer SIs would be available. As it was, NW Natural was able to negotiate discounts reducing first-year costs by $252,971, and 3-year costs by $349,811.

Third, if the project had been delayed, then the Company would have needed to renew its current services and licensing contract (currently set to expire at the end of 2024). The 2024 services and licensing contract value is $328,000. While the precise value of a renewed contract is unknown, the Company's new contract removes the need for these renewal costs.

Q. How did moving forward with full implementation of the Genesys Re-platform Project in early 2024 minimize customer service impacts?

A. Moving forward with the project implementation in early 2024 allows the project to be placed in service in the autumn—before the winter months and the associated upswing in customer call volume. Re-platforming Genesys entails considerable support from the same staff that maintain the system's day-to-day operations. Thus, overlapping the re-platforming project with the winter season's high call volume would place considerable strain on NW Natural staff, and undermine the resiliency of the system's operations.

To be clear, re-platforming the Genesys system is not a simple switch that can be conducted in just a few months. NW Natural initiated this project in summer 2023 and initiated full project implementation in February 2024. NW Natural expects to place the project in service in October 2024, yielding approximately an 8-month implementation period. If the Company had delayed the project to enter service in July 2025, then it would have needed to begin in November 2024—right when call volumes have begun ramping up. Instead, NW Natural prudently determined to proceed with the Genesys Re-platform Project on a timeline that would allow the project to be complete before winter.

Q. How did moving forward with the Genesys Re-platform Project in early 2024 limit project implementation risks?

A. Moving forward with the project in early 2024 avoided two potential implementation risks by ensuring that the Company could (1) meet the July 31, 2025, end-of-support deadline and (2) retain a competent SI capable of facilitating the re-

platform project. If the Company had delayed the project to deploy right before the deadline, then any issues or delays in project implementation would result in missing the deadline—creating unacceptable cybersecurity risks. Similarly, given that Genesys is a widely used platform, many companies will be competing for SIs to support the re-platforming transition. Delaying the project would have increased the risk of being unable to obtain a competent SI for this crucial project.

E. Start-Stop-Transfer Project

Q. Please briefly summarize the Start-Stop-Transfer Project.

A. The Start-Stop-Transfer Project provides a new web-based tool that will allow customers to seamlessly initiate, terminate, or relocate their service with NW Natural using the Company's website. This project will replace and expand on the existing manual entry forms currently found on the Company's website.

Q. What is the status of the Start-Stop-Transfer Project?

A. The Start-Stop-Transfer Project is now underway and is on track to be completed ahead of schedule in August 2024 (as opposed to the originally anticipated in-service date of October 2024).

Q. Are there any cost updates for the Start-Stop-Transfer Project?

A. No. This project remains on track to be placed in service in line with budget parameters, including contingency.

Q. Does Staff or any other party propose an adjustment related to the Start-Stop-Transfer Project?

A. No. Staff witness Ms. Dyck reviewed and analyzed the Company's investment and proposed no adjustment.[20]

F. Clevest Optimization Project

Q. Please briefly summarize the Clevest Optimization Project.

A. The Clevest Optimization Project is an incremental new effort to optimize and improve the Clevest mobile work management system, including (1) resolving post-deployment issues identified in the product's performance and (2) adding new functionalities that were initially not included but, following the product's launch, turned out to be critical. By expeditiously stabilizing and optimizing the Clevest software, the Company can ensure that the tool continues to provide the best value for the Company and its customers.

Q. What is the current status of the Clevest Optimization Project?

A. The Clevest Optimization Project is well underway. The project is being deployed on a department-by-department basis and more than half of these departments have now received completed updates. The rolled-out enhancements have been well-received, and are now successfully improving the platform's functionality. The project remains on track to be complete by September 2024.

[20] Staff/1000, Dyck/14-15.

Q. Are there any cost updates for the Clevest Optimization Project in this case?

A. Yes. Based on updated statements of work from the project vendor, the Clevest Optimization Project's budget has increased from $7.5 million to $8.6 million on a system basis (or $7.6 million Oregon-allocated), including cost contingency. The Company's previous cost estimate was based on the initial vendor estimate.

Q. Does Staff or any other party propose an adjustment related to the Clevest Optimization Project?

A. No. Staff witness Ms. Dyck reviewed and analyzed the Company's investment and proposed no adjustment, other than the contingency fund proposal that I discussed earlier in my Reply Testimony.[21]

G. Identity Governance and Administration Automation Project

Q. Please briefly summarize the IGA Automation Project.

A. The IGA Automation Project implements a comprehensive new software solution to track and manage the security access and identity management for Company personnel, particularly during onboarding, transfers, and offboarding.

Q. What is the current status of the IGA Automation Project?

A. The Company is on track to place the IGA Automation Project in service in July 2024.

Q. Are there any cost updates for the IGA Automation Project in this case?

A. Yes. Based on actual (rather than estimated) costs, the IGA Automation Project's updated budget increased somewhat from $3.0 million to $3.3 million in capital

[21] Staff/1000, Dyck/15-16.

investment (or $2.9 million Oregon-allocated). These final costs also included higher software licensing costs, increasing incremental ongoing O&M from $113 thousand to $259 thousand ($228 thousand Oregon-allocated).

Q. Does Staff or any other party propose an adjustment related to the IGA Automation Project?

A. No. Staff witness Ms. Dyck reviewed and analyzed the Company's investment and proposed no adjustment, other than the contingency fund proposal that I discussed earlier in my Reply Testimony.[22]

Q. Did Staff express any general concerns regarding the IGA Automation Project?

A. Yes. Staff expressed concern regarding the Company's use of consultants. With respect to the IGA Automation Project, Staff stated "that the process to acquire the IGA Automation Project was convoluted with multiple consultants, including Forrester, with whom they have a subscription, and Integral Partners."[23]

Q. How does NW Natural determine whether to retain outside consultants on a specific project?

A. NW Natural considers several factors in determining whether to retain outside consultants on a specific project, including: (1) whether the Company has sufficient internal expertise on a particular technical issue; (2) whether the Company frequently needs high-level technical expertise in a particular area, or can more

[22] Staff/1000, Dyck/13.

[23] Staff/1000, Dyck/17.

cost-effectively access such expertise through a consulting arrangement; and (3) whether the independence of a third-party consultant will strengthen the impartiality of a particular decision. Indeed, bringing in an outside consultant can be an efficient way to ensure that NW Natural is incorporating industry best-practices—particularly in highly sensitive, security-related areas. Importantly, however, even where the Company determines that retaining outside consulting services is appropriate, the Company rigorously oversees such consultants' scope and performance.

Q. Please respond to Staff's concern regarding the use of consultants on the IGA Automation Project.

A. The IGA Automation Project reflects the Company's effective leveraging of an existing consulting contract to obtain needed outside expertise, coupled with a closely supervised SI contract to ensure effective project implementation. NW Natural determined that we did not have sufficient internal expertise to design the project architecture, which needed to reflect an overarching strategy for identity governance. NW Natural therefore made use of an existing subscription with Forrester Research, which allowed Company staff to access expert research materials and consult with third-party experts. This subscription was made consistent with the Company's established procurement process. This process generally utilizes competitive procurement of goods and services costing more than $100 thousand, but provides for certain enumerated exceptions—such as where a product or service replaces a preexisting, more expensive option. In this case, the Forrester subscription contract was a more cost-effective alternative to

an existing consulting arrangement with the Gartner Group, and therefore was appropriately not the result of an RFP process.

For the project implementation process, the Company conducted a competitive RFP for the SI role. To clarify, an SI is not commonly referred to as a "consultant," as SIs are hands-on technicians experienced with the practical details of project implementation—rather than third-party experts who are retained at a consulting level. In this case, having retained Integral Partners, NW Natural carefully oversaw the SI's implementation activities. The Company committed a dedicated project manager and business lead to focus on the work, including monitoring the consultant's activities, conducting weekly project meetings, and providing monthly reports to the executive sponsor and program steering committee. This oversight process closely mirrors other consultant arrangements, where outside expert services are needed on Company projects.

H. Telemetry Refresh Projects

Q. Please briefly summarize the Telemetry Refresh Projects.

A. The Telemetry Refresh Projects involve surveying, permitting, and deploying new equipment to the Company's remote monitoring and control sites. These projects replace outdated monitoring and control equipment to ensure crucial reliability and safety of the gas supply system.

Q. What is the current status of the Telemetry Refresh Projects?

A. The Company is on track to complete the Telemetry Refresh Projects described here by October 2024.

Q. Are there any cost updates for the Telemetry Refresh Projects in this case?

A. No. NW Natural remains on track to complete this project within budget parameters, including contingency.

Q. Does Staff or any other party propose an adjustment related to the Telemetry Refresh Projects?

A. No. Staff witness Ms. Dyck reviewed and analyzed the Company's investment and proposed no adjustment.[24]

I. Utilities International Planner Re-platform Project

Q. Please briefly summarize the UI Planner Re-platform Project.

A. The UI Planner Re-platform Project entails migrating the Company's UI planning system into the cloud. UI Planner is NW Natural's corporate financial and regulatory finance planning system and is also used by most of the Company's utility peers to perform complex, iterative forecasts and problem-solving. The current on-premises solution is no longer supported by the software vendor. Thus, in order to continue using the UI Planner software, the system must be re-platformed to the modern cloud-based environment—which also requires integrating UI Planner's new cloud-based software product.

Q. What is the current status of the UI Planner Re-platform Project?

A. The Company is on track to complete the UI Planner Re-platform Project by August 2024. As noted below, the replaced on-premises asset will be retired November 1, 2024.

[24] Staff/1000, Dyck/17.

Q. Are there any cost updates for the UI Planner Re-platform Project in this case?

A. Yes. The initial expected $1.8 million cost for this project inadvertently omitted certain project cost components, including resources required to support the project's implementation. The updated expected project cost is $2.4 million on a system basis, or $2.1 million on an Oregon-allocated basis. Incremental ongoing O&M remains at $208 thousand ($183 thousand Oregon-allocated) for software licensing.

Q. Does Staff or any other party propose an adjustment related to the UI Planner Re-platform Project?

A. No. Staff witness Ms. Dyck reviewed and analyzed the Company's investment and proposed no adjustment.[25]

J. PowerPlan Project

Q. Please briefly summarize the PowerPlan Project.

A. The PowerPlan Project transitions a key accounting function, known as the capital settlement process, from the Company's existing PowerPlan tool and into the broader SAP[26] enterprise resource planning system. The capital settlement process tracks costs accumulated under work orders and projects and allocates those costs to various accounts in PowerPlan.

[25] Staff/1000, Dyck/18.

[26] SAP refers to the name of the developer, Systeme, Anwendungen und Produkte in der Datenverarbeitung, which is a German software company.

Q. What is the status of the PowerPlan Project?

A. The PowerPlan Project is now complete, having been placed in service ahead of schedule in March (as opposed to May) 2024.

Q. Are there any cost updates for the PowerPlan Project?

A. No. This project was placed in service within budget parameters.

Q. Does Staff or any other party propose an adjustment related to the PowerPlan Project?

A. No. Staff witness Ms. Dyck reviewed and analyzed the Company's investment and proposed no adjustment.[27]

K. SAP Treasury Project

Q. Please briefly summarize the SAP Treasury Project.

A. The SAP Treasury Project implements an industry-standard software tool to automate and manage the Company's treasury functions—such as financial tracking and payment approval systems. The new tool provides consolidated and comprehensive visibility into the Company's financial risk management using the necessary subset of SAP's "Treasury Track" software functionalities.

Q. What is the current status of the SAP Treasury Project?

A. The Company placed the SAP Treasury Project in service in November 2023.

Q. Are there any cost updates for the SAP Treasury Project in this case?

A. No. This project was placed in service within budget parameters, with contingency.

[27] Staff/1000, Dyck/18.

Q. Does Staff or any other party propose an adjustment related to the SAP Treasury Project?

A. No. Staff witness Ms. Dyck reviewed and analyzed the Company's investment and proposed no adjustment.[28]

IV. IT&S STAFFING NEEDS

Q. Is NW Natural seeking cost recovery for new FTE positions to support IT&S in particular?

A. Yes. NW Natural is seeking cost recovery for eight new IT&S-related FTEs. These FTEs include four application positions, three operational technology positions, and one security position, as shown in Table 1, below:

Table 1

Department	Role	Hire Date
Applications	CIS Senior Developer	July 2024
Applications	CIS Developer	July 2024
Applications	CIS System Analyst 1	May 2024
Applications	CIS System Analyst 2	September 2024
Operational Technology	IT&S Engineer	June 2024
Operational Technology	IT&S Engineer	September 2024
Operational Technology	Applications Engineer 3	August 2024
Security	Information Security Specialist	June 2024

Q. Does Staff propose an adjustment related to the above FTEs?

A. Yes. Staff witness Ms. Dyck proposes to disallow the costs associated with the CIS Senior Developer, the CIS Developer, the CIS System Analyst 1, and the CIS System Analyst 2 because these positions are necessary to facilitate the planning

[28] Staff/1000, Dyck/19.

and development of the H2: Vista program—a program which is not yet in rates.[29] Moreover, Staff asserts that these FTEs should be removed because "NW Natural was able to complete the work of Horizon 1 while being 'understaffed' from their previous request."[30]

Q. Does the Company agree with Staff's proposed adjustment to remove these four CIS FTEs?

A. No. The four new FTEs are fully dedicated to, and will be actively working on, existing NW Natural systems that currently serve NW Natural's customers. These positions are neither temporary nor short-term. These four new CIS FTEs are needed to support the Company's current CIS, and to support the development of the H2: Vista program.

Q. Please expand on why these 4 new CIS FTEs are needed.

A. As the Company explained in its Direct Testimony, the need for these positions has been largely driven by the need to support the prospective H2: Vista program.[31] As the H2: Vista program proceeds, existing personnel will need to be available to develop, test, and implement H2: Vista, meaning that existing CIS support capacity will be substantially under-resourced. In order to effectively support NW Natural's ongoing CIS needs, new personnel need substantial lead times—between 18 and 24 months—to be educated and integrated. As a result, the new FTEs need to be brought on board quickly in order for these individuals to effectively back-fill

[29] Staff/1000, Dyck/20.

[30] Staff/1000, Dyck/21.

[31] NW Natural/700, Downing/51-52.

existing NW Natural personnel for the H2: Vista effort and to support reliable provision of service to customers.

To be clear, however, the need for these FTEs exists regardless of the timing of H2: Vista. For instance, if the current study demonstrated that prerequisite projects would need more time to implement before the larger CIS project was launched, then the need for these new FTEs would be even more crucial, as the Company would need to substantially increase staffing necessary to support long-term reliance on the existing CIS. Existing staffing levels for the current CIS are low, and rely heavily on employees that are nearing retirement age. As explained in UG 388,[32] the existing CIS was developed and customized for the Company over 25 years ago and is both highly complex and requires deep expertise to maintain. Moreover, the CIS programming language is no longer widely used, meaning that those with experience in the relevant language are difficult to find. As a result, new FTEs would need to train extensively to take over for retiring individuals and take on long-term responsibility for the maintenance of the current CIS.

Thus, the need for these FTEs is independent of the H2: Vista program; these positions are essential to ensure that this core system can continue to perform reliably, while also allowing for adequate training time.

[32] UG 388, NW Natural/600, Downing/10-11.

Q. Does the Company's on-time, on-budget deployment of Horizon 1 warrant disallowing FTEs necessary to support H2: Vista?

A. No. NW Natural's on-time and on-budget deployment of Horizon 1 is not a basis for disallowing staffing necessary to support H2: Vista. The IT&S team worked incredibly hard to successfully deploy Horizon 1, despite recognized staffing challenges.[33] Understaffing is not sustainable. It would be neither fair nor prudent to plan to understaff a future crucial infrastructure project.

Q. Staff points out that NW Natural expects to include the cost of these 4 H2: Vista-related FTEs in the planned deferred accounting application.[34] Would this deferred accounting application include all of NW Natural's costs for these positions?

A. No. The planned deferred accounting application will not fully encompass cost recovery for the 4 H2: Vista-related FTEs, as the Company is already prudently filling these positions to ensure adequate training. For these positions, the Company's deferred account would include only those costs incurred prior to the rate effective date.

V. STAFF REQUESTS

Q. Please summarize how this portion of your Reply Testimony is structured.

A. This portion of my Reply Testimony responds to Staff's general requests for

[33] NW Natural/700, Downing/12.

[34] Staff/1000, Dyck/21.

clarification and comment on IT&S matters.[35] Specifically, Staff asks the Company to address (1) the Company's policy for spending time in a training environment for IT&S projects, and whether the time spent in such an environment might be amended; (2) whether IT&S projects and suppliers were contracted for as the result of RFPs; (3) how the Company plans to reflect forecasted retirements for Genesys and UI Planner, including Test Year rate request impacts; and (4) any update on the planned deferred accounting request for H2: Vista.

A. Software Testing/Training

Q. What is NW Natural's policy for spending time in a training environment for IT&S projects?[36]

A. The Company's policy is to train and test IT&S projects before projects are placed in service. However, specific training and testing processes necessarily vary by project. Project-specific training and testing plans are developed for each project before the project is executed. Plans include time in a dedicated virtual training environment, where new projects can be tested and individuals can learn how to effectively use new applications.

[35] Staff/1000, Dyck/22. Staff's question concerning the timing of the Genesys Re-platform Project ("Can Genesys continue to operate after July 31, 2025?") was addressed above, during the discussion of that project. Staff's question concerning the accounting treatment of cloud licensing costs is addressed in the Reply Testimony of Kyle T. Walker, NW Natural/3800, Walker.

[36] Staff/1000, Dyck/22; *see also* UG 490 OPUC DR 495.

Q. Has the Company considered amending the testing/training process in light of the deployment issues experienced in the initial Clevest project?

A. Yes. In fact, the Company has already implemented a new virtual testing and training environment, which allows users to "test drive" new and updated applications without impacting existing NW Natural systems and operations. This virtual testing and training environment has two important benefits for future project implementation. First, the training environment allows individuals the chance to learn and adapt to new applications before the project impacts any real-life, day-to-day operations and activities. Second, by allowing users to preview the application, the Company can solicit feedback and make critical changes before the project goes live. Implementing this new virtual testing and training environment was a major "lesson learned" from the Clevest deployment experience and will facilitate the successful deployment of future projects.

B. IT&S Provider Selection and Consultants

Q. Does NW Natural identify and source outside consultants and providers through competitive RFP processes?[37]

A. Yes, for major contracts and procurements. Pursuant to NW Natural's procurement policy, any asset procurements or consulting contracts exceeding $100 thousand must be conducted through a competitive procurement process, unless subject to certain specified exceptions. Any such exceptions (such as the identification of a more affordable replacement to an existing service) must first be

[37] Staff/1000, Dyck/17; *see also* UG 490 OPUC DR 496.

detailed in a competitive assessment memorandum and approved by the Company's Purchasing department.

C. Asset Retirements

Q. Please clarify how the replaced Genesys and UI Planner assets are reflected in forecasted retirements?[38]

A. Following communications with Staff during the discovery process, the Company's asset retirements have been updated to reflect a modified characterization of the Genesys and UI Planner projects. The current Genesys asset will be retired by December 31, 2024. The UI Planner asset will be retired by November 1, 2024. This update reduces the Company's Test Year rate request by $589 thousand.

D. H2: Vista Deferral

Q. Please provide an update on the Company's planned deferred accounting application for the H2: Vista program.[39]

A. The Company is still planning to file a deferred accounting application for H2: Vista program costs in the second half of this year, which would track and defer the program's significant, non-routine expenses.[40]

Q. Does this conclude your Reply Testimony?

A. Yes.

[38] Staff/1000, Dyck/10, *see also* UG 490 OPUC DR 497.

[39] Staff/1000, Dyck/21; *see also* UG 490 OPUC DR 498.

B. Reply to Staff's Testimony Regarding Investigation of Problems and Pursuit of Warranty Claims 12

C. Reply to Staff's Testimony Regarding Drift Adjustment as Alternative 22

D. Reply to Staff's Testimony Regarding Use of Ultrasonic Meters 25

I. INTRODUCTION AND SUMMARY

Q. Are you the same Joe S. Karney who presented Direct Testimony in this proceeding on behalf of Northwest Natural Gas Company dba NW Natural ("NW Natural" or the "Company")?

A. Yes, I presented NW Natural/900, Karney.

Q. What is the purpose of your Reply Testimony?

A. In my Reply Testimony, I provide updates to the Company's Meter Modernization Program ("MMP") that have occurred since the time I presented the MMP in my Direct Testimony. I also respond to the Opening Testimony of Public Utility Commission of Oregon Staff ("Staff") witness Dr. Curtis Dlouhy regarding the MMP.

Q. Please provide a summary of your testimony.

A. NW Natural requests the Commission reject Staff's proposed adjustment and approve cost recovery for the Company's MMP. The MMP is a thoughtful approach to combine efforts to replace Periodic Cause for Change ("PCC") meters and Encoder Receiver Transmitters ("ERTs") that have reached the end of their useful life. Staff raises a number of questions about the Company's MMP and the Company's approach to pursuing warranty claims and recommends removing from rate base the net book value of PCC meters that will be removed from service through the MMP, and further suggests that instead of replacing PCC meters, the Company could refurbish its meters to extend their useful life. With respect to investigation of meters and pursuit of warranty claims, my Reply Testimony demonstrates the Company has diligently pursued warranty claims to receive

compensation for faulty meters and meter families when it is economic to do so. My Reply Testimony also demonstrates that Staff's proposal to refurbish diaphragm meters instead of deploying new meters is infeasible, and does not result in the cost reductions that Staff anticipates. Staff also questions the Company's choice to deploy ultrasonic meters in place of diaphragm meters, but my Reply Testimony demonstrates the benefits of ultrasonic meters compared to diaphragm meters and the supply chain issues that have limited the availability of diaphragm meters. Finally, Staff raises concern about the Company's investment in the MMP in an era of decarbonization mandates and electrification opportunities, but my Reply Testimony illustrates that the Company is taking a measured approach that benefits customers. Further, the Company must employ accurate meters to protect customers from inaccurate billing and to comply with Commission mandates for in-service meters. Despite Staff's criticisms of the MMP, Staff does not provide viable alternatives to the MMP that would result in significant additional cost reductions while achieving reliable readings for all in-service meters. My Reply Testimony explains that the MMP is a conservative approach to ensuring in-service meters work properly, and the Commission should approve recovery of the full cost without removing any PCC meters from the rate base.

Q. Do you include any exhibits with your testimony?

A. Yes, I am presenting the following exhibits: NW Natural/3001, Karney (NW Natural Response to OPUC Data Request No. 386), Confidential NW Natural/3002, Karney (Confidential Supplemental Response to OPUC Data Request No. 387 and

Confidential Supplemental Response to OPUC Data Request No. 464), and NW Natural/3003, Karney (proposed calculation of meter net book value).

II. MMP UPDATES

Q. In your Direct Testimony, you indicated that field work to support the MMP will begin in the first quarter of 2024.[1] Did field work begin as anticipated?

A. Yes. The Company's deployment of ERT change outs began in March 2024 and is expected to continue as planned through 2027. The first meter replacements were completed on May 13, 2024.

Q. What is the status of the Company's new software system, Temetra?

A. Temetra has passed through its "proof of concept" phase and is gearing up for its pilot phase. In other words, the Company has completed initial testing and expects to do more controlled testing before fully rolling the system out. We expect that Temetra will be implemented by October 2024.

Q. In your Direct Testimony, you indicated the NW Natural plans to add three full-time employees ("FTE") for the MMP.[2] Has NW Natural hired the FTEs that were identified in your Direct Testimony?

A. Yes. NW Natural has hired all three of the anticipated FTEs, including the Itron Applications Suite Application Engineer 2 and the Metering and Network System Engineer that were in recruitment when I submitted my Direct Testimony in December 2023.

[1] NW Natural/900, Karney/24.

[2] NW Natural/900, Karney/33.

Q. Has there been any update to the anticipated costs of the MMP?

A. No. At this time, the MMP is still on budget, consistent with the anticipated costs presented in my Direct Testimony.

III. REPLY TO STAFF

Q. Please summarize Dr. Dlouhy's testimony concerning the Meter Modernization Program.

A. In its Opening Testimony, Staff criticizes the MMP, raising concerns about warranty claims on existing meters and **[BEGIN CONFIDENTIAL]** [redacted] **[END CONFIDENTIAL].** Staff also questions whether, if some customers will choose to electrify, replacing and upgrading meters may leave stranded asset costs and not be in customers' best interest.[4] Staff also criticizes the Company's use of ultrasonic meters in the MMP.[5] Though Staff acknowledges that ultrasonic meters may be a sensible choice for placement in a remote location, Staff questions whether switching to ultrasonic meters across the entire service territory is in customers' best interests due primarily to concerns about their 20-year useful life.[6] Staff does not raise any objections to the Company's request for

[3] Staff/900, Dlouhy/55-56.

[4] Staff/900, Dlouhy/52-53.

[5] Staff/900, Dlouhy/51.

[6] Staff/900, Dlouhy/51-52.

FTEs related to the MMP or the need to replace end-of-life ERTs, and agrees that certain MMP costs are appropriately recovered through a deferral.[7]

A. Clarifications / Background

Q. As an initial matter, are there any statements included in Staff's testimony regarding the MMP that warrant clarification?

A. Yes. First, I would like to clarify the scope of the MMP. Staff states that "the MMP would replace meters that run 'fast' – known as Periodic Cause for Change (PCC) meters – and failing Encoder Receiver Transmitter (ERT) devices."[8] It is important to understand that the PCC program and the ERT replacement project are separate initiatives which have been merged through the MMP. The PCC program is an ongoing program and exists year to year–and will exist with or without the MMP.

Q. Why did NW Natural integrate the PCC program and the ERT replacement project for end-of-life ERTs?

A. NW Natural determined that there could be efficiency gains by integrating these efforts. In particular, combining these two programs results in fewer touch points with (and less impact to) the customer. Additionally, because there are fewer touch points and the Company is able to group work by geographic region, the field crews required for these efforts can be deployed more efficiently, which results in lower costs.

[7] Staff/900, Dlouhy/59-60.

[8] Staff/900, Dlouhy/47.

Q. Are there any other statements included in Staff's testimony regarding the MMP that warrant clarification?

A. Yes. In his testimony, Dr. Dlouhy indicates that Staff was concerned that more could be done to verify whether replacing the family was the right decision ex post.[9] Staff acknowledges that NW Natural provided further explanation in response to discovery, which was included as an exhibit to Staff's testimony.[10] To elaborate further on this point, NW Natural performs accuracy testing on each meter that is removed from service, including all PCC meters. This process considers both the individual meters and meter families to determine trends. These test results are recorded for each meter in the Company's Customer Information System.

Q. Does the Company's ex post testing validate the designation of PCC meters?

A. Yes. To evaluate the accuracy of the Meter Sampling Program statistical analysis, these test results are periodically evaluated to ensure that the PCC meters being removed from service exhibit the same performance characteristics of the sample meters upon which the PCC determination was based. If the test results from PCC meters removed from service exhibit statistically significant differences from the sample meters, the Company performs additional analyses to determine the reason for the difference.

[9] Staff/900, Dlouhy/48.

[10] Staff/902, Dlouhy/7 (NW Natural's Response to OPUC DR 386).

Q. Please provide an example.

A. An example of this analysis was discussed in the Company's RG 41 Annual Meter Sampling Program Report for 2022.[11] A modification to the 2005 Perf #572 Sensus R-275 meter family was made after evaluating meter tests for PCC meters removed from service, where specific delivery lots for these meters were determined to be non-conforming, while others were determined to be conforming, resulting in reducing the number of PCC meters by 6,673.

Q. Staff asserts that the Company designates all its meters pre-2020 into various families and subfamilies based on the manufacturer, meter characteristics, and the date that the meter is placed in service, whereas post-2020, families are made solely on the meter manufacture date.[12] Is Staff's characterization accurate?

A. No, it is not accurate for the post-2020 meters. Similar to the pre-2020 meters, they are grouped into families based on the manufacturer, meter characteristics, and the date of manufacture.

[11] NW Natural/3001, Karney.

[12] Staff/900, Dlouhy/49.

Q. Staff also indicates that it holds concerns about whether using ultrasonic meters across the Company's entire service territory would be in customers' best interest should the Company choose to move in that direction in the future.[13] Is the Company proposing to migrate its entire system to ultrasonic meters at this time?

A. No. As I indicated in my Direct Testimony, the Company considered and rejected the possibility of migrating the entire system to use advanced metering infrastructure and ultrasonic meters.[14] Instead, the Company is taking a more conservative approach and replacing the meters identified through PCC and that have end-of-life ERTs.

Q. Staff comments that it is skeptical as to whether it is in the customers' best interest to undertake an aggressive initiative to replace and upgrade all the Company's meters at this time.[15] Is the Company replacing all meters?

A. No. For context, out of approximately 800,000 meters in total, the Company plans to replace 90,000 meters which have been identified as PCC meters. This will occur over the course of the next four years. Of the PCC meters, only 50,000 will be replaced with ultrasonic meters—comprising approximately 6 percent of the meters on NW Natural's system.

[13] Staff/900, Dlouhy/51-52.

[14] NW Natural/900, Karney/27-28.

[15] Staff/900, Dlouhy/51-52.

Q. How is the Company planning to address the meters that require ERT replacements?

A. For the meters requiring ERT replacements, the Company is leaving the existing diaphragm meter in place and simply replacing the ERT. In other words, the Company is not prematurely retiring functional diaphragm meters, and instead is only replacing the component that is at or near end-of-life.

Q. Staff also comments that ultrasonic meters have a useful life of 20 years, whereas diaphragm meters have a useful life of 30 years, and also have a suite of replaceable parts that could extend the useful life of the meter beyond the expected service life.[16] How do you respond?

A. While it is true that diaphragm meters typically have a longer useful life in comparison with ultrasonic meters, it appears that Staff has a misunderstanding regarding the cost and feasibility of replacing parts in diaphragm meters to extend the overall life of the meters.

Q. What is the cost to refurbish a diaphragm meter?

A. The total cost per meter to refurbish a diaphragm meter is $95.49 as shown in Table 1, below. Note this estimate uses an average price on shipping cost as it can fluctuate depending on gas prices.

[16] Staff/900, Dlouhy/51-52.

Table 1. Cost to Refurbish Diaphragm Meter

Labor cost per Meter	$	4.95
Shipping Cost per Meter (roundtrip)	$	5.41
Cost for Refurbishment	$	85.13
Total Meter Shop Cost to Refurbish Meters	**$**	**95.49**

Q. How does the cost to refurbish a meter compare to the cost of a new meter?

A. For 2024, the new diaphragm AC250 meters cost $109.78. In other words, a refurbished meter only would be $14.29 cheaper per meter in comparison with a new meter.

Q. Will manufacturers refurbish all parts of a diaphragm meter?

A. No. Refurbished meters do not receive new diaphragms, and instead only receive repairs to gearing and new gaskets. The diaphragm is a key wear component of the meter, and any degradation in the diaphragm can cause the meter to become inaccurate.

Q. Do manufacturers provide warranties for refurbished meters?

A. Yes, but typically they are limited to only one year. That means that NW Natural could spend the resources to pull the meter from the field, ship it to the manufacturer, pay to have the meter refurbished, and then only get one year of warranty coverage, such that if it failed for any reason outside of the warranty period, NW Natural would incur additional expense to either send it off for repairs *again* or purchase a replacement. Given the expense and resources that would be involved with refurbishing meters, and the limited warranty coverage, it is more effective to replace the meter with a new one—with a 15-year warranty—rather than refurbish the meters.

Q. Staff further states that it expects that, in many cases moving forward, continuing to use diaphragm meters is a more cost-effective way to provide service than a full ultrasonic meter conversion.[17] Does NW Natural agree?

A. Yes, and it is for that reason that NW Natural is not pursuing a full ultrasonic meter conversion. However, NW Natural considers a range of factors in selecting meters, which includes cost, but also considers safety, availability, and diversity of meters in the field. As explained further below, NW Natural currently faces supply chain issues with meters, which has been exacerbated by one of the three meter vendors choosing to limit its offering of diaphragm meters. Despite these challenges, NW Natural is continuing to use diaphragm meters where it is most cost effective and safe to do so, and following the completion of the MMP in 2027, approximately 94 percent of NW Natural's meters will continue to be diaphragm meters. Upon completing the MMP, NW Natural will continue to make meter purchases that prioritize safety, function, and diversity, while remaining sensitive to costs to customers.

Q. Is it possible that diaphragm meter supply will continue to be limited in the future?

A. Yes. Part of the reason why NW Natural is exploring the use of ultrasonic meters is because there are significant supply chain delays associated with diaphragm meters. The total number of vendors for most residential diaphragm meters has dropped from three to two, and there have been significant delays in fulfilling

[17] Staff/900, Dlouhy/51-52.

existing orders and new orders, and there also has been some significant cost increases. In 2021, there were one-year lead times for diaphragm meters, and in 2024, the lead time increased to 1.5 to 2 years.

Q. Did the vendor that stopped selling diaphragm meters leave the market entirely?

A. No. That vendor, Itron, now predominantly sells ultrasonic meters.

Q. How much have the costs for diaphragm meters increased over the past two years?

A. In 2022, the AC250 meter price was $74.83 per meter compared to the current price of $109.78—representing close to a 47 percent increase over approximately 2 years.

B. Reply to Staff's Testimony Regarding Investigation of Problems and Pursuit of Warranty Claims

Q. Staff raises concerns about whether the Company diligently pursued warranty claims for the PCC meters from 2005 to 2009. At the outset, is there any clarification that the Company needs to make?

A. Yes. It appears that there may have been a misunderstanding regarding two of Staff's data requests, OPUC Data Request No. 387 and 464. NW Natural had provided completed warranty claims, but did not provide detail regarding pending warranty claims. Thus, after reviewing Staff's Opening Testimony and recognizing that Staff was looking for a broader scope of information, the Company determined that it would need to update its responses to OPUC Data Request Nos. 387 and 464, and provided Supplemental Confidential Responses to OPUC Data Request

Nos. 387 and 464 on April 26, 2024. The Supplemental Confidential Responses to OPUC Data Request Nos. 387 and 464 provided additional detail regarding the Company's approach to investigation of meter families and pursuit of warranty claims, and are included as Confidential NW Natural/3302, Karney. The Company diligently pursues warranty claims when any meter family has been determined non-conforming and is within its 15-year warranty period. In the case of the meter families from 2005 to 2009, NW Natural pursued warranty claims for each meter family year except for the 2006 meter family, which was out of its warranty period when declared non-conforming. These claims were made as soon as the Meter Sampling Program returned indications that the meter families were non-conforming and manufacturers were promptly notified. The warranty process requires additional sampling and verification efforts that take time to complete. To ensure that the Company remains compliant with meter removal time period requirements in the Meter Sampling Program and General Schedule M-1, meters can be removed from the field ahead of resolution of a warranty claim.

Q. Staff asserts the bulk of the Company's PCC meters appeared to have failed between 2005 and 2008 and seem to come almost exclusively from a single manufacturer.[18] Is this accurate?

A. Yes, Staff's statement is correct. As shown in Figure 2 of Staff's testimony,[19] American/Honeywell was the manufacturer of the PCC meters. The Company

[18] Staff/900, Dlouhy/53.

[19] Staff/900, Dlouhy/54.

further comments that Figure 2 highlights the importance of diversifying the Company's meter complement by adding ultrasonic meters to the system. The Company expects that deploying ultrasonic meters will help alleviate some of Staff's concern regarding reliance on meters that could be subject to similar issues as the meters that have been subject to warranty claims.

Q. Referring to a warranty claim for the 2009 Honeywell AC-250, Staff comments that there was an entire batch of meters from American for which the Company eventually got refunded through the warranty claim.[20] Were these meters fully refunded?

A. No. Due to the timing of the identification of the PCC meters relative to the warranty period, NW Natural's warranty coverage was more limited. For this warranty claim **[BEGIN CONFIDENTIAL]** [redacted] **[END CONFIDENTIAL]**.

///

///

///

///

///

///

[20] Staff/900, Dlouhy/56.

Q. Staff also observes that the Company installed a large number of meters from the same manufacturer in each of the prior four years, and comments that it would have been reasonable and prudent for the Company to investigate whether these meters were systematically running fast and whether a warranty claim would be available.[21] How does the Company respond?

A. NW Natural disagrees with the assertion that the Company did not properly investigate the Honeywell/American AC-250 meter families from 2005 to 2009. The Company evaluates the performance of all meter families less than 1,000 cubic feet per hour in size annually in the statistical Meter Sampling Program, and acts immediately if it determines a meter family fails to meet the criteria specified in General Schedule M-1 and Engineering Procedure Z-1. At times during the Meter Sampling Program, the Company noted in different years that the 2005 to 2009 Honeywell AC-250 meter family performance exhibited a trend of fast performance. However, these meter families continued to meet the Meter Sampling Program criteria for satisfactory performance through much of their 15-year warranty life. NW Natural pursued these meters as quickly as possible to determine if they could receive warranty treatment, but also had to meet the manufacturer's warranty requirements before a claim could be made. Even when the Company determined that the meters were non-conforming, it still had to meet manufacturer warranty claim criteria.

[21] Staff/900, Dlouhy/56.

Q. Please describe the warranty claim criteria and process.

A. Honeywell's warranty requires 15 percent of the meter family be determined not accurate before a warranty claim can be issued. The Meter Sampling Program conservatively detects meter families trending fast before they meet manufacturer criteria for a warranty claim. For example, the Company's Meter Sampling Program identified the 2007 AC-250 meter family as non-conforming with 13.3 percent of the sample meters registering fast (greater than 102 percent), when the manufacturer threshold for a warranty claim is 15 percent. **[BEGIN CONFIDENTIAL]** [redacted] **[END CONFIDENTIAL]**. Additionally, if the Company does receive compensation from a warranty claim, the gross plant of the affected meters will be reduced and overall rate base will be reduced. The warranty claims benefit customers by lower return on meter investments as well as lower depreciation expense (return of) those investments in the next rate case and until those meters are retired.

Q. Did the Company investigate the 2005-2009 meters and pursue warranty claims where available?

A. Yes. The Company further investigated and sought warranty claims on meters purchased in 2005, 2007, 2008, and 2009. NW Natural's analysis revealed that:

- A portion of the 2005 meter family was identified as non-conforming and removed from service in 2016 and 2017. A warranty claim was received for 588 meters in the 2005 meter family, as well as meters purchased in 2003 and 2004. The remainder of the 2005 meter family was determined non-conforming in 2021 with 29.8 percent of the meter samples determined fast. This was compared to 12.8 percent the year before.
- The 2006 meter family was determined non-conforming in 2022 (after the 15-year warranty period) with 13.5 percent fast, versus 11.5 percent the year before.
- The 2007 meter family was determined non-conforming in 2022 with 13.3 percent fast, versus 11.5 percent the year before. A warranty claim was filed, and meters are being sent to the manufacturer for validation. They must meet the manufacturer's threshold of 15 percent.
- The 2008 meter family was determined non-conforming in 2020 with 13 percent fast, versus 10.4 percent the year before. A warranty claim was filed, and meters are being sent to the manufacturer for validation. They must meet the manufacturer's threshold of 15 percent.

NW Natural has made warranty claims on a portion of the 2005 meter family, as well as the 2007, 2008 and 2009 meter families.

Q. At what point in the useful life of the meters did the Company pursue warranty claims?

A. **[BEGIN CONFIDENTIAL]** [redacted] **[END CONFIDENTIAL]**.

Q. What did the warranty coverage and claims process entail for this 15-year warranty?

A. The Company provided this information in its response to UG 435 OPUC Confidential DR 301 and attachments. **[BEGIN CONFIDENTIAL]** [redacted] **END CONFIDENTIAL]**.

Q. Does the warranty include replacement of the diaphragm?

A. **[BEGIN CONFIDENTIAL]** [redacted] **[END CONFIDENTIAL]**.

Q. Did the Company receive refurbished meters as part of its warranty claims?

A. **[BEGIN CONFIDENTIAL]** [redacted] **[END CONFIDENTIAL]**.

Q. Are there other costs associated with pursuing meter refurbishment under a warranty claim?

A. Yes, the Company will need to bear the costs of removing the meters from service, packing and shipping the meters, and then resetting the refurbished meters into service. As described above, the refurbished meters have only a limited warranty period (typically one year).

Q. How important is it that the Company have accurate meters in the field?

A. It is extremely important for our business and our customers that our meters give accurate readings. The Company is committed to ensuring its meters are accurate for customers while being cautious about removing meters too soon. Accordingly, the Company only removes meters that meet the criteria for removal.

Q. Do the Commission's rules prescribe a certain level of accuracy for meters?

A. Yes. It is my understanding that OAR 860-023-0015(1) and (2) require meters be accurate within two percent.

Q. Staff also questions whether it is in the best interest of customers to replace these meters rather than to merely repair and redeploy them.[22] How do you respond?

A. As an initial matter, NW Natural does not repair PCC meters and put them back into service. As was discussed above, the costs associated with repair of PCC meters and limited warranty for refurbished meters make this option impractical.

Q. Staff proposes an adjustment to remove from rate base $9.3 million representing the net book value of the PCC meters put into service from 2005 to 2008 for failing to catch PCC meters while they were still under warranty.[23] How do you respond to Staff's adjustment?

A. Staff's proposal is punitive and unfounded. As described above, the Company has diligently investigated its meters from the 2005 to 2008 family years and pursued warranty claims to the extent they were available. Staff has not justified any adjustment to the Company's proposed MMP.

Q. Staff comments that it is difficult to exactly determine the net book value of these meters because the Company relies on group depreciation and groups all meters that were put into service in the same calendar year into a single group. Did Staff calculate its adjustment correctly?

A. With respect to the Company's use of Group Depreciation, Staff is correct regarding the Company's use of the Group Depreciation method. The Reply

[22] Staff/900, Dlouhy/57.

[23] Staff/900, Dlouhy/57.

Testimony of John J. Spanos (NW Natural/3700, Spanos) addresses the depreciable lives of the meters.

While we disagree with Staff's prudency adjustment, with respect to Staff's calculation of the netbook value of the meters, we have reviewed Staff's calculation and found significant errors.

Q. Please describe how Staff calculated the $9.3 million rate base adjustment.

A. The proposed $9.3 million rate base adjustment was calculated using total meter installation costs. Total meter installation costs include the cost of all meters during those periods, ERTs, service lines, risers, regulators, meter fittings, related labor and overheads and other costs incurred. However, only the meters themselves are being replaced.

Q. Do you agree with Staff's methodology and calculation of the net book value of the PCC meters put into service from 2005 to 2008?

A. At the outset, I reiterate my position that any adjustment is not appropriate, and the Company acted prudently in testing its meters and seeking warranty claims. However, in also reviewing Staff's attempt to calculate the net book value of the PCC meters put into service from 2005 and 2008, I have found significant errors in this adjustment. As noted above, the costs used in the calculation include all meter set related costs incurred including assets that are not being replaced (riser, service lines), labor and third-party costs prudently incurred related to the meter sets, and costs related to other meter manufacturers that are not being replaced. The Company believes a more appropriate calculation would be to calculate the actual estimated net book value of only the physical meter assets being replaced.

The Company's records indicate that the average Honeywell meter purchase price during the period in question was $55.62. Additionally, the PCC meter count to be used in the calculation is 47,282 Honeywell PCC meters as opposed to Staff's calculation of 50,330 which represents all meters purchased during 2004-2008 and a reduction of 3,048 meters. The resulting estimated remaining net book value of the physical meters is $1,263,464. Refer to NW Natural/3003, Karney for the proposed calculation. Additionally, it is important to note that the current Depreciation Study already took into consideration the upcoming meter retirements as well as the variability in the useful lives, including meters that are still in service after their estimated useful life.

C. Reply to Staff's Testimony Regarding Drift Adjustment as Alternative

Q. Staff also questions whether it would be more cost effective to apply a drift adjustment rather than replacing PCC meters.[24] Is this a viable option?

A. No. Applying a drift adjustment to PCC meters would not allow the Company to accurately bill its customers, and could result in compounding inaccuracies over time. As the Company explained in its Direct Testimony,[25] providing accurate billing information is an essential component of providing utility service, and the Company strongly disagrees with Staff's suggestion that it should have considered a drift adjustment as an alternative to replacing PCC meters.

[24] Staff/900, Dlouhy/58-59.

[25] NW Natural/900, Karney/15.

Q. Did Staff take a different position on drift adjustments in a recent proceeding?

A. Yes. Staff notes that it highlighted problems with a drift adjustment in Avista's general rate case proceeding in docket UG 461,[26] but now is recommending that the Company should consider the drift adjustment approach in this proceeding.

Q. What concerns did Staff highlight docket UG 461?

A. While some concerns were specific to Avista's drift adjustment, which was called the Installation Constant Factor, Staff also highlighted the following more generalized concerns:

- Meters with incorrect usage are left in the field: Despite evidence that there are meters that are incorrectly reading usage, Avista leaves these meters in service and adjusts the usage to be "correct".
- Full meter families are corrected without evidence that all meters in that family are incorrect: Avista states that when a family of meters is determined to have an increased incidence of incorrect usage, the whole family is corrected using the Installation Constant Factor, despite having no clear evidence that all meters in the family are incorrect.
- Meter testing program delays application of Installation Constant Factor: Avista states that its meter testing program does not start testing meters until 10 years after installation, which is then monitored for increased testing parameters. It

[26] *See In the Matter of Avista Corporation, dba Avista Utilities, Request for a General Rate Revision*, Docket No. UG 461, Staff Opening Testimony, Staff/1300, Nottingham-Shearer-Stevens/6-11 (Jul. 7, 2023).

is possible that some meters do not have the Installation Constant Factor applied until as many as 15 years after installation, and as discussed before, Avista does not begin testing families until the family is 10 years old. Assuming the installation constant factor is an appropriate adjustment, it appears likely some meters will run fast for a number of years before the factor is applied.

- Unique use of an Installation Constant Factor: Avista is proposing the Installation Constant Factor program based off a similar program used by SoCal Gas Company. However, SoCal Gas uses the factor to reduce greenhouse gas emissions caused during the meter change out process, not to correct meters reading incorrectly. Staff has been unable to identify any other companies that use this approach as a replacement for meter testing and replacement program. No tariff was filed by the Company to demonstrate the accuracy of this practice and the potential impact to Avista's Oregon customers.[27]

Q. Did Staff attempt to reconcile these inconsistent positions that were taken less than a year apart?

A. No, Staff made no attempt to do so.

[27] *In the Matter of Avista Corporation, dba Avista Utilities, Request for a General Rate Revision*, Docket No. 461, Staff Opening Testimony, Staff/1300, Nottingham-Shearer-Stevens/11-13 (Jul. 7, 2023).

D. Reply to Staff's Testimony Regarding Use of Ultrasonic Meters

Q. Staff states that it expects that some amount of NW Natural customers will voluntarily choose to electrify for either personal or economic reasons.[28] To date, has NW Natural observed that customers are leaving the gas system to electrify their homes for personal or economic reasons?

A. No, we have not observed this trend. It appears that Staff is speculating regarding possible future electrification scenarios. As described in the Direct Testimony of Messrs. Palfreyman and Kravitz (NW Natural/100, Palfreyman-Kravitz) and Reply Testimony of Mr. Kravitz (NW Natural/2200, Kravitz), the Company is continuing to grow its system and is not observing that customers are leaving the system.[29]

Q. Staff asserts that any customer that receives a meter replacement and opts to fully electrify before the end of the new meter's service life will necessarily leave stranded asset costs that remaining customers are responsible for paying.[30] How do you respond?

A. I fundamentally disagree with Staff's premise that the meter replacements will become stranded assets. The Company has a responsibility to replace failing assets and to ensure it can accurately read meters. NW Natural has an obligation to the customer to accurately bill the customer.

[28] Staff/900, Dlouhy/52.

[29] NW Natural/100, Palfreyman-Kravitz/25-27; NW Natural/2200, Kravitz.

[30] Staff/900, Dlouhy/52.

Q. Staff also states that it is skeptical of the value of transitioning to primarily ultrasonic meters in the long term, and while Staff acknowledges that there may be appropriate use cases for ultrasonic meters, Staff is wary of investing in the highest-grade technology while the Company is also balancing decarbonization obligations.[31] How do you respond?

A. Again, accurate measurement of gas usage is a fundamental part of utility service, and in NW Natural's view, decarbonization is not related to the MMP. The careful and conscientious integration of ultrasonic meters into our meter complement addresses a variety of problems that were discussed in more detail above, namely long lead times and increasing prices for diaphragm meters, shrinking market for diaphragm meter supplies, as well as meter diversification.

Q. Are there other logistical complications associated with procuring additional diaphragm meters?

A. Yes. One particularly challenging aspect of diaphragm meter procurement is that the ERT and meter need to be joined at the meter vendor. As a result, when NW Natural needs additional supply, it has to coordinate procurement and delivery of two separate assets that are experiencing supply chain delays. It has become increasing more difficult for NW Natural to plan the timing of its purchases. Because the ERT is integrated with the ultrasonic meter, the procurement logistics are more streamlined.

[31] Staff/900, Dlouhy/60-61.

Q. What are the current lead times for diaphragm meters in comparison with ultrasonic meters?

A. The current delivery times for diaphragm meters are 1.5 to 2 years, whereas the lead times for ultrasonic meters are six months.

Q. Does this conclude your Reply Testimony?

A. Yes, it does.

Rates & Regulatory Affairs
UG 490
Request for a General Rate Revision
Data Request Response

Request No.: UG 490 OPUC DR 386

Please discuss whether the Company performs any ex post testing on a family of PCC meters that were removed.

Response:

NW Natural performs accuracy testing on each meter that is removed from service, including all PCC meters. These test results are recorded for each meter in the Company's Customer Information System. To evaluate the accuracy of the Meter Sampling Program statistical analysis, these test results are periodically evaluated to ensure that the PCC meters being removed from service exhibit the same performance characteristics of the sample meters upon which the PCC determination was based. If the test results from PCC meters removed from service exhibit statistically significant differences from the sample meters, the Company performs additional analysis to determine the reason for the difference.

An example of this analysis was discussed in the Company's RG 41 Annual Meter Sampling Program Report for 2022, included here as UG 490 OPUC DR 386 Attachment 1. A modification to the 2005 Perf #572 Sensus R-275 meter family was made after evaluating meter tests for PCC meters removed from service, where specific delivery lots for these meters were determined to be non-conforming, while others were determined to be conforming, resulting in reducing the number of PCC meters by 6,673. NW Natural continues to evaluate performance of all meters removed from service to ensure accuracy and compliance with the Meter Sampling Program.

Re: RG 41: Meter Sampling Program Report for 2022

At the request of Commission Staff, Northwest Natural Gas Company, dba NW Natural, submits herewith its 2022 Meter Sampling Program Report.

As required by our Meter Testing Standards and Procedures document, the accuracies of all operating families of diaphragm meters with capacities 1000 ft^3/hr and below have been statistically analyzed for the year 2022. This analysis utilized all relevant meter tests conducted during the five calendar years between January 1, 2017, and December 31, 2022. The results of this analysis are as follows:

- As of December 31, 2022, 791,368 meters are installed and covered under the Meter Sampling Program. Of these, 695,137 meters, forming 369 distinct meter families, are conforming. The remaining 96,231 meters forming 78 distinct meter families are non-conforming and are scheduled for replacement. 60 non-conforming meter families were identified in prior years and 18 new meter families were identified as non-conforming in 2022. The 96,231 non-conforming meters represent 12 percent of the total meter population.
- Over the course of 2022, the company tested 9,577 meters. Over the five-year period of 2017 through 2022, the company had a total of 37,442 meter samples from which to base its results.
- 369 meter families either had sufficient meter samples to establish statistical confidence in their accuracy, or are new for 2022. These meter families amount to 695,137 meters, or 88 percent of the total meter population. The performances of these families are exhibited in Appendix A.
- 1 meter family, Perf #572, the 2005 Sensus R-275, was previously declared PCC for PCC Year 2022. However, after performing and evaluating the results of 5,569 meter tests in 2021 and 2022, specific delivery lots of these meters were determined to be non-conforming, while other lots remained conforming. Due to this, a population of 6,673 meters were removed from the PCC schedule and will remain in the Meter Sampling Program. As of 12/31/2022, 4,424 meters from specific lots of Perf #572, 2005 Sensus R-275 remain listed for removal in the 2022 PCC program.
- 12 new meter families were added in 2022, reflecting new meters placed in service during the normal course of business, as well as meter replacements to replace non-conforming meters. 8 meter families were removed from service, due to small family size, during the normal course of business. 3 meter families were removed from service due to the number of supplementary samples required exceeding 50% of the family size, with a family size less than 100 meters.

Michael J. McKenzie, PE
503-610-7494
mike.mckenzie@nwnatural.com

250 SW Taylor Street
Portland, OR 97204

503-226-4211
nwnatural.com

- 18 meter families, consisting of a total of 70,251 meters at the time of declaration, were identified as not conforming in 2022. Due to the number of meters requiring change-out (8.9% of the total population), these meters have been put on the list to be removed over the course of the next four years, by December 2026, per Meter Sampling Program (MSP) guidelines outlined in NW Natural Engineering Procedure Z-1. The performance of these families is exhibited in Appendix B.
- A further breakdown of the 18 non-conforming meter families and associated meters described above are as follows, the performance of these families is exhibited in Appendix B:
    - 7 meter families, totaling 70,167 meters had sufficient meter tests available to have their accuracy determined statistically and determined non-conforming. Significant results include:
        - 42,486 meters from the 2006 & 2007 American AC-250 meter families make up the bulk of this lot, reflecting the last American AC-250 meters in service from the 2005-2010 timeframe.
        - 13,495 American AL-175 meters from 1987, 1989, 1991
        - 14,106 American AC-250 meters from 1998
    - 8 meter families, totaling 25 meters, will be removed from service due to their small population size and age.
    - 3 meter families, totaling 59 meters, will be removed from service due to a family size less than 100 meters, and sampling requirements exceeding 50% of the total family population.
- Compared to the results above, the Year 2021 report resulted in 35,677 meters being put on the list for removal by December 2025.
- Regarding the planned four year removal of meters determined non-conforming from 2019-2022, the following meters remain:
    - PCC Year 2020 (for removal 2020 to 2023): 2,583 remain out of 42,046 determined
    - PCC Year 2021 (for removal 2021 to 2024): 9,487 remain out of 27,204 determined
    - PCC Year 2022 (for removal 2022 to 2025): 14,977 remain out of 35,677 determined
    - PCC Year 2023 (for removal 2023 to 2026): 69,184 remain out of 70,251 determined
- Consistent with the NW Natural's tariff, bills for meters that are subject to the four year removal schedule and are later found to not meet the accuracy requirement are deemed subject to refund to customers based on the date when the meter family was determined to require change-out to the date the meter was replaced.

IV. Pay-At-Risk for NBU Employees 10

V. FTEs 15

I. INTRODUCTION AND SUMMARY

Q. Are you the same Melinda B. Rogers who filed Direct Testimony in this proceeding on behalf of Northwest Natural Gas Company dba NW Natural ("NW Natural" or the "Company")?

A. Yes, I presented NW Natural/1000, Rogers.

Q. What is the purpose of your Reply Testimony in this proceeding?

A. The purpose of my Reply Testimony is to respond to testimony filed on April 18, 2024, by the Public Utility Commission of Oregon Staff ("Staff") related to employee and officer compensation. Specifically, I will respond to issues presented in the testimony of Staff witness Steph Yamada (Staff/2000, Yamada) and Staff witness Nicola Peterson (Staff/1500, Peterson).

Q. Please summarize your Reply Testimony.

A. In my testimony, I respond to proposed adjustments and concerns raised by Staff on the following issues:

- *Base Pay Escalation for Officers and Non-Bargaining Unit ("NBU") Employees:* In response to Staff witness Ms. Yamada's proposed adjustment, I explain that the Company accurately projected Test Year officer and NBU employees' base pay, relying on detailed surveys and trend data, and that therefore all officer and NBU employees' base pay should be recovered.
- *Base Pay Escalation for Bargaining Unit ("BU") Employees*: I agree with Staff witness Ms. Yamada's proposal to reflect actual negotiated union wage increases for the Test Year. The Company has reached agreement on a new

collective bargaining agreement ("CBA") that has been ratified by BU employees.[1]

- *Pay-at-Risk:* In response to Staff witness Ms. Yamada's proposal to adjust a portion of pay-at-risk, I explain that the Company prudently incurs Test Year costs of $9,340,431 million in pay-at-risk compensation for NBU employees as part of a market median total compensation package and, under standard ratemaking principles, should be recovered in rates.
- *Full-Time Employees ("FTEs"):* In response to Staff witness Ms. Yamada's proposal to adjust costs associated with 20.96 NBU FTEs, including medical costs referenced in Staff witness Ms. Peterson's testimony, I explain why Staff's sole metric for the adjustment (the number of NBU employees per customer) is flawed and that both NBU employee growth and overall FTE growth has been minimal.

II. BASE PAY ESCALATION FOR OFFICERS AND NBU EMPLOYEES

Q. Does Staff propose to adjust Test Year base pay for NBU employees and officers?

A. Yes. Staff recommends a total reduction of $1,473,983 to the Company's base salaries and wages for Oregon, excluding union labor. This amount is Oregon-

[1] The CBA is in the process of being finalized and, therefore, is not attached as an exhibit. However, NW Natural expects a final version to be available soon and will provide a copy either as a supplement to this testimony or in response to a data request.

allocated $956,615 in operations and maintenance ("O&M") expense and $517,368 in rate base.[2]

Q. How does Staff arrive at its proposed adjustment?

A. Staff applies a three-year wage and salary model ("W&S Model") to escalate base pay for NBU employees and officers. Rather than utilizing the Company's Base Year (calendar year 2023), Staff looks to a historical year that is three years prior to the Test Year – in this case 2022. In applying its W&S Model, Staff does not rely on surveys and trend data based on actual market salaries in relevant markets for the same positions. Instead, Staff adjusts NBU employee and officer base pay upward for each subsequent year using the All-Urban Consumer Price Index ("CPI") to establish a projection for the Test Year. The All-Urban CPI is a measure of inflation, i.e., the average change over time in prices paid by urban consumers for goods and services, and does not account for other market conditions that can affect wages and salaries. Finally, Staff compares the results of its W&S Model to the Company's projection of NBU employee and officer pay over the Test Year. Since these amounts differ by less than 10 percent, Staff's position is that the Company should recover half of the difference under a "sharing" principle.[3]

Q. Please describe the Company's methodology.

A. NW Natural uses competitive compensation data to determine compensation for NBU employees and officers. For NBU employees, base pay is determined by

[2] Staff/2000, Yamada/6.

[3] Staff/2000, Yamada/6.

analyzing comprehensive survey data to ensure that it is aligned with the median of the market for comparable jobs with other companies that would typically compete with NW Natural for employee talent. This well-established process demonstrates that NW Natural is offering an appropriate level of base pay to its employees as a component of competitive total compensation. For officers, NW Natural relies on competitive compensation data that include base pay and pay-at-risk comprised of both short- and long-term incentives, and is collected and analyzed annually by an independent compensation consultant, Pay Governance, using peer company, proxy, and survey data.

Q. Does any party criticize or rebut the Company's general methodology for escalating NBU and officer base pay or otherwise challenge the underlying compensation trend studies relied upon by the Company?

A. No. No party criticizes the studies used by the Company or asserts that the Company misapplied the studies or that our general approach is flawed.

Q. Does Staff provide any evidence to suggest that its W&S Model produces more accurate or appropriate base pay estimates for the Test Year than that the data-driven approach used by NW Natural?

A. No. Staff does not produce any evidence to suggest that its W&S Model is better than the Company's methodology.

Q. Do you have concerns with Staff's escalation methodology?

A. Yes. Staff escalates base pay from 2022 using a metric for inflation of consumer goods and services (All-Urban CPI). However, the CPI is not a proxy for actual labor market conditions, and is less tailored and, therefore, less accurate than the

methodology used by the Company. The CPI is not specific to the gas industry or any other defined market from which the Company draws many employees. In contrast, the compensation trend surveys relied on by the Company provide information specific to wages and salaries broken down by position categories and are based upon the relevant hiring market, rather than national averages. In addition, if Staff decides it is still appropriate to use its W&S Model, it should escalate costs from the Base Year—in this case calendar year 2023—not 2022. This treatment would mitigate one of the Company's concerns with Staff's W&S Model and would focus more appropriately on the Base Year and the Test Year, not years prior.

Q. Staff cites a 25-year-old Commission order that states that its W&S Model holds labor costs to inflation, thereby incentivizing the Company to keep labor costs low. Do you agree?

A. No. Since Staff's W&S Model does not reflect actual labor conditions, it is simply inaccurate. For example, in the Company's prior rate case, Staff's W&S Model indicated that the Company's NBU wages should have been higher than what the Company actually proposed.[4] Staff's W&S Model reached the same result for some of Portland General Electric Company's ("PGE's") employees in its last general rate case.[5] These results show that Staff's W&S Model does not necessarily incentivize the Company to keep labor costs low and, in fact, may

[4] NW Natural/3101, Rogers (UG 435 Staff/600, Cohen/11).

[5] NW Natural/3102, Rogers (UE 416 Staff/1300, Jent/13-14).

encourage them to increase such costs beyond what is reflected in the labor market. With the benefit of this experience, NW Natural respectfully requests that Staff no longer rely on its traditional W&S Model. Rather than the static W&S Model that does not examine the conditions of actual labor market, market median compensation analyses should be utilized.

Q. Is Staff's W&S Model consistent with standard regulatory principles?

A. No. Under standard regulatory principles of cost-based ratemaking, the Company should recover all prudently incurred costs. The Company has demonstrated prudence through the fact that it is providing market median base pay to its officers and NBU employees. NBU employee and officer base pay at market median levels is a necessary cost of providing utility service, so there should be no reduction to these prudently incurred costs.

Q. You have presented a detailed critique of Staff's W&S Model—but do you acknowledge that Staff's model has been approved by the Commission in the past?

A. Yes. However, NW Natural has presented a robust case supporting its rate case proposal based on a meticulous, data-driven approach, while Staff has not presented any explanation as to why its approach is more accurate or appropriate. Furthermore, recent experience has shown that Staff's W&S Model is not necessarily more effective at cost control than the Company's approach. Depending on the circumstances, Staff's W&S Model may either be more generous than what the Company believes is warranted in its evaluation of the labor market (as in UG 435 and UE 416) or, as in this proceeding, prevent the

Company from recovering prudently incurred costs that are necessary to provide utility service. Neither circumstance should occur.

Q. If the Commission nevertheless decides to escalate base wages and salaries only commensurate with inflation, is the All-Urban CPI the best inflation metric for this purpose?

A. No, it is not. The West Region Urban CPI is a better reflection of the costs experienced in NW Natural's service territory than the All-Urban CPI, in which Oregon data represent only a very small percent. As Mr. Davilla explains in detail in his Reply Testimony (NW Natural/3500, Davilla), Oregon experiences much higher costs than most other states on many attributes, including wages. As such, the West Region Urban CPI would be a better representation of the measure of inflation that NW Natural employees experience, at least as compared to a national rate. Other organizations agree, most notably the Public Employees Retirement System, or PERS, which is using the West Region Urban CPI as an escalator for its cost-of-living adjustment, or COLA. However, if the Commission were to accept Staff's use of the All-Urban CPI rate, then the Commission should use the most recently released June 2024 report, issued on May 29, 2024. And again, costs should be escalation from the Base Year of calendar year 2023, not the calendar year 2022.

Q. If the Commission relies on the most recent All-Urban CPI report (June 2024), how much would the adjustment proposed by Staff decrease?

A. With this modification, the reduction proposed by Staff would decrease overall by $311,403, of which $202,101 is O&M and $109,302 is capital.

III. BASE PAY FOR BU EMPLOYEES

Q. Does Staff propose to adjust Test Year base pay for BU employees?

A. No. Staff did not make any specific adjustments to base pay for BU employees. However, since the Company's previous CBA with its BU employees expired on May 31, 2024, Staff did recommend that BU wages be updated to reflect actual negotiated union wage increases for the Test Year once those amounts are known.[6]

Q. Does the Company support Staff's recommendation?

Yes. The Company supports Staff's recommendation to update BU wages to reflect actual negotiated union wage increases. Since filing its Direct Testimony in this proceeding, the Company has reached agreement on a new CBA that has been ratified by BU employees.

Q. Please summarize the terms of the CBA that impact revenue requirement.

A. BU employees will receive a six percent wage increase on June 1, 2024. There is an additional four percent increase on December 1, 2024 and every December 1 thereafter through December 1, 2027. BU employee health care costs reflect an 85 percent/15 percent sharing between the employer and employee, whereas previously the sharing was 80 percent/20 percent. Lastly, 51 positions were re-graded, increasing the wages for those positions.

[6] Staff/2000, Yamada/7.

Q. Please briefly summarize the negotiation process for the CBA.

A. **[BEGIN HIGHLY CONFIDENTIAL]** [redacted] **[END HIGHLY CONFIDENTIAL]**.

Q. How do the terms of the CBA compare to NW Natural's estimate in Direct Testimony?

A. Compared to our estimate in Direct Testimony, O&M expense is **[BEGIN HIGHLY CONFIDENTIAL]** [redacted] **[END HIGHLY CONFIDENTIAL]**. Please see Table 1 below for more details:

///

///

///

///

///

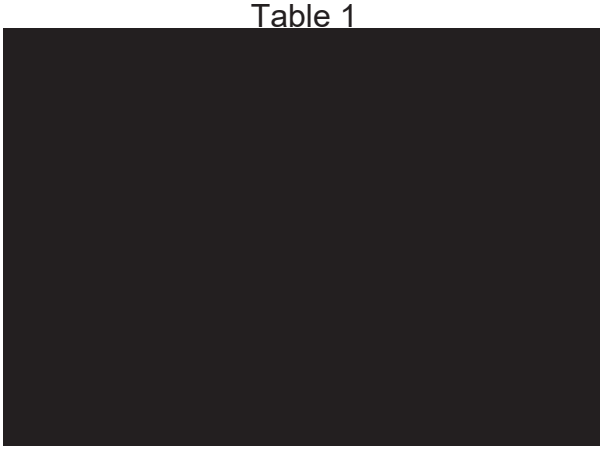
///

///

///

[BEGIN HIGHLY CONFIDENTIAL]

Table 1



[END HIGHLY CONFIDENTIAL]

Q. Does the new CBA impact any other adjustments made by Staff?

A. Yes. NW Natural believes that Staff should no longer propose to adjust any overtime costs. Staff proposed reducing $4,935 of overtime costs ($3,203 in O&M expense and $1,732 in capital). However, the revised amounts for base pay in Table 1 above includes overtime. The reduction in base pay, inclusive of overtime, has a greater reduction than what was in Staff's testimony. Therefore, Staff's overtime adjustment is not appropriate.

IV. PAY-AT-RISK FOR NBU EMPLOYEES

Q. Does Staff propose to adjust Test Year pay-at-risk for NBU employees?

A. Yes. Staff recommends an Oregon-allocated reduction in NBU pay-at-risk of $3,186,968 in O&M expense and $1,723,614 in rate base. As explained in Direct Testimony, NW Natural is not seeking recovery of officer bonuses to limit the size of its rate request.[7]

[7] NW Natural/1000, Rogers/9.

Q. How does Staff arrive at its proposed adjustment?

A. Staff states its proposed adjustments are consistent with past Commission practice, arguing that the Commission disallows 50 percent of merit-based bonuses for NBU employees because they equally benefit shareholders and customers.[8]

Q. Does the Company agree with Staff's approach to NBU pay-at-risk?

A. No. Staff seeks to disallow recovery for significant portions of pay-at-risk costs it presumes are designed to incentivize employee behavior that primarily or solely serves shareholder interests. Its proposed adjustments reflect a general philosophy that the interests of shareholders and customers are zero-sum and segregable, and accordingly, that a cost should not be recoverable to the extent it may benefit shareholders. NW Natural understands there is Commission precedent for imposing flat percentage disallowances such as those recommended by Staff. Nevertheless, standard regulatory principles support moving away from basing disallowances on flat percentages, which discourages best practices for employee compensation and results in a substantial disallowance of prudently incurred, reasonable and necessary business expenses that form part of the utility cost of service.

[8] Staff/2000, Yamada/11.

Q. Are the costs that the Company incurs for its NBU pay-at-risk programs prudently incurred and necessary business expenses that form part of the utility cost of service?

A. Yes. First, as explained in my Direct Testimony,[9] the Company structures employee compensation, including base pay and pay-at-risk, to ensure both individual elements and the total compensation package are comparable to market levels. Competitive pay helps the Company attract and retain qualified employees and officers, which is necessary to ensure the Company operates a safe, reliable, cost-effective, and customer-responsive gas distribution business.

Second, the pay-at-risk program costs that NW Natural has included in its requested revenue requirement are structured to compensate employees for achieving baseline targets tied to standard business operations, not for exceptional performance going above and beyond the call of duty.[10] By contrast, the costs associated with incentive programs rewarding extraordinary performance are not included in the requested revenue requirement, as the Company proposes these be absorbed entirely by shareholders. For the pay-at-risk programs at issue in this proceeding, employees receive their pay-at-risk as a result of achieving normal, expected levels of performance, both individually and for the Company as a whole. In fact, every NBU employee's compensation package incorporates some element of pay-at-risk, not just those employees whose positions officially require them to

[9] NW Natural/1000, Rogers/10-12.

[10] NW Natural/1000, Rogers/8-10. NW Natural/1003, Rogers.

consider shareholder implications. Funding for pay-at-risk at target levels is therefore expected and included in annual budgeting. Because the Company is well-managed, in the ordinary course employees and officers generally receive their pay-at-risk compensation. In other words, it is typically only when individual and/or Company performance is sub-par that employees see a reduction in their total compensation package through reductions to or elimination of pay-at-risk. Accordingly, pay-at-risk payouts represent the steady state of operations. The total compensation package under those normal circumstances, inclusive of salaries and pay-at-risk payouts, is a necessary cost of operating the utility business.

Q. You mentioned above that pay-at-risk payouts represent the steady state of operations. That being the case, why does the Company continue to place this portion of compensation in an "at risk" category, rather than shifting all compensation to base pay?

A. Placing a portion of an employee's total compensation at risk is a standard best practice in the human resources field. Pay-at-risk is widely incorporated into the compensation packages offered by competitors, preferred by the industry, and expected by the workforce. When implemented effectively, pay-at-risk helps to motivate strong performance, increase productivity, reduce problematic behaviors, communicate to employees they are valued, give them a greater degree of control over their salary, and improve morale and retention.

Q. From the Company's perspective, is an effort to segregate customer benefit from shareholder benefit the right approach for determining the extent to which pay-at-risk compensation costs should be recoverable?

A. No. While shareholder and customer interests may occasionally diverge on a particular issue in a particular case, in general, shareholder and customer interests are aligned when it comes to business operations and the overall health of the Company, as the provision of adequate service is a core pillar for sustaining a gas distribution service.

Q. Can you elaborate on the relationship between work performance and customer benefit?

A. There is a clear connection between incentive-based compensation, employee work performance, and the service that customers ultimately receive. It is indisputable that safety, reliability, rates, and customer service all are affected by how employees perform on the job. For example, when a customer service employee resolves a customer issue efficiently, the customer benefits directly, while shareholders benefit from lower costs and increased customer loyalty.

Q. In addition to short-term incentives, Staff also proposes to disallow 50 percent of restricted stock units ("RSUs") provided to NBU employees.[11] Please explain why RSUs should be eligible for full cost recovery.

A. The purpose of RSUs is to encourage key NBU employees to remain with the Company, which is why they vest over a number of years. While RSUs will not

[11] Staff/2000, Yamada/12-13.

vest if the Company has a very poor year, it is designed to ensure that NW Natural retains qualified employees.

Q. Staff also proposes to disallow 50 percent of the Employee Stock Purchase Plan ("ESPP") provided to NBU employees.[12] Please explain why the ESPP should be fully recovered.

A. The ESPP encourages employees to provide customers with efficient natural gas service. By encouraging employees to own shares in NW Natural, the interests of employees and the Company are better aligned, helping to maintain strong performance and increased productivity.

In addition, NW Natural must compete for talent with other utilities that offer ESPPs, as well as other businesses where they are also common. In a very tight labor market, the Company must both retain and attract qualified employees, and continuing programs, such as the ESPP, that encourage employees to continue to perform strongly and provide service more efficiently is very important.

V. FTES

Q. Does Staff propose to adjust the number of FTEs in the Test Year?

A. Yes. In Direct Testimony, NW Natural proposes to include 1,183 employees in the Test Year.[13] Staff proposes a blanket reduction of 20.96 FTEs on an Oregon allocated basis,[14] which I will address in my Reply Testimony. Staff also proposes to exclude four of the eight proposed new Information Technology & Services

[12] Staff/2000, Yamada/11.

[13] NW Natural/1000, Rogers/22.

[14] Staff/2000, Yamada/16.

("IT&S") FTEs and four of the five proposed new decarbonization FTEs, which are addressed in the Reply Testimony of Dina L. Thompson (NW Natural/2800, Thompson) and the Reply Testimony of Zachary D. Kravitz and Kyle N. Griffiths (NW Natural/3600, Kravitz-Griffiths), respectively.

Q. Please explain Staff's rationale for disallowing 20.96 FTEs on an Oregon allocated basis.

A. Between 2021 and 2023, Staff claims that the Company served an average of 1,469.9 customers per FTE at the Oregon level. Based on the projected customer count of 702,022 in Oregon at the end of the Test Year, Staff claims that this 3-year average number of customers resulted in a total of 481.0 NBU employees, whereas the Company's Test Year proposal reflects 506.4 FTE in Oregon. This difference is 25.4 NBU FTEs. After adding back in the five new IT&S and decarbonization FTEs that Staff recommends allowing into rates, the disallowance is 20.96 FTEs on an Oregon-allocated basis.

Q. Does the Company agree with Staff's adjustment?

A. No. First, the Company notes that its proposal results in only modest NBU employee growth compared to 2021-23 levels. An additional 20.96 Oregon-allocated FTEs represents only a 4.3 percent increase in NBU FTEs and a 2 percent difference in the overall number of FTEs. Staff also does not explain: 1) why a blanket disallowance based on the number of customers per FTE is appropriate, 2) why NBU, union, and officers are separated into different categories, or 3) why some growth is permitted for union employees (1.2 percent) but none is permitted for NBU FTEs. Instead, to support its adjustment, Staff cites

to a single order, Order No. 99-033, involving PGE. However, the facts in that case are very different from what is presented here. At the time of the order, PGE proposed to transition away from being a vertically integrated utility to a distribution-only utility, which would affect the number of FTEs. Staff used the FTE per customer trendline to establish what PGE's number of FTEs should be as a distribution-only electric utility instead of a vertically integrated one. To calculate this number, Staff developed a trend analysis of FTEs per customer between 1991 and 1997. The same circumstances are not present here. NW Natural is not proposing to restructure. Therefore, the Commission principle that was adopted in that order is not present here:

> "These [FTE] levels should be limited to levels forecasted as a function of customers per FTE **applied to the restructured utility.** "[15]

Again, NW Natural is not a restructured utility and, accordingly, the Order No. 99-033 principle does not apply to NW Natural.

Second, over the long-term, NW Natural's customers/employee ratio has greatly decreased over time. On a system level, for example, in 2005, NW Natural had 1,305 employees in total (NBU, BU, and officers), which worked out to an employee for every 473 customers. In almost two decades since that time, that number has risen to 658 customers per employee. Due to a lack of a readily available information over this timeframe, this metric differs somewhat from Staff because it looks at customers per employee, not customers per FTE. For

[15] *In the Matter of PGE's Request for a General Rate Revision,* Docket No. UE 102, Order No. 99-033 (Jan. 27, 1999) (emphasis added) (available at: https://apps.puc.state.or.us/orders/1999ords/99-033.htm).

example, NW Natural would count two half-time employees as two employees, whereas Staff would count them as one FTE. Nevertheless, NW Natural does not believe it is appropriate for Staff to only look at the last three years (and only at NBU FTEs), where the Company's trendline shows an increasing number of customers served per employee.

Third, and perhaps most importantly, our FTE footprint is not directly tied to the number of customers served. NW Natural needs to have a workforce to meet the needs of its customers and, as such, FTE levels may fluctuate over time. Similarly, the composition of the workforce (i.e., the number of BU and NBU employees) will shift over time to meet changing needs and demands. NW Natural considers 4.3 percent growth in NBU FTEs and 2 percent overall growth in FTEs compared to 2021-2023 to be relatively modest, especially compared to historical trends.

///

///

///

///

///

///

///

Q. Regarding benefits, Staff witness Peterson states proposed medical benefit adjustments due to Staff witness Yamada's adjustment of 20.96 FTEs. Staff witness Pederson states that "Staff also is only proposing an adjustment to O&M expense based on the Staff-proposed adjustment to FTEs," and that "further clarification is required prior to recommending an adjustment to capitalized benefits or before Staff can draw conclusions regarding the overall level of costs."[16] Please respond.

A. As explained above, NW Natural disagrees with Staff's proposed FTE adjustment and, therefore, the corresponding adjustment to medical benefits. In response to Staff's specific concern, the Company clarified that its medical benefits are all included in the Company's Payroll Overheads. NW Natural is happy to provide further clarification informally or through the formal data request process.

Q. Does this conclude your Reply Testimony?

A. Yes, it does.

Q. Please state your name, occupation, and business address.

A. My name is Heather Cohen. I am a Senior Utility Analyst employed in the Rates, Finance and Audit (RFA) Division of the Public Utility Commission of Oregon (OPUC). My business address is 201 High Street SE, Suite 100, Salem, Oregon 97301.

Q. Please describe your educational background and work experience.

A. My witness qualification statement is found in Exhibit Staff/601.

Q. What is the purpose of your testimony?

A. I provide background, analysis, and recommendations regarding the Company's Test Year expense for wages, salary, incentives, and full-time equivalents (FTE). I also address the Company's Test Year expense for customer account, customer services, sales expenses as well as some miscellaneous Operation and Maintenance(O&M) expenses.

Q. How is your testimony organized?

A. My testimony is organized as follows:

ISSUE 1. WAGES, SALARIES AND FTE

Q. Please provide a summary of the Commission's historical method for determining the amount to include in a utility's revenue requirement for wages, salaries, incentives, and overtime expense.

A. The Commission's methodology has many components. The Commission determines the appropriate level of wages and salaries for employees in the Test Year using its three-year wage and salary (W&S) model to estimate union and non-union payroll levels for energy utilities.[1,2] The model determines an appropriate level of Test Year expense and capital investment for wages and salaries by escalating the Company's base year wages and salaries by annual changes to the All-Urban CPI (for non-union) or negotiated increases (for union) and applying a sharing mechanism between the wages and salaries determined by the W&S model and the wages and salaries proposed by the utility.

To determine the appropriate amount to include in revenue requirement for incentives paid to employees, the Commission's policy is to disallow 100 percent of officers' bonuses because they are typically based on increased

---

1 *In the Matter of Northwest Natural Request for a General Rate Revision*, Docket No. UG 132, Order No. 99-697 at 43 (November 12, 1999); and *In the Manner of PacifiCorp* dba Pacific Power *Request for a General Rate Revision*, Docket No. UE 374, Order No. 20-473 at 102 (December 18, 2020).

2 *See Pacific Power & Light*, Docket No. UE 116, Order No. 01-787 at 40 (September 7, 2001); *Northwest Natura*l, Order No. 99-697 at 43; *In the Matter of the Application of Portland General Electric Company for Approval of Customer Choice Plan,* Docket No. UE 102, Order No. 99-033 at 61 (January 27, 1999); and *In the Matter of the Revised Tariff Schedules for Electric Service in Oregon filed by Portland General Electric Company,* Docket No. UE 88, Order No. 95-322 at 10 (March 29, 1995).

earnings, which benefit shareholders.[3] It is also Commission policy to disallow 75 percent of performance-based bonuses because they are generally focused on increased earnings and therefore bring more benefit to shareholders. The Commission disallows 50 percent of merit-based bonuses because they equally benefit shareholders and ratepayers. Union bonuses are treated in the same manner as non-union bonuses.[4]

Finally, the Commission determines the appropriate ratio of expense and capital to apply to the total forecasted compensation and applies it to determine what compensation expense that is included in Test Year expense and what compensation is included rate base.

Q. Please explain how Staff used the Three-Year W&S model to arrive at its recommendation for wage and salary levels for the Test Year.

A. As a starting point for determining non-union wages for each employee class, the W&S model uses the utility's actual wage, salary, and overtime levels as they existed three years prior to the Test Year.[5] For example, a 2022 Test Year would require a Base Year of 2019. From there, the Base Year wages and salaries are adjusted by a year-over-year escalation of expenses using the All-Urban CPI for each of the three subsequent years to establish a forecast of Test Year wage and salary levels.[6]

---

3 See *Northwest Natural,* Order No. 99-033 at 62; and *In the Matter of the Application of US West Communications, Inc. Application for an Increase in Revenues*, Docket No. UT 125, Order No. 97-171 at 74-76 (May 19, 1997).
4 *See PacifiCorp*, Order No. 20-473 at 97; *Northwest Natural,* Order No. 99-697 at 44-45; and *PGE,* Order No. 99-033 at 62.
5 See *Northwest Natural,* Order No. 99-697 at 43.
6 *Ibid*.

In effect, the model calculates the average salary based on the Company's actual Base Year calendar payroll (2020), divided by the actual Base Year FTE (2020), then escalates the average by the annual changes to the All-Urban CPI for 2021, 2022, and 2023. Once the escalated amount is determined, it is compared to the Company's Test Year figures.[7] At this point the sharing principle is applied, wherein Staff adjusts its forecasted amount to allow the Company to share 50/50 the lesser of the difference between the model forecast and the amount the Company has included in its Test Year or a 10 percent band around Staff's projection.[8]

For non-union wages, the W&S model incorporates actual market-based data by using historic wages and adjusting for inflation using the All-Urban CPI index.[9] The Commission has consistently validated the All-Urban CPI to adjust historic wages and salaries as "adjusting payroll levels by changes in inflation provides employees the same real level of compensation as in the base year and provides an incentive to companies to minimize labor costs."[10] Further, the methodology of equally dividing between ratepayers and shareholders the difference between the utility's Test Year forecast and the forecast obtained by the model allows for some adjustments to reflect changes in market conditions without allowing unchecked escalation.[11]

7 Ibid.
8 Ibid.
9 Ibid.
10 Ibid.
11 *PGE,* Order No. 95-322 at 10.

For union wages, the W&S model again starts with actual wages three years before the Test Year. Rather than escalating the wages using All-Urban CPI, wages are escalated using negotiated wage increases as set forth in union contracts, and Staff's final adjustment incorporates any sharing between the Company's Test Year forecast and the forecast obtained under the W&S model.[12] In Order 20-473 (2020) in PacifiCorp's general rate case, the Commission rejected Staff's proposed 50/50 sharing between Staff's Test Year determination of expense for union wages and salaries and the Company's projection. The Commission concluded that the arms-length nature of the negotiations regarding wages was sufficient protection for ratepayers.[13]

Q. Please summarize Company's proposal for wages, salaries, incentives and overtime expense in this case.

A. The Company's 2023 Test Year includes $106 million in wages and salaries (base pay), $11.5 million in incentive compensation, and $6.8 million in overtime.[14] While the Company's initial testimony reported a total of $11.3 million in incentives, the Company corrected their Non-Exempt Restricted Stock Units (RSU) amounts to $437,254.[15] The Oregon allocation factor is 100 percent with a O&M/Capital split of 59.8/40.2.[16]

The Company states it removed half of the officer short-term incentives associated with net income from its proposed Test Year.[17] However, also included in the Test Year Operations and Maintenance expense is $1.9 million of stock expense, which includes the employee stock purchase plan as well as $2.3 million of the Long-Term Incentive Plan for Officers and key employees.[18] With respect to officer incentives capitalized in plant since the effective date of NW Natural's last general rate increase (November 1, 2020), Staff included incentives in the last two months of 2020 and the entirety of 2021. Staff calculates Northwest Natural's proposed Revenue Requirement includes total officer incentives capitalized in plant for that period at $954 thousand.[19]

Q. How does the Company determine the compensation for employees?

[17] NW Natural/800, Rogers/5.
[18] NW Natural/1200, Davilla/18.
[19] Staff/602, Cohen/8, NWN Response to Staff DR 344 (electronic spreadsheet).

Docket No: UG 435

Staff/600
Cohen/8

A. NW Natural testifies that it uses third party survey data completed in 2020 to ensure base pay midpoints are at the median of comparable companies for Non-Bargaining Unit (NBU) employees. Bargaining Unit (BU) employee pay is determined through a negotiated process that uses comparable market survey data and union contracts as points of comparison for setting wage steps. The Company uses compensation data provided by independent compensation consultant Pay Governance to set officer pay.[20]

In addition to base pay, the Company offers the following incentives:

- Goals Incentive Program: Offered to NBU non-officer employees for those who meet or exceed their annual performance objectives.
- Employee Stock Purchase Plan: Allows employees to purchase common stock at 85 percent of closing price.[21]
- Executive Annual Incentive Plan: Short-term incentive program or cash-payments for Officers that is based on a weighted formula of 70 percent Company Performance Factor (71.43 percent Net income and 28.57 percent Operations) and 30 percent Priority/Individual Goals (which includes a Return on Invested Capital (ROIC) component).[22]

[22] NW Natural Schedule 14A Proxy Statement, April 15, 2021, https://www.sec.gov/Archives/edgar/data/1733998/000119312521117464/d45834ddef14a.

- NBU Short-Term Incentive Plan: Offered to non-officers and is based on customer service, company growth and public and employee safety goals.[23]
- Long-Term Incentive Plan (LTIP): Qualifying officers and key NBU employees are eligible for the LTIP which comes in the form of stock, restricted stock, restricted stock units, stock options or performance shares.[24] Officers receive 35 percent of their compensation in the form of Restricted Stock Units and 65 percent in the form of Performance Shares. RSUs vest over four years if Return-on-Equity performance threshold is met while performance share awards are based on achieving ROIC threshold, three-year Cumulative Earnings-per-Share (EPS) and a modifier based on Relative Total Shareholder Return (TSR).[25] The three-year cumulative EPS as well as the Relative TSR were chosen "to align executives' interest with shareholders interest."[26]

Q. What adjustments did the Company make to its actual 2020 Base Year salaries and wages to forecast the 2023 Test Year?

A. To project its Test Year, the Company escalates its 2021-year end NBU employee salaries by 4.6 percent in 2022 and 4.35 percent in 2023. This

26 *Ibid.*

includes merit increases of 4 percent and 3.75 percent with an additional 0.6 percent to reflect promotions and equity adjustments. Salary increases are also influenced by CPI Western increases of 4.5 and 3.9 percent in 2021 and 2022. Based on union contracts, bargaining unit employee salary is escalated 3.5 percent June 2021 and every June 1st thereafter until the end of the contract in 2024. Union increases include an additional 0.8 percent to account for movement throughout the training steps. Officers were escalated by the same percentages as NBUs with other updates to officer salaries who were paid below the competitive range of market data.[27]

Wages, Salaries, Overtime & FTE Recommendation

Q. What is Staff's recommendation for Test Year wages and salaries including and overtime?

A. Staff, consistent with the W&S model, starts with a Base Year (2020) that is three years prior to the Test Year, and escalates to the Test Year using All-Urban CPI (CPI) rates, which are 4.7 percent for 2021, 4.2 percent for 2022, and 2.2 percent for 2023.[28] Staff escalates BU or union salaries and wages in the same manner as the Company, applying a rate of 3.5 percent for 2021, 2022 and 2023 based on collective bargaining increases.[29]

Staff then applied the sharing principle to its and the Company's projected 2023 test year amounts. The sharing principle, which allows the Company to

[27] NW Natural/800, Rogers/5-6.

share 50/50 the lesser of the difference between the Company's and Staff's calculated projections, or a 10 percent band around Staff's calculated projection, makes a reduction to Staff's projection. Because of the high inflation via the CPI, Staff's projection for Exempt, Non-Exempt and Union base salaries is slightly higher than the Company's, with one exception: Officer salaries. Staff has a small adjustment to Officer salaries of $28 thousand O&M and $19 thousand rate base.[30]

FIGURE 2: W&S MODEL ADJUSTMENTS

Description	Officers	Exempt	Non Exempt	Union
Actual Base Payroll (2020) calendar year	3,327,706	48,746,541	1,016,008	41,913,501

Staff Proposed Level	3,700,689	56,179,500	908,243	45,224,165
Net Payroll Adjustment	(47,652)	-	-	-

Q. Does Staff have an adjustment for Overtime?

Staff has adjustments for Union Overtime, split between $544,144 expense and $365,796 rate base. Staff calculates a $1.2 million between Staff's projection ($5.6 million) and the Company's ($6.8 million). Staff's calculation was based on the Company's union escalation rates of 3.2 percent per year.

[30] See Staff/604, Staff electronic work paper UG 435 Exhibit 604 Wage and Salary Model CONF, tab 3-year W&S.

After the sharing principle is applied, the model suggests an adjustment of half of the initial difference of $544 thousand O&M and $365 thousand rate base.[31]

Q. Does Staff have an adjustment for FTE?

A. Staff does not have an adjustment for FTE. The Company's FTE count remained flat, never increasing over 3.5 percent since 2018 and Staff is satisfied with the Company's justification for year-over-year FTE changes.[32]

FIGURE 4: FTE

Docket No: UG 435

Staff/600
Cohen/13

Q. What does the Company propose for employee incentives?

A. As noted earlier, the Company includes $11.5 million in incentives in its testimony[33] but only $8.5 million in its response to Staff DR 92. The discrepancy is due to Standard Data Request 92 reporting only paid cash compensation whereas the $11.5 million includes non-cash elements such as stock units.[34] Staff's count of incentives is also slightly higher at $11.7 million due to our inclusion of $174 thousand in Employee Stock Purchase Plan (ESPP) dollars.

FIGURE 5: STAFF CALCULATED INCENTIVES

Staff thought it appropriate to include the ESPP since it was included in the Company's O&M Test Year FERC allocation summary within the total stock expense total of $2,030,585 (or $1.9 million Oregon) and specifically

[33] NW Natural/800/Rogers/17.
[34] Staff/602, Cohen/10, NWN Response to Staff DR 361.

mentioned in the Company's testimony as part of the stock expense in Operations.[35] The Test Year O&M FERC Allocation also included $2,554,429 in the Long-Term Incentive Plan in the Test Year.[36]

The total breakdown in OR allocated numbers showed $1.3 million in Stock Expense/RSUs and Employee Stock Plan for Officers and $605 thousand for NBU employees.[37] $2.1 million of Officer Long Term Incentives are also included alongside $145 thousand for NBU employees. Finally, short term incentives consist of $876 thousand for Officers and $6.7 million for NBU employees.

Q. Does Staff propose an adjustment to incentives?

A. Staff proposes excluding 100 percent of Officer incentives ($4.3 million) and half of non-Officer incentives ($3.7 million) for a total of $8 million ($4.8 million O&M and $3.2 million capital) based on the Commission's long-standing policy.[38]

FIGURE 6: INCENTIVES ADJUSTMENT

	Officers	Exempt	Non Exempt	Union	Total

Staff Proposed Level	$0	$3,697,766	$41,187	$0	$3,738,953
Net Payroll Adjustment	($4,269,954)	($3,697,766)	($41,187)	$0	($8,008,907)

35 Staff/602, Cohen/2, NWN Response to Staff DR 143 Attachment 1, tab O&M TY FERC Allocation Summary cell R12 (electronic spreadsheet), NW/Natural/1200/Davilla/18.
36 Staff/602, Cohen/2, NWN Response to Staff DR 143 Attachment 1, tab O&M TY FERC Allocation Summary cell S12 (electronic spreadsheet).
37 Staff/602, Cohen/4, NWN Response to Staff DR 265 Attachment 1 (electronic spreadsheet).
38 See Staff/604, Staff electronic work paper UG 435 Exhibit 604 Wage and Salary Model CONF.

The Commission's policy in disallowing 100 percent of officers' bonuses and 50 percent of non-officer bonuses is based on the conclusion these percentages of bonuses for each type of employee are typically based on increased earnings, which benefits shareholders.[39] While the Company's removal of half of its Officer Short-term incentives is a step in the right direction, its inclusion of LTIP and any portion of the Executive Annual Incentive Plan deviates from Commission policy as they are by design meant to benefit shareholders.[40]

Q. Please summarize all of Staff's adjustments to Salaries, Wages, Overtime, and Incentives.

A. Staff proposes $5.6 million of reductions to O&M and $2.6 million to Capital which includes reductions to:

- Wages & Salaries of $28 thousand O&M and $19 thousand Capital;
- Incentives of $4.8 million in O&M and $3.2 in Capital (Test Year);
- Overtime of $544 thousand in O&M and $365 thousand Capital;
- Officer Incentives in Plant of $954 thousand Capital (from 2020 and 2021); and
- Smaller adjustments to payroll taxes ($85 thousand) and depreciation ($113 thousand).[41]

ISSUE 2. CUSTOMER ACCOUNT, CUSTOMER SERVICE AND SALES EXPENSES

Q. Please describe customer account and customer service expenses.

A. Customer account expense is recorded in FERC accounts 901, 902, 903, 904, and 905. These accounts track expenses related to Supervision, Meter Reading, Customer Records and Collection, Uncollectibles, as well as Miscellaneous Customer Accounts. Customer Service expense is recorded in FERC accounts 907, 908, and 910 (excluding 909 Informational and Instructional Advertising Expenses, which was analyzed separately). These expenses are for Supervision, Customer Assistance, and Miscellaneous Customer Service. Uncollectibles and Advertising have been reviewed separately in Staff/200/Fjeldheim and Staff/1000/Jent. Finally, FERC accounts 911-917 are comprised of other Advertising, Demonstration and Selling, and Misc. Sales Expenses.

Q. Does the Commission Staff have a standard for how Customer Account, Customer Service and Sales expenses are treated for ratemaking purposes?

A. Rule 860-026-0020 Standards Governing Promotional Activities and Concessions mandates that all promotional activities be just, reasonable, prudent, economically feasible and beneficial to both the utility and its customers. Sales and marketing (including advertising) expenses are prohibited from being posted in customer account or customer service expenses in keeping with Order No. 99-033. Sales and Marketing Costs

Docket No: UG 435

Staff/600
Cohen/18

must demonstrate reasonableness and consumer benefits to be present in rates.[43]

Staff reviews expenses per appropriate use per FERC account. Staff also reviews transaction-level data to ensure expenses relate to activities such as responding to customer requests, inquiries, and safety concerns, resolving customer complaints, extending service to new customers, and providing information about safety and service issues.

Q. Please describe the Company's customer account and customer service expenses in the Base Year and historically.

[43] *PGE, supra*, Order 99-033 at 63.

A. For Customer Account expenses (FERC accounts 901-905), the Company reported a Base Year Oregon allocated total of approximately $20 million, which included $13 million in labor costs.[44] When compared to 2020, most expenses have increased in the Base Year.[45] The Company attributes these increases to additional FTE and year over year increases in payroll for Supervision and Meter Reading (901-902) as well as a $2.3 million increase by payment vendor Paymentus in Customer Records (FERC 903) which is discussed in the Miscellaneous O&M section.[46] Fluctuations in Customer Service Expenses (FERC 908-910) are attributed to non-payroll expenses for postage, printing and professional services in Advertising (FERC 909) as well as a decrease due to the addition of an automated process for handling customer and supplier interactions in Misc. Customer Service (FERC 910).[47] Staff's examination of DR 153, which lists transactions from 2019-2021 confirms the above changes.

Sales Expenses & Supervision (FERC 911) saw a decrease of 21 percent, largely due to decreased payroll and overhead. Demonstration and Selling Expenses (FERC 912) recorded increases, mainly due to Professional Services, Dealer Relations, Corporate Identity and Other Contract Work. Staff audited the expenses related to professional services, dealer relations,

Q. Does Staff have any adjustments to these accounts?

A. Staff has several adjustments across FERC accounts 908 and 912, related to the Base Year increases in Corporate Identity, Dealer Relations, and Professional Services. Customer Assistance (FERC 908) Dealer Relations' expense went up over eight-fold from 2020 to the 2021 base year (from $5 thousand to $45 thousand).[48] As branding and building industry events have spurious benefits for consumers, Staff proposes the following adjustment of ($41,112) before escalation.[49]

48 Staff/602, Cohen/12, NWN Response to Staff DR 364 Attach 1 (electronic spreadsheet).

912 Total		**154,378**	**568,664**

In Demonstration and Selling Expense (FERC 912), cost elements such as Corporate Identity, Dealer Relations and Professional Services were responsible for most of the expense increases. Corporate identity is comprised of event sponsorships, sports sponsorship, home builder association events, block parties, shopping sprees, and trade ally appreciation events with the

highest ticket items being a Timbers game and Thorns game as well as an event at the Lot at Zidell Yards.[50] Staff proposes a reduction of $153,043 thousand in base year Corporate Identity expense in FERC 912. Staff has excluded the $422 of meals and entertainment adjustments proposed in this area in Staff/1200/Rossow.

FIGURE 12: FERC 912 CORPORATE IDENTITY

912 Total				422.78
			Excluding ME adjustment	153,043

Items in Dealer Relations consist of sponsorships, galas, payments to the Home Builders Associations, home tours and other related activities.[51] As ratepayers receive little benefit for these activities, Staff recommends a reduction of $92,482 after excluding the $3,207 of meals and entertainment adjustments in this area.

Q. What are Staff's final adjustments to Customer Assistance and Demonstration and Selling Expenses?

A. After escalating the adjustments by the All-Urban CPI for 2022 and 2023, Staff's proposal is to remove $584,841 in the Test Year from Customer Assistance Expenses (FERC 908) and Demonstration and Selling Expenses (FERC 912) as detailed below.

Q. Why does Staff propose to escalate Base Year expenses by the All-Urban CPI?

A. The Commission has a long history of relying on the All-Urban CPI and Staff uses it almost invariably to escalate costs in a general rate case. As the Commission has noted, "the All-Urban CPI measures price changes in a fixed market basket of goods and services in 200 categories, generally including

housing, apparel, transportation, medical care, recreation, education, and others to urban consumers."[52] "Local economic conditions are represented in the All-Urban CPI, as the Bureau of Labor Statistics includes prices in Oregon when it conducts its survey."[53]

			Total	584,841

ISSUE 3. MISCELLANEOUS O&M EXPENSE INCREASES

Q. Please explain the Company's individual increases to O&M.

A. The Company lists several items that were not escalated by the CPI but by expected increases in contract costs. Staff reviewed Company work papers and contracts to ensure these costs were appropriately estimated. Staff examined the following expenses:

Paymentus: An increase of $57 thousand (Oregon) due for electronic bill payment services. Accordingly, test year transactions are expected to grow by 4.5 percent annually.[54] The Company trended total payment volume based on customer growth rate as well as a bankcard usage rate of 34 percent.[55]

Locating, Inc.: An increase of $807 thousand (Oregon) based on increased prices per locate (2.25 percent in 2022 and 10 percent in 2023) as well as a 4.5 percent annual growth increase in the number of locating units.[56]

Heath Consultants: The contractual rate per foot of inspection for the survey service will increase 2 percent annually throughout the three-year contract. There is also a projected 25 percent increase in unit cost starting in 2023 due to rising labor costs. The combined effect is an increase of $223 thousand (Oregon). In addition, the Company is required to inspect its Business Districts annually per the U.S. Department of Transportation Pipeline and Hazardous Materials Safety Administration. Business Districts

are gas mains or services where the public regularly congregates. Heath Consultants has projected an increase of $1.4 million (Oregon) related to the necessary inspections.[57]

The Company also has projected an increase of $226 thousand in severance based on a three-year average (2019-2021).[58] Finally, the Company is including $1.9 million in stock expense as well as $2.3 million of Long-Term Incentive Plan.[59] These items have been discussed in the Wages, Salary, and Incentive section.

Q. Does Staff have any adjustments in this area?

A. Staff does not have any adjustments**.**

Q. Does this conclude your testimony?

A. Yes.

NAME: Heather Cohen

EMPLOYER: Public Utility Commission of Oregon

TITLE: Senior Utility Analyst
Energy Rates, Finance and Audit Division

ADDRESS: 201 High Street SE., Suite
100 Salem, OR. 97301

EDUCATION: Bachelor of Arts, Political Science
Fordham University, New York, NY

Master of Public Policy
American University, Washington, DC.

EXPERIENCE: I have been employed as a Senior Financial Analyst by the Oregon Public Utility Commission since January 2020 in the Energy, Rates and Finance Division. I currently perform a range of financial analysis duties related to natural gas, electric and water utilities, with a focus on operations and maintenance. I have worked on the following general rate and power cost dockets: UG 388, UG 389, UG 390, UE 374, UE 390, UE 391, UE 394 and UW 184.

I have ten years of professional level budget and fiscal analysis experience. I was previously employed as a Budget Analyst with the Oregon Department of Education (ODE), where I was the lead analyst for the Early Learning Division (ELD) which includes the federal $97M Child Care Development Fund (CCDF) and $37M Preschool Promise program. Prior to ODE, I was a Senior Financial Analyst for the state of Texas's Department of Family and Protective Services and Health and Human Services. Before that, I was a Project Manager for the University of Southern California where I directed data collection and analysis, staffing and deliverables for a $1.2M federal grant related to the provision of mental health services in Los Angeles County. Prior to USC, I was a Senior Budget Analyst for the City of New York responsible for the $1B expense budget of the Administration for Children's Services (ACS).

278. Company's response to DR 163 shows very large changes from 2020 – 2021 expenses in most areas of Customer Accounts and Customer Service (FERC 901-903), 909-910. Please provide an explanation for these variances.

FERC	FERC Category	System 2020	OR -allocated 2020	System 2021	OR -allocated 2021	2020 - 2021 % change
901	Supervision (of Customer Accounting and Collecting	1,960,822	1,730,217	2,094,963	1,848,583	7%
902	Meter Reading Expenses	1,017,646	898,142	1,121,648	989,930	10%
903	Customer Records and Collection Expenses	16,156,223	14,276,363	18,421,531	16,278,091	14%
907	Supervision (Customer Service Activities)	256	-		-	
908	Customer Assistance Expenses	2,916,819	2,562,328	2,785,206	2,446,711	-5%
909	Informational and instructional advertising expense:	2,360,120	2,082,809	3,125,635	2,758,377	32%
910	Misc Customer Service and Information Expenses	271,432	239,215	175,290	154,485	-35%

Response:

The Company objects to, and does not accept, the characterization in the data request that the noted changes are "very large." Notwithstanding this objection, the Company responds as follows:

FERC 901 – System year over year increase of $134k is payroll related with one additional FTE on average in 2021 as well as normal year over year increases in salaries and benefits.

FERC 902 – System year over year increase of $104k is payroll related representing normal year over year increases in salaries and benefits including more overtime and lower costs charged out of FERC 902.

FERC 903 – The system year over year increase of $2.3M is due to the additional Other Contract Work costs related to the billing and payment vendor Paymentus. Please refer to further the Company's explanation of these variances at **UG 435 OPUC DR 279**.

FERC 909 – System year over year increase of $766k included total payroll expense increase of 7% year over year and a non-payroll increase of $708k across advertising, postage, printing, and professional services. The Company incurred additional advertising and media related expense during 2021, the Base Year, in response to

NW Natural/3101
Rogers/Page 39

Staff/602
Docket No: UG 435 Cohen/7
UG 435 OPUC DR 278
NWN Response
Page 2 of 2

increasing concerns regarding its carbon emissions, increased investments in digital advertising, as well as lower advertising and media costs in 2020 due to the pandemic. The increased advertising delivered facts about RNG supply, sources, carbon reduction benefits for customers as well as NW Natural's plan for acquiring it.

FERC 910 – System year over year decrease of $96k, related to costs incurred for the Customer Order Management ("COM") Project in 2020. This project replaced an outdated, homegrown software system encompassing order management and NW Natural's interactions and relationships with current and prospective customers and trade allies (known as a customer relationship management system, or "CRMS"). The previous, outdated system has been replaced by a streamlined, automated process for handling interactions with customers, trading partners (such as equipment suppliers), municipalities, and prospective customers. The COM project was completed and placed into service in June 2020, and therefore the related O&M costs did not recur in 2021.

Request for a General Rate Revision
Data Request Response

Request No.: UG 435 OPUC DR 361

361. Company's responses in DR 267 and DR 268 appear to be contradictory and are provided below for ease of reference. Please reconcile and explain whether there is or is not consistency between these two responses and refile the Company's response to either of these data requests as appropriate.

Request No.: UG 435 OPUC DR 267

267. The Company seeks full recovery of long-term incentives for Officers and employees which include restricted stock units (RSUs) and Performance Shares, is this correct?
a. Please breakdown the dollar amounts tied to long-term incentives, separately for Officers, Exempt and Non-exempt.
b. Please breakdown the dollar amounts of RSUs and Performance Shares within long-term incentives, separately for Officers, Exempt and Non-exempt.

Response:

Correct. The Company is seeking full recovery of long-term incentives for Officers and employees which does include restricted stock units (RSUs) and Performance Shares (Long Term Incentive Compensation).

See UG 435 OPUC DR 265 Attachment 1, tab DR 267 269 for breakdown of both RSU and LTIP by Officers, Exempt and Non-exempt.

Request No.: UG 435 OPUC DR 268

268. Please reconcile the amounts in question 4 parts a and b with Exempt and Non-Exempt amounts of $6,641,122 and $73,972 in the Test Year and $6,737,316 and $74,084 in the Base Year) in DR 92.

Response:

UG 435 SDR 92 includes incentive or bonus cash paid or expected to be paid to employees for short-term incentives. RSUs and Performance Shares are long-term incentives and therefore were not included in UG 435 SDR 92.

Response:

The Company's responses in DR 267 and DR 268 are not contradictory or inconsistent with each other. UG 435 OPUC SDR 92 which is being referenced in UG 435 OPUC

Staff/602
Docket No: UG 435 Cohen/11

DR 268 asks specifically to include “actual paid cash compensation” and, as such, is interpreted by the Company to exclude incentive compensation that is awarded not as cash but as stock units. This is in line with how the Company has historically answered SDR 92.

Request No.: 2022 OR GRC OPUC SDR 92
For the Test Year and the preceding 4 calendar years, please provide (on a Total Company basis), a summary table (using the categories and format shown below) that includes the number of FTE’s (exclude FTEs created by overtime hours) and the actual paid cash compensation broken down between base wages or salaries, overtime, and incentives or bonuses. For any calendar year included in this request for which actual data is not available for the entire calendar year, please create a calendar year using the available actual data combined with the forecast applicable to the rest of the year. Please note which months and figures are associated with both the actual and forecast data.

Wages, Salary, and Overtime

Q. Please explain how Staff used the Three-Year W&S model to arrive at its recommendation for wage and salary levels for the Test Year.

A. As previously stated, PGE escalated its Base Year 2022 non-union and union wages and salaries by four percent for 2023 and 2024.[25] Staff, consistent with the W&S model, starts with a Base Year that is three years prior to the Test Year (2021), and escalates to the Test Year using All-Urban CPI (CPI) rates, which are 8.0 percent for 2022, 3.9 percent for 2023, and 2.2 percent for 2024.[26] Staff escalated union salaries and wages in the same manner as the Company, applying a rate of 7.0 percent for 2022 and 4.0 percent for 2023 and 2024 based on expected collective bargaining increases.[27]

Staff then applied the sharing principle to its and the Company's projected 2024 test year amounts. The sharing principle, which allows the Company to share 50/50 the lesser of the difference between the Company's and Staff's calculated projections, or a 10 percent band around Staff's calculated projection, results in a reduction to Staff's projection.

Q. What is Staff's recommendation for Test Year wages and salary, including overtime?

A. Based on application of the Three-Year Wages and Salary Model, Staff proposes the following adjustments to PGE's proposed wages and salaries levels: ($52 thousand) to Officer salaries, ($110,000) to Exempt salaries, and

[25] PGE/500, Mersereau – Neitzke/19.

[27] Staff/1301, PGE response to Staff DR 94 (pdf) and 95 (pdf).

($1.26 million) to non-Exempt salaries. This results in an overall adjustment of ($1.43 million). Lastly, Staff made no adjustments to union salaries or overtime since the Company's filed proposal was less than Staff's calculation.[28]

Incentives[29]

Q. What does PGE propose for employee incentives?

A. For non-Officer incentives, PGE includes $20.3 million in the Test Year. PGE testifies that it removed 50 percent of its budgeted Non-Officer Incentives to be consistent with the Commission's policy regarding incentives and 100 percent of officer incentives.

Q. Does Staff agree with PGE's removal of 50 percent of non-Officer Incentives?

[28] See Staff/1303, Staff electronic work paper, UE 416 Exhibit 1303 Wage and Salary Model CONF.xlsx, tab PUC 3-year W&S. Historically, the adjustments from Staff's model have been public/non-confidential but the model itself is published as confidential.

[29] See Staff/1301, PGE Response to Staff DR 255 attachment A (electronic spreadsheet) provides underlying data for incentives and Response to DR 256 Attachment A (electronic spreadsheet), which provides the information on total aggregate labor costs by division.

I. INTRODUCTION AND SUMMARY

Q. Are you the same Cory Beck who filed Direct Testimony in this proceeding on behalf of Northwest Natural Gas Company dba NW Natural ("NW Natural" or the "Company")?

A. Yes, I presented NW Natural/1100, Beck.

Q. What is the purpose of your Reply Testimony in this proceeding?

A. The purpose of my Reply Testimony is to respond to the Opening Testimony of Paul Rossow on behalf of Staff for the Public Utility Commission of Oregon ("Commission"), as well as the Opening Testimony of Nora Apter of the Oregon Environmental Council and Meredith Connolly of Climate Solutions on behalf of the Coalition,[1] concerning NW Natural's customer communications (or advertising)[2] expenses for the Test Year (November 2024 through October 2025). I will also respond to the testimony of Charity Fain (Community Energy Project), Anahi Segovia Rodriguez (Verde), and Nikita Daryanani (Coalition of Communities of Color) on behalf of the Coalition regarding the advertising for the Company's bill discount program and investment in multilingual outreach.

Q. Please summarize your Reply Testimony.

A. In my testimony, I:

[1] The Coalition includes the Coalition of Communities of Color, Climate Solutions, Verde, Columbia Riverkeeper, Oregon Environmental Council, Community Energy Project, and Sierra Club.

[2] NW Natural uses the term "customer communications," while other parties use the term "advertising." NW Natural understands these terms to be referring to the same category of expense. These terms are used interchangeably throughout this testimony.

- Provide relevant background regarding Category A and B customer communications expense;
- Respond to Staff's and the Coalition's recommended adjustments to NW Natural's proposed Test Year Category A advertising expense;
- Respond to Staff's and the Coalition's recommended adjustments to NW Natural's proposed Test Year Category B advertising expense;
- Respond to the Coalition's testimony regarding the Company's marketing of the bill discount program and investment in multi-lingual outreach.

Q. Do you include any exhibits with your testimony?

A. Yes, I am presenting the following exhibits:

- NW Natural/3201, Beck (Coalition's response to UG 490 NWN to Coalition DR 20).
- NW Natural/3202, Beck (Company's response to UG 490 OPUC DR 337).

II. BACKGROUND REGARDING CUSTOMER COMMUNICATIONS EXPENSE

Q. What are expenses for Category A communications?

A. Category A expenses are energy efficiency or conservation advertising expenses that do not relate to a Commission-approved program, utility service advertising expenses, and utility information advertising expenses.[3] Under OAR 860-026-0022(3)(a), expenditures for Category A advertising up to 0.125 percent of gross retail operating revenues are presumed just and reasonable. As I explained in my Direct Testimony, in NW Natural's case, that percentage results in $1,354,530 for

[3] OAR 860-026-0022(2)(a).

Category A communications based on forecasted revenues and customer count, which is equivalent to about $1.92 per customer.[4]

Q. Did NW Natural request more than the amount of Category A expense presumed reasonable for the Test Year?

A. Yes, by 3 cents per customer. The Company is requesting $1.95 per customer, $0.03 higher than the customer rate derived using the level presumed just and reasonable under OAR 860-026-0022(3)(a). The threshold in OAR 860-026-0022(4) sets an amount that is presumed reasonable but allows for more to be recovered as long as support is provided, and the Commission approves it.[5] The Company's proposed Category A request for cost recovery amounts to approximately $1.95 per customer, which is very close to the $1.92 customer rate presumed just and reasonable under OAR 860-026-0022(3)(a) and is justified in order for the Company to effectively deliver its current level of Category A communications on topics outlined in my Direct Testimony and includes a minimal increase ($0.03 per customer) to account for producing a bill insert to educate customers about the new climate policy changes that could impact customer bills beginning during the Test Year.

[4] NW Natural/1100, Beck/2.

[5] "The presumptions in section (3) of this rule are rebuttable. An energy or large telecommunications utility seeking to include expenditures in excess of amounts in section (3) of this rule shall have the burden of showing that the expenditures are just and reasonable. Parties challenging expenditures which are equal to or less than the amounts in section (3) of this rule have the burden of showing that the expenditures are not just and reasonable."

Q. What are Category B customer communications?

A. Category B communications are safety-related communications, and include legally mandated messages intended to ensure that NW Natural's customers, contractors, public officials, emergency officials, and the general public within the NW Natural service territory know how to use natural gas safely, have emergency preparedness awareness (for example, being prepared in the event of an earthquake), know how to recognize, react, and respond to a potential leak or safety issue related to natural gas, and know how to prevent damages to underground utility pipelines.[6] The Company develops its Category B communications through its Public Safety Awareness Program. The Program is regularly inspected by the OPUC. Under OAR 860-026-0022(3)(b), Category B communications are presumed to be just and reasonable for ratemaking purposes. NW Natural requested $975,000 for the Category B customer communications for the Test Year.[7]

Q. Does the Company's Test Year include any other expenses for Categories C, D, or E customer communications?

A. No. As I explained in my Direct Testimony,[8] NW Natural is not seeking rate recovery of any expenses in Category C (corporate imaging),[9] Category D

[6] OAR 860-026-0022(2)(b) ("Category 'B' - Legally mandated advertising expenses"). "Legally mandated advertising expenses" means advertising expenses, the primary purpose of which is to comply with (A) local, state, or federal statutes, ordinances, rules, or regulations; and (B) court or commissions orders. OAR 860-026-0022(1)(d).

[7] NW Natural/1100, Beck/6.

[8] NW Natural/1100, Beck/2.

[9] OAR 860-026-0022(2)(c) ("Category 'C' - Institutional advertising expenses, promotional advertising expenses and any other advertising expenses not fitting into Category 'A,' 'B,' or 'D'").

(political/non-utility advertising),[10] or Category E (energy efficiency/conservation advertising related to a program approved by the Commission).[11]

III. CATEGORY A CUSTOMER COMMUNICATIONS EXPENSE

A. Staff's Recommendations

Q. What were the results of Staff's review of NW Natural's proposed Category A customer communication expense?

A. Staff confirmed that the customer communications identified by NW Natural under the Category A customer communication expense were related to energy efficiency, safety, and conservation.[12]

Q. What is Staff's recommendation regarding Category A customer communications expense?

A. Staff recommends limiting the Company's recovery of Category A expense to the amount that is presumed reasonable under OAR 860-026-0022(3)(a), which is $1,354,530 or $1.92 per customer.[13]

Q. What is NW Natural's response to Staff's recommendation for the Category A customer communications expense?

A. NW Natural continues to support the Company's proposed Category A request for cost recovery for the Test Year—approximately $1.95 per customer—as justified

[10] OAR 860-026-0022(2)(d) ("Category 'D' - Political advertising expenses and nonutility advertising expenses").

[11] OAR 860-026-0022(2)(e) ("Category 'E' - Energy efficiency or conservation advertising expenses that relate to a Commission-approved program[]").

[12] Staff/1700, Rossow/7.

[13] Staff/1700, Rossow/8.

and reasonable because it is very close to the amount considered reasonable in accordance with the Commission's rules and allows for the expense for production of a bill insert to educate customers and properly inform them about the new climate policy changes that could affect customers beginning during the Test Year.

The Company took seriously the Commission's direction in Order No. 22-388 to carefully scrutinize its Category A advertising expense, and to remove expense that the Commission deemed promotional in nature, and did so in this case. Thus, even though the advertising expense is slightly above the Commission's threshold, it represents advertising connected with core utility service and does not include any promotional advertising, and therefore should be recoverable in rates.

Q. How does NW Natural's Category A request compare to the amounts presumed reasonable for other utilities?

A. The revenue-based formula applicable to all energy utilities results in natural gas utilities having far less Category A expense presumed reasonable as compared to electric utilities. NW Natural should be allowed rate recovery for communications that are generally in line with electric utilities in Oregon on a per customer basis. NW Natural's request for $1.95 per customer is far less than electric utilities that serve most of the same customers as well. For example, based on 2022 data, Table 1 below shows that the revenue-based formula translates into an allowance of $2.56 per customer for PacifiCorp and $2.91 per customer for Portland General Electric Company compared to $1.52 per customer for NW Natural. This funding gap is inappropriate, given NW Natural's communication topics are not unique from

an electric utility. Additionally, NW Natural has an expansive Oregon service territory, which includes the Oregon coast from Astoria to Coos Bay, the Willamette Valley from Portland to Eugene, and the Columbia River Gorge.

TABLE 1

2022 Category A per Customer Based on Operating Revenue

	Year	Operating Revenue	CAT A - 0.125%	# of Customers	CAT A per Customer

Source of Revenues and Customers - OPUC Oregon Utility Statistics 2022

B. The Coalition's Recommendations

Q. What is the Coalition's recommendation regarding Category A customer communications expense?

A. The Coalition recommends seeking a disallowance of $310,641 from the Company's Category A customer communications expense, arguing that NW Natural is improperly including Category C (corporate imaging) or Category D (political/non-utility advertising) in its Category A customer communications expense.[14]

[14] Coalition/200, Apter-Connolly/36-37.

Q. Why does the Coalition claim that the Company's Category A customer communications expense includes Category C and Category D customer communications?

A. It appears that the Coalition's argument is rooted in its belief that any customer communications regarding NW Natural's utility service, by the very nature of the Company being a gas utility, contain "implied political agenda to influence ratepayers and promote the continued use of gas" and therefore cannot be designated as Category A customer communications expense.[15] Thus even though the communications may have the primary purpose of informing customers of the Company's energy efficiency or conservation programs, or utility information such as rate increases, environmental impacts, or other contemporary items of customer interest, because they suggest that NW Natural will continue to provide natural gas services in the future, the Coalition would argue they are political or promotional in nature.

Q. How does NW Natural respond to the Coalition's underlying claim?

A. While I am not a lawyer, it is my understanding that when the Commission reviews customer communication expenses to ensure compliance with the requirements of OAR 860-026-0022, the Commission looks to the primary purpose of the advertisement by considering the context of the publication.[16] I disagree with the Coalition's underlying claim that would attach an implied political or promotional

[15] Coalition/200, Apter-Connolly/35.

[16] *In re Revised Tariff Schedules Filed by Nw. Nat. Gas Co. for a Gen. Rate Increase*, Docket No. UG 81, Order No. 89-1372 (Oct. 18, 1989) ("The advertising rule defines advertisements according to their primary purpose.").

motivation as it seems contrary to the inquiry of the primary purpose of the customer communications. As such, the Commission should reject the Coalition's proposed adjustment for Category A communications expense.

Q. What are the major topics covered in the Coalition's testimony regarding Category A customer communications?

A. The Coalition specifically addresses six topics in its testimony regarding Category A customer communications: (1) the Company's "Comfort Zone" newsletters; (2) customer communications regarding the Company's community service activities; (3) customer communications regarding gas appliances; (4) customer communications regarding the Company's Smart Energy Program; (5) customer communications regarding conservation efforts, greenhouse gas ("GHG") emissions data, factual information regarding electrification, and the status of Oregon's invalidated Climate Protection Program ("CPP") and future greenhouse gas regulations; and (6) rate impact information as a result of climate change policies.

1. <u>"Comfort Zone" Newsletters</u>

Q. Please describe the Company's "Comfort Zone" newsletters.

A. The Company's "Comfort Zone" newsletters are typically published five to six times per year and inserted into customer bills. The Company also issues an electronic newsletter that is emailed to Paperless Billing Customers each month. In 2023, the Company published 5 such printed newsletters and 12 electronic newsletters. Typically, the primary purpose of the "Comfort Zone" newsletters is to provide utility billing, payment programs, and energy efficiency information to customers, along

with other messages that may be of interest to customers and to assist them in understanding complex issues and services for one of their essential energy providers. Accordingly, where such information is identified in the newsletters, it is recorded to the Category A customer communications expense.

Q. Did NW Natural identify different categories of customer communications in the "Comfort Zone" newsletters?

A. Yes. In response to feedback received in the last rate case, docket UG 435, my department carefully reviewed the content of the "Comfort Zone" newsletters to ensure that the messages are being recorded to the appropriate cost center (Category A, Category B, Category C). The Company noted Category C customer communications and allocated about 25 percent of the total cost for the printed "Comfort Zone" newsletters to the Category C customer communications cost center.

Q. What concerns does the Coalition raise regarding the "Comfort Zone" newsletters?

A. The Coalition claims that "many advertisements the company billed as Category A or B advertising are either promotional, political or nonutility advertising."[17]

[17] Coalition/200, Apter-Connolly/44.

Q. Does the Coalition provide particular examples of the "Comfort Zone" newsletters that it believes are promotional, political, or represent nonutility advertising?

A. Yes. The Coalition points to "Comfort Zone" newsletters/e-newsletters containing information regarding community service activities, natural gas appliances, the Company's Smart Energy Program, and information about Oregon's invalidated and future greenhouse gas regulations.[18] I will respond to these topics in the relevant sections below.

Q. Why is communicating about community service activities, natural gas appliances, the Company's Smart Energy Program and information about Oregon's invalidated and future greenhouse gas regulations relevant for Category A communications?

A. NW Natural understands that customer satisfaction is a critical aspect for measuring the success of the services and information we provide. Customer satisfaction measures the overall customer experience to gauge if we are meeting customer expectations.

Q. How has NW Natural performed in providing excellent customer satisfaction to its customers?

A. One method how NW Natural measures customer satisfaction is through a third – party study conducted by J.D. Power and Associates. Now in its 22nd year, the J.D. Power study measures residential customer satisfaction with natural gas

[18] Coalition/200, Apter-Connolly/44-51.

utilities across six factors: safety and reliability, customer care, billing and payment, price, corporate citizenship, and communications. The 2023 results are based on more than 60,000 responses from residential customers of the 85 largest gas utilities across the United States, which represent more than 64.6 million households. The study was conducted from January 2023 through October 2023. NW Natural scored second highest in customer satisfaction among large utilities (500,000 or more customers) in the Western United States, according to J.D. Power's Gas Utility Residential Customer Satisfaction Study. This is the 20th time NW Natural has scored in the top two in the West; 2023 survey results placed the Company in the top-10 nationally, as well. In addition, NW Natural finished first among West peers in the customer satisfaction categories for safety and reliability, price, and corporate citizenship.

Q. What J.D. Power questions that measure customer satisfaction are directly linked to the Company's communications regarding high-efficiency natural gas appliances, Oregon's invalidated and future greenhouse gas regulations, the Smart Energy Program, and community service activities?

A. The J.D. Power study involves survey questions addressing the following topics:

- Efforts to communicate changes that affect account/service, which may implicate Oregon's invalidated and future greenhouse gas regulations;
- Usefulness of suggestions to reduce usage/lower bills, which relates to the Company's messaging regarding high-efficiency natural gas appliances;
- Actions to take care of the environment, which would include the Company's Smart Energy Program;

- Involvement in the community, which is addressed by the Company's community service activities.

Q. Why is NW Natural communicating with its customers regarding its community service activities?

A. NW Natural understands that overall customer experience and satisfaction is critical to meeting customer expectations. Providing information concerning Company involvement and informing and educating customers about the Company's community service activities and offering customers opportunities for engagement is necessary to meet customer expectations of their utility.

Q. Please explain why NW Natural considers customer communications regarding its community service activities as appropriate for cost recovery as a Category A expense.

A. Under OAR 860-026-0022(2)(a), "Category A" advertising expenses include (among others) utility information advertising expenses. In turn, "utility information advertising expenses," are defined as:

> advertising expenses, the primary purpose of which is to increase customer understanding of utility systems and the function of those systems, and to discuss generation and transmission methods, utility expenses, rate structures, rate increases, load forecasting, environmental considerations, and other contemporary items of customer interest[.][19]

The Company's community service activities and corporate responsibility efforts are a contemporary item of customer interest, and it is appropriate to provide information to customers about the Company's community engagement.

[19] OAR 860-026-0022(1)(g).

Q. What are the Coalition's criticisms of the Company's customer communications regarding community service activities?

A. The Coalition claims that customer communications describing NW Natural's community service activities and opportunities for engagement and support are unrelated to utility service and are not calculated to improve ratepayers' understanding of utility systems. Instead, the Coalition argues that these customer communications are either corporate imaging institutional advertising (Category C) or nonutility related (Category D) advertising.[20]

Q. How do you respond to the Coalition's claims that the Company's customer communications regarding community service activities is promotional/institutional in nature because it is intended to promote the Company's brand rather than inform customers?

A. I disagree with the assertion that the Company's customer communications discussing community service are primarily promotional/institutional in nature. The Company works diligently to provide information to customers that meets customer expectations. The Company understands that its customers are concerned about community engagement, which includes corporate responsibility efforts and community service activities, such as the Gas Assistance Program ("GAP").[21] It is clear from the examples chosen by the Coalition (specifically shown in Figures 1 through 4 in my Reply Testimony, below), that the primary purpose of the

[20] Coalition/200, Apter-Connolly/44-46.

[21] Coalition/245, Apter-Connolly/32 (NW Natural Response to UG 490 Coalition DR 117 Attachment 2 (32 of 53)).

messages is to inform and educate customers about NW Natural's corporate responsibility efforts and community engagement activities, including donations to, partnerships with, and recognition from community organizations and programs, as well as to provide customers the opportunity to support the Company's community-focused programs. All messages aid in providing customers information they expect to receive.

Q. By contrast, what is Category C institutional and promotional advertising?

A. Institutional advertising is not primarily designed to convey information, but rather is designed to enhance the credibility, reputation, character, or image of an entity or institution.[22] Promotional advertising is designed to aid in the retention of customers and attract new customers by promoting the cost and performance benefits of natural gas and a variety of natural gas products.[23] NW Natural specifically excluded promotional/institutional advertising—or Category C communications—from its request for cost recovery.

Q. The Coalition also asserts that the Company's internal strategy documents admit that the purpose of communicating information regarding public service activities is to improve corporate image.[24] Is this true?

A. No. I reviewed the materials referenced by the Coalition, and although they describe the Company's communication strategy and community engagement activities, the strategies are clearly identified as a customer service message area

[22] OAR 860-026-0022(1)(c).

[23] OAR 860-026-0022(1)(c); OAR 860-026-0010.

[24] Coalition/200, Apter-Connolly/45.

of focus and does not include any linkage with promotional advertising. The strategy is high-level to guide direction for development of messages. The Company reviews all messages that are produced for the appropriate charge category. If a message is Category C in nature, it will be charged to a Category C account.

Q. How do you respond to the Coalition's claims that the Company's customer communications regarding community service activities is non-utility related information?

A. I disagree with the assertion that the Company's customer communications discussing community service is non-utility related information. As discussed above, the Company understands that its customers are concerned about community engagement and support, which includes corporate responsibility efforts and community service activities. The primary purpose of the messages noted by the Coalition, which I will discuss in further detail below, is not to provide information about or encourage the purchase of products or services that fall outside the rate of return regulation.

Q. Can you explain non-utility advertising?

A. Non-utility advertising is communication, "the primary purpose of which is to provide information about or encourage purchase of products or services whose revenues fall outside the scope of rate of return regulation by a state or federal

regulatory body[.]"[25] NW Natural specifically excluded non-utility information advertising—or Category D communications—from its request for cost recovery.

Q. How do you respond to the Coalition's claim that informing customers about the community service activities of NW Natural's employees is promotional, institutional, or non-utility related advertising?[26]

A. I disagree that the primary purpose of customer communications regarding the community engagement of NW Natural's employees is to promote the Company's brand or otherwise does not provide useful utility information. An example of one of the messages referenced by the Coalition[27] recognizes a NW Natural employee's work on the Board of Trustees of the Oregon Historical Society, work on the Board of Directors of the nonprofit OnPoint Community Credit Union, and pro bono financial-planning services.

NW Natural encourages its employees to constructively engage in the community and contribute to the Company's corporate responsibility, a contemporary item of interest to our customers. The primary purpose of this message is to provide useful information to customers about the community engagement of NW Natural's employees and to inform customers about possible additional avenues of intersection with the Company and outside community organizations.

[25] OAR 860-026-0022(1)(i).

[26] Coalition/200, Apter-Connolly/44.

[27] Coalition/216, Apter-Connolly/8.

Q. How do you respond to the Coalition's claim that informing customers about opportunities to contribute to the GAP is promotional, institutional, or nonutility related advertising?[28]

A. I disagree that the primary purpose of customer communications providing information regarding the GAP and offering customers the opportunity to voluntarily contribute to the program (e.g., Figure 1) is to promote the Company's brand or otherwise does not provide useful utility information.

Figure 1. Example of GAP Communications.

GAP is wholly incremental above other low-income energy assistance programs and is funded by voluntary contributions from customers, employees, and occasionally by private grants.[29] NW Natural also contributes shareholder dollars to the program annually from its Corporate Philanthropy fund.[30] Offering customers information regarding the low-income GAP and informing customers

[28] Coalition/200, Apter-Connolly/45.

[29] Coalition/223, Apter-Connolly/1.

[30] Coalition/223, Apter-Connolly/1.

about how to voluntarily contribute to and/or support such energy assistance programs for customers in need is pertinent utility information and does not implicate promotional/institutional advertising.

Q. The Coalition seems to imply that charging the GAP customer communications to Category A customer communication expense is contrary to the Company's assertion that NW Natural shareholders (not customers) cover "all the program delivery and administrative costs so that every dollar goes to GAP recipients."[31] Is the Coalition correct?

A. No. GAP delivery expenses and administrative costs are separate and distinct from NW Natural's customer outreach regarding the GAP program and solicitation of voluntary customer contributions. GAP delivery costs are allowable costs incurred for implementing and carrying out eligible GAP activities and cover the costs of employees directly carrying out program activities, including employee salaries and fringe benefits that are necessary for successful completion of the program activities. Administrative costs are costs for staff-time and overhead costs for planning and general administration of the program. GAP administrative costs cover the cost of planning, general management, oversight, coordination, in addition to equipment, general office supplies, travel/mileage and implementation costs of the GAP program as a whole. It is these costs that go to the actual implementation of the GAP that are fully covered by NW Natural shareholders (not customers).

[31] Coalition/200, Apter-Connolly/45; Coalition/223, Apter-Connolly/1.

Q. How do you respond to the Coalition's claim that newsletter communications to customers regarding the Company's donations to community organizations, partnerships with community organizations, and announcements about education scholarship programs are primarily promotional, institutional, or nonutility related advertising?[32]

A. I disagree that the primary purpose of customer communications providing information regarding the Company's donations to community organizations, partnerships with community organizations, and announcements about education scholarship programs is promotional/institutional or otherwise nonutility related information. An example of one of the newsletter messages referenced by the Coalition (shown below in Figure 2) provides information about the Company's partnership with Here is Oregon to feature the work of nonprofit Adelante Mujeres (Women Rise Up) at the Fiesta of Hope event.

///

///

///

///

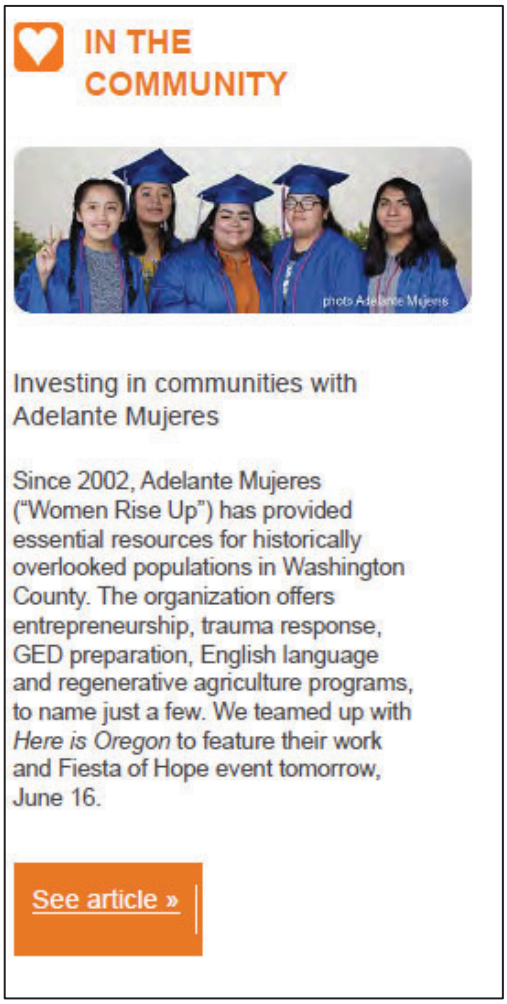
[32] Coalition/200, Apter-Connolly/45.

Figure 2. Example of Company Community Service Communications.



The primary purpose of this message is to provide useful information to customers about the community engagement of NW Natural and to inform customers about possible additional avenues of intersection with the Company and outside community organizations.

Q. How do you respond to the Coalition's claim that customer communications regarding third-party recognition of NW Natural's corporate responsibility, ethics, and compliance practices are primarily promotional, institutional, or nonutility related advertising?[33]

A. I disagree that the primary purpose of customer communications providing information regarding third-party recognition of NW Natural's corporate responsibility, ethics, and compliance practices is to promote the Company's brand or otherwise does not provide useful utility information. The message specifically referenced by the Coalition (shown below in Figure 3) informs customers regarding NW Natural's recognition by Ethisphere in its World's Most Ethical Companies list.

Figure 3. Example of Company Corporate Responsibility Recognition Communications.

The Company understands that its customers are concerned about community engagement, and to this end, informing customers about third-party recognition of the Company's ethical and compliance practices is directly related to this customer item of interest.

[33] Coalition/200, Apter-Connolly/45.

2. Gas Appliances

Q. What concerns does the Coalition raise regarding the Company's customer communications concerning rebates on gas appliances?

A. The Coalition argues that NW Natural improperly included numerous "Comfort Zone" newsletters, bill inserts, on hold messages, and emails and e-newsletters promoting the purchase of gas appliances in its Category A customer communication expense, which should be designated as Category C promotional advertising.[34] For convenience, examples of the messages specifically referenced by the Coalition are copied below in Figure 4 through Figure 8.

Figure 4. "Comfort Zone" Example of Gas Appliance Utility Information / Service Communication

///

///

///

///

///

///

Figure 7. Bill Insert Example of Gas Appliance Energy Efficiency Communication

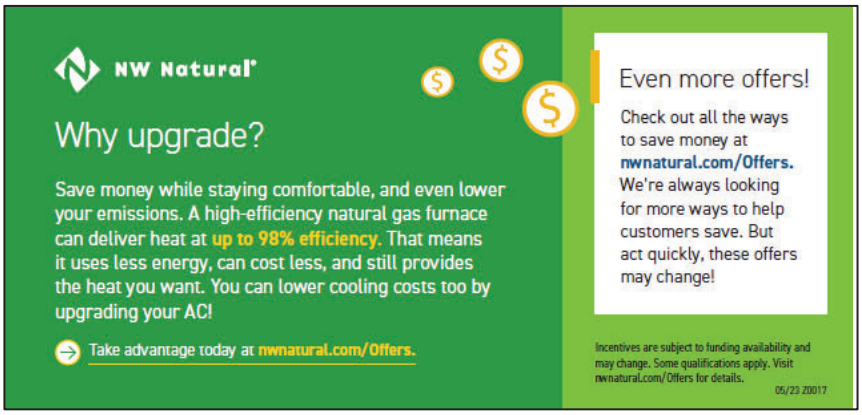

Figure 8. e-Newsletter Example of Gas Appliance Energy Efficiency Communication

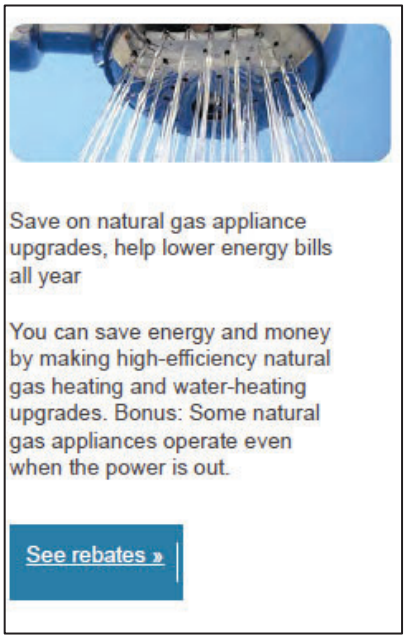


Q. How do you respond to the Coalition's arguments regarding the Company's customer communications expense associated with natural gas appliances?

A. As discussed above, Category A customer communication expense includes energy efficiency or conservation advertising expenses that do not relate to a Commission-approved program, utility service advertising expenses, and utility

information advertising expense. The primary purpose of the messages referenced by the Coalition, including the examples in Figure 4 through Figure 8 above, are not promotional; rather, the primary purpose of the messages is to inform customers about high efficiency appliances, lowering gas consumption and energy usage, costs, and emissions. The customer communications in Figure 5 through Figure 8 above squarely fit under energy efficiency and conservation advertising expenses included in Category A. Figure 5 through Figure 8 also strongly focus on environmental considerations, which are included under utility information advertising expenses, and "encourage efficient and safe use of utility services," which is included under utility service advertising expenses. While it is true that these messages also include references and links to rebate offers for more energy efficient appliances, it is clear that the primary purpose of those communications is to encourage energy efficiency and conservation and to provide information to customers about opportunities and methods to effectively reduce energy and gas consumption. Similarly, other messages like Figure 4—which informs customers about backup generators and safe use of gas appliances in emergency situations—are primarily focused on encouraging efficient and safe use of utility gas services during power outages and natural disasters and informing customers about potential resiliency opportunities.

Q. The Coalition argues that including these gas appliance messages with references and links to rebates and incentives in the Company's Category A customer communications expense is contrary to NW Natural's assertion that the Company is not seeking cost recovery in this rate case for expenses related to rebates or incentives for gas appliances.[35] Is the Coalition correct?

A. No. Communicating with customers about ways for customers to increase the efficiency of their gas appliances through upgrades to high-efficiency appliances is clearly the primary intent of the messages showing rebates and incentives for high-efficiency appliances. The actual rebates themselves are not funded by customers, and the inclusion of the rebates is a secondary purpose of the messages.

Q. Please comment on whether any of the messages referenced by the Coalition have been wholly or partially attributed to Category C.

A. The cost strategy the Company took with regard to the printed "Comfort Zone" newsletters was to charge about 25 percent of the printing costs to Category C to cover any messages that could be interpreted as promotional in nature. After further consideration, the Company should have adopted the same approach for the electronic newsletter. NW Natural has made a note of this and will reduce the revenue requirement for Category A by $8,000 or about 25 percent of the cost for distributing the electronic "Comfort Zone" newsletters.

[35] Coalition/200, Apter-Connolly/49.

Q. Does the Coalition make any other claims regarding the gas appliance customer communications?

A. Yes. The Coalition further asserts that the Company's gas appliance messages include misinformation about the health impacts of gas stoves because the communications state that customers should turn on their fan hoods regardless of stove type, apparently "implying that emissions from gas stoves and electric stoves have the same health impacts."[36] A copy of the message referenced by the Coalition is provided in Figure 9 below.

Figure 9. e-Newsletter Smart Cooking Communication

As an initial matter, the primary purpose of the communication in Figure 9 above is to educate customers regarding the use of proper ventilation when cooking, which is necessary when cooking on any appliance—whether gas or electric. This advertising is appropriately considered Category A because it addresses a

[36] Coalition/200, Apter-Connolly/48; Coalition/217, Apter-Connolly/31.

contemporary item of customer interest—cooking and proper appliance use. Moreover, contrary to the Coalition's baseless assertions, nothing in Figure 9 implies greater, equal, or less health impacts with respect to emissions from gas versus electric cooktops. It is factually accurate that good ventilation in the kitchen during high temperature cooking, regardless of whether you are using a natural gas or electric cooktop, is a best safety practice. Proper ventilation not only addresses fumes and gases from cooking (which occur whether using gas or electric cooktops), but also reduces airborne grease, prevents the build-up of grease, and decreases the temperature around the stove area. In short, regardless of the type of cooktop used, proper ventilation reduces indoor pollutants and prevents kitchen incidents such as grease burns, smoke and overheating, and fires.

3. Smart Energy Program

Q. Please describe the Coalition's arguments regarding NW's Natural's customer communications regarding the Smart Energy Program.

A. The Coalition argues that, regardless of whether the purpose of the customer communications is to encourage customers to join the Smart Energy Program to lower GHG emissions by contributing to a mix of carbon offsets and renewable natural gas projects, the fact that the program is offered by a utility that offers gas services means that such messages are *per se* promotional/institutional Category C advertising expenses.[37] In essence, the Coalition argues that

[37] Coalition/200, Apter-Connolly/51-52.

customer communications that contain anything less than statements encouraging customers to explicitly disconnect or reduce gas service are promotional.[38]

Q. How do you respond?

A. As an initial matter, the primary purpose of the Smart Energy Program customer communications is clearly to address customer environmental considerations and other items of customer interest (such as climate change and ways to mitigate emissions from natural gas use), which are included under utility information advertising expenses, Category A. If the Coalition's arguments were taken to their ultimate conclusion, all customer communications by any energy utility service offering opportunities for customers to invest in carbon offsets and renewable energy projects would be considered promotional unless there were zero emissions associated with that utility service and its programs, which is not the case in reality.

4. Climate Change Communications

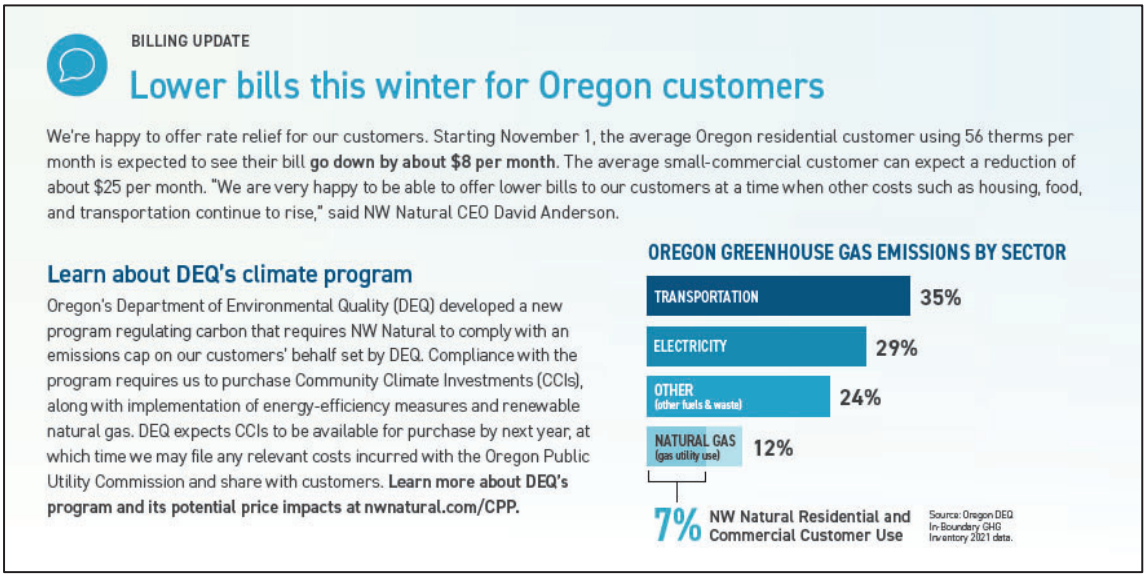
Q. Please describe the Coalition's arguments concerning NW Natural's customer communications regarding climate change, and Oregon's invalidated and future greenhouse gas regulations.

A. The Coalition argues that NW Natural's customer communications regarding climate change-related conservation efforts, GHG emissions data, electrification, and the status of Oregon's invalidated and future greenhouse gas regulations and

[38] Coalition/200, Apter-Connolly/52 ("By participating in this program, customers may conclude they can responsibly maintain their gas service or level of gas consumption instead of disconnecting service or at least reducing gas usage out of concern for climate impacts.").

resulting impacts of that decision on rates are political Category D advertising and are therefore not recoverable.[39] In particular, the Coalition points to the "Comfort Zone" newsletter where the Company informed its customers about the invalidated greenhouse gas regulations and directed its customers to a webpage that discussed the status of the invalidated greenhouse gas regulations and its impacts on customer rates.[40]

Figure 10. "Comfort Zone" Invalidated CPP Customer Communication



The Coalition claims that these messages do not "provide information" about the invalidated CPP; rather, the purpose of these customer communications are to "influence public opinion against the CPP."[41]

[39] Coalition/200, Apter-Connolly/49-50.

[40] Coalition/200, Apter-Connolly/49-50; Coalition/216, Apter-Connolly/15.

[41] Coalition/200, Apter-Connolly/49-50.

Q. How do you respond?

A. The Coalition mischaracterizes the customer communications regarding the invalidated CPP; the messages were not intended to influence public opinion against the invalidated CPP, but rather to inform the Company's customers of the invalidated CPP, provide the current status of the invalidated rules, and notify customers that the anticipated rate increase attributed to compliance with the invalidated CPP would not occur at the time. These messages clearly fall under utility information advertising (Category A), which includes communications regarding environmental considerations and rate increases. Moreover, NW Natural truthfully and transparently informed customers on its position on the invalidated CPP, why the court invalidated the CPP, and the Company's commitment to working with the Oregon Department of Environmental Quality ("DEQ"), customers, and the community on the potential successor CPP rules so that the rules are lawfully promulgated, "focused on emission reductions, have clear accountability for effectiveness, and retain energy affordability and security."[42] To simply "provide information" on the invalidated CPP, as the Coalition suggests, without informing customers on the current status of those rules, resulting impacts on rates, and the Company's position would be incomplete and a disservice to the Company's customers.[43]

[42] *New DEQ Climate Regulation in Oregon*, NW Natural, https://www.nwnatural.com/about-us/rates-and-regulations/cpp (last visited May 28, 2024).

[43] Coalition/200, Apter-Connolly/49.

Q. The Coalition also takes issue with the Company including a link in the September 2023 "Comfort Zone" newsletter that directs the reader to the webpage nwnatural.com/cpp,[44] and argues that it should not be recoverable from customers. How do you respond?

A. The webpage in question is simply an extension of all invalidated CPP communications and provides timely status updates for the program development, as costs associated with the invalidated CPP may impact customer rates.

Q. The Coalition also claims that NW Natural's customer communications regarding GHG emissions data and electrification are misleading and should be characterized as political Category D advertising because they minimize the role of NW Natural's contribution to climate change and mislead customers about the role of electrification in mitigating GHG emissions.[45] Is the Coalition correct?

A. No. As an initial matter, the customer communications referenced by the Coalition, which include GHG data from the DEQ and other third-party sources, such as the City of Portland Bureau of Planning and Sustainability, clearly fall under utility information advertising (Category A), which includes advertising regarding environmental considerations. While the Coalition claims without basis that the

[44] The particular statement that the Coalition excerpts to is "With the prior CPP rules invalidated, the costs we had anticipated our customers would begin seeing this year to comply with the program are no longer required. We are pleased with the Court's decision because the program was designed in a way that would have been costly to customers and without accountability for quantifiable emission reduction benefits." Coalition/200, Apter-Connolly/49-50.

[45] Coalition/200, Apter-Connolly/50; Coalition/217, Apter-Connolly/24.

information presented by NW Natural is misleading, it does not point to any data, data sources, or information provided by NW Natural that is factually incorrect.

5. Rate Impact Information

Q. The Coalition also argues that NW Natural's webpage "Rate changes for 2023-2024" is political Category D advertising because it refers to compliance costs for the invalidated CPP and is therefore misleading.[46] How do you respond?

A. In this example, the Coalition is leaving out an essential detail. The communication at issue provides an update regarding the rate change resulting from the Company's 2023 purchased gas cost (PGA) filing, which included costs associated with the invalidated CPP. The communication is not misleading, as it directs customers to updated information on the invalidated CPP, which informs customers that invalidated CPP compliance costs will not be included in rates as had been previously anticipated prior to invalidation of the CPP.

6. Calculation of the Coalition's Proposed Adjustment

Q. Is it clear how the Coalition arrived at its proposed Category A adjustment?

A. No, it is not clear how the Coalition arrived at its proposed $310,641 adjustment. NW Natural provided a data request to the Coalition to gain clarification. The Coalition's response did not directly address the question, and instead stated: "The Coalition does not have any work papers calculating this deduction. Please see the testimony in Coalition/200, Apter-Connolly/53, Lines 2-7, for an

[46] Coalition/200, Apter-Connolly/50-51; Coalition/213, Apter-Connolly.

explanation of this disallowance recommendation."[47] In turn, the testimony at Coalition/200, Apter-Connolly/53, Lines 2-7 recommends the removal of the Category A Test Year costs for bill inserts, electronic newsletter and website content. Proposed Test Year budgets were provided in response to UG 490 OPUC DR 337 (NW Natural/3202, Beck) and are shown below in Table 2.

TABLE 2

TOTAL CATEGORY A

Category A Channels		Total Budget		OR Test Year Budget		Total
Salaries/Overhead	$	650,000	$	573,625		
Bill inserts	$	252,000	$	222,390	$	222,390
Brochures/ Customer support Items	$	65,000	$	57,363		
eNewsletter	$	35,000	$	30,888	$	30,888
Professional Services - Design & Writing	$	150,000	$	132,375		
Website support/development	$	35,000	$	30,888	$	30,888
Postage	$	85,000	$	75,013		
Media - Production	$	50,000	$	44,125		
Media - IVR	$	10,000	$	8,825		
Media - Telephone directory	$	30,000	$	26,475		
Media - TV/Digital/Streaming	$	200,000	$	176,500		
Category A Totals	**$**	**1,562,000**	**$**	**1,378,465**	$	284,166

The total Oregon Test Year budget proposed for Bill inserts, Electronic Newsletter and Website total $284,166, not $310,641.

Q. In the event that the Commission agrees with the Coalition, should the Coalition's recommended Category A adjustment be modified?

A. Yes. As a starting point, the Coalition's deduction should be lowered to $284,166. The remainder of the recommended deductions should also be removed as explained further my Reply Testimony.

[47] NW Natural/3201, Beck (Coalition's response to UG 490 NWN to Coalition DR 20).

IV. CATEGORY B CUSTOMER COMMUNICATIONS EXPENSE

A. Staff's Recommendations

Q. What were the results of Staff's review of NW Natural's proposed Category B customer communication expense?

A. Staff confirmed that the customer communications identified by NW Natural under the Category B expense were related to safety-related communications.[48]

Q. What is Staff's recommendation regarding Category B customer communications expense?

A. Staff found that while the Company's proposed Category B expense is presumed reasonable, that presumption is overcome due to the increase proposed by NW Natural. Staff recommends determining the Test Year expense for Category B advertising by averaging in the expense for the years before and after the Base Year to smooth out the increase in the Test Year.[49] This modification results in a Test Year expense of $836,078, an adjustment of $139,085 to NW Natural's proposed Test Year Category B advertising expense of $975,163.[50]

Q. What is NW Natural's response to Staff's recommendation for the Category B customer communications expense?

A. NW Natural disagrees with Staff's proposed adjustment. The incremental Category B cost is associated with the Company's multi-language safety-related content, and will allow the Company to expand the reach of its safety messaging

[48] Staff/1700, Rossow/9.

[49] Staff/1700, Rossow/9-10.

[50] Staff/1700, Rossow/10.

beyond English and Spanish-speaking households to also reach customers that speak Chinese and Russian. If Staff's adjustment were to be adopted by the Commission, the multi-language advertising campaign would need to be significantly reduced or not developed at all. As I mentioned in Direct Testimony and further below, Spanish, Russian and Chinese speaking residents make up more than 36 percent of adults in some Portland Zip Codes (our largest service area). These non-native English-speaking residents could struggle to understand the many nuances of natural gas safety. Native language advertising performs better because it is created with the specific target audience in mind, using language and distinctions the audience understands resulting in better brain processing, connection and cultural relevance. While NW Natural can appreciate Staff's position with regard to reducing the cost impact to customers overall, NW Natural disagrees with Staff's proposed adjustment.

B. Coalition's Recommendations

Q. What is the Coalition's recommendation regarding Category B customer communications expense?

A. The Coalition recommends deducting all costs for advertising unrelated to preventing leaks from gas pipelines, which the Coalition estimates as being a reduction of $80,000 from NW Natural's Category B customer communications expense.[51] In other words, the Coalition recommends deducting the entire system-wide Test Year budget for safety-related (Category B) bill inserts and brochures for

[51] Coalition/200, Apter-Connolly/53-55.

customers, as NW Natural is only asking for $70,600 from Oregon customers.[52] In particular, the Coalition argues that Category B expenses for communications regarding use of ventilation fans in the kitchen, the safe operation and installation of gas appliances, operating gas appliances during a blackout, and regarding NW Natural's pipeline system should be removed from recovery.[53]

Q. Why does the Coalition claim that communications regarding the safe use of the natural gas system should not be recoverable expenses?

A. The Coalition argues that NW Natural is not legally mandated to provide these customer communications, and that these advertisements are promotional in nature.

Q. How do you respond?

A. I disagree. None of NW Natural Category B communications are promotional. At NW Natural**,** safety guides everything we do and keeping customers, employees and the communities we serve safe around natural gas – pipelines, house lines, meters and appliances -- are all considered under the intent of the law. Guidance is provided by law through Federal Regulations by the U.S. Department of Transportation, Pipeline and Hazardous Materials Safety Administration and RP1162 and governed and inspected by the Commission. Although I am not a lawyer, I disagree with the Coalition's position that the law has a limited focus only with regard to pipeline safety and preventing damages to the pipeline. The intent of the law is to protect people and property. Educating the public about natural

[52] NW Natural/3202, Beck (Company's response to UG 490 OPUC DR 337).

[53] Coalition/200, Apter-Connolly/53-55.

gas safety is essential. Advertising campaigns, guidelines, and community outreach help inform individuals about safe practices, proper use of equipment, emergency and prevention procedures, the signs of a gas leak and how to safely respond. The Commission's mission "is to ensure Oregonians have access to safe, reliable and fairly priced utility services that advance state policy and promote the public interest". Further, one of the Commission's guiding principles is to "ensure the safety, reliability and quality of essential utility services."[54] NW Natural understands these principles to encompass all safety education topics in the Public Safety Awareness Plan and Standard Practices document to ensure the customers and communities we serve know how to be safe around natural gas. The Commission regularly inspects the Company's Public Safety Awareness Plan to ensure compliance. NW Natural's Public Safety Awareness Plan was last inspected on October 3, 2023, where no issues or concerns were identified by the Commission Safety Staff.

V. ENROLLMENT IN BILL DISCOUNT PROGRAM AND INVESTMENT IN MULTI-LINGUAL OUTREACH

Q. The Coalition argues that NW Natural did not invest sufficient funds to advertise the bill discount program.[55] How do you respond?

A. I disagree with the Coalition's opinion. NW Natural deployed an extensive and comprehensive targeted, and multi-channel approach to advertising the bill

[54] https://www.oregon.gov/puc/about-us/pages/default.aspx.

[55] Coalition/300, Fain-Segovia Rodriguez-Daryanani/26-27.

discount program to customers. Examples of direct engagement where materials and marketing toolkits were shared include:

- More than 250 Community Based Organizations
- More than 100 School Districts in every NW Natural County (representing 835 schools)
- Community colleges and Headstart Agencies
- Over 40 County, Federal & State Agencies
- In-person events

Publications distributed:

- 65 Neighborhood Newsletters
- More than 100 City Homepages
- 95 library homepages
- 50,000 brochures distributed and 5,000 pre-launch program postcards distributed to schools and homebound Seniors

Redoubled and Data-informed outreach:

- Low-income communities with low bill discount program enrollment rates
- Schools with the highest rates of student eligibility for free and reduced meals
- Title 1 Schools

Other advertising

- Dedicated web section
- Produced radio spots

- TV Public Service Announcements
- Digital Ads
  - Delivered more than 1.6 million impressions
- NW Natural Customer communications
  - Five email communications
  - Six bill insert articles
  - Letter sent to all customers that were automatically enrolled

In my nearly 20 years with the Company, I have not seen a more comprehensive and wide-reaching approach to advertising a Company program. The positive results point to the successful execution of the Company's communication strategy, outreach and advertising efforts.

Q. The Coalition also argues that the methods NW Natural uses to advertise the bill discount program do not match the preferred method of outreach for customers.[56] Do you agree?

A. No, I do not agree. The assumptions by the Coalition are inaccurate. The Coalition references the Low Income Needs Assessment ("LINA") study for reporting preferred methods of outreach and awareness of the program. First, this statement is not valid because at the time of the LINA, the bill discount program did not exist. Second, and with the LINA in mind, the Company's 2023 communications plan ***did*** include advertising to customers through emails, electronic newsletters and bill inserts. Additionally, there is a permanent section

[56] Coalition/300, Fain-Segovia Rodriguez-Daryanani/26-27.

on the NW Natural website (https://www.nwnatural.com/account/bill-discount-program). All of the channels mentioned above represent the top three channels identified by the LINA.

Q. The Coalition claims that NW Natural's investment in multi-lingual outreach for the bill discount program is not justified because survey data show radio and TV advertisements are not effective for increasing awareness of the program.[57] What is your response?

A. Holistically, I do not agree with the Coalition's claims regarding multi-lingual advertising. The LINA is one data source, but there are many other sources to consider when developing communication and outreach plans. Moreover, to provide effective outreach, multiple channels need to be in play to meet customers where they consume media – TV, radio, community events, social media, etc.

- First, NW Natural's annual safety survey of customers (and general public) show that TV and radio are the number two and number four most important source for news and information, respectively.
- Second, the multi-language media proposal provided with my original testimony shows 79 percent of Spanish-speaking adults watch connected TV (streaming TV) and 85 percent use streaming audio.
- Third, 10.4 percent of households in Portland are Spanish speaking, which equates to over 479,000 adults. Additionally, 97 percent of Spanish-speaking households listen to AM/FM Radio.

[57] Coalition/300, Fain-Segovia Rodriguez-Daryanani/26-27.

- Fourth, Spanish, Russian and Chinese speaking residents make up more than 36 percent of adults in some Portland Zip Codes.

This data demonstrates that it would be irresponsible to not include TV and radio into the media mix and in native language to be effective and can produce better engagement by providing cultural nuance and context, emotional connection, and reduced misunderstandings, and building trust.

Q. Does this conclude your Reply Testimony?

A. Yes.

POLITICAL ACTIVITIES EXHIBIT 3300

REDACTED

June 4, 2024

EXHIBIT 3300- REPLY TESTIMONY – POLITICAL ACTIVITIES

Table of Contents

I. Introduction and Summary 1

II. Background Regarding Political Activity Expenses and Order No. 22-388 3

III. Staff's Recommendations 8

IV. The Coalition's Recommendations 10

I. INTRODUCTION AND SUMMARY

Q. Are you the same Kathryn M. Williams who presented Direct Testimony in this proceeding on behalf of Northwest Natural Gas Company dba NW Natural ("NW Natural" or the "Company")?

A. Yes, I presented NW Natural/1200, Williams.

Q. What is the purpose of your Reply Testimony in this proceeding?

A. The purpose of my Reply Testimony is to respond to the Opening Testimony of Paul Rossow on behalf of Staff for the Public Utility Commission of Oregon ("Commission"), as well as the Opening Testimony of Nora Apter of the Oregon Environmental Council ("OEC") and Meredith Connolly of Climate Solutions on behalf of the Coalition,[1] concerning NW Natural's political activity/lobbying expenses for the Test Year (November 2024 through October 2025).

Q. Please summarize your Reply Testimony.

A. In my testimony, I:

- Provide relevant background regarding political activity or lobbying expenses and direction from Commission Order No. 22-388 in the Company's most recent general rate case, docket UG 435, as it applies to this general rate case;
- Respond to Staff's recommendation regarding political activity/lobbying expenses; and

[1] The Coalition includes the Coalition of Communities of Color, Climate Solutions, Verde, Columbia Riverkeeper, Oregon Environmental Council, Community Energy Project, and Sierra Club.

- Respond to the Coalition's recommended adjustments for political activity/lobbying expenses;

Q. Do you include any exhibits with your testimony?

A. Yes, I am presenting the following exhibits:

- NW Natural/3301, Williams (Company's textual response to UG 490 Coalition DR 145).
- Confidential NW Natural/3302, Williams (Company's Confidential UG 490 Coalition DR 145 Attachment 1).
- Confidential NW Natural/3303, Williams (Company's job description of a certain employee of the Government Affairs team, provided as Confidential UG 490 Coalition DR 290 Attachment 4).
- Confidential NW Natural/3304, Williams (Company's job descriptions of the other employees of the Government Affairs team, provided as Confidential Amended Response to UG 490 Coalition DR 290, Confidential UG 490 Coalition DR 277 Attachment 2, Confidential UG 490 Coalition DR 277 Attachment 4, and Confidential UG 490 Coalition DR 290 Attachments 1-3 and 5-6).
- Confidential NW Natural/3305, Williams (Company's Confidential response to UG 490 Coalition DR 291).

II. BACKGROUND REGARDING POLITICAL ACTIVITY EXPENSES AND ORDER NO. 22-388

Q. Please summarize the Commission's direction regarding Government Affairs expense, and specifically regarding political activities in Order No. 22-388.

A. With respect to recording expense information related to political activities or lobbying, the Commission stated that, "[g]oing forward, we expect NW Natural to provide detailed expense information that clearly categorizes its [political] activity."[2] The Commission specifically noted that:

> NW Natural should be clear whether it is engaging, for example, primarily in an informational capacity in response to local government requests for assistance in developing and meeting climate policies, versus engaging with local governments with an intention to advocate against particular policies and develop support for others.[3]

Q. How has the Commission defined political activity or lobbying?

A. While I am not a lawyer, from the Company's review of available precedent, it appears that the Commission has not previously defined political activity or lobbying. However, the Commission cited the Federal Energy Regulatory Commission's ("FERC") 18 Code of Federal Regulations ("CFR") Section 367.4264 in Order No. 22-388 when it stated that the Commission's precedent that "utilities are not permitted to recover expenses associated with political lobbying"

[2] *In re Northwest Natural Gas Co., dba NW Natural, Request for a General Rate Revision,* Docket No. UG 435, Order No. 22-388 at 23 (Oct. 24, 2022).

[3] *Id.*

is "similar to FERC's regulations prohibiting political activities and lobbying."[4] Accordingly, as discussed in more detail below, the Company's accountants have informed me that NW Natural has used 18 CFR Section 367.4264 as guidance in determining political activities and lobbying.

Q. What is the FERC definition of lobbying?

A. The FERC guidance in 18 CFR Section 367.4264 describes the below-the-line (i.e., non-recoverable) FERC account 426.4, as follows:

> 426.4 Expenditures for certain civic, political and related activities. This account shall include expenditures for the purpose of influencing public opinion with respect to the election or appointment of public officials, referenda, legislation, or ordinances (either with respect to the possible adoption of new referenda, legislation or ordinances or repeal or modification of existing referenda, legislation or ordinances) or approval, modification, or revocation of franchises; or for the purpose of influencing the decisions of public officials, but shall not include such expenditures which are directly related to appearances before regulatory or other governmental bodies in connection with the reporting utility's existing or proposed operations.

Q. After the Commission issued its Order No. 22-388 in docket UG 435, what actions did the Company take to meet the Commission's going-forward expectation that NW Natural provide detailed expense information that clearly categorizes its political activities?

A. As discussed in my Direct Testimony,[5] the Company updated its time-tracking policy for political activities, or activities intended to influence a legislative body,

[4] *In re Northwest Natural Gas Co., dba NW Natural, Request for a General Rate Revision,* Docket No. UG 435, Order No. 22-388 at 22, n.70 (Oct. 24, 2022).

[5] NW Natural/1200, Williams/3-4.

through exception time reporting. Effective January 1, 2023, employees have been entering exception time into the Company's time tracking system, called "WorkForce," for time spent each working day on such activities. The Company created a "Time Charging Procedures – Political Activities" ("General Procedure") to help its employees with the exception time reporting function. A copy of the General Procedure is attached to my Direct Testimony as Confidential NW Natural/1201, Williams. The Company's employees have been trained on use of the General Procedure, which, as discussed in my Direct Testimony, provides detailed instructions for exception time reporting of political activities. Exception time is to be reported in half-hour increments daily, in the cost center identified in the General Procedure (Confidential NW Natural/1201, Williams). The General Procedure provides illustrative examples for use in exception time reporting and step-by-step screen shots of the "WorkForce" time entry system.

Q. Does NW Natural seek recovery of expense for political activities or lobbying in this rate case?

A. No. As I discussed in my Direct Testimony, the Company is not seeking recovery for these types of expenses, including incidental expenses like mileage related to meetings involving political activities, in the Test Year.[6]

[6] NW Natural/1200, Williams/2-7.

Q. What types of political activity/lobbying expenses did the Company exclude from its request for cost recovery?

A. Through discovery, the Company demonstrated that it time-tracks and directly allocates the costs incurred for political activities/lobbying to non-recoverable accounts. The Company's time tracking is provided in NW Natural/3301, Williams, which is a copy of the Company's narrative response to UG 490 Coalition DR 145, and Confidential NW Natural/3302, Williams, which is a copy of the Company's Confidential UG 490 Coalition DR 145 Attachment 1.

Q. The total Government Affairs Test Year expense is $1,725,922.[7] Does this include exception time?

A. No, the Company removed all exception time and related costs from this amount. As noted later in my Reply Testimony, the Company does not oppose Staff's recommended Oregon-allocated adjustment of $11,047 regarding an identified "104 lobbying transactions" recorded to cost elements titled "Meals and Entertainment" and "Business Travel."[8]

Q. How much did NW Natural remove from its request for cost recovery through exception time reporting

A. Confidential NW Natural/3302, Williams, shows, by summing the dollar amounts in Column (C) ("Val.in rep.cur."), that the Company removed $625,160 of Base

[7] Coalition/241-242, Apter-Connolly (the Company's response to UG 490 OPUC DR 343, including its Attachment 1).

[8] Staff/1700, Rossow/4.

Year expense from its request for cost recovery through exception time reporting in FERC Account 426.4.

Q. How would you describe the amount of Base Year expense removed from the Company's request for cost recovery through exception time reporting in FERC Account 426.4, compared with the historical allocation method used before 2023?

A. Noting that exception time reported $625,160 in the Base Year (2023), compared with $506,223 in 2021 and $592,226 (in 2022) using the previous historical allocation method ,[9] the exception time reporting under the General Procedure has provided us a higher level of confidence that we are and have been accurately reporting our lobbying and political activities to non-recoverable accounts. Of course, these dollar amounts provide snapshots of our lobbying and political activities that may vary from year to year. With that said, based on the exception time that we reported under the General Procedure in the Base Year, the Company is appropriately categorizing its lobbying and political activities to cost accounts that are not recovered from our customers.

[9] The Coalition's testifies that the Company "reports that for 2023, $775,673 was charged to FERC 426.4 (up from $506,223 in 2022)…." Coalition/200, Apter-Connolly/56. Actually, as shown in cited Exhibit Coalition/242, Apter-Connolly, $506,223 was charged-out in 2021 (not 2022) and $592,226 was charged-out in 2022.

III. STAFF'S RECOMMENDATIONS

Q. Did Staff analyze the Company's Government Affairs expense?

A. Yes. Staff reviewed the Company's Direct Testimony and issued 11 data requests, and also analyzed the Company's response to Standard Data Request No. 57.[10]

Q. Does Staff provide any guidance on which types of activity can fall under the political activity/lobbying category?

A. Staff states that political activities and lobbying can, but do not necessarily, include the following:

- Directly communicating with officials;
- Providing transportation for elected officials;
- Attending government conferences and expressing special interest views;
- Drafting special interest legislation and presenting it to a legislator for consideration;
- Providing support for elected officials on trade missions, by providing in kind services to special interest groups;
- Hosting receptions for congressional delegations; and
- Attempting to influence legislators and other public officials to introduce or support measures that favor some special interest.[11]

[10] Staff/1700, Rossow/4.

[11] Staff/1700, Rossow/3.

Q. How does the Company respond to Staff's list of activities that can fall under the political activity/lobbying category?

A. The Company views Staff's list of activities that can fall under the political activity/lobbying category as reasonable, and appreciates Staff's effort to provide greater specificity to stakeholders.

Q. Has the Company tracked as exception time the activities listed by Staff?

A. Yes. The Company tracks the activities listed by Staff as exception time through the General Procedure. Out of an abundance of caution, our exception time reporting likely has captured more than the items on this list. That time is recorded in a non-utility account, and the wages, compensation, and benefits/overheads sought for recovery in this rate case do not include the dollars associated with that tracked time.

Q. What does Staff recommend regarding adjustments for political activity/lobbying expenses?

A. Staff identified "104 lobbying transactions" recorded to cost elements titled "Meals and Entertainment" and "Business Travel," and recommends excluding 100 percent of those expenses, which in total equates to an Oregon Base Year allocated amount of $11,047.[12] Staff applied All-Urban Consumer Price Index (CPI) inflation factors of 2.7 percent and 2.0 percent in 2024 and 2025, respectively, resulting in an Oregon escalated Test Year adjustment to lobbying

[12] Staff/1700, Rossow/4.

expenses of $11,572.[13] Staff therefore recommends an adjustment of $11,572 for the Test Year.

Q. How does the Company respond to Staff's recommendation?

A. The Company does not oppose Staff's recommended adjustment.

IV. THE COALITION'S RECOMMENDATIONS

Q. What does the Coalition recommend regarding adjustments for political activity/lobbying expenses?

A. The Coalition recommends that the Commission "hold the Company responsible for failing to address the concerns raised by the Commission in Order No. 22-388 and previous Commission precedent"[14] by completely eliminating the Company's Test Year expense for employee salaries and office supplies and expense for the Government Affairs team, which is $1,725,922.[15]

Q. What is the rationale underlying the Coalition's recommendation?

A. The Coalition argues that: (1) NW Natural's policy for distinguishing exception time in the General Procedure is too narrow and does not include all political activities as defined in the FERC definition, 18 CFR § 367.4264; and (2) the Company's tracking mechanism fails to provide the detailed reporting of political activities as directed by the Commission in Order No. 22-388.[16] According to the Coalition, without *positive* reporting for time spent on utility activities, "stakeholders have no

[13] Staff/1700, Rossow/4.

[14] Coalition/200, Apter-Connolly/58.

[15] Coalition/200, Apter-Connolly/68-69.

[16] Coalition/200, Apter-Connolly/62, 68-69.

means by which to confirm employees are appropriately categorizing their time."[17] Without such "actual evidence" that the Company's employees are engaged in "properly recoverable activities," the Coalition argues that "the assumption should be that they are not."[18] For these reasons, the Coalition argues that NW Natural employees have undercounted the total hours that should have been billed below the line as political activity/lobbying costs.[19]

Q. With respect to the first point, the Coalition argues that NW Natural's policy is inconsistent with the Commission's direction in UG 435 and inconsistent with 18 CFR Section 367.4264 because the Company's policy does not specifically address lobbying for the purpose of influencing the decisions of public officials, and instead only applies to legislative activities. Is this true?

A. No. As illustrated in the General Procedure, one specific example of exception time tracking is **[BEGIN CONFIDENTIAL]** [redacted] **[END CONFIDENTIAL].**[20] This example is illustrative only, but clearly demonstrates that the Company is also tracking efforts beyond the legislative context through exception time.

[17] Coalition/200, Apter-Connolly/58.

[18] Coalition/200, Apter-Connolly/58.

[19] Coalition/200, Apter-Connolly/68-69.

[20] Confidential NW Natural/1201, Williams/3.

Q. The Coalition also argues that the Company has undercounted the number of hours (and the costs) of its employees engaging in political activities because it did not include hours and costs related to attempting to influence non-legislative public officials.[21] How do you respond?

A. The Company developed, implemented and is managing its General Procedure consistent with the Commission's holding reiterated in Order No. 22-388 that, "[u]nder this Commission's precedent, utilities are not permitted to recover expenses associated with political lobbying."[22] The Company reasonably describes "political lobbying" as time spent working on "political activities, or activities intended to influence a legislative body."[23] The actual definition of lobbying can differ across jurisdictions and we comply with each jurisdiction's requirements. Simply for reference, Webster's dictionary defines "lobbying" as "conduct[ing] activities aimed at influencing public officials and especially members of a legislative body or legislation."[24] The Company drafted and interprets the General Procedure to appropriately cover communications intended to influence "any member or employee of a legislative body, *or with any governmental official or employee who may participate in the formulation of legislation*."[25] As such, the General Procedure governs activities highlighted by the Commission, including

[21] Coalition/200, Apter-Connolly/67.

[22] *In re Northwest Natural Gas Co., dba NW Natural, Request for a General Rate Revision,* Docket No. UG 435, Order No. 22-388 at 22 (Oct. 24, 2022).

[23] NW Natural/1200, Williams/3.

[24] https://www.merriam-webster.com/dictionary/lobbying.

[25] NW Natural/1200, Williams/4 (emphasis added).

"efforts to influence city or county officials, such as the communications with Multnomah County officials and the communications with Milwaukie city councilors"[26] and "engaging with municipalities or other jurisdictions regarding topics such as local climate change initiatives."[27] Importantly, the General Procedure governs all sides of political activity and lobbying, such as when the Company submits support of the Commission's budget to legislators.

Under the General Procedure, political lobbying does not include communications with "judicial, executive or administrative body (e.g., Department of Environmental Quality, Department of Energy, Treasury, school boards, housing authorities, sewer and water districts, zoning boards), whether elected or appointed." The Company followed the language in FERC Account 426.4 that political lobbying activities "shall not include such expenditures which are directly related to appearances before regulatory or other governmental bodies in connection with the reporting utility's existing or proposed operations."[28] The Company also used as guidance the Commission's Order No. 22-388, which did not hold that communications "with judicial, executive or administrative body …, whether elected or appointed" are political lobbying activities that the Company should exception time report. Just because the Company holds communications with "judicial, executive or administrative body (e.g., Department of Environmental

[28] 18 CFR § 367.4264.

Quality, Department of Energy, Treasury, school boards, housing authorities, sewer and water districts, zoning boards), whether elected or appointed" as something other than political activities/lobbying, does not necessarily mean that the Company always treats such communications as recoverable. As noted later in my Reply Testimony, the Company does use other below-the-line cost centers to track time and activities for which it does not seek cost recovery.

Q. How do you respond to the Coalition's testimony about the April 16, 2024, public hearing on NW Natural's rate increase?

A. The Coalition suggests that the Company "choreographed" testimony provided by "numerous organizations, including homeowners and representatives of chambers of commerce … in favor of NW Natural's proposed LEA [line extension allowance]," and that any such activities constitute political lobbying that should not be paid by ratepayers.[29]

For the record, NW Natural did correspond with organizations regarding participation in the public hearing on April 16, 2024, and/or submitting public comments for this rate case, UG 490. It is important that these stakeholders are aware of the regulatory process available to them in this rate case and the positions being taken by parties that may affect them, their businesses and their constituents. It is with these ideals in mind that NW Natural proactively undertakes informational engagement and education with organizations such as those identified by the Coalition.

[29] Coalition/200, Apter-Connolly/62-63.

Although NW Natural believes that such correspondence is part of its core utility functions for which ratepayer support would be appropriate, the Company is not seeking cost recovery in this rate case for any of its time or activities related to corresponding with any of those organizations regarding participation in the public hearing on April 16, 2024, and/or submitting public comments for this rate case, UG 490. The Company has booked such time and activities to a non-utility (i.e., below-the-line) Civic cost center (FERC account) for which it does not seek cost recovery. The Company does not agree with the Coalition that such communications are political lobbying, and, out of an abundance of caution, has decided to book its time associated with such activities to a non-recoverable account.

Q. The Coalition also argues that NW Natural undercounted the number of hours (and the costs) of its employees engaging in political activities because "it must have included time beyond *responding* to public official inquiries."[30] How do you respond?

A. As stated in my Direct Testimony, the Company views responding to informational requests from public officials to be a core utility function that is appropriate for recovery.[31] The Commission made clear in Order No. 22-388 that engaging "*primarily* in an informational capacity in response to local government requests for assistance in developing and meeting climate policies" was distinct core utility

[30] Coalition/200, Apter-Connolly/67 (emphasis added).

[31] NW Natural/1200, Williams/5.

work separate and distinct from political activity/lobbying.[32] The Commission also did not find that anything other than "responding" to public officials was lobbying. Indeed, the Commission agreed with NW Natural that "communications intended purely to ensure that public officials are receiving routine information about the company and the gas system do not qualify as lobbying expenses."[33] In certain cases, routine provision of information about the Company and the gas system may be initiated by the Company, while in others, it may be initiated by the local government officials.

The critical factor is the employee's ***intent***. If the employee's *intent* is to influence any member or employee of a legislative body, or with any governmental official or employee who may participate in the formulation of legislation, the employee tracks and charges out of the utility the time associated with those intended efforts. If the employee's *intent* is not to influence, but rather provide information to elected officials or their staff or the general public regarding NW Natural as a utility, then the employee treats the time associated with engagement as a core utility function that is not exception time reported.

And, importantly, an employee does not determine his or her intent in isolation of other employees. Employees are trained on the General Procedure, have been reviewing their exception time together, and discuss hypothetical and actual scenarios, and whether and how they should be exception time reporting

[32] *In re Northwest Natural Gas Co., dba NW Natural, Request for a General Rate Revision,* Docket No. UG 435, Order No. 22-388 at 23 (Oct. 24, 2022) (emphasis added).

[33] *Id.*

under the General Procedure in those instances. This helps those employees calibrate their exception time tracking work with each other and promotes consistency across the employees. In addition, the Accounting department has reviewed exception time reporting several times in 2023, and we have made adjustments as appropriate. And, when a situation arises that arguably may or may not be time spent on political activity/lobbying, we err on the side of caution and exception time report it so customers do not pay for that time.

Q. With respect to the second point, the Coalition argues that the Company's current tracking mechanism "reveals only what the *company* believes is lobbying, leaving no means by which the Commission or stakeholders can confirm whether NW Natural's employees have properly characterized their time."[34] Is the Coalition correct?

A. No. The Company provided an explanation as to why many of its Government Affairs activities are core utility activities and not political activities or lobbying, and also demonstrated that it allocates costs for political activities and lobbying outside the utility.

To the extent that the Coalition is suggesting that NW Natural needs to provide detailed time tracking for all of its core utility functions as well, the Company opposes such a proposal. To NW Natural's knowledge, no utility tracks time for its core utility activities, and to do so discriminately here would be a sharp

[34] Coalition/200, Apter-Connolly/67.

departure from prior Commission practice, a major burden on the Company's employees and would increase costs to customers.

Q. The Coalition further argues that NW Natural's exception time tracking mechanism does not contain enough information to clarify the nature of communications between NW Natural employees and government officials.[35] Did the Company provide a detailed breakdown of the lobbying expenses in FERC Account 426.4 that it claims were excluded from this case?

A. Yes. As shown in Confidential NW Natural/3302, Williams, the Company has provided 2,263 entries of exception time reporting to FERC Account 426.4, with each entry identifying the number of hours exception time reported, the dollar value of that exception time, the cost center and FERC indicator, notes and the personnel number. The Company has provided clarity about the identity of the entity to which it is lobbying, using the naming convention provided in the General Procedure for transparency, consistency and simplicity/efficiency. In some cases, that means identifying whether the legislative body being lobbied is federal, state or local. In other instances, the time is "general" lobbying of something other than a particular jurisdiction. Later in my Reply Testimony, I will address instances in which the exception time reporting is blank in the notation field.

[35] Coalition/200, Apter-Connolly/67.

Q. As an example of alleged overcounting, the Coalition points to the time split of [BEGIN CONFIDENTIAL] [redacted] [END CONFIDENTIAL].[36] Is it unusual for members of the Government Affairs team to not perform lobbying activities 100 percent of the time?

A. No. In fact, no member of the Government Affairs team performs lobbying activities 100 percent of the time, and excepted "outside" time does vary from employee to employee. That is because each member of the Government Affairs team has two roles in their engagement with jurisdictions and performs his or her duties uniquely from other members of the Government Affairs team. In many cases, their primary role is as a subject matter expert for the utility, where they provide information to the local jurisdictions regarding NW Natural as a utility and any utility-related data they may need. For example, if a jurisdiction is working on a climate action plan, they might ask the Company for its emissions data to help inform the development of their plan. Similarly, a municipality could be considering budget issues and raising funds unrelated to climate issues. Core utility engagement includes responding to information requests from the local jurisdictions to provide input to inform the development of climate plans, sharing the Company's data, and helping local jurisdictions to better understand the context for their local climate planning initiatives. When local jurisdictions come to NW Natural with questions about the State of Oregon's climate goals, and the potential implications of natural gas bans,

[36] Coalition/200, Apter-Connolly/67-68.

it is incumbent on NW Natural to respond. Members of the Government Affairs team are responsible for providing any data requested, including the costs to customers. NW Natural considers activities in this role as a subject matter expert to be a core utility service and appropriate for cost recovery. No exception time reporting is required in these circumstances. Confidential NW Natural/1201, Williams, provides examples of core utility functions.

As part of their role, members of the Government Affairs team also act as advocates for the Company. In the advocate role of intending to influence a legislative body, the Company allocates that time to non-recoverable cost centers. Exception time reporting is required in these circumstances. Confidential NW Natural/1201, Williams, provides examples of activities intended to influence a legislative body.

It Is important to remember that only a portion of these employees' time is spent working with local and state jurisdictions. Much of their work is also focused on the utility, by helping to shape utility policies, practices and programs based on their knowledge of local and state issues, completely unrelated to lobbying or contact with public officials. For example, members of the Government Affairs team regularly spend time tracking ordinances and legislation around the State and the country (e.g., easement matters, privacy laws) in order to understand the potential impact on the Company if such ordinances and legislation were to apply to the Company. That time spent monitoring local, regional, state and federal developments does not equate to taking a position and does not constitute political activities/lobbying.

Q. The Coalition provided an exhibit containing the LinkedIn page for [BEGIN CONFIDENTIAL] [redacted] [END CONFIDENTIAL]. How do you respond?

A. As an initial matter, I would note that a LinkedIn page is not necessarily indicative of all of the job functions an individual may perform. A LinkedIn page is not an official Company job description of the position, but rather a business and employment-focused social media platform for members to network with other professionals. However, even considering the information on that page, the description of **[BEGIN CONFIDENTIAL]** [redacted] **[END CONFIDENTIAL]**.[37] These responsibilities are core utility functions appropriate for rate recovery.

Q. Can you elaborate further on the core utility functions that are included in [BEGIN CONFIDENTIAL] [redacted] [END CONFIDENTIAL] role?

A. Yes. Confidential NW Natural/3303, Williams, is a copy of the employee's job description (provided as Confidential UG 490 Coalition DR 290 Attachment 4). In 2023, NW Natural charged 48.9 percent of the employee's salary above the line, to be recovered from customers.[38] The employee develops policy guidance for the Company on specific and complex strategic business and environmental

[37] Confidential Coalition/243, Apter-Connolly.

[38] NW Natural/3305, Williams (Company response to UG 490 Coalition DR 291).

issues. In addition, the employee monitors activity and prepares reviews for Company subject-matter experts and managers on proposed legislative changes and the status of pending legislation that may have an impact on Company operations. The employee also creates and presents information on legislative and political activities for internal groups such as company senior management and internal subject matter experts. Generally speaking, the employee analyzes and evaluates complex utility issues and recommends strategies to minimize Company risks. In many cases this work may involve leading a team effort to develop work plans and complete policy analysis, and bringing recommended policies through internal review process. Through briefings and engagement with all related company departments, the employee ensures that Company decisions take into account local and regional policies as well as Company business interests.

Q. On April 29, 2024, about 10 days after it filed its Direct Testimony and as the Company was preparing its Reply Testimony due June 4, 2024, the Coalition served 66 data requests on the Company, 22 of which related to "Lobbying/Government Affairs." Five of those data requests, UG 490 Coalition DRs 276-277 and 290-292, sought job descriptions and other information about certain employees. How did the Company respond to those five data requests?

A. The Company's responses provided the requested information. Confidential NW Natural/3303-3304, Williams, are the requested job descriptions and other requested information related to members of the Government Affairs team. As

expected, the descriptions portray a mixture of core utility functions, with associated costs properly recovered from customers, as well as activities intended to influence a legislative body, with associated costs properly not recovered from customers. The job descriptions translate into many areas of core utility work performed by the Company's Government Affairs team, including:

- Developing, implementing and quality testing the General Procedure.
- Exception time reporting, in compliance with the General Procedure.
- Answering data requests in rate cases.
- Addressing operational issues as a conduit for community groups.
- Involvement in the Company's Incident Command Team on matters such as the impact of severe weather events on our customers, and related communication and coordination with other utilities regarding gas system resiliency and reliability during those events.
- Coordination with regional utility partners on efficiency and reliability commitments, especially during weather events.
- Working with local governments and their public works engineers on permitting processes.
- Safety issues, such as houseless encampments that are potentially dangerous to work crews and too close to utility infrastructure.
- Tracking various municipal planning efforts, such as right-of-way changes.
- Participation in low-income rate assistance efforts.

- Outreach to unhoused populations and representative community groups about Company projects that may impact them.
- Outreach to homeowners, renters, and businesses about Company projects that may impact them.
- Acting as conduits between Company departments and municipalities' economic development departments regarding gas service capacity to new residential, commercial and industrial developments.
- Communicating with customers and the general public about gas safety at community safety events.
- Participating in trainings (e.g., about the Company's Code of Conduct and safety-related matters).

Q. After taking into consideration all of the core utility functions performed by the Company's Government Affairs team, how much time did that team exception time report in 2023?

A. As I indicated earlier, it varied depending upon the member of the Government Affairs team. Exception time reported in 2023 for the Government Affairs team accounted for 51.1 percent, 38.2 percent, 34.3 percent, 30.7 percent, 26.5 percent, 22.7 percent, 7.3 percent and 4.3 percent of the various individuals' time.[39] As I noted earlier, while these percentages (and their associated dollar amounts) do provide snapshots of our lobbying and political activities that will vary significantly year to year, the exception time reporting under the General Procedure has

[39] NW Natural/3305, Williams (Company response to UG 490 Coalition DR 291).

provided us a higher level of confidence that we are and have been accurately reporting our lobbying and political activities to non-recoverable accounts.

Q. Do you have any further comments regarding the Company's General Procedure and use of exception time tracking?

A. The Coalition presumes bad faith by the Company in the Coalition's recommendation that, without "actual evidence" of positive time reporting, the Commission should assume that the Company's Governmental Affairs employees "are not" working at all on core utility functions. The implication that Company employees are falsifying their time sheets[40] is absurd and wholly unsupported. These are professionals whose actions – including exception time reporting – are governed by a Company Code of Conduct. The Coalition's "scorched-earth" tactic of proposing to disallow all costs of NW Natural's Government Affairs department flies in the face of the Commission's awareness in Order No. 22-388 (at page 24) that "some proportion of the department's work involves informational engagement and education for local governments for which ratepayer support is appropriate." As an officer of the Company, I personally have reviewed reports summarizing exception time reporting by our employees, I have had numerous discussions with our employees about their exception time reporting and the imperative that it be done so accurately and completely, and I have talked with key Company

[40] For example, the Coalition asserts that the Company "continues to evade attempts by the Commission and stakeholders to ensure the company does not charge ratepayers for its promotional and lobbying activities." Coalition/200, Apter-Connolly/58. The Coalition also calls on the Company "to ensure that the utility is not padding some of its expense since the Commission removed a portion of its government affairs budget in Order No. 22-388." Coalition/200, Apter-Connolly/69.

employees about my own exception time reporting. Based on my first-hand knowledge and careful review, I believe that our employees are appropriately exception time reporting their activities working on political activities/lobbying separate from their core functions.

Q. The Coalition also notes that that certain entries in the exception time reporting narratives are blank. How do you respond?

A. Yes, there are instances in which the "Notes" field in the exception time report is "blank."[41] While a blank description lacks detail that is required in our policy, it is not indicative of a lack of exception time tracking. Rather, it is evidence that employees did track their time (and specifically to the political activities cost center). As such, it should not be a factor in determining a disallowance to the Company's request. While the blank notes should have no bearing on cost recovery, we will continue to educate our employees about exception time reporting, review exception time entries and make adjustments as appropriate, and counsel our employees about such adjustments. To penalize the only utility in Oregon that is so robustly exception time reporting its lobbying activities to my knowledge, because of "blank" notes in exception time reports, by completely eliminating the cost of the Company's entire Government Affairs department would prevent the Company from being able to recover its legitimate and reasonable costs of providing utility service to our customers. It is my hope that the Commission acknowledges the Company's substantial efforts to comply with the

[41] Coalition/200, Apter-Connolly/58 and 65.

Commission's expectations,[42] recognizing that the Company commits to continuing to review and refine its General Policy and how our employees implement it.

Q. The Coalition's testimony references a single email from a Government Affairs employee to an employee of the City of Portland regarding a concert to support its assertion that the Company should also record non-exception time.[43] How do you respond?

A. As I have already explained at length, the Company disagrees with the Coalition's proposal to require the Company to track non-exception time. On occasion, the Company interacts with public officials in informal settings—such as lunch, coffee, or even a concert. Connecting outside of an office setting is common in the business world, and this particular communication regarding a concert does nothing to support the Coalition's case that the entire cost of the Company's Government Affairs department should be disallowed for recovery.

Q. Does this conclude your Reply Testimony?

A. Yes.

I. INTRODUCTION AND SUMMARY

Q. Are you the same Brody J. Wilson and Nikki R. Sparley who provided Direct Testimony on Northwest Natural Gas Company's dba NW Natural ("NW Natural" or "the Company") uncollectible expense?

A. Yes, we presented NW Natural/1300, Wilson-Sparley.

Q. Have you reviewed the Opening Testimony regarding the Company's uncollectible expense?

A. Yes, we reviewed the Opening Testimony of Public Utility Commission of Oregon Staff ("Staff") witness Charles Lockwood and Oregon Citizens' Utility Board ("CUB") witness John Garrett addressing the Company's uncollectible expense.

Q. Please summarize Staff's and CUB's Opening Testimony as it relates to the Company's uncollectible expense.

A. Staff and CUB both criticize NW Natural's forecast approach of taking the uncollectible rate from docket UG 435 and making several relevant and timely modifications to account for factors that the Company expects to affect the rate in the Test Year.[1] Staff criticizes each of the modifications the Company made to arrive at a forecasted uncollectible rate for the Test Year.[2] Staff proposes to calculate the uncollectible rate using a three-year historical average, which it claims is the Commission's long-standing policy,[3] and Staff proposes an

[1] NW Natural/1300, Wilson-Sparley/11-12.

[2] Staff/1200, Lockwood/5-17.

[3] Staff/1200, Lockwood/18-19.

approximately $2.8 million[4] decrease in expense to reflect an uncollectible rate of 0.182 percent.[5] CUB, on the other hand, recognizes that the three-year historical average may not be representative of the future.[6] While CUB specifically criticizes two of the Company's proposed modifications to forecast the uncollectible rate,[7] CUB does not propose a specific adjustment or calculation methodology.

Q. Please summarize your Reply Testimony.

A. NW Natural urges the Commission to adopt the uncollectible rate of 0.491 percent as proposed in our Direct Testimony because neither Staff nor CUB provide reliable data that demonstrate a lower amount is reasonable or any reason to ignore the current economic, regulatory, and policy environment affecting uncollectible amounts. First, the three-year historical average approach to calculating the uncollectible rate is not a long-standing Commission policy as Staff claims. Second, even if using a three-year historical average were the Commission's preferred policy, it should not be applied in this case because the historical period includes effects of the COVID-19 pandemic and several other significant changes, which will cause the uncollectible rate to remain higher than pre-pandemic levels and volatile over the next several years. Staff and CUB do

[4] Staff's Opening Testimony stated Staff's adjustment as $2.6 million. See Staff/1200, Lockwood/20. However, Staff confirmed in Staff Response to NW Natural Data Request No. 9, Exhibit NW Natural/3401, Wilson-Sparley, that this amount contained a typo and Staff's true recommended adjustment results in a $2.8 million decrease.

[5] Staff/1200, Lockwood/4, 19. As discussed later in this testimony, Staff's adjustment uses outdated numbers that the Company has since corrected.

[6] CUB/200, Garrett/5.

[7] CUB/200, Garrett/6-7.

not contest this point. Third, Staff's and CUB's criticisms of the factors the Company used to project the Test Year uncollectible rate are unfounded. Although they are necessarily estimates, the Company's projections are reasonable and consistent with data available to date.

Q. Do you include any exhibits with your testimony?

A. Yes, we are presenting the following exhibits: NW Natural/3401, Wilson-Sparley (Staff Response to NW Natural Data Request No. 9), and NW Natural/3402, Wilson-Sparley (NW Natural Response to CUB Data Request No. 14)[8].

Q. Before responding to Staff's and CUB's arguments, please provide an overview and update regarding the uncollectible rate data that will be discussed in your Reply Testimony.

A. The three-year historical average for the most recent three-year period from January 1, 2021 to December 31, 2023 is 0.220 percent.

As NW Natural explained in response to CUB Data Request 14 (NW Natural/3402,Wilson-Sparley), our Opening Testimony incorrectly reflected the rate for October 2020 to October 2022 (0.182 percent), not October 2021 to October 2023 (0.242 percent). The 0.220 percent figure provided above uses the more recent time frame (2021-2023) but relies upon updated information through December 2023 that was not available when we filed Direct Testimony. We note that Staff recommends using the three-year historical average for 2021 to 2023,

[8] The Attachment to this data request was provided as CUB/202, Garrett. Therefore, NW Natural provides only the narrative portion of the response in this exhibit.

which it states is 0.182 percent based on NW Natural's Direct Testimony,[9] but in light of the updated information provided above, we understand that Staff's recommended rate may be 0.220 percent.

In addition, CUB testifies that the Company's 2023 uncollectible rate was 0.284 percent,[10] which reflects the rate for January 1, 2023 to October 31, 2023. However, the uncollectible rate for January 1, 2023 through December 31, 2023 was 0.250 percent. The uncollectible rate for March 1, 2023 to March 31, 2024 is 0.260 percent, and we will provide another update with the most recent information available in our Surrebuttal Testimony.

II. RESPONSE TO STAFF AND CUB

Q. What is the basis for Staff's recommendation to use the three-year historical average?

A. Staff states that the Commission's "historic precedent" is to use a three-year historical average of the uncollectible rate.[11]

Q. Does CUB comment on the method for calculating the uncollectible rate?

A. Yes, CUB frames the three-year historical average as the Commission's "standard method," though it notes that effects of the pandemic may make this approach less reliable for the Test Year.[12]

[9] Staff/1200, Lockwood/19.

[10] CUB/200, Garrett/5.

[11] Staff/1200, Lockwood/18-19.

[12] CUB/200, Garrett/7.

Q. Do you agree that the three-year historical average is established Commission policy?

A. No, the Commission has not adopted a policy or standard method for calculating the uncollectible rate for a utility's revenue requirement, and our understanding is that there are no Commission orders or rules prescribing the method for the uncollectible expense. Staff provided four examples of uncollectible expense calculations in past utility rate cases.[13] However, as Staff acknowledges,[14] only two of the examples use a three-year historical average to calculate the uncollectible rate.[15] The other two examples rely on a four-year average and a two-year average.[16] Additionally, both of the Commission orders Staff cites as examples of a three-year historical average involved stipulations where the parties agreed to use the three-year historical average to calculate the uncollectible rate. But our understanding is that the Commission's orders adopting the stipulations do not indicate any intent to adopt the three-year historical average as the standard method to be used in all future rate cases. Therefore, we disagree with Staff and CUB that the three-year average is a "historic precedent" or "standard method" of the Commission.

[13] Staff/1200, Lockwood/3.

[14] Staff/1200, Lockwood/4.

[15] *In the Matter of Avista Corp.*, Docket No. UG 246, Order No. 14-015 at 2-3 (Jan. 21, 2014); *In the Matter of Avista Corp.*, Docket No. UG 186, Order No. 09-422, App. A at 4 (Oct. 26, 2009).

[16] *In the Matter of Idaho Power Co.*, Docket No. UE 167, Order No. 05-871, App. A at 4 (Jan. 28, 2005); *In the Matter of Cascade Nat. Gas Corp.*, Docket No. UG 287, Order No. 15-412, App. A at 2 (Dec. 28, 2015).

Q. Why does Staff contend that the three-year historical average is appropriate for this case?

A. Staff implies that the three-year average is reasonable for the Test Year because, historically, the three-year average "smooth[s] out year-over-year variances."[17]

Q. Does CUB agree that the three-year historical average is appropriate?

A. CUB states that the three-year historical average would be preferable to the Company's approach but questions whether it is representative of the future given the pandemic-related impacts during the period covered by the historical three-year average.[18]

Q. Why does NW Natural believe that the three-year historical average for the years 2021 to 2023 is not representative of the Test Year uncollectible rate?

A. As we explained in our Direct Testimony, this three-year period contains significant fluctuations in the economy due to the COVID-19 pandemic and regulatory and policy changes that are likely to have an effect on the uncollectible rate.[19] While the worst of the COVID-19 pandemic had subsided by 2023, there still exist lingering economic pressures that have pushed the 2023 uncollectible rate higher than the three-year historical average of 0.220 percent, resulting in a total uncollectible rate for 2023 of 0.250 percent.[20] In addition to these pressures on the economy, the Division 21 rule updates impact the way that overdue accounts

[17] Staff/1200, Lockwood/19.

[18] CUB/200, Garrett/7.

[19] NW Natural/1300, Wilson-Sparley/2-3.

[20] NW Natural/1300, Wilson-Sparley/3.

are handled, which supports the projection that the uncollectible rate will continue to increase.

Q. Staff indicates that the three-year historical average approach typically tracks the overall trend.[21] Is that the case for the years 2021 through 2023?

A. No. As we discussed earlier, the historical average (0.220 percent) is lower than both the actual rate for the 2023 calendar year (0.250 percent) and the rolling 12-month rate through March 2024 (0.260 percent). An historical average may produce an accurate projection when the uncollectible rate is stable year-to-year. However, as discussed throughout this testimony, there are multiple factors that have made the current uncollectible rate volatile and likely to remain that way, making Staff's three-year historical average approach unreliable for use in this case.

Q. Has the Company continued to witness the uncollectible rate increase?

A. Yes. The current 12-month average rate from March 1, 2023 to March 31, 2024 is 0.260, which is higher than the three-year historical average for January 1, 2021 through December 31, 2023 of 0.220 percent. Moreover, the uncollectible rate fluctuates over the course of the year, and NW Natural expects that the uncollectible rate will continue to climb as we get later into the year. Specifically, because NW Natural is a seasonal business, it receives higher revenue in the winter than in summer. However, accounts that become overdue are not written off as uncollectible until months later. Because the uncollectible rate is expressed

[21] Staff/1200, Lockwood/19.

as a percentage of revenue, the uncollectible rate begins to climb as the weather gets warmer and the Company's seasonal revenues begin to decrease. Due to this pattern, the current rolling 12-month uncollectible rate will almost certainly be higher than the current rate once winter uncollectible accounts are written off.

Q. Turning to NW Natural's proposal, what factors has the Company identified that are likely to affect the uncollectible rate?

A. In our Direct Testimony, we provided six modifications based on conditions we expect to affect the uncollectible rate that should be accounted for in forecasting the uncollectible rate for the Test Year.[22] Those modifications relate to lingering pandemic economic conditions, residential deposits, changes to the Division 21 rules and the collections process, and the end of the arrearage management program. Specifically, the Company proposes the following calculation:

Baseline Uncollectible Rate 2017-2019	0.097%
Weaker Economic Conditions	0.100%
Deposits No Longer Collected	0.137%
Division 21: Temperature/Weather/Wildfire/AQI/Shortened Day	0.029%
Division 21: Customer Notice Change 15 to 20 Days	0.007%
Collection Agency Reduced Recoveries	0.071%
Discontinued Arrearage Management Program	0.050%
	0.491%

[22] NW Natural/1300, Wilson-Sparley/12.

Q. Please summarize Staff's and CUB's testimony regarding the Company's proposed modifications to the uncollectible rate.

A. Staff took issue with each of the Company's six modifications. Specifically, Staff was unconvinced that economic conditions will lead to increasing uncollectible accounts.[23] Staff criticized the Company's modification relating to residential deposits, arguing that the Company had not demonstrated the connection between the end of collecting deposits and an increase in delinquent accounts.[24] Staff also argued that the Division 21 rules changes were made to increase customer protections, and Staff does not understand the Company's reasoning that these protections would cause an increase in uncollectible accounts.[25] Staff further criticized the Company's modification to the uncollectible rate based on the end of the arrearage management program.[26]

CUB critiqued two modifications: the Company's modification based on the Division 21 rules' increased notice period and the Company's modification based on lingering pandemic effects on the economy, but did not make a specific recommendation for the uncollectible rate.[27]

[23] Staff/1200, Lockwood/7.

[24] Staff/1200, Lockwood/9.

[25] Staff/1200, Lockwood/12.

[26] Staff/1200, Lockwood/15.

[27] CUB/200, Garrett/7.

A. Economic Conditions Modification

Q. Staff argued that while the economy is weaker, it "is not in a technical recession today," and Staff states the Company has not justified the economic impact modification to the uncollectible rate.[28] How do you respond?

A. While it is true that Oregon is not in a technical recession, we disagree with Staff that economic conditions do not justify a modification to the uncollectible rate. The Company reviewed economy recovery data for the region, and Oregon specifically, to determine that economic conditions in Oregon have not recovered as swiftly or as robustly as in other areas of the country or other parts of the Company's service territory. For example, Oregon has experienced two consecutive quarters of employment loss.[29] Oregon's unemployment rate in March 2024 was 4.2 percent.[30] This number is high relative to the U.S. as a whole, which was at 3.8 percent unemployment in March 2024.[31]

Further, data support concern surrounding Oregon's increasing unemployment insurance initial claims, declining exports, and depressed housing market suffering from limited sales activity, higher mortgage rates, and ongoing affordability issues. Oregon exports were down 19 percent through the 12 months

[28] Staff/1200, Lockwood/6-7.

[29] State of Oregon Employment Dept., *Oregon's Nonfarm Payroll Employment Rises by 4,900 in April* at 1, News (May 15, 2024) (available at https://www.qualityinfo.org/documents/20126/110739/Employment+in+Oregon/443acc10-b64a-e9d5-2f48-988e1e0d45df?version=1.141).

[30] *Id*.

[31] *Id*.

ending in February 2024, led by a decline of $3.4 billion in semiconductor exports, which made up approximately 32 percent of exports.[32] Of the 107 goods-exporting industries in Oregon, 64 percent saw exports decline over the past 12 months ending February 2024.[33] In addition, new listings of homes for sale and closed sales continue to decline in the first quarter of 2024 across Oregon and the Portland metro area, while total listing time on the market increased to about 90 days in both areas.[34]

Given the stagnation in opportunities and growth, Oregon has not fully recovered from the pandemic and continues to experience economic pressures in a variety of industries. Staff does not provide evidence to dispute the ongoing economic downturn experienced by Oregon residents, instead arguing that Oregon is not in a "technical recession today."[35] However, the data demonstrate that a significant number of Oregon industries are still plagued by a stagnated economy.

[35] Staff/1200, Lockwood/6.

Q. Staff additionally argues that the Company's economic conditions modification overstates the likely uncollectible rate because it relies on data from periods of more significant economic downturn such as 2001.[36] How do you respond?

A. The Company acknowledges that the current conditions are different from these previous periods of economic turmoil and that its modification is necessarily an approximation. That said, the Company believes its proposal is reasonable. However, even if the Company's modifications were overstated, the appropriate response would be to propose a lesser modification—not to make no modification to the forecasted uncollectible rate to reflect expected economic conditions. There is no dispute that economic conditions in the Test Year are likely to differ significantly from the economic conditions in 2017 to 2019, which is the period used to establish the baseline uncollectible rate.

Q. Does Staff raise any other concerns regarding the economic conditions modification?

A. Yes, Staff criticized the Company's process for calculating the 0.10 percent economic conditions modification.[37] Specifically, in our Direct Testimony, we explained that NW Natural found the average of uncollectible rates during recessions was 0.40 percent, which is 0.15 percent higher than uncollectible rates in non-recessionary periods.[38] The Company reasoned that if the economy were

[36] Staff/1200, Lockwood/8.

[37] Staff/1200, Lockwood/6-7.

[38] NW Natural/1300, Wilson-Sparley/12.

in a recession, it would expect to see rates in line with this average—that is, approximately 0.15 percent higher than non-recession years. However, because the economy is not in a technical recession though it is struggling, the Company did not apply the full 0.15 percent modification and instead adjusted this modification down to 0.10 percent.[39] Staff criticizes the Company's methodology stating that this modification "assumes conditions that raise the current uncollectible rate unrealistically."[40] Although Staff acknowledges the Company did not apply the full 0.15 percent but instead reduced the amount of this modification to 0.10 percent, Staff questions the Company's justification for this reduction.[41]

Q. How did the Company conclude the reduction from 0.15 percent to 0.10 percent was necessary?

A. The Company acknowledges that this calculation is necessarily an estimate to account for the present, unique economic environment. However, the Company determined that applying the full amount of the recession average was inappropriate given that we are not in a technical recession. The Company conservatively reduced the percentage by one-third to appropriately capture the likely rise in uncollectible rates due to economic pressures.

[39] NW Natural/1300, Wilson-Sparley/12-13.

[40] Staff/1200, Lockwood/8.

[41] Staff/1200, Lockwood/8-9.

Q. Regarding the economic conditions modification, CUB commented that while the Company's data indicate customers are having a harder time affording gas bills, the Company is seeking to increase rates for these customers.[42] How do you respond?

A. CUB does not appear to contest that economic conditions will lead to a higher uncollectible rate in the future. That said, the Company is aware that costs are rising for customers in many areas of daily life, energy costs included. The Company works to keep rates fair, just, and reasonable while also setting the uncollectible rate at a level that will allow the Company to meet its obligation to offer safe and reliable service at a time that its costs are also rising.

As indicated in the Direct Testimony of Cecelia Tanaka, NW Natural has prepared and continues to improve on its equity analysis.[43] NW Natural continues to analyze and review the tools available to help mitigate rate changes and energy burden, thus helping to insulate the impacts of rate changes on customers most in need.

[42] CUB/200, Garrett/7.

[43] NW Natural/200, Tanaka/12-13.

B. Deposits No Longer Collected Modification

Q. The Company included this modification to address the fact that the Company is no longer collecting deposits on any customer accounts.[44] Does Staff agree with the Company's modification?

A. No, Staff criticizes the Company's modification, stating that there is no evidence that the end of collecting deposits will affect the uncollectible rate.[45] Staff also questions the relationship between deposits and the uncollectible rate.[46]

Q. Please respond to Staff's request for clarification regarding how the deposit refunds on customers' closing bills relate to the uncollectible amount.[47]

A. The Company held deposits for certain customers and would credit the deposit back on a customer's account to lower the balance owing to the Company. As such, when a customer who had paid a deposit closed their account or was disconnected from service, the deposit would be credited back on their final bill. For example, if a customer had paid a $100 deposit but their final bill was $200, the deposit would be credited toward the final bill so the customer would owe a balance of only $100. If a customer was unable to pay that final bill, only the $100 that was not covered by the deposit and was still owed would be included in uncollectible amounts.

[44] NW Natural/1300, Wilson-Sparley/13-14.

[45] Staff/1200, Lockwood/9.

[46] Staff/1200, Lockwood/9-10.

[47] Staff/1200, Lockwood/9-10.

Q. Staff argues that there is no evidence that halting deposits will lead to an increase in uncollectible amounts.[48] Why does the Company expect that no longer collecting deposits will increase uncollectible amounts?

A. Because the deposits that would have been applied to reduce customers' closing balances are no longer available, customers will have higher account balances when sent a final bill, and the full amount of that final bill, if unpaid, would be included in uncollectible amounts instead of only the portion not covered by the deposit credit. Because the Company is no longer collecting deposit amounts up front, the uncollectible amounts are likely to be higher.

Without deposits to apply to offset overdue accounts, the Company expects the uncollectible rate to continue rising as it has observed in recent years. For example, over the past three years, the Company has observed a steady increase in amounts ultimately written off. In 2021, the Company wrote off $2.3 million; in 2022, it wrote off $2.5 million, and in 2023, it wrote off $3.5 million. The Company expects this write-off amount to continue increasing in 2024 and beyond.

Q. Staff argues NW Natural's deposit adder modification fails to account for new customer protections that are aimed at alleviating residential customers' energy burden.[49] How do you respond?

A. NW Natural does not expect other customer protections to decrease the level of write-offs. In fact, the Company's experience demonstrates that since the

[48] Staff/1200, Lockwood/9-10.

[49] Staff/1200, Lockwood/10.

adoption of Division 21 additional customer protections, write-offs have increased rather than decreased.

C. Division 21 Rule Change Resulting in Shortened Service Days Modification

Q. Staff criticizes the Company's premise that fewer service days will increase the uncollectible rate and argues that the Division 21 rule changes are likely to lower the number of customer disconnections.[50] How do you respond?

A. While the updated Division 21 rules may lead to fewer disconnections, disconnections do not equal uncollectible amounts. As discussed in detail below, although disconnections may happen less frequently under the new Division 21 rules, a customer is likely to have a higher balance when experiencing disconnection than under the prior rules, likely leading to higher uncollectible amounts.

Q. The Company indicated in its Direct Testimony that the Division 21 rule changes decrease the amount of field orders it can complete due to restrictions on timing and weather conditions.[51] What are "field orders"?

A. When the Company discusses "field orders," it refers to field technicians sent out to a customer's residence to collect overdue amounts or disconnect the gas service. Field technicians provide a final line of communication with a customer in arrears. They can also help the customer trouble-shoot issues or connect them with additional assistance, providing personal help for individual issues. Field

[50] Staff/1200, Lockwood/12.

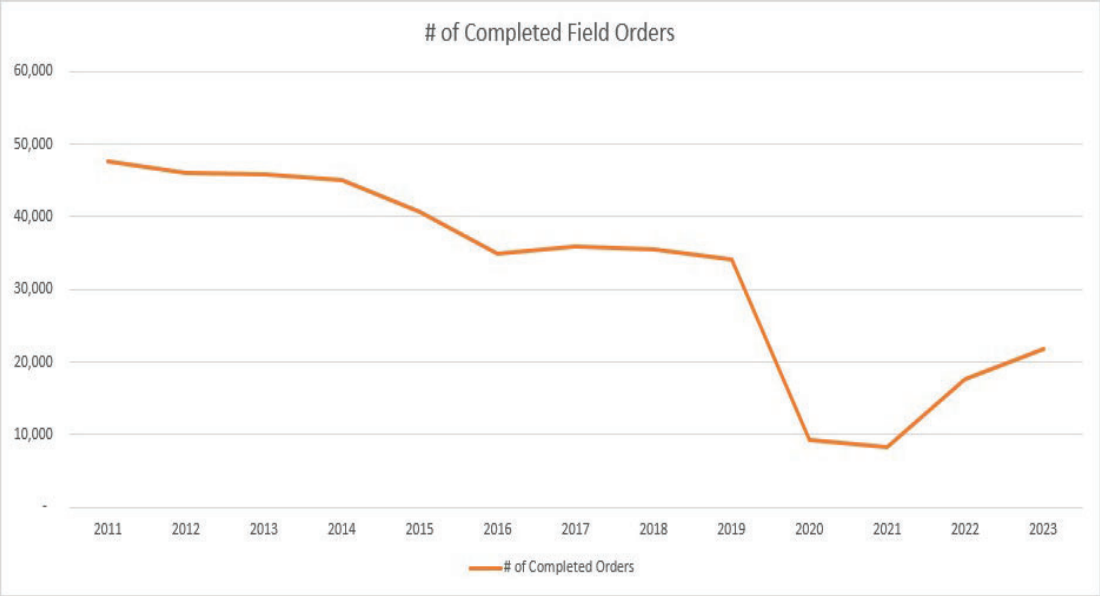
[51] NW Natural/1300, Wilson-Sparley/14-15.

orders must be completed timely to address arrearages but also to avoid a customer's overdue balance spiraling out of control, because the longer a customer is allowed to continue using gas service without payment, the more likely that the account will become uncollectible.

Q. How have the rule changes affected the number of field orders the Company can complete in a year?

A. The Company is able to complete significantly fewer field orders in a year. As depicted below in Figure 1, prior to the pandemic, the Company averaged approximately 36,000 field orders completed per year. The Company was unable to complete many field orders at all during the pandemic, dipping below 10,000 completed orders in 2020 and 2021, as reflected in Figure 1. However, once the Company resumed field orders, the completed field order number should have returned to pre-pandemic levels. But, after the Division 21 rules affecting field order hours took effect in late 2022, the Company was only able to complete 22,000 field orders in 2023. The Company will continue to function under a reduced number of hours within which to complete field orders; therefore, it is likely that the number of completed field orders will remain suppressed and similar to 2023 numbers.

Figure 1



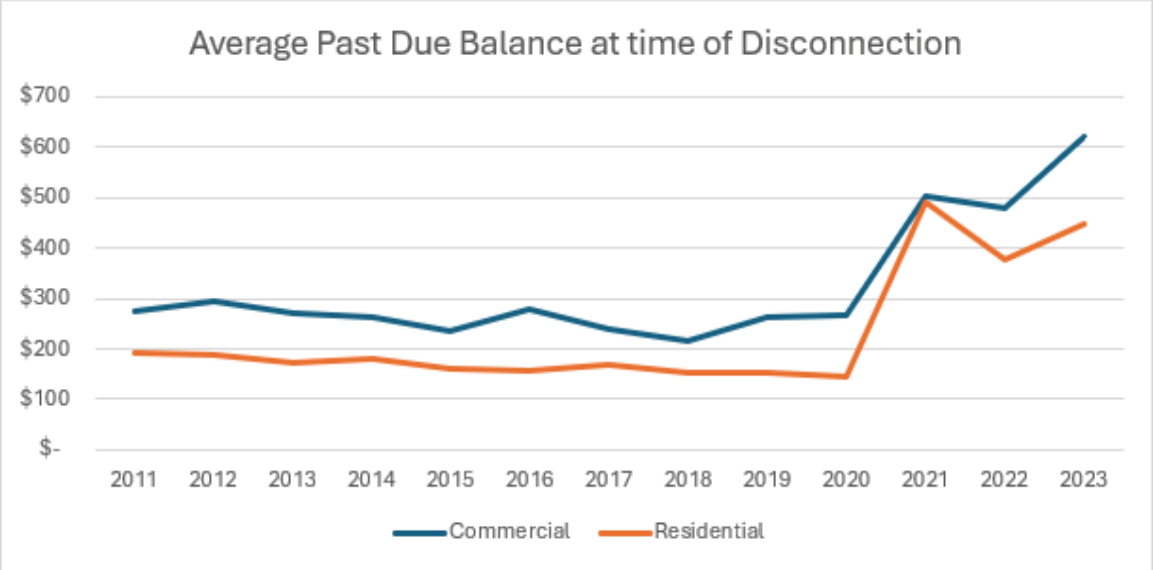
Q. What trends has the Company observed in customer bills when performing field orders before and after the rule changes?

A. Because the Company is completing fewer field orders due to the rule changes, field technicians are unable to reach a customer until their balance is much higher than in prior, comparable years. As a result, the amount that the field technician is going out to collect is averaging approximately double the average prior to the Division 21 rule changes.

As is illustrated in Figure 2 below, prior to the Division 21 rule changes, the average overdue balance for a residential customer facing disconnection by field technicians was approximately $200, where a commercial customer had an average overdue balance of $400 with no outlier months where the average overdue amount was over $400. This trend remained steady for nearly a decade.

However, post-pandemic, the Company is seeing both residential and commercial customers' overdue balances skyrocket before a field order to disconnect the customer can be completed, with the highest monthly average residential balances reaching approximately $800 and commercial monthly average balances over $1,000. While disconnections can prompt customers to pay, customers whose balances have ballooned will have a harder time making payments in full. Accordingly, the increase in customer balances is likely to lead to increased uncollectible amounts than would have occurred under the prior rules.

Figure 2[52]



[52] As discussed below and in our Direct Testimony, the Arrearage Management Program reduced the amounts customers owed from May 2021 when NW Natural started giving out grants and through 2022 when the program ended. *See* NW Natural/1300, Wilson-Sparley/17.

Q. Staff additionally criticizes the Company's modification for shortened field order days, arguing it "assumes that all customers will accrue balances uniformly."[53] How do you respond?

A. While the Company agrees that customers do not typically accrue balances uniformly, the Company believes it is reasonable to assume balances accrue uniformly for the purposes of a projection calculation.

D. Division 21 Rule Change Resulting in Customer Notices Extending from 15 to 20 Days Modification

Q. Please summarize the Company's modification based on the Division 21 rule change that extends customer notice periods.

A. In our Direct Testimony, the Company describes how the Division 21 rules increased notice time to customers for any service interruptions from 15 to 20 days.[54] To comply with this change, the Company had to remove its courtesy three-day call ahead that contacted customers three days prior to service disconnection due to an overdue balance.[55] The Company still provides a courtesy call one day prior to disconnection.[56] The Company expects that the elimination of the three-day call ahead will increase uncollectible amounts, because any customer that would have responded to that call with a payment will not have the same opportunity to do so.[57]

---

[53] Staff/1200, Lockwood/12.

[54] NW Natural/1300, Wilson-Sparley/15-16.

[55] NW Natural/1300, Wilson-Sparley/15.

[56] NW Natural/1300, Wilson-Sparley/15-16.

[57] NW Natural/1300, Wilson-Sparley/15-16.

Q. Do Staff or CUB agree with this modification?

A. No. Staff argues it is unclear how the Division 21 rule change resulted in the Company's removal of the three-day call ahead and expected increase in uncollectible amounts.[58] Staff also questions whether the Company has evidence to show this rule change has increased the uncollectible rate to date.[59] CUB also appears to contest this modification.[60]

Q. How do you respond?

A. The three-day call ahead provided one more touchpoint with the customer to collect on the account. The Company observed the three-day call ahead generated up to 20 percent of payments of customers who carried past-due balances. The Company expects that it will not see this same level of payment toward overdue balances in the future.

Q. Why did the Company remove the three-day call ahead to customers?

A. The Company was required to change its billing and collections processes to conform to changes in the Division 21 rules. In order to convert its system to work within the new rules, the Company had to remove the three-day call ahead. The Company was unable to take a different approach, such as changing the entire collections system to implement shortened timing, due to the high cost and disruptive nature of such a project. These costs would have ultimately been borne

[58] Staff/1200, Lockwood/13.

[59] Staff/1200, Lockwood/13.

[60] CUB/200, Garrett/6-7. CUB reiterates the Company's reasoning for this modification but does not provide any argument or clear criticism.

by customers. After careful consideration, the Company determined that removing the three-day call-ahead was the most efficient way to comply with the Division 21 rules, despite the impact on the uncollectible amount.

Q. Is it reasonable to conclude that without this three-day call ahead, the Company will not receive payments on overdue accounts that it would have received with the three-day call ahead?

A. Yes, and this conclusion serves as the basis of the need for this modification to the uncollectible calculation.

E. Collection Agency Reduced Recoveries Modification

Q. Please summarize Staff's testimony regarding the Company's proposed modification to the uncollectible rate based on reduced collection agency recovery rates.

A. Staff questioned the Company's proposed methodology that accounts for changes in the Consumer Financial Protection Bureau Regulation F, effective as of November 30, 2021, that permits a consumer to have more control over how collection agencies communicate with them and creates new restrictions on collection activities.[61] Staff notes that the Company provided collection rate data from 2014-2019 compared to the past two years after this regulatory change became effective and questions whether two years of data are sufficient to establish a trend.[62]

[61] Staff/1200, Lockwood/14.

[62] Staff/1200, Lockwood/14.

Q. How do you respond to Staff's argument that two years of data on collection agency recoveries is not sufficient to establish a trend for purposes of increasing the uncollectible rate?[63]

A. We disagree. Staff acknowledges that the collections recovery rate has decreased and does not dispute the Company's data showing that collection efforts have become significantly less effective in the past two years.

F. Discontinued Arrearage Management Program Modification

Q. Staff criticized the Company's modification due to the end of the Arrearage Management Program ("AMP"), arguing that the pandemic economic conditions that made the AMP necessary have subsided.[64] How do you respond?

A. As discussed above, Oregon is still experiencing economic effects and has been slower to rebound than many other areas of the country. Therefore, it is reasonable to conclude that Oregon customers will see higher unpaid balances in the absence of the AMP.

Q. How many grants did the Company give to customers through the AMP and how did those grants affect overdue balances?

A. Through the AMP, NW Natural gave out 41,478 grants to customers totaling $9,077,994. The over $9 million in grants was provided as an instant credit on these customers' accounts, reducing their balance and helping them avoid

[63] Staff/1200, Lockwood/15.

[64] Staff/1200, Lockwood/16.

disconnection. Without these funds, customers' balances that remained unpaid would have become uncollectible and written off by the Company.

Q. Did some customers who benefitted from AMP nevertheless have overdue balances?

A. Yes. While the AMP was able to assist a significant number of customers, 25.73 percent of AMP grant recipients fell into arrears that ended up being written off as part of the uncollectible amounts after receiving an AMP grant. As discussed in our Direct Testimony, with the help of the AMP, NW Natural was able to reduce its uncollectible expense but still wrote off $4,704,000 between May 2021 through December 2022.[65] Of those write-offs, $1.2 million were associated with accounts that received AMP funds. It is reasonable to assume that in the absence of the AMP, these customers—and others who received benefits—will continue to have overdue balances. Therefore, the Company's modification to account for discontinuance of the AMP is reasonable.

Q. Staff criticized the Company's lack of discussion of the bill discount program and its effect on the uncollectible rate.[66] Has the Company considered how the changes to the bill discount program proposed in this rate case will affect the uncollectible rate?

A. Yes. Currently, approximately 5 percent of our total customer count is enrolled in the bill discount program. Of that 5 percent of customers, only 5.21 percent of bill

[65] NW Natural/1300, Wilson-Sparley/18.

[66] Staff/1200, Lockwood/18.

discount program participants have been written off to bad debt. This is approximately 0.3 percent of NW Natural's total customer base, or approximately 2,600 customers. Because this number is such a small percentage, the bill discount program is unlikely to make a material difference in our write-off numbers.

Q. Does this conclude your Reply Testimony?

A. Yes.

Data Request No 09:
Referring to Staff/1200, Lockwood/20, line 3 and /29, Line 9. Please state whether "$2.6 million" or "$2.8 million" is the correct amount.

Staff Response No 09:

Staff's proposed downward adjustment of the Company's proposed uncollectible rate from 0.491 percent to 0.182 percent, is accompanied by a downward adjustment of approximately $2.8 million ($2,825,682,82) to the Company's Test Year expense. Staff appreciates the Company finding the typo of "$2.6 million" on Staff/1200, Lockwood/20, Line 3 and confirms that $2.8 million is the correct amount.

UG 490
Request for a General Rate Revision
Data Request Response

Request No.: UG 490 CUB DR 14

On NW Natural/1300/Wilson-Sparley/Page 18, regarding uncollectible expense, the Company states "The three-year historical average rate for years October 2021 through October 2023 is 0.182 percent, which is much lower than the rate the Company has observed in 2023…"

a. Please provide workpapers for the Company's calculation of the "three-year historical average rate for years October 2021 through October 2023" in USD.

b. Please provide workpapers for the Company's calculation of "the rate the Company has observed in 2023" in USD.

Response:

Please see UG 490 CUB DR 14 Attachment 1.

After reviewing this data request and the cited testimony, the Company has determined that there is a typographical error in the testimony. The three-year historical average rate of 0.182 percent is for the three years "October 2020 through October 2022," not October 2021 through October 2023. The Company will correct the testimony for the record during the pendency of this proceeding. For the three-year period October 2021 through October 2023, the three-year historical average rate was 0.242 percent, which is lower than the 0.284 percent that the Company experience in October 2023.

I. INTRODUCTION AND SUMMARY

Q. Are you the same Tobin F. Davilla who filed Direct Testimony in this proceeding on behalf of Northwest Natural Gas Company dba NW Natural ("NW Natural" or the "Company")?

A. Yes, I presented NW Natural/1400, Davilla.

Q. What is the purpose of your Reply Testimony in this proceeding?

A. The purpose of my Reply Testimony is to respond to testimony filed on April 18, 2024, by the Public Utility Commission of Oregon ("Commission") Staff ("Staff"), the Alliance of Western Energy Consumers ("AWEC"), and the Coalition of Communities of Color, Climate Solutions, Verde, Columbia Riverkeeper, Oregon Environmental Council, Community Energy Project and Sierra Club ("Coalition") related to operations and maintenance ("O&M") expenses. I will respond to issues presented in the testimony of Staff witnesses Luz Mondragon (Staff/200, Mondragon), David Abraham (Staff/500, Abraham), Russ Beitzel (Staff/700, Beitzel), Julie Dyck (Staff/1000, Dyck), Mitchell Moore (Staff/1300, Moore) and Paul Rossow (Staff/1700, Rossow); AWEC witness Bradley G. Mullins (AWEC/100, Mullins); and Coalition witnesses Nora Apter and Meredith Connolly (Coalition/200, Apter-Connolly).

Q. Please summarize your Reply Testimony.

A. In my testimony, I respond to proposed disallowances and concerns raised by Staff, AWEC, and Coalition on the following issues:

O&M Expenditures and Forecasts

- *Non-Payroll O&M Escalation Method:* In response to staff witnesses Abraham, Mondragon, Dyck, Rossow, and Moore, I explain that NW Natural more accurately projects the majority of non-payroll O&M costs using the West Region Consumer Price Index ("CPI"), as this inflation index most accurately reflects the costs experienced by the Company. If the Commission accepts Staff's use of the All-Urban CPI rates, those rates should be updated for the most recent June 2024 Oregon Economic and Revenue Forecast rates of 3.3 percent and 2.2 percent for 2024 and 2025, respectively.
- *Directors and Officers ("D&O") Insurance:* In response to both Staff witness Mr. Beitzel and AWEC witness Mr. Mullins, I explain that the Company's allocation of D&O insurance policy premiums is appropriate, as these expenses protect the Company's financial stability and ensure that the Company can continue to reliably serve customers. Further, I discuss Staff's misinterpretation of the Commission's previous ruling regarding primary versus excess layers.
- *Storage Operating Expense (FERC 816-847)*: In response to Staff witness Mr. Abraham, I explain that his calculation of Test Year expense based on historical results does not accurately capture the inflation impact and that relying on historical results in this FERC account is not a good basis for the Test Year projection. In addition, I explain why his additional adjustment for CPI is duplicative based on his use of the revised CPI rate to inflate Staff's recommended historical average amount to the Test Year.

- *A&G Expense (FERC 921, 922, 930 & 931):* In response to Staff witness Ms. Dyck, I discuss the adjustment for revised inflation rates and explain why I do not agree with a proposed 50/50 sharing of expenses related to Corporate Secretary and Director Expenses.
- *Distribution O&M (FERC 870-894):* In response to Staff witness Mr. Moore, I explain that his calculation of Test Year expense based on historical results does not accurately capture the current expense for this work, nor does it fully capture the impact of additional mandated United States Department of Transportation Pipeline and Hazardous Materials Safety Administration survey work that began in 2023. In addition, the contract is known and measurable because it has specified prices for services and annual increases into the Test Year, which are not factored into Staff's analysis. Finally, Staff witness Mr. Moore's calculation disregards the increase in number of locates that the Company has been experiencing historically and expects through the Test Year.
- *Customer Accounts (FERC 901-903):* In response to Staff witness Mr. Moore, I explain how his calculation of Test Year expense based on historical results does not accurately capture the current expense for this work, nor does it capture the impact of greater customer adoption of the Payment Processing service that has been growing near 13 percent per year over the past five years and is projected to continue to grow by 10 percent per year. Mr. Moore's calculation disregards the impact of the new contract for this service that is known and measurable. Finally, Mr. Moore's opening testimony, which argues

that the Company should not use services like Venmo and PayPal, does not take into account that unbanked customers utilize services like Venmo and PayPal to pay their gas bills.

- *Meals & Entertainment and Misc. O&M Expenses:* In response to Staff witness Mr. Rossow, I explain for each expense category why they are appropriate for recovery and agree that the first-class airfare costs inadvertently included in this case should be excluded from cost recovery.
- *Dues and Memberships Expenses:* In response to Staff witness Mr. Rossow and Coalition witnesses Ms. Apter and Ms. Connolly, I explain that the Company's dues and memberships expenses are a necessary portion of the Company's business expenses, as many memberships provide educational opportunities, increase industry engagement, and support and engage local communities.
- *Board of Directors' Fees and Related Expenses:* In response to AWEC witness Mr. Mullins, I explain that Board of Directors' fees are an essential cost of doing business, and time spent on non-utility or affiliate concerns has already been excluded from the Company's cost recovery request. In addition, I explain that AWEC offers no evidence beyond speculation that the Board of Directors is more concerned with furthering the interests of shareholders than benefiting customers, or that the Board of Directors' fees are not reasonable.

- *Water Insurance:* In response to AWEC witness Mr. Mullins, I explain that all insurance expense for NW Natural Water Company, LLC ("NW Natural Water") and its water utility subsidiaries already has been excluded from this case.
- *NW Natural Water Expenses:* In response to AWEC witness Mr. Mullins, I agree that the expenses found should have been removed from the case and agree with removing the quantified amount; however, I explain that any additional adjustment beyond what has been identified is unfounded.
- *Legal Fees:* In response to Coalition witnesses Ms. Apter and Ms. Connolly, I explain that the Company (i) has documented that it does not seek in the case to recover from Oregon ratepayers the legal fees of Baker Botts or Snell & Wilmer associated with NW Natural's legal challenge to the invalidated Climate Protection Plan ("CPP"), (ii) is removing $48,539 of legal fees related to the Climate Commitment Act ("CCA") and Washington State Building Code Council's ("SBCC") amendments to the building codes, after the Company discovered that they had been inadvertently included in this case to recover from Oregon ratepayers, and (iii) **[BEGIN CONFIDENTIAL]** [redacted] **[END CONFIDENTIAL]**.

Q. Do you sponsor any exhibits to your Reply Testimony?

II. OPERATIONS & MAINTENANCE EXPENSE

A. Non-Payroll O&M Escalation Method

Q. When the Company used a CPI escalation method to forecast Test Year non-payroll O&M expenses, which CPI did the Company use?

A. As explained in my Direct Testimony, the Company generally escalated non-payroll costs using year-over-year increases reflected in the West Region Urban CPI, as reported in the September 2023 Oregon Economic and Revenue Forecast, published by the Oregon Office of Economic Analysis ("OEA").[1] The Company specifically selected the West Region Urban CPI because a regional CPI provides a better measure of aggregate price changes than a national CPI.[2]

Q. Does Staff agree that the Company should use the West Region Urban CPI to escalate O&M expenses?

A. No. Staff witnesses Abraham, Mondragon, Dyck, Rossow, and Moore would apply the Consumer Price Index – All Urban -Consumers for the U.S. ("All-Urban CPI"), as published by the OEA, for year-over-year escalation of expenses.[3] Additionally,

[1] NW Natural/1403, Davilla/54.

[2] NW Natural/1400, Davilla/9.

[3] Staff/200, Mondragon/15; Staff/500, Abraham/3-4; Staff/1000, Dyck/24-25; Staff/1300, Moore/10; Staff/1700, Rossow/12, 15.

they propose using the most recent release (then, the March 2024 report) of the All-Urban CPI for 2024 and 2025.

Q. How do the rates recommended by Staff compare to those filed by the Company in this case?

A. The All-Urban CPI rates recommended by Staff for 2024 and 2025 are 2.7 percent and 2.0 percent. This compares to the West Region CPI rate in the March 2024 report for 2024 and 2025 of 2.7 percent and 2.1 percent, respectively.

Q. Has there been a more recent release of the CPI since Staff's testimony, and, if so, how do those rates compare?

A. Yes, the June 2024 report was released on May 29, 2024. The All-Urban CPI rates increased from 2.7 percent and 2.1 percent in 2024 and 2025 in the March 2024 report to 3.3 percent and 2.2 percent, respectively, in the June 2024 report. The West Region rates by comparison increased to 3.4 percent and 2.3 percent for 2024 and 2025, respectively, in the June 2024 report.

Q. Does Staff explain why it uses the All-Urban CPI for the escalation factor rather than the West Region Urban CPI?

A. Yes. Staff witness Dyck states that "[i]t is Staff policy to use the Consumer Price Index – All Urban Consumers for the U.S. (CPI, Urban U.S.) as published by the State of Oregon Office of Economic Analysis for year over year escalation."[4] Staff witness Abraham states "Staff recommends using the all-urban CPI."[5]

[4] Staff/1000, Dyck/24.

[5] Staff/500, Abraham/4.

Q. Do you agree with these statements by Staff?

A. No. As explained in my Direct Testimony, a regional CPI provides a better measure of aggregate price changes experienced by the Company than the national CPI proposed by Staff because the Company's non-payroll expenses (e.g., utilities, repairs and maintenance, contractors, professional services) are largely regional expenses generated in Oregon or southwest Washington.[6] Therefore, national price fluctuations will be less representative of the price changes experienced by the Company than the West Region Urban CPI.

Q. Are Oregon-specific cost changes reflected in the All-Urban CPI?

A. Yes, but to a much lesser extent than in the West Region Urban CPI. Oregon's economy differs from national trends in areas that directly impact the Company's costs, such as wages, property, and fuel. For example, compared to all other U.S. states, Oregon has the fifth highest gasoline prices,[7] the sixth highest minimum wage,[8] and the eighth highest median home price.[9] All of these costs result in increased prices for non-payroll items.

The combined impact of these cost increases can also be seen through Oregon's relative cost-of-living index, shown below for 2023.[10]

---

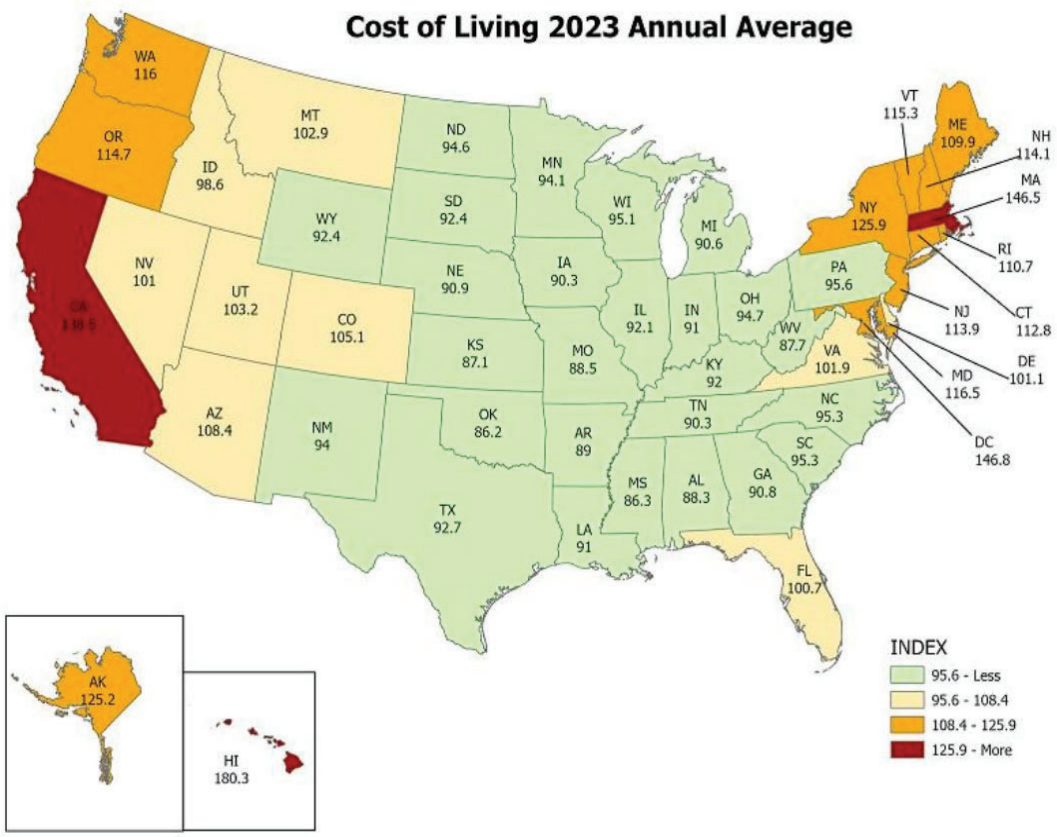
[6] NW Natural/1400, Davilla/9.

[7] AAA, *State Gas Price Averages* (accessed May 6, 2024) (available at https://gasprices.aaa.com/state-gas-price-averages/) (comparing regular gas prices by state).

[8] U.S. Dept. of Labor, *State Minimum Wage Laws* (Jan. 1, 2024) (accessed May 6, 2024) (available at: https://www.dol.gov/agencies/whd/mw-consolidated) (comparing minimum wage by state).

[9] Wikipedia, *List of U.S. states by median home price* (2024) (accessed May 6, 2024) (available at: https://en.wikipedia.org/wiki/List_of_U.S._states_by_median_home_price).

[10] Missouri Economic Research and Information Center, *Cost of Living Data Series* (accessed May 6, 2024) (available at: https://meric.mo.gov/data/cost-living-data-series).



The cost-of-living index allows for a state-by-state comparison of the overall cost of goods and services. The states that make up the West Region Urban CPI have an average cost of living index of 113.8. This compares similarly to the Oregon index of 114.7 and is much closer than the national average of 100. In sum, the All-Urban CPI fails to adequately capture Oregon's greater inflationary pressure, which results in greater inflation of the Company's costs.

Q. Do other entities that operate in Oregon use the West Region Urban CPI to escalate costs?

A. Yes. The Oregon Public Employees Retirement System ("PERS") uses the West Region Urban CPI to ensure that retirees' income keeps pace with the rising prices they experience.[11]

Q. Does Staff propose an adjustment related to the CPI?

A. Yes. Staff witnesses Abraham, Mondragon, Dyck, Rossow and Moore all make adjustments for the lower CPI or use the lower CPI in their determination of Test Year expenses.

Q. Does the Company propose any changes to CPI as compared to the original rate that was filed in this case?

A. No. The West Region Urban CPI is a more representative rate for the reasons mentioned above. However, if the Commission accepts Staff's use of the All-Urban CPI, this rate should be updated for the most recent report (June 2024).

B. D&O Insurance

Q. What is D&O insurance and why is it included in the Company's cost recovery request?

A. D&O insurance protects the Company's directors and senior officers against the risks associated with managing the Company. These risks are an inherent part of managing and overseeing a utility or other company and are a necessary cost to

[11] Oregon Public Employees Retirement System, *2024 Cost-of-Living Increase Coming in August* (accessed May 6, 2024) (available at: https://www.oregon.gov/pers/ret/pages/cost-of-living-adjustment.aspx).

ensure that the Company remains financially secure and capable of serving NW Natural's customers. NW Natural's Test Year D&O, Crime and Travel Accident insurance premiums were $805 thousand[12] on an Oregon-allocated basis.

Q. How does Staff propose adjusting the Company's recovery of D&O insurance premiums?

A. Staff witness Mr. Beitzel proposes that 50 percent of the excess D&O liability insurance costs be disallowed, citing past Commission practice. This approach, according to Staff's calculation, would result in a downward adjustment of $403 thousand.[13]

Q. Does any other party recommend adjusting the Company's recovery of D&O insurance premiums?

A. Yes, AWEC witness Mr. Mullins proposes D&O insurance premiums also be split 50/50 between shareholders and ratepayers. He proposes an adjustment to reduce O&M by $374 thousand.[14] His proposed O&M reduction is different than Staff's $403 thousand.

Q. Does the Company agree with Staff's and AWEC's calculations of their proposed adjustments?

A. No. The Company's response to UG 490 OPUC DR 224 – Confidential Attachment 1 (Confidential NW Natural/3501, Davilla) combines both D&O and

[12] Confidential NW Natural/3501, Davilla (Confidential UG 490 OPUC DR 224 Attachment 1).

[13] Staff/700, Beitzel/6.

[14] AWEC/100, Mullins/40.

Crime and Travel Accident premiums. The $805 thousand in the Test Year is comprised of $760 thousand for D&O and $45 thousand for Crime and Travel Accidents. In addition, the $760 thousand D&O Insurance is comprised of $465 thousand for the Primary layer and $295 thousand of Excess layers.

Q. Does the Company agree with Staff's and AWEC's proposed adjustment of a 50/50 sharing?

A. No. While Staff states "Staff has routinely recommended removal of 50 percent of Excess D&O liability insurance as a shareholder cost,"[15] that is not what Staff performed as its adjustment. Instead of sharing on the "Excess" layers, Staff proposes a 50/50 sharing on all D&O liability insurance. In UE 197, Staff Witnesses Ball-Dougherty proposed the 50 percent sharing of excess D&O liability and specifically stated: "The excess insurance should be considered a joint shareholder/customer cost. It is important to note that Staff did not recommend any adjustments to the primary D&O insurance costs. The 50 percent reduction in excess D&O liability insurance cost only represents 32.3 percent of the total D&O liability insurance."[16] The Commission agreed with Staff's adjustment related to the excess layers being shared.[17]

[15] Staff/700, Beitzel/5.

[16] *In re Portland Gen. Electric Co., Request for a General Rate Revision,* Docket No. UE 197, Staff/300, Ball-Dougherty/10-11 (Jul. 9, 2008).

[17] *In re Portland Gen. Electric Co., Request for a General Rate Revision,* Docket No. UE 197, Order No. 09-020 at 19-20 (Jan. 22, 2009).

Q. What would have been Staff's proposed adjustment had the 50/50 sharing been applied only to the Excess D&O liability insurance as approved by the Commission in UE 197?

A. The adjustment that should have been proposed by Staff is $147.5 thousand,[18] instead of the $403 thousand in Staff's testimony, to share 50/50 on the excess layers.

Q. Does the Company agree with any proposed adjustment to its Excess D&O liability insurance?

A. No. While the Company recognizes that the Commission has previously supported sharing the excess cost of D&O insurance in an earlier Portland General Electric Company ("PGE") rate case, such cost sharing inappropriately assumes that customers receive only partial benefit from such expense. Notably, Staff and AWEC do not contest that D&O insurance is a necessary cost of doing business and is therefore a prudently incurred expense.[19] Indeed, these costs help ensure the Company's financial stability and continued ability to serve customers. Moreover, NW Natural has already removed D&O liability expenses allocated to non-utility business units, meaning that the remaining amounts are those solely dedicated to the regulated utility's stability and security. Thus, these remaining utility-allocated costs are prudently incurred and should be fully recovered in rates.

[18] $295,000 x 0.50 = $147,500.

[19] Staff/700, Beitzel/5-6; AWEC/100, Mullins/39-40.

C. Storage Operating Expense (FERC 816-847)

Q. Please describe the costs included in FERC Accounts 816-847.

A. The expenses occurring in FERC Accounts 816-847 are related to the Company's underground and Liquid Natural Gas ("LNG") storage facilities. The storage facilities allow the Company to store lower summer-priced natural gas to be used in the winter during high demand or peak day events.

Q. Please describe how the Company developed the non-payroll Storage Operating Expense in the Test Year.

A. To get to the Test Year expense, the Company performed two calculations. First, the Base Year expenses were escalated into the Test Year using the West-Region CPI. Secondly, beginning in 2024 (i.e., after the Base Year), the Company will begin its first rig-based casing inspection program to perform re-assessments in accordance with 49 CFR 192.12(d)(2). This will be an on-going expense beginning in 2024. The total expense is $625 thousand, and the Oregon allocated amount is $556 thousand. That Oregon allocated amount was added to the Test Year amount.

Q. How does Staff review these expenses?

A. Staff witness Mr. Abraham analyzed historical data provided by the Company and looked for trends in the expenses.

Q. Does Staff propose an adjustment to these FERC accounts?

A. Yes, Staff proposed a total downward adjustment of $210,320. This amount is made up of an expense reduction of $130,504 to align to Staff's calculated

historical trend and a downward adjustment of $79,816 to account for the lower CPI forecast.[20]

Q. How does Staff witness Mr. Abraham calculate his proposed Test Year amount?

A. First, Staff calculates a three-year moving average for the years 2021 through 2023 and uses that amount for the projected 2024 expense. To calculate the Test Year amount, Staff takes the increase in the moving average for 2021 through 2023 as compared to 2020 through 2022 and adds that to the projected 2024 expense to develop Staff's Test Year amount prior to any adjustments. Staff then adds in the $556 thousand incremental amount for the rig-based inspection program beginning in 2024. Staff then compares that projected Test Year amount to the Company's proposed amount. This produced an adjustment of $130,504. Second, Staff calculates the change in the Company's Test Year amount using Staff's proposed CPI rates of 2.7 percent in 2024 and 2.0 percent in 2025 instead of the Company's CPI rates as filed. This produced an additional downward adjustment to expense of $79,816.[21]

Q. Do you agree with Staff's calculation of its Storage Expense (FERC 816-847) disallowance?

A. No. I do not agree with Staff's calculation for two reasons. First, Staff uses a simple average of 2021 through 2023 for its 2024 value. Staff's calculation

[20] Staff/500, Abraham/7-8.

[21] Staff/500, Abraham/5-8.

disregards CPI increases of 8.0 percent in 2022 and 4.1 percent in 2023. Second, Staff's additional CPI adjustment of $79,816 is duplicative to and already captured in Staff's $130,504 adjustment. Staff's historical trend analysis calculates Staff's proposed Test Year expense for Storage Expenses, and it arrives at that amount by using the lower Staff-recommended CPI rates. The $130,504 adjustment, therefore, already includes the reduction for CPI.

Q. Do you agree with any adjustment to Storage Expense?

A. No, however, if the Commission accepts Staff's use of the All Urban-CPI rates, the Commission should use the most recent release of the CPI published in the June 2024 report. The impact of this change would result in a reduction to Storage Expense of $43,087. I do not agree with the other Staff adjustment to Storage Expense for $130,504. As stated above, $79,816 of that amount is duplicative and the remaining $50,688 adjustment is not warranted because expenses four years removed from the Test Year that do not include an inflation adjustment during a period of significant inflationary pressure (12.4 percent, 2022-2023) are less representative of costs than those the Company actually experienced in the Base Year 2023.

D. Customer Service Expense (FERC 907-916)

Q. Please describe the costs included in FERC Accounts 907-916.

A. The expenses occurring in FERC Accounts 907-916 are related to Customer Service and Informational activities.

Q. Please describe how the Company developed the Customer Service Expense in the Test Year.

A. To determine the Test Year expense, the Company escalated the Base Year expenses into the Test Year using the West-Region CPI rates at the time of filing.

Q. How does Staff review these expenses?

A. Staff witness Ms. Mondragon reviews Base Year expenses including transactional level data.[22] In addition, Staff reviews historical data for trends, variances, average and growth. Staff's review excluded FERC 909 Informational and Instructional Advertising Expense and 913 Advertising Expense of which the latter expenses were not included in this case.[23]

Q. Does Staff propose an adjustment to these FERC accounts?

A. Yes, Staff proposes an adjustment of $108,457 system or $95,858 Oregon allocated adjustment.[24] In addition, Staff proposes an adjustment of $5,810 to account for Staff's proposed updated CPI adjustments.[25] The Company addresses the first Staff adjustment in the Reply Testimony of Mr. John Frankel, NW Natural/4300, Frankel. I will address the second Staff adjustment.

[22] Staff/200, Mondragon/9-11.

[23] Staff/200, Mondragon/8-15.

[24] Staff/200, Mondragon/14.

[25] Staff/200, Mondragon/15.

Q. How do you respond to Staff's proposed adjustment of $5,810 to account for Staff's proposed updated CPI adjustments?

A. As I stated earlier in my Reply Testimony, if the Commission accepts Staff's proposed All-Urban CPI rates, the Commission should use the most recent release of the All-Urban CPI published in the June 2024 report. The impact of this change would result in a reduction to Customer Service Expense of $3,827.

E. A&G Expenses (FERC 921, 922, 930 & 931)

Q. Please describe the costs included in FERC Accounts 921, 922, 930 & 931.

A. The expenses occurring in these FERC accounts include Administrative and General Salaries and Office Supplies and Expenses (FERC 921), Administrative Expenses Transferred-Credit (FERC 922), Misc. General Expenses (FERC 930), and Rent (FERC 931).

Q. How does Staff review these expenses?

A. Staff witness Ms. Dyck reviews expenses for reasonableness and appropriate use.[26] Staff reviews sections of the Company's application, reviewed responses to Standard and Staff DRs and analyzes corresponding transactional data including review of historical trends and proposed escalation adjustments.[27]

Q. Does Staff propose an adjustment to these FERC accounts?

A. Yes, Staff proposes a total adjustment of $865,046 Oregon allocated adjustment.[28] This adjustment is made up of an adjustment of $652,794 for the lower proposed

[26] Staff/1000, Dyck/23.

[27] Staff/1000, Dyck/25.

[28] Staff/1000, Dyck/30.

CPI rate and an adjustment of $212,252 for sharing 50/50 of specific expenses occurring in FERC 930 related to Corporate Secretary Misc Expense Director Fees and Expense.[29]

Q. How does Staff calculate the proposed Test Year amount?

A. Staff takes all the expenses occurring in this cost center for Directors Fees and Expenses that were not covered by other Staff adjustments and recommends sharing 50/50 these expenses. Staff does not specifically state why these expenses in particular should be shared, but states they follow guidance in relation to "Directors and Officers (D&O) liability insurance, meals, entertainment, gifts, airfare, travel, lodging, awards, office refreshments, catering, promotional items, and bonuses and incentives."[30]

Q. How do you respond to Staff's calculation and adjustment to A&G expenses?

A. As I stated earlier in my Reply Testimony, if the Commission accepts Staff's proposed All-Urban CPI rates, the Commission should use the most recent release of the All-Urban CPI published in the June 2024 report. The impact of this change would result in a reduction to A&G Expense of $350,432.

I disagree with Staff's additional proposed 50/50 expense sharing adjustment of $212,252. While Staff lists in its testimony those expenses that they typical propose sharing of, many of the costs included in this adjustment do not fit

[29] Staff/1000, Dyck/29-31.

[30] Staff/1000, Dyck/29 (footnotes omitted).

that typical description. For example, $130,796 of that $212,252 adjustment is for Professional Services expenses for consultants who continually review compensation or for subscription costs to Diligent, which is a software used to support governance, risk, compliance, audit and ESG (Environmental Social and Governance). Such expenses are a necessary expense for the Company and therefore should not be disallowed.

F. Distribution O&M (FERC 870-894)

Q. Please describe the costs included in FERC Accounts 870-894.

A. The expenses occurring in these FERC accounts mainly include expenses and activities related to locating and survey expenses, system operations, customer field services, engineering, and compliance. The bulk (60 percent) of non-payroll expenses occur as a result of our locating and survey/leakage contract.

Q. Please describe how the Company developed the non-payroll Distribution O&M Expense in the Test Year.

A. For all but the Company's locate and survey work, the Company used the Base Year and escalated that using the West Region CPI rate to get to the Test Year amounts. For the Company's locate and surveying work, the Company included costs for the new contract for locating services and survey work that were not captured in the Base Year expenses. The costs in the Test Year also reflect the increasing number of locates being performed.[31]

[31] NW Natural/1400, Davilla/11-12.

Q. Did the Company provide the contract in its Opening Testimony?

A. Yes. The contract can be found at Confidential NW Natural/1406, Davilla.

Q. How does Staff review these expenses?

A. Staff witness Mr. Moore reviews historical expenses and looks at trends, transactional details and adjustments proposed by the Company.[32] Staff also reviews Company's responses to Staff Data Requests focused on investigating the Company's new locating and survey contracts with Heath Services.[33]

Q. Does Staff propose an adjustment to these FERC accounts?

A. Yes, Staff proposes an adjustment of $6.2 million.[34]

Q. How does Staff calculate the proposed Test Year amount?

A. First, Staff calculated a three-year moving average for the years 2021 through 2023 and used that number as the 2023 expense. Staff then escalates that number to 2024 and 2025 by Staff proposed CPI rate of 2.7 percent and 2.0 percent. Staff then compared that projected Test Year amount to the Company's proposed amount. This produced a disallowance of $6.2 million.[35]

[32] Staff/1300, Moore/3.

[33] Staff/1300, Moore/4.

[34] Staff/1300, Moore/5.

[35] Staff/1300, Moore/4-5.

Q. Does Staff acknowledge that there is a new contract beginning September 1, 2023 impacting the Test Year?

A. Yes, in Staff testimony Mr. Moore noted the Company conducted a request for procurement ("RFP") in late 2022 and the Company has provided the contract.[36] However, Staff "does not believe the Company has substantiated the reasonableness of the extreme increase in the cost of survey and locate rates."[37] Therefore, Staff disregards the impact of the new contract, and instead recommends only using a three-year average of expenses escalated for inflation for their Test Year amount.[38] Staff states that "[t]he increase in the Test Year expense over CPI inflation is almost entirely a result of the increase in NW Natural's contract locating and survey rates."[39]

Q. Can you explain the RFP process and the criteria that was evaluated in selecting this vendor for this required service?

A. An RFP process was completed in conjunction with procurement procedures as NW Natural's locating and leakage contracts were ending December 31, 2023. The RFP process was started in the fourth quarter of 2022 and completed in the first quarter of 2023 to allow time for a transition if it were determined that we were switching contractors with either locating or leakage. Six companies responded to the RFP: Heath, **[BEGIN CONFIDENTIAL]** [redacted]

[36] Staff/1300, Moore/5.

[37] Staff/1300, Moore/5.

[38] Staff/1300, Moore/5.

[39] Staff/1300, Moore/4.

[redacted] **[END CONFIDENTIAL]**. Only four companies met all the requirements and completed the documentation of the initial RFP: Heath, **[BEGIN CONFIDENTIAL]** [redacted] **[END CONFIDENTIAL]**. **[BEGIN CONFIDENTIAL]** [redacted] **[END CONFIDENTIAL]** was removed because they chose not to bid on leakage and only bid on the locating portion of the RFP. **[BEGIN CONFIDENTIAL]** [redacted] **[END CONFIDENTIAL]** was removed as they were determined early on that they did not have the resources to complete a contract this large. They are a small locating vendor that at the time only had 20 vehicles and approximately the same number of employees and did not have the financial backing to expand to meet NW Natural's needs.

The RFP was submitted to all companies for response. Companies were identified based on services offered, history with other utilities and ability to perform. Each company submitted a statement of work ("SOW") for the services. All questions from each company were responded to in a group setting or questions submitted individually by companies and then identical answers submitted to the entire group. Along with the SOW, companies were required to answer questions and were scored based on their answers, safety scores, along with pricing for both leakage and locating.

Q. Why was Heath selected?

A. The questionnaire had all remaining companies relatively even with two companies scoring slightly lower than the rest. Heath was significantly less expensive than all other companies when looking at leakage services. When looking at locating

services per individual price they were the most expensive, but when volume was factored in with the highest volume being standard distribution locates, Heath was the second least expensive. There were serious concerns over whether the lowest priced company could scale up to handle the contract and whether the cost was actually feasible as they were significantly lower than all others including our current contract.

Q. What other criteria were important in the selection of Heath for locating and survey work?

A. We evaluate all bidders in ISN, an independent safety scoring system. Three of the top 4 bidders were "As" with one being an "F." Heath Consultants was ranked as an A and the lowest priced vendor was ranked with a failing grade of F.

In addition, when checking with our peers across the industry, Heath was a more known contractor. We did not have many peers that had done a lot of work with the lowest priced vendor. They are used in the area by a telecommunications utility and in the last couple of years there have been reported issues with on-time locates mostly due to maintaining personnel and hiring employees. Heath is used by several gas utility companies along the West Coast and came highly regarded by our peers in the American Gas Association. Their strengths noted by other utility companies included their ability to hire, retain, and train employees and their management's ability to respond to and fix problems and ability to maintain an excellent company culture. Finally, Heath Consultants is a diverse supplier as a registered woman-owned company whereas the lowest priced vendor is majority-

owned by an investment firm. Choosing Heath was in line with our diversity, equity and inclusion goals.

When evaluating all four RFP bidders, Heath was clearly the leading candidate. They out competed all companies in leakage prices, out competed all but one company in locating prices by volume, were significantly higher than the next closest bidder by safety metrics, had great peer reviews, improved NW Natural's diverse spend goals, and had a proven track record working with NW Natural on prior contracts.

Q. Do you agree with Staff's calculation of its Distribution O&M disallowance?

A. No. I disagree with Staff for multiple reasons. First, the contract for Locates and Surveys was competitively bid through an RFP process as explained above. The resulting costs from the contract are market costs for this type of work. Second, Staff's proposal of a disallowance of locating and survey expenses appears to encourage lower safety standards or incentivize the Company to propose reduced calls for locates. We should be doing the opposite of this and promoting calling 8-1-1 before digging as "Research has revealed that if someone calls 8-1-1 before they dig, they have a 99 percent chance of avoiding an incident, injury, harm to the environment and even death".[40] Third, Staff uses a simple average of 2021 through 2023 for its 2023 value. Staff acknowledges and uses CPI; however, it does not apply it to the 2021 and 2022 historical expenses to bring the historical

[40] U.S. Dept. of Transp., *811 Day* (Aug. 11, 2022) (available at https://www.phmsa.dot.gov/safety-awareness/811-day).

amounts up to 2023 dollars. In doing so, Staff's calculation disregards CPI increases of 8.0 percent in 2022 and 4.1 percent in 2023. Fourth, using historical averages excludes additional work being performed to inspect the Company's Business District annually per U.S. Department of Transportation Pipeline and Hazardous Materials Safety Administration ("PHMSA") regulation 192.723(b). This additional expense was included in the Company's last rate case UG 435.[41] In UG 435, the additional expense, which began in 2023, was an Oregon-allocated amount of $1.4 million. Staff's methodology of averaging with periods prior to that regulation does not include this incremental work. Fifth, beyond the initial rate increase for locates that took effect in 2023, the contract calls for a 3 percent increase in rates annually. Staff's methodology would assume annual increases in rates below that of the contract (2.7 percent in 2024 and 2.0 percent in 2025). Finally, Staff disregards the annual increase in calls for locates that the Company has been experiencing and is expected to increase by 1.5 percent annually through the Test Year.

Staff's Test Year amount being proposed using its methodology would leave the Company well short of the expense in the Test Year; in fact, Staff's proposed Test Year amount is $1.3 million lower than the Base Year expense in this case. It is unrealistic to believe that the expense for locates and survey work will be lower than the expenses experienced in the Base Year, especially when including

[41] Docket No. UG 435, NW Natural/1200, Davilla/Page 13 (Dec. 17, 2021).

expected increase in number of locates and impacts of a new contract that began near the end of the Base Year.

G. Customer Accounts (FERC 901-903)

Q. Please describe the costs included in FERC Accounts 901-903.

A. The expenses occurring in these FERC accounts include expenses and activities related to customer records and collection expense.

Q. Please describe how the Company developed the non-payroll Customer Accounts Expense in the Test Year.

A. The Company used the Base Year forecast and escalated that using the West Region CPI rate to get to the Test Year amounts. In addition, the Company included additional expense for a new agreement with Paymentus for Customer Payment Processing Fees that was executed in December 2023 and greater adoption of the service.[42]

Q. Please explain the process of amending the agreement with Paymentus.

A. Before extending the current contract, competitive pricing was received from two other processors that provide bankcard processing services. The pricing of each of those other two processors was greater than our current and selected processor. Vendor A's proposal was approximately 39 percent more expensive and Vendor B's proposal was approximately 47 percent more expensive. Please see the Company's response to UG 490 OPUC DR 404 (NW Natural/3502,

[42] NW Natural/1400, Davilla/11.

Davilla), specifically Confidential UG 490 OPUC DR 404 Attachment 2 (Confidential NW Natural/3503, Davilla) for a comparison of those proposals.

Q. How does Staff review these expenses?

A. In Confidential UG 490 OPUC DR 404 Attachment 1, the Company provided the amended Paymentus contract that was made effective in December 2023, attached to my testimony as Confidential NW Natural/3504, Davilla. Staff witness Mr. Moore reviews this contract and also reviews previous cases where "Staff has recognized that it is reasonable to make payment options available to customers to ensure customers have convenient methods to pay their bills."[43] In addition, Staff also acknowledges that "given the importance of accessibility to payment options, Staff has supported spreading the costs of these payment options to all customers rather than requiring that the individual customers that use these options pay for them at the time of use."[44]

Q. Does Staff still believe spreading the costs to all customers is appropriate?

A. Staff states that the Company has a responsibility to communicate to its customers the various methods of payment, and if customers choose options that are less reasonably priced, the costs should not be spread to other customers.[45]

Q. Does Staff propose an adjustment to these FERC accounts?

A. Yes, Staff proposes an adjustment of $2.1 million.[46]

[43] Staff/1300, Moore/10.

[44] Staff/1300, Moore/10.

[45] Staff/1300, Moore/10.

[46] Staff/1300, Moore/11.

Q. How does Staff calculate the proposed Test Year amount and adjustment?

A. First, Staff calculates a three-year moving average for the years 2021 through 2023 and uses that number as the 2023 expense. Staff then escalates that number to 2024 and 2025 by Staff proposed CPI rate of 2.7 percent and 2.0 percent. Staff then compares that projected Test Year amount to the Company's proposed amount. This produced a disallowance of $2.1 million. Staff does not include any adjustment for the impact of the new contract.[47]

Q. Does Staff state why they are not including the impact of the new contract?

A. No, Staff only mentions that their calculation of the Test Year accounts for an increase in payment processing costs and incentivizes the Company to encourage lower-cost payment options.[48]

Q. Staff mentions "more expensive" payment options.[49] Can you describe those?

A. Staff mentions the advanced payment options of Amazon Pay, PayPal and Venmo to be the more expensive options,[50] however from April 2023 through March 2024 the average expense per transaction for these payment options were $0.0328 higher than the other payment options. When this is applied to the 20,366 payments made via these channels the additional expense is $668/month.

[47] Staff/1300, Moore/10.

[48] Staff/1300, Moore/10-11.

[49] Staff/1300, Moore/10-11.

[50] Staff/1300, Moore/10-11.

Q. Why is it important for the Company to provide those payment options?

A. Mobile payment applications are frequently used by both younger customers and those without bank accounts. Excluding advanced payment options would limit non-banked households' ability to pay. According to the FDIC,

> While many banked households appear to use nonbank online payment services such as PayPal, Venmo, and Cash App to complement banking products, unbanked households may be using them as substitutes for banking or other financial services. These use cases have different economic inclusion implications but highlight that it is important for all consumers to understand limits and applicability of consumer protections, especially deposit insurance.[51]

Q. In your Direct Testimony you state that the Company has also experienced an increase in the adoption of customers utilizing this service.[52] Does Staff consider this increase in their Test Year calculation?

A. No, when Staff performs their three-year historical average and then only a CPI adjustment it does not consider the impact of increased adoption by customers. Currently over 280,000 customers use this service per month. There has been a seismic shift from paying bills via check to electronic methods in the last 10 years alone. In 2013, 32.9 percent of payments were checks sent by mail. In 2023, only 13.9 percent of payments were checks sent in the mail. For the last five years the Company has experienced a year over year average increase of approximately 13 percent per year in the count of debit, credit card, and advanced payment method payments. This is a result of both annual customer growth, but mostly driven by

[51] FDIC, *2021 FDIC National Survey of Unbanked and Underbanked Households* (Jul. 24, 2023) (available at https://www.fdic.gov/analysis/household-survey/index.html).

[52] NW Natural/1400, Davilla/11.

increased adoption of existing customers. The Company is utilizing a 10 percent annual growth rate from the Base Year to the Test Year in this case. See Table 1 below for annual historic adoption growth.

Table 1

Year	Count Increase
2019	14%
2020	19%
2021	11%
2022	12%
2023	10%

Q. Do you agree with Staff's calculation of its Customer Accounts disallowance?

A. No, for multiple reasons. First, Staff uses a simple average of 2021 through 2023 for its 2023 value. Staff acknowledges and uses CPI; however, they do not apply it to historical values to calculate their simple average to bring the historical numbers up to 2023 dollars. Staff's calculation disregards CPI increases of 8.0 percent in 2022 and 4.1 percent in 2023. Second, Staff's methodology dismisses or severely negates the impact of the high rate of annual adoption. It averages it out when taking the three-year average and does not apply any impact of adoption when grossing up the 2023 average amount to the Test Year. Third, Staff disregards completely the impact of the new contract, which is known and measurable.

Staff's Test Year amount being proposed using their methodology would leave the Company well short of the expense in the Test Year, in fact Staff's proposed Test Year amount is lower than the actual expense the Company

incurred in 2022. It is unrealistic to believe that the expense for this service will be lower than the expenses incurred in 2022 let alone the Base Year, especially when including customers' strong desire for this service as evidenced by the increase adoption of this service.

Q. Do you agree with Staff's statement that their "forecast methodology accounts for an increase in payment processing costs and incentivizes the Company to encourage lower-cost payment options, while still allowing for more expensive options such as Amazon Pay, PayPal, and Venmo to be available to customers"[53]?

A. I do not agree with that statement and cannot reconcile how suggesting that having lower Test Year expense than the Company has experienced the last two years, which was prior to the effect of the new contract, would somehow allow for an increase in payment processing costs or encourage lower-cost payment options or even allow for more expensive options to be available to customers. As stated above the "more expensive" options equate to roughly $668/month. The $8,016 annual expense is a far distance from Staff's proposed $2.1 million disallowance. It is clear the proposed disallowance is not supported by the idea that the advanced payment options are the reason for the disallowance.

[53] Staff/1300, Moore/10.

Q. Do you believe any adjustment to Customer Accounts (FERC 901-903) is warranted?

A. No. The Company's proposed Test Year expense is based on the Base Year expenses grossed up by CPI and includes the incremental impact of the new Paymentus contract effective December 2023 and the impact of the annual increase in customer adoption of this service. However, as I stated earlier in my Reply Testimony, if the Commission accepts Staff's proposed All-Urban CPI rates, the Commission should use the most recent release of the All-Urban CPI published in the June 2024 report. The impact of this change would result in a reduction to Customer Accounts Expense of $46,433.

H. Meals and Entertainment, Awards, Gifts, Airfare, Lodging, and Travel Expenses

Q. What is included in this category of expenses being disallowed that Staff reviewed?

A. Staff witness Mr. Rossow utilizes the Company's response to SDR 57, Data Request Nos. 442-455, and Data Request No. 201 Attachment 3, to review meals and entertainment, awards, gifts, refreshments, airfare, lodging and travel type expenses.[54]

Q. How did Staff review and analyze these categories of expenses?

A. Staff witness Rossow reviews the Company's responses to data request to identify any "O&M non-payroll discretionary expenses that appear to be excessive or not

[54] Staff/1700, Rossow/14-15.

related to the provision of safe and reliable energy to customers."[55] Staff reviews transactions and expenditure types mentioned above following a Commission-approved cost sharing from a previous PGE rate case that recommends expenses that benefit both customers and shareholders should be shared 50/50, and expenses found to have no benefit to customers should be excluded 100 percent.[56]

In this case, for Meals and Entertainment, Employee Awards, Gifts, Lodging and Travel, Staff proposes 50 percent sharing of all the expenses.[57] For other selected expenditure types that Staff noted related to expenses for first class airfare, Staff recommends excluding those expenses at 100 percent.[58]

Q. What is Staff's recommendation regarding these expenses?

A. Staff recommends reducing the Company's Test Year expenses for these combined categories of expenses by $351,069.[59]

Q. Does the Company believe that meals, entertainment, refreshment, awards, lodging and gifts should be shared on a 50/50 basis?

A. No. While the Company recognizes that the Commission approved cost sharing in a prior PGE rate case, the Company continues to believe that these prudently incurred costs should be fully recoverable in rates.

[55] Staff/1700, Rossow/15.

[56] Staff/1700, Rossow/14-15.

[57] Staff/1700, Rossow/16.

[58] Staff/1700, Rossow/15-16.

[59] Staff/1700, Rossow/16.

Q. Please explain why employee awards and gifts should be fully recoverable.

A. Staff witness Rossow proposes excluding $85 thousand of employee awards and gifts from the O&M Test Year. Employee awards should be fully recoverable because they are an important part of how NW Natural attracts, motivates, and retains qualified workers. Qualified workers help ensure a safe and reliable system, resolving customer concerns and providing prompt and high-quality service. Moreover, retaining such qualified workers reduces the costs associated with finding and hiring new employees. Thus, by fostering a positive business culture for the Company, awards are prudently incurred and should be fully recoverable in rates.

Q. Please explain why refreshments and meals expenses should be fully recoverable.

A. Staff witness Rossow proposes excluding $207 thousand of refreshments and meals and entertainment expenses from the O&M Test Year.[60] Refreshments and meals expenses for employees are prudently incurred and should be fully recoverable because those costs are incurred for business purposes. For instance, both refreshments and meals provided to employees during working meetings increase efficiency and ensure that the Company can achieve more in a shorter time period—thereby benefitting customers. While the Company could attempt to avoid scheduling meetings that run over mealtimes, this would reduce efficiency.

[60] Staff/1704, Rossow.

Similarly, NW Natural provides meals expenses for employees traveling on business for NW Natural. Work-related travel is customary in the business world, as is reimbursement for the reasonable cost of meals necessitated by this travel. As a result, this compensation is an essential aspect of the Company's total compensation policies. The travel related expenses benefit Oregon ratepayers as they relate directly to traveling for work or conferences, where employees expand their knowledge about topics such as safety, security and operational best practices, learn about new trends and share experiences with their peers in collaborative settings.

Q. Please explain why lodging should be fully recoverable.

A. Staff witness Rossow proposes a disallowance of $18 thousand for costs associated with the NW Natural Leadership Meeting.[61] This disallowance includes lodging and meals during the retreat. This retreat focuses on developing leadership skills as well as used for critical discussions about industry topics.

Q. Please explain Staff witness Rossow disallowance for inadvertent airfare.

A. In response to Data Request No. 447, the Company revealed that it inadvertently included first class airfare totaling a Base Year amount of $36,257 resulting in a Test Year adjustment of $37,981.[62] I agree that an adjustment to remove $38 thousand is appropriate.

[61] Staff/1700, Rossow/16.

[62] Staff/1700, Rossow/16.

I. Dues and Membership Expenses

Q. What is included in the Company's expense category for dues and memberships?

A. The expense category for dues and memberships includes dues paid to organizations where membership is necessary for the Company and its employees for perform their job functions (e.g., the Oregon State Bar and Oregon Board of Accountancy). In addition, these expenses include dues and memberships paid to organizations that:

- provide educational opportunities for NW Natural employees (e.g., American Institute of Certified Public Accountants, American Society of Safety Professionals and the Association of Threat Assessment Professionals),
- certify NW Natural employees for specialized job functions (e.g., the Information Systems Audit and Control Association (ISACA), and the Oregon State Bar Association), and
- provide opportunities to build and maintain relationships with other entities operating in the natural gas industry (e.g., the American Gas Association ("AGA"), Western Energy Institute, and the Coalition for Renewable Natural Gas).

Q. How did Staff review and analyze the Company's dues and memberships expenses?

A. Staff witness Mr. Rossow reviews a list of memberships from NW Natural's response to Data Request Nos. 90 and 130. He then classifies memberships into

two groups: (1) for memberships related to national and regional industry trade organizations; and (2) membership he attributes to economic development and civic organization.[63]

Q. Based on this review, what adjustment does Staff propose to the Company's memberships and dues expenses?

A. Staff makes the following recommendations: (1) disallow 25 percent of expenses associated with national and regional industry organizations, on the basis that these organizations conduct some level of lobbying and promotional activities, or otherwise do not benefit customers; and (2) wholly disallow expenses associated with economic development and civic organizations.[64] Staff recommends reducing the Company's Test Year expenses by $481,938.[65]

Q. Please explain your general concerns with Staff's framework for evaluating dues and memberships expenses.

A. Staff's framework would inappropriately disallow costs associated with two categories of organizations: (1) Staff identified memberships to national and regional industry trade organizations (at 25 percent) and (2) Staff identified memberships for organizations related to economic development and civic organizations (at 100 percent). Both disallowances improperly assume that shareholders—rather than customers—are receiving the benefit of the Company's memberships.

[63] Staff/1700, Rossow/12.

[64] Staff/1700, Rossow/12.

[65] Staff/1700, Rossow/12-13.

With respect to Staff's characterization of memberships for organizations related to economic and civic organizations, the costs of which are primarily made up of all chambers of commerce dues, the Company's memberships enable the Company to be engaged with the local communities in which we serve. NW Natural is a corporate member of over 40 local chambers of commerce throughout our service territories. These organizations support local businesses and their operating environments, providing education and programs for members that address local challenges and opportunities, staffing and workforce development needs and member education and local leadership programs. Utilities, both investor-owned and public, have traditionally participated in chambers of commerce as our organizations are viewed as critical local infrastructure and economic partners for the communities and businesses we serve.

With respect to national and regional industry trade organizations, Staff ignores the significant and diverse benefits offered by these organizations, including training, education, and community relations. Certainly, there is no reason to conclude that membership in such organizations like the American Society of Safety Professionals is for the benefit of shareholders, but instead is an expense of doing business to safely serve utility customers. Thus, Staff's 25 percent disallowance is inappropriate.

Q. Do you agree with Staff's calculation of the proposed disallowances?

A. No. It appears Staff's workpaper combines the initial DR 130 response that lists the Company's dues and memberships expenses for Q1-Q3 of the Base Year ($586,347 Oregon allocated expense) with the supplemental response to DR 130

that includes expenses occurring in Q4 of 2023 ($351,779 Oregon allocated expense), which should have produced an Oregon allocated expense of $938,127 in the Base Year. However, in Staff's workpaper the total is $1,172,694. It appears in the consolidation of files some entries are duplicated. For instance, the PHMSA user fee only occurs once in the data responses, yet Staff's file has it in twice.

Q. Do you agree with how Staff allocates the transactions to the two categories?

A. No, for instance, using the example of the PHMSA fee from above, this expense was incorrectly classified to this GL account in April 2023 and in the same closing period was moved out of Dues/Memberships. In the transaction details Staff uses for their adjustments there is both an expense of $258 thousand and a credit for $258 thousand to move it out of Dues and Memberships. Staff includes the $258 thousand expense to calculate a $60 thousand disallowance (at 25 percent) but does not include the $258 thousand dollar credit. Therefore, this one error alone makes up $60 thousand of the proposed disallowance.

In addition, as stated above some transactions appear to be duplicated in Staff's workpaper and, in this instance, the PHMSA fee was duplicated and in both instances the credit was not included. Therefore, this total error is $118 thousand of the total $482 thousand dollar adjustment.

Q. Why does NW Natural participate in memberships with chambers of commerce and economic development organizations?

A. In almost all chamber and economic development organizations that NW Natural supports, critical infrastructure providers like utilities, municipalities and

jurisdictions participate because these organizations provide a direct connection to the businesses in our service areas. This connection provides a vehicle for keeping abreast of area business issues and conditions, as well as sharing information that may be important for businesses to learn about or know. Additionally, ratepayers benefit from these memberships through healthy business environments and the employment and business development opportunities they provide.

Q. What do the chambers of commerce membership fees that utilities, municipalities, jurisdictions, and other businesses pay for?

A. Membership fees provide organizations funding to cover general organization operations including staff expense, office space, and membership recruitment. Membership fees are the only portion of NW Natural's chamber of commerce and economic development participation that is paid through O&M cost centers.

Q. If a chamber of commerce or economic development organization engages in lobbying, do ratepayers pay for that through the membership fee?

A. No. When an organization shares the percentage of membership fee that goes toward lobbying, NW Natural attributes that portion to a non-utility lobbying cost center.

Q. What other expenses does NW Natural pay to chambers of commerce and economic development organizations that are paid by shareholders?

A. When NW Natural supports organization events and programs through event sponsorships, registration expenses and incidental expenses like mileage, parking

and meals and entertainment are paid for and attributed to non-utility civic cost centers.

Q. Does any other party propose adjustments to Dues and Memberships expenses?

A. Yes, Coalition witnesses Apter and Connolly propose adjustments to memberships and dues. The Coalition is concerned that NW Natural would include any payments to outside groups and trade organizations that "commonly engage in political activities and expend considerable effort to market and promote gas utilities. Consequently, their membership dues are not expenditures that benefit customers, and they are not necessarily for furnishing utility service."[66]

The Coalition specifically discusses membership and dues for AGA, Northwest Gas Association ("NWGA"), Chambers of Commerce and other "utility adjacent" organizations as regularly engaging in lobbying or political activities and expend considerable efforts to market and promote gas utilities.[67]

Q. How does the Coalition describe "Utility Adjacent" organizations?

A. The Coalition describes these organizations as groups that have focused purposes that are unrelated to the provision of service to Oregon gas utility customers and instead promote continued or increased gas usage.[68]

[66] Coalition/200, Apter-Connolly/74.

[67] Coalition/200, Apter-Connolly/71, 74.

[68] Coalition/200, Apter-Connolly/80.

Q. Based on this review, what adjustment does the Coalition propose to the Company's memberships and dues expenses?

A. The Coalition proposes removing all expenses made to any of the above-described organizations that engage in substantial political activity or in community service and economic development, and proposes a disallowance of $801,277.[69]

Q. Does the Company agree that the Staff and Coalition disallowances are appropriate?

A. No. These organizations provide a benefit to NW Natural's customers and are a reasonable business expense that should be recoverable. These organizations keep employees informed and trained, provide opportunities to build and maintain relationships with other entities operating in the natural gas industry, and, in many cases, directly take on issues that benefit customers (e.g., the AGA engaging in federal tax reform and increased LIHEAP funding). They directly benefit employees' work performance, and in some cases are simply *necessary* for the Company's employees to perform their jobs and for the Company to operate.

Q. Please provide some examples of memberships that are essential for the Company's operation.

A. The Company pays dues to the Oregon Bar Association on behalf of its lawyers and to the Board of Accountancy on behalf of its accountants. These dues are required for these employees to practice their professions. Another expense in this category is our subscription to the WebICE service. WebICE is an energy

[69] Coalition/200, Apter-Connolly/82.

trading system that allows its members to see real-time natural gas pricing information at the various hubs where the Company purchases gas. This system allows the Company to track real-time pricing and ensure that its deals align with the market.

Q. Please describe the role of the AGA.

A. The AGA's mission is to represent companies delivering natural gas, and to promote the safe, reliable, and efficient delivery of natural gas to homes and businesses across the nation. The AGA's activities include initiatives to improve the safety, efficiency and productivity of member companies' engineering and operating functions, such as:

- Technical Committees and Taskforces, addressing topics such as construction operations, cybersecurity strategy, enterprise risk management, gas control, and natural gas security.
- Technical Discussion Groups covering issues such as asset management, corrosion control, emergency management and public safety, emissions reduction and field worker assault prevention.
- Mutual Assistance Program and Emergency Planning Resource Center, which facilitates response, recovery, and restoration of services following a natural or other disaster.
- Technical Publications, regarding specific equipment, pipelines, gas measurement, leaks, etc.

Q. Please describe the role of the NWGA.

A. The NWGA's mission is to advance the safe, dependable, and responsible use of natural gas, to foster greater understanding and informed decision-making among industry participants, opinion leaders, and governing officials in the Pacific Northwest on issues related to natural gas. The NWGA's activities include:

- Convening industry CEOs to share information about the industry.
- Providing information through publications, speeches, seminars, and conferences on important topics such as safety, alternative fuels for vehicle fleets and new alternative fuel technologies.
- Providing educational blogs and newsletters on industry developments.
- Developing collective industry perspectives on key regulatory issues, such as winter storms and regional planning.

Q. Does the AGA or NWGA engage in lobbying and other political activities?

A. Yes, both organizations engage in lobbying and political advocacy. However, as can be seen from the above, political work is just one area of activity among many others. For this reason, expenses related to dues and memberships are not booked to the FERC accounts reserved for lobbying and political activities.

J. Board of Directors' Fees and Related Expenses

Q. Does any party propose adjustment to the Company's Board of Directors' fees and related expenses?

A. Yes. AWEC witness Mullins proposes an adjustment that would disallow 90 percent of the Company's Board of Directors' fees on the premise that "directors

primarily benefit shareholders, and that NW Natural is now structured as a holding company."[70] AWEC claims "given that NW Natural is now structured as a holding company, with a major focus on acquiring new businesses in new markets, the focus of the directors is now less on its gas business and more on NW Natural as a holding company."[71]

Q. Does Staff propose an adjustment to the Company's Board of Directors' fees or related expenses?

A. No.

Q. Does the Company agree with AWEC's proposed adjustment?

A. No, for a couple of reasons. First, AWEC offers no evidence beyond speculation that the Board of Directors is more concerned with furthering the interests of shareholders than benefiting customers, or that the Board of Directors' fees and expenses are not reasonable. Indeed, AWEC's assertion is simply untrue. The NW Natural Board of Directors' interest is in ensuring a strong, stable, and efficient natural gas utility that serves its customers in a safe, reliable, and affordable manner. NW Natural's Board of Directors has a proven track record of effectively balancing the Company's central interests, and the NW Natural Board's continued oversight, governance, and guidance is, beneficial, necessary by law, and required by the OPUC pursuant to ring-fencing provisions imposed when the Commission approved the company's holding company structure.

[70] AWEC/100, Mullins/38.

[71] AWEC/100, Mullins/38.

Second, AWEC's proposed adjustment appears to misunderstand NW Natural's structure. In accordance with the Commission ring-fencing provisions in docket UM 1804, NW Natural maintains a separate Board of Directors, which includes an independent director. AWEC appears to contend that NW Natural's Board of Directors' time is being spent on affiliate or non-utility matters. On the contrary, because of the holding company reorganization, all non-utility entities have been moved out from under NW Natural, and therefore, the NW Natural Board does not spend any time on matters relating the Northwest Natural Holdings LLC's ("NW Holdings'") water business or other subsidiaries. To be clear, in this rate case, NW Natural seeks to recover only NW Natural's Board of Directors fees—not those for NW Holdings. The fees for NW Holdings' Board of Directors, which is where water and other acquisitions are governed, are fully absorbed by shareholders and are not charged to NW Natural. It is also worth mentioning, that as of December 31, 2023, NW Natural is the overwhelming driver of the NW Holdings' consolidated enterprise, comprised over 92 percent of the consolidated assets of NW Holdings.

K. Water Insurance

Q. Please explain AWEC's proposed disallowance for water insurance costs.

A. AWEC witness Mullins proposes to remove $775,938 of revenue requirement related to water company insurance costs that he sees in his review of transactional data provided in Staff Data Request 201 that he states "are

associated with the water company operations but recorded on NW Natural's books."[72]

Q. Do you agree with AWEC that these expenses are associated with water company operations but recorded on NW Natural's books?

A. I do agree that the individual transactions Mr. Mullins sees are occurring on NW Natural's books, but the accounting treatment for these costs removes this expense and reallocates them to the correct entities.

Q. Can you explain the accounting for insurance expenses?

A. Consistent with NW Natural's Cost Allocation Manual the Company's annual insurance renewal is allocated to the affiliates benefitting from the insurance renewal after it is paid by NW Natural. As part of this annual insurance renewal process there are also some insurance policies that may be procured for affiliates only; these are referred to as the affiliate stand-alone policies. These stand-alone policies that benefit others are allocated 100 percent to the affiliates they benefit along with the shared services and administrative overhead from the NW Natural team involved in procuring the insurance.

Q. Do you believe an adjustment is needed to remove any insurance expense related to water or any other entity out of the utility in this case?

A. No. While the accounting for these prepaid insurance expenses and allocations can be challenging to understand based on individual transactions, insurance costs included in this case represent only the gas utility's allocations and no

[72] AWEC/100, Mullins/40.

adjustment is warranted. In prior cases there have been data requests about the Company's allocation of insurance renewals to demonstrate these allocations of insurance costs. The 2023 insurance renewal included $849,741 of water stand-alone insurance policies (system), which represents the same policies Oregon allocated of $775,938 identified by AWEC that were allocated 100 percent to water. The total stand-alone water policies were allocated out of NW Natural's expense accounts in October 2023 as part of excel line 79755 in UG 490 OPUC DR 201 Attachment 3 (NW Natural/3505, Davilla), as described in the Company's Supplemental Response to UG 490 OPUC DR 201 (NW Natural/3506, Davilla). The remaining insurance applicable to NW Natural is summarized in Amended Confidential UG 490 DR 224 Attachment 1 (Confidential NW Natural/3507, Davilla), described in the Company's Supplemental Response to UG 490 OPUC DR 224 (NW Natural/3508, Davilla).

L. Water Company Expenses

Q. Please explain AWEC's proposed disallowance for water company expenses.

A. AWEC witness Mr. Mullins proposes to remove $50,000 of expenses or $51,672 of revenue requirement related to water company expenses.[73] The Company in AWEC Data Request Nos. 23 and 24 acknowledges that there were some operating expenses included that were improperly recorded to the gas utility. AWEC states that the Company "identified $33,714 of Oregon allocated expenses

[73] AWEC/100, Mullins/41.

that were improperly recorded."[74] In addition to the above transactions, Mr. Mullins states that "transactional data are generally vague", and that there "were also items clearly related to the water business that were missed in NW Natural's review."[75] He goes on to provide an example of a $247 charge with the description of "Meetings w/AZ Commissioners."[76] Mr. Mullins concludes that since "there are some expenses remaining in NW Natural's case related to its water business and given the vague descriptions" he recommends a $50,000 expense disallowance.[77]

Q. Do you agree with the adjustment amount that Mr. Mullins proposes?

A. No. In the Company's responses to UG 490 AWEC DR 23 and 24 (NW Natural/3509, Davilla and NW Natural/3510, Davilla) the Company does acknowledge inadvertent remaining charges that occurred of $33,714 in calendar year 2023, however the Company in the response specifically separated out $27,789 of expenses that occurred during the period of January through September 2023. The Base Year in this case is made up of nine months actuals, January through September 2023, and the Company's projected spend for the last three months of the year. That projection did not include any expected water expenses occurring in the utility. Therefore, the Company would agree that the Test Year inadvertently included the $27,789 but rejects the additional disallowance of $5,925 not included in this case.

[74] AWEC/100, Mullins/40.

[75] AWEC/100, Mullins/41.

[76] AWEC/100, Mullins/41.

[77] AWEC/100, Mullins/41.

Q. Are there more water expenses that should be removed beyond the amounts included above?

A. Yes, as Mr. Mullins points out there are additional transactions that were missed during the Company's initial review that should also be removed from this case. Additional review has found $1,854 of travel related expenses to water service territory. These expenses should be excluded.

Q. Do you believe any further adjustment should be applied for vague descriptions or other unidentified expenses?

A. No. While the Company admits to missing some transactions related to water in its initial review, I do not believe a "blanket" adjustment assuming there are other water expenses in utility results is warranted. If any further water transactions are identified during this processing of this case, the Company would agree to remove them.

Q. What is the Company's total amount of adjustment for water expenses?

A. The Company is proposing to remove the $27,789 expense identified in AWEC DR 23 Attachment 1 (NW Natural/3509, Davilla), and an additional $1,854 of water expenses found during further review for a total expense adjustment of $29,643.

///

///

///

///

///

M. Legal Fees

Q. What is the Coalition's recommendation regarding the Company's recovery of legal fees in rates?

A. The Coalition recommends that the Commission "disallow $701,290.23 in legal fees for Baker Botts and Snell & Wilmer LLP from FERC Account 921,"[78] "associated with NW Natural's litigation expenses related to its lawsuits against the CPP and the Washington Building Code amendments."[79] Although the Coalition acknowledges that the Company stated that it "is not seeking in this case to recover from Oregon ratepayers the legal fees of Baker Botts LLP or Snell & Wilmer LLP associated with NW Natural's legal challenge to the invalidated CPP,[80] the Coalition has "serious concerns" about that statement "given the absence of documentation provided by the company to substantiate its claim that they removed CPP litigation costs."[81] The Coalition also recommends that [**BEGIN CONFIDENTIAL**] [redacted] [**END CONFIDENTIAL**].[82]

[78] Coalition/200, Apter-Connolly/8, 34.

[79] Coalition/200, Apter-Connolly/17.

[80] Coalition/200, Apter-Connolly/22; Coalition/238, Apter-Connolly/1.

[81] Coalition/200, Apter-Connolly/22.

[82] Coalition/200, Apter-Connolly/17-18.

Q. Just to be clear, does the Company seek in this case to recover from Oregon ratepayers the legal fees of Baker Botts or Snell & Wilmer associated with NW Natural's legal challenge to the invalidated CPP?

A. No. The Company does not seek to recover from Oregon ratepayers the legal fees of Baker Botts or Snell & Wilmer associated with NW Natural's legal challenge to the invalidated CPP.[83]

Q. Did the Company provide documentation in this case to support this fact?

A. Yes. The Company provided documentation to support this fact in my Test Year O&M Model, which the Company provided to the parties in this case as my workpaper, UG 490 – Exh. 1400 – OM Model Workpaper-Non-Confidential, an electronic copy of which I am providing as an exhibit to my Reply Testimony, NW Natural/3512, Davilla. In the tab "Dept Non-Payroll Forecast," specifically excel row 3386, for Cost Center 10835 (Legal Fees-Risk-Offi), GL Account 605000 (Legal Fees), I subtracted a total of $255,891 in columns Z through AH, which equals the total amount of actual legal fees that the Company paid to Baker Botts and Snell & Wilmer in January through September 2023 of the Base Year associated with NW Natural's legal challenge to the invalidated CPP. The Oregon allocated amount removed is $225,512. Recall that the Company forecasted the expenses for the remaining three months of 2023 to develop the Base Year O&M expenses,[84] so any actual legal fees that the Company paid to Baker Botts and

[83] NW Natural/3511, Davilla/1, NW Natural Response to UG 490 Coalition DR 219.

[84] NW Natural/1400, Davilla/2.

Snell & Wilmer in those three months associated with NW Natural's legal challenge to the invalidated CPP were not included in the Base Year O&M expenses.

Q. Furthermore, is the $701,290.23 in legal fees for Baker Botts and Snell & Wilmer that the Coalition recommends be disallowed limited to those firms' work "associated with NW Natural's litigation expenses related to its lawsuits against the CPP and the Washington Building Code amendments"[85] as the Coalition alleges?

A. No. NW Natural/3513, Davilla, is a copy of Coalition/226, Apter-Connolly, with yellow highlighted rows reflecting actual legal fees, which the Company removed from this case as I just described, that the Company paid to Baker Botts and Snell & Wilmer in January through September 2023 of the Base Year associated with NW Natural's legal challenge to the invalidated CPP. As NW Natural/3513, Davilla shows, Baker Botts and Snell & Wilmer represented the Company during the Base Year on matters not associated with NW Natural's litigation expenses related to its legal challenge to the invalidated CPP and the Washington Building Code amendments.

Q. Has the Company described the broader extent of legal representation received from Baker Botts and Snell & Wilmer during the Base Year?

A. Yes. The Company described the broader extent of legal representation received from Baker Botts and Snell & Wilmer during the Base Year in Confidential NW Natural/3514, Davilla, which is the Company's response to UG 490 Coalition DR

[85] Coalition/200, Apter-Connolly/17.

220 (including confidential material). Baker Botts [**BEGIN CONFIDENTIAL**] [redacted] [**END CONFIDENTIAL**] but even its representation of the Company on those identified matter types is not restricted to "lawsuits against the CPP and the Washington Building Code amendments." Snell & Wilmer [**BEGIN CONFIDENTIAL**] [redacted] [**END CONFIDENTIAL**]. Thus, Snell & Wilmer's representation

[86] Confidential NW Natural/3514, Davilla/2.

[87] Confidential NW Natural/3514, Davilla/2.

[88] Confidential NW Natural/3514, Davilla/2-3.

[89] Confidential NW Natural/3514, Davilla/2.

[90] Confidential NW Natural/3514, Davilla/2.

[91] Confidential NW Natural/3514, Davilla/2.

of the Company is not restricted to "lawsuits against the CPP and the Washington Building Code amendments."

Q. How do you respond to the Coalition's assertion that NW Natural "may have charged Oregon ratepayers for litigation against the Washington Building Code Amendments"?[92]

A. During the preparation of its Reply Testimony, the Company discovered that it had inadvertently included in this case to recover from Oregon ratepayers legal fees of $48,539 related to the CCA and Washington SBCC's amendments to the building codes.[93] The blue highlighted rows in NW Natural/3513, Davilla, reflect the entries of legal fees related to the Climate Commitment Act and Washington State Building Code Council's amendments to the building codes that comprise the $48,539. As a result, the Company has removed $48,539 from the revenue requirement presented in its Reply Testimony of Kyle T. Walker, NW Natural/3800, Walker.

///

[92] Coalition/200, Apter-Connolly/27-31.

[93] NW Natural/3515, Davilla/1, NW Natural's Amended Response to UG 490 Coalition DR 218.

Q. Recognizing that the Company removed and does not seek in the case to recover from Oregon ratepayers the legal fees of Baker Botts or Snell & Wilmer associated with NW Natural's legal challenge to the invalidated CPP, and that the Company has removed $48,539 from the revenue requirement presented in its Reply Testimony associated with the CCA and SBCC's amendments to the Washington State's building codes, should the Company be allowed to recover from Oregon ratepayers the legal fees of Baker Botts and Snell & Wilmer that remain in this case?

A. Yes. The legal fees of Baker Botts and Snell & Wilmer that were not removed and remain in this case are recoverable from Oregon ratepayers and benefit our customers because they are legitimate, reasonable costs incurred to ensure that NW Natural complies with laws and regulations in the operation of the business and protects our customers and their assets in the provision of utility service.

Q. Do you agree with the Coalition's recommendation that [BEGIN CONFIDENTIAL] [redacted] **[END CONFIDENTIAL]?**[94]

A. No. As the Company explained in NW Natural/3514, Davilla, **[BEGIN CONFIDENTIAL]** [redacted]

[94] Coalition/200, Apter-Connolly/17-18.

[redacted]

[redacted]

[redacted]

[redacted]

[redacted]

[**END CONFIDENTIAL**].

Q. Does this conclude your Reply Testimony?

A. Yes, it does.

Request for a General Rate Revision
Data Request Response

Request No.: UG 490 OPUC DR 404

Referencing NW Natural/1400, Davilla/pg. 11, Contracted Customer Payment Processing Fees (FERC 903), and NW Natural/1405, Davilla/pgs 1-14:

a. When does the current contract expire?

b. What is the Oregon-allocated total actual expense for this contract for the years 2020-2023?

c. What is the Oregon-allocated total forecast expense for this contract for 2024?

d. What is the Oregon-allocated Test Year forecast for this expense?

e. Please explain and demonstrate the basis for the Oregon-allocated forecast increase to this contract in the Test Year.

f. When (month/year) does the Company expect to have an amended contract in place?

g. What efforts has the Company made to ensure that costs for bankcard services are competitive? Please describe and demonstrate.

Response:

A. The testimony states that the Company "expects to sign a contract amendment and extension in the near term." NW Natural/1400, Davilla/Page 11, Lines 11-12. An extended contract was entered into on December 27, 2023, and is provided as Confidential UG 490 OPUC DR 404 Attachment 1. The current contract expires May 4, 2027.

B. The Oregon-allocated total actual expense for this contract for the years 2020-2023 are as follows:

Period	System Wide	Oregon Allocation
2020 Oct to Dec	$633,000	$557,000
2021	$3,460,000	$3,045,000

2022	$3,930,000	$3,459,000
2023	$4,370,000	$3,846,000

C. The Oregon-allocated total forecast expense for this contract for 2024 is as follows:

Period	System Wide	Oregon Allocation
2024	$5,339,332	$4,699,146

D. The Oregon-allocated Test Year forecast for this expense is $5,490,211 ($6,237,881 System).

E. Please see NW Natural/1400, Davilla/Page 11, Lines 12-16. Primary factors for the Oregon-allocated forecast increase to this contract in the Test Year are:

   a. Customers have expressed a significant preference for bankcard payments.
   b. Migration of customers from 1.) paper payment methods (mailing a check) and 2.) customer specific bank bill pay methods to 3.) autopay methods via ach or bankcard or 4.) one time ach and bankcard payments.
   c. Test Year transactions are expected to grow at a 10 percent compound annual growth rate from the Base Year to the Test Year.

F. Please see the response to subpart A.

G. Before extending the current contract, competitive pricing was received from two other processors that provide bankcard processing services. The pricing of each of those other two processors was greater than our current and selected processor. Vendor A's proposal was approximately 39% more expensive and Vendor B's proposal was approximately 47% more expensive. Please see Confidential UG 490 OPUC DR 404 Attachment 2 for a comparison of those proposals and the Paymentus extended contract.

Please provide a supplement to SDR 57 and include actual transactional cost summaries for all **(Non-Labor)** costs for 2021, 2022, and 2023.

Response:

Refer to UG 490 OPUC DR 201 Attachment 1 for a supplement to SDR 57 for the non-labor transaction costs for 2021. This was previously provided in UG 435 OPUC DR 401.

Refer to UG 490 OPUC DR 201 Attachment 2 for a supplement to SDR 57 for the non-labor transaction costs for 2022. Note that we had a system change and related significant account coding change in September 2022 which can be observed in the 2022 transaction results.

A supplement to SDR 57 for the remainder of 2023 will be provided after NW Holdings files its 10-K for 2023 in late February 2024. **This request is now being supplemented with the 2023 non-labor transactional costs as a supplement to SDR 57 as UG 490 OPUC DR 201 Attachment 3.**

Data Request Response

Request No.: UG 490 OPUC DR 224

Related to Company Insurance (non-labor, non-medical) primarily in FERC 924, please provide the following in a format similar, but not limited, to the below for the noted years for Oregon. If there are additional insurance expenses not listed below or the total amount per year doesn't match the Company's response to SDR 58B, please add lines as necessary to explain the difference. Please notate and use a separate line for D&O Insurance.

Insurance Type	FERC Acct	Cost Element	Test Year	Base Year	Base Year -1	Base Year -2
Property Premium "All Risk Property Premium"						
Property - Uninsured Loss						
Liability Premium"Excess Liability Premium"*						
Liability - Uninsured Losses						
Terrorism Premium						
Terrorism Uninsured Losses						
Excess Workers' Comp Premium						
Excess Workers' Comp - Uninsured Losses						
Other Risk Management Expenses (FERC accounts 924 & 925)						

Response:

The requested table was intended to be originally included in UG 490 OPUC SDR 68 and has been updated for Confidential UG 490 OPUC DR 224 Attachment 1. The original table in UG 490 OPUC SDR 68 was prepared on a total premium year basis vs. the actual fiscal year system allocated and did not include some of the other FERC 924 insurance categories such as Cyber, Fiduciary, and D&O as they weren't included in the original SDR template. Refer to an update in UG 490 OPUC SDR 224 – Attachment 1.

In Confidential UG 490 OPUC DR 224 Attachment 1 we have reconciled to FERC 924 in UG 490 OPUC SDR 58B.

This response has been amended to break out the D&O insurance premiums further. Note that only 2020 and 2021 were impacted and had the Crime and Travel premiums included with D&O. Refer to Amended Confidential UG 490 DR 224 Attachment 1.

DECARBONIZATION EMPLOYEES AND RENEWABLE NATURAL GAS AUTOMATIC ADJUSTMENT CLAUSE EXHIBIT 3600

June 4, 2024

EXHIBIT 3600 – REPLY TESTIMONY – DECARBONIZATION EMPLOYEES AND RENEWABLE NATURAL GAS AUTOMATIC ADJUSTMENT CLAUSE

Table of Contents

I. Introduction and Summary 1

II. Decarbonization Employees 2

III. RNG AAC 14

IV. Shift in RNG Acquisitions 25

I. INTRODUCTION AND SUMMARY

Q. Are you the same Zachary D. Kravitz and Kyle N. Griffiths who filed Direct Testimony in this proceeding on behalf of Northwest Natural Gas Company dba NW Natural ("NW Natural" or the "Company")?

A. Yes. Zachary D. Kravitz and Anna K. Chittum presented NW Natural/1500, Kravitz-Chittum. In NW Natural/2100, Griffiths, Kyle N. Griffiths explained that he was adopting NW Natural/1500, Kravitz-Chittum as his own testimony in place of Ms. Chittum who is no longer employed by NW Natural. Mr. Kravitz remains the co-sponsor of NW Natural/1500, Kravitz-Chittum.

Q. What is the purpose of your Reply Testimony in this proceeding?

A. The purpose of this testimony is to:

- Respond to the testimony of Staff witness Curtis Dlouhy, Staff/900, Dlouhy, regarding his proposal to disallow the recovery of four out of five decarbonization full-time equivalents ("FTEs") sought by the Company;
- Respond to the testimony of Staff witness Curtis Dlouhy, Staff/900, Dlouhy, and the testimony of the Oregon Citizens' Utility Board ("CUB") witness Bob Jenks, CUB/100, Jenks, concerning the Company's proposed changes to Schedule 198, which is the Company's Renewable Natural Gas ("RNG") automatic adjustment clause ("AAC"); and
- Respond to the testimony of Staff witness Curtis Dlouhy, Staff/900, Dlouhy, concerning the structure of future RNG investments that the Company may make.

II. DECARBONIZATION EMPLOYEES

Q. Please summarize NW Natural's Direct Testimony that requested rate recovery for five FTEs focused on decarbonization.

A. NW Natural stated in Direct Testimony that it planned to hire five additional FTEs focused on decarbonization and (subsequently-invalidated) Climate Protection Program ("CPP") compliance.[1] Specifically, NW Natural stated it planned to fill the following positions by the rate effective date in this proceeding (November 1, 2024):

1. Peak Load Management Analyst;
2. Decarbonization Compliance Rates Analyst;
3. Decarbonization Services Analyst;
4. Decarbonization Services Operations Support; and
5. Decarbonization Portfolio Manager.

The Peak Load Management Analyst will be part of the Strategic Planning Department. The Decarbonization Compliance Rates Analyst will be part of the Rates & Regulatory Affairs Department. The remaining positions will be part of NW Natural's Renewables Department.

Although NW Natural's rationale for these five positions was premised, in part, on CPP compliance, the CPP was invalidated shortly after NW Natural had written its Direct Testimony.

[1] NW Natural/1500, Chittum-Kravitz/20.

Q. Did the invalidation of the CPP change NW Natural's plans with respect to these five additional FTEs?

A. No. In Supplemental Testimony, NW Natural stated that "these five positions are still necessary for NW Natural to meet Oregon's increasing renewable natural gas ("RNG") targets under SB 98,[2] prepare for potential climate policies, and move forward with analysis for non-pipeline solutions."[3]

Q. Please summarize Staff's framework for evaluating NW Natural's request for cost recovery associated with these five FTEs.

A. Staff's Opening Testimony states that "it recognizes the need for a fine balance between allowing the Company to meet Oregon's decarbonization goals, advocating for policies in furtherance of said goals . . ." with the recognition that future Oregon greenhouse gas ("GHG") regulations are subject to judicial review and may be invalidated, like the CPP was.[4] Staff appears to be focused on whether these additional positions will be "no regrets"[5] solutions towards decarbonization given the uncertainty concerning GHG regulation in Oregon.[6]

[2] ORS 757.390-398. Per ORS 757.396, the RNG acquisition target will double from 5 percent of sales load to 10 percent in 2025.

[3] NW Natural/2000, Kravitz-Therrien/6.

[4] Staff/900, Dlouhy/6.

[5] *Id.* at 8.

[6] *Id.* at 6, 8.

Q. What is the current status of the Oregon Department of Environmental Quality's ("ODEQ") rulemaking to establish new GHG regulations?

A. NW Natural understands that ODEQ seeks to adopt new GHG regulations to replace the invalidated CPP on an accelerated schedule. ODEQ currently plans to submit these new rules for Oregon Environmental Quality Council ("OEQC") approval in November 2024 and have the new rules go into effect on January 1, 2025,[7] which is several months faster than NW Natural anticipated when it drafted its Supplemental Testimony.[8] ODEQ has already held two of the three Rules Advisory Committee ("RAC") meetings and plans to hold the final RAC meeting on June 25, 2024. According to ODEQ, the RAC "represent[s] affected parties and stakeholders" that "will review proposed rules and provide feedback on potential fiscal, economic, and racial equity impacts."[9]

Q. Is NW Natural part of the RAC?

A. Yes. NW Natural is part of the RAC and has been actively engaging in the rulemaking process. NW Natural's participation is consistent with its Supplemental Testimony, where we stated: "[W]e look forward to reengaging with [ODEQ], our customers and the communities we serve to develop cost effective, constructive solutions that address our shared climate goals."[10]

[7] https://www.oregon.gov/deq/rulemaking/Pages/CPP2024.aspx.

[8] NW Natural/2000, Kravitz-Therrien/4.

[9] https://www.oregon.gov/deq/rulemaking/Pages/CPP2024.aspx.

[10] NW Natural/2000, Kravitz-Therrien/4.

Q. Please summarize Staff's concerns with NW Natural's proposal to recover any costs associated with compliance of any future Oregon GHG regulations.

A. Staff states that it is "premature" for NW Natural to receive rate recovery for costs to implement any future Oregon GHG regulations because NW Natural will likely challenge that program in court.[11]

Q. Please respond to Staff's concerns.

A. First, regarding NW Natural potentially challenging any new Oregon GHG regulations in court, NW Natural reiterates that RAC meetings are ongoing and ODEQ has not issued any draft rules. Therefore, no party is in a position to determine what NW Natural may or may not do if such regulations are subsequently enacted. Staff's statement is unsupported and completely speculative.

Second, NW Natural is not and has never been opposed to climate regulation. In the past, it has supported legislation that would have established a cap-and-trade program in Oregon that is similar to those programs in California and Washington. Currently, NW Natural does not support the effort to repeal the Climate Commitment Act in Washington, which establishes that state's cap-and-trade program. Therefore, it is inappropriate to assume that the Company will automatically seek to challenge future Oregon GHG regulations.

[11] Staff/900, Dlouhy/5.

Third, and perhaps most importantly, NW Natural must plan to comply with future Oregon GHG regulations, regardless of potential legal challenges. In formulating its previous Integrated Resource Plan ("IRP"), the Company diligently prepared a plan to comply with the CPP, even though the CPP was being challenged in court. In addition, prior to the CPP's invalidation, the Company was planning to purchase $220 million in Community Climate Investment ("CCI") credits for CPP compliance in the first compliance period (2022-2024),[12] and had made a filing seeking recovery of a portion of such compliance costs. However, using Staff's logic, NW Natural should not have engaged in any of these planning activities, especially the IRP, because the validity of the CPP was uncertain at that time. NW Natural believes this is the wrong approach and fully intends to use these positions to assist in its compliance with future Oregon GHG regulations.

Q. Given this background, did Staff oppose NW Natural's proposal to recover the costs of all five positions related to decarbonization?

A. No. Staff recommends that NW Natural recover the costs of the Peak Load Management Analyst in rates. However, Staff does not recommend that NW Natural recover the costs of the remaining four positions.

Q. Why does Staff recommend that NW Natural recover the cost of the Peak Load Management Analyst in rates?

A. In supporting the recovery of the Peak Load Management Analyst position, Staff states that "exploring methods to reduce load holds intrinsic value for both the

[12] NW Natural/1500, Kravitz-Chittum/7.

Company and its ratepayers, irrespective of the validity of the CPP or any future decarbonization obligation the Company may have."[13]

Q. Does NW Natural agree with Staff's recommendation?

A. Yes. NW Natural supports Staff's recommendation concerning the Peak Load Management Analyst. NW Natural is in the hiring process for this position.

Q. Why does Staff not recommend that NW Natural recover the cost of the Decarbonization Compliance Rates Analyst in rates?

A. In making its recommendation, Staff states that it "does not envision there being significant analysis of the rate impacts of decarbonization absent the CPP or a successor program and would like to reiterate that the SB 98 targets are entirely voluntary."[14]

Q. Does NW Natural agree with Staff's recommendation?

A. No, it does not. First, while Staff is correct that SB 98 targets are not mandatory, that is not germane to the Decarbonization Compliance Rates Analyst. To date, the Company has cautiously invested in RNG and made several RNG purchases, but it has not approached the targets set in the law. As the Company increases RNG acquisitions in response to new GHG regulations, SB 98 (or both), it will need additional regulatory analysis that this position will conduct.

Second, Staff's argument is premised on there being no future Oregon GHG regulations. However, as shown above, ODEQ is actively working on such

[13] Staff/900, Dlouhy/8.

[14] *Id.* at 9.

regulations and it intends to have draft rules submitted to the OEQC for approval in November 2024 and for the program to go into effect on January 1, 2025. As stated above, NW Natural cannot take a wait-and-see approach to these regulations, as well as other standards currently in statute.[15] Rather, it must actively plan to comply with them, regardless of any potential litigation concerning their validity. Moreover, the Company's current plans include ongoing work to reduce GHG emissions based on both the state's current laws and its own internal policies.[16] Therefore, according to Staff's own testimony, the Decarbonization Compliance Rates Analyst will be performing "significant analysis of the rate impacts of decarbonization."

Finally, similar to the Peak Load Management Analyst, the Decarbonization Compliance Rates Analyst is a "no regrets" position that is necessary regardless of the validity of any future Oregon GHG regulations and SB 98. NW Natural expects the Decarbonization Compliance Rates Analyst to collaborate with the Peak Load Management Analyst in looking at ways to reduce load to avoid system expansions. Such work inherently has an ongoing regulatory component that involves obtaining regulatory approval of any such program, determining how to set incentives for customers to reduce load in a certain area, and how those

[15] ORS 468A.205.

[16] *See* VISION 2050, Destination Zero, available at: https://www.nwnatural.com/about-us/the-company/carbon-neutral-future#:~:text=Our%20vision%20is%20to%20champion,residents%20we%20serve%20every%20day; ORS 468A.205.

incentives are recovered in rates. Similarly, the Company is pursuing hybrid heating and geothermal heat pumps. All of these initiatives involve evaluating customer rate impacts, developing ratemaking models, and evaluating cost allocation of these initiatives with a view towards promoting fairness and equity.

Q. What is the current status of the Decarbonization Compliance Rates Analyst?

A. NW Natural has posted the position of Decarbonization Compliance Rates Analyst and is evaluating applications.

Q. Why does Staff not recommend that NW Natural recover the cost of the Decarbonization Services Analyst in rates?

A. Staff does not recommend that the Decarbonization Services Analyst be recovered in rates because it claims that the position would be involved in RNG-related projects related to meeting SB 98 acquisition targets.[17]

Q. Does NW Natural agree with Staff's recommendation?

A. No. First, regarding Staff's concerns with RNG, nothing in either Direct Testimony or Supplemental Testimony indicates that the Decarbonization Services Analyst has anything to do with RNG.[18] Rather, the Decarbonization Services Analyst will "research and analyze new and emerging technologies and develop business cases for new decarbonization services, including district energy and geothermal energy in both residential and commercial and industrial applications, as well as

[17] Staff/900, Dlouhy/10-11.

[18] NW Natural/1500, Kravitz-Chittum/21. NW Natural/2000, Kravitz-Therrien/6-7.

negotiating agreements with large customers in hard-to-decarbonize sectors for siting hydrogen and carbon capture projects."[19] Using Staff's terminology, NW Natural considers these technologies to be "no regrets" decarbonization solutions. As we stated in Supplemental Testimony, district energy and ground-source heat pumps are specific types of electrification that can reduce winter peak on both the natural gas and electric systems.[20] Decarbonizing the industrial sector is also important to help Oregon achieve its 2050 goal of a 75 percent reduction in GHG emissions relative to 1990 levels per ORS 468A.205. Having expertise in these areas gives the Company more potential decarbonization solutions.

Second, as stated above, NW Natural will plan to comply with future Oregon GHG regulations. NW Natural expects draft rules to be submitted for approval to the OEQC in November 2024, meaning that the Company can begin to make such plans shortly after the rate effective date. Therefore, the Decarbonization Services Analyst will help plan for compliance with such a program, as well as comply with existing state statutes concerning GHG emissions and our own internal decarbonization goals.[21]

[19] NW Natural/2000, Kravitz-Therrien/6-7.

[20] *Id.*

[21] *See* VISION 2050, Destination Zero, available at: https://www.nwnatural.com/about-us/the-company/carbon-neutral-future#:~:text=Our%20vision%20is%20to%20champion,residents%20we%20serve%20every%20day; ORS 468A.205.

Q. What is the current status of the Decarbonization Services Analyst?

A. NW Natural has filled this position. The new Decarbonization Services Analyst will begin work in mid-June 2024.

Q. Why does Staff not recommend that NW Natural recover the cost of the Decarbonization Services Operations Support position in rates?

A. Similar to the Decarbonization Services Analyst, Staff does not recommend that NW Natural recover the cost of the Decarbonization Services Operations Support position in rates because it claims that the position would be involved in RNG-related projects related to meeting SB 98 acquisition targets.[22]

Q. Does NW Natural agree with Staff's recommendation?

A. No. First, NW Natural understands that SB 98 RNG acquisition targets are not mandatory. However, SB 98 states that "[r]enewable natural gas provides benefits to natural gas utility customers and to the public," and, "[t[he development of renewable natural gas resources should be encouraged to support a smooth transition to a low carbon energy economy in Oregon."[23] Given that SB 98 establishes clear policy promoting the acquisition of RNG by Oregon natural gas utilities, NW Natural does not understand Staff's recommendation to deny recovery of the Decarbonization Services Operations Support position because that employee will be helping the Company acquire RNG (i.e., helping to achieve the state policy objectives articulated in SB 98).

[22] Staff/900, Dlouhy/10-11.

[23] ORS 757.390.

Second, NW Natural will need to acquire decarbonized fuels in addition to pursuing other technologies to help meet Oregon's 2050 decarbonization goal in ORS 468A.205 and to help comply with future Oregon GHG regulations. These are transformative changes that require additional FTEs. Again, NW Natural expects draft greenhouse gas rules to be submitted for approval to the OEQC in November 2024, meaning that the Company can begin to make such plans shortly after the rate effective date, and the Decarbonization Services Operations Support position will provide valuable help in complying with the program.

Third, the Decarbonization Services Operations Support position is not limited to RNG acquisitions. Rather the position will collect and manage details supporting operational contracts and finances for all of the Company's decarbonization projects, not just RNG.[24] As the Company's decarbonization portfolio grows, this position will support projects associated with other technologies, such as district energy, geothermal, carbon capture, and hydrogen, in addition to RNG projects.[25]

Finally, NW Natural is surprised to see that Staff expressed reservations with the Decarbonization Services Operations Support position because of Staff's concerns regarding adequate risk modeling and customer protections associated with the Company's Dakota City RNG project. NW Natural does not understand

[24] NW Natural/2000, Kravitz-Therrien/7.

[25] *Id.*

how that can be the case considering Staff entered into a stipulation supporting Dakota City's inclusion into customer rates.[26]

Q. What is the current status of the Decarbonization Services Operations Support position?

A. NW Natural has filled this position and the individual is working at the Company.

Q. Why does Staff not recommend that NW Natural recover the cost of the Decarbonization Portfolio Manager in rates?

A. Staff does not recommend that NW Natural recover the cost of the Decarbonization Portfolio Manager in rates because it claims that the position would only be involved in the rulemaking regarding future Oregon GHG regulations.[27] Staff does not believe that a new FTE is warranted for participation in a single rulemaking.

Q. What is the current status of the Decarbonization Portfolio Manager?

A. An existing FTE is performing the duties of the Decarbonization Portfolio Manager in addition to her existing duties. Therefore, NW Natural is no longer seeking cost recovery of the Decarbonization Portfolio Manager. The Reply Testimony of Kyle T. Walker, NW Natural/3800, Walker, removes the cost of the Decarbonization Portfolio Manager from the Company's revenue requirement.

[26] *In the Matter of Northwest Natural Gas Co., dba NW Natural, Renewable Natural Gas Adjustment Mechanism- Dakota City*, Docket No. UG 462, Order No. 23-367, at 3 (Oct. 16, 2023).

[27] Staff/900, Dlouhy/9-10.

III. RNG AAC

Q. Please describe NW Natural's two proposed changes to Schedule 198—RNG AAC.

A. NW Natural proposed two changes to Schedule 198. The first change is to permit NW Natural to defer, for later cost recovery, the costs of its RNG investments between the investment's in-service date and the rate effective date. The second change is to set the Schedule 198 earnings test at NW Natural's authorized ROE, removing the current deadband of 50 basis points below and 50 basis points above authorized ROE.[28]

Q. What were the parties' positions regarding NW Natural's proposal to defer, for later cost recovery, the costs of its RNG investments between the investment's in-service date and the rate effective date?

A. Both Staff and CUB oppose the proposal. AWEC and the Coalition do not take a position.

Q. Please summarize Staff's opposition to the deferral.

A. Staff states that NW Natural's comparison of Schedule 198 to electric utilities' Renewable Resource Automatic Adjustment Clauses ("RRAC") is not entirely fair.[29] Under the RRAC, electric utilities can defer the costs of its renewable investments between the investment's in-service date and the rate effective date, whereas such treatment is not currently available under Schedule 198. Staff

[28] NW Natural/1500, Kravitz-Chittum/14-20.

[29] Staff/900, Dlouhy/14-15.

argues that this is appropriate because electric utilities must acquire renewable electricity to comply with the state's renewable portfolio standard ("RPS"), but NW Natural is not required to acquire RNG to comply with the now invalidated CPP or any future Oregon GHG regulations.[30] Staff also states that RNG is costly and risky compared to renewable electricity and it is unclear how effective RNG will be as a compliance resource.[31]

Q. Please respond to Staff's concerns.

A. First, NW Natural disagrees that its comparison of Schedule 198 to electric utilities' RRACs is not entirely fair. Staff suggests that NW Natural could meet state greenhouse goals and comply with future Oregon GHG regulations solely "through strategic electrification, energy efficiency, non-pipes alternatives, or other means."[32] Staff, however, does not support this view with any analysis and overlooks the fact that NW Natural has a utility obligation to its customers. In other words, NW Natural must provide as much natural gas as its customers desire. Therefore, as a practical matter, NW Natural cannot both comply with future Oregon GHG regulations and fulfill its basic utility obligations solely through the non-pipeline alternatives suggested by Staff. Instead, customers continue to demand natural gas for heating, cooking, and industrial applications and NW Natural must provide it. After taking actions to mitigate this demand through energy efficiency, demand response, and other means, it naturally follows that NW

[30] *Id.* at 15-16.

[31] *Id.* at 17-18.

[32] *Id.* at 15-16.

Natural must acquire decarbonized fuels to both satisfy its customers' needs, help Oregon meet its greenhouse gas reduction goals, and comply with any future Oregon GHG regulations.

Second, NW Natural notes that Staff mentions that it "testified [in PGE's last general rate case—UE 416—that] the use of the R[R]AC should be investigated given the drastic change in policy landscape following the passage of HB 2021 to balance concerns of customer protections with resource acquisition."[33] However, to NW Natural's knowledge, such an investigation has not taken place. Therefore, NW Natural continues to believe that the disparity between RRAC and Schedule 198 continues to exist and should be remedied in this proceeding.

Finally, NW Natural disagrees with Staff's conclusion that this change "would incentivize the Company to unfairly favor RNG investments in a way that may be detrimental to customers and that allowing this deferral would sub-optimally shift both upside and downside risks onto customers."[34] Staff's argument goes to the prudency of any RNG investment, not whether a deferral is appropriate. More importantly, however, NW Natural is simply seeking the opportunity to recover costs for RNG produced between the project's in-service date and the rate effective date. RNG produced during this time benefits customers, particularly if it is used to comply with future Oregon GHG regulations and, therefore, NW Natural should have the opportunity to recover those costs.

[33] *Id.* at 16.

[34] *Id*. at 17.

Q. Please summarize CUB's opposition to the deferral.

A. CUB argues that NW Natural has failed to present adequate evidence that a deferral is necessary. It argues that NW Natural continues to seek a deferral even though it was decided in the last rate case (UG 435) and, in CUB's opinion, nothing has changed. Specifically, CUB states that NW Natural is still committed to meeting the targets in SB 98 regardless of whether they are necessary for compliance with future Oregon GHG regulations.[35]

Q. Please respond to CUB's concerns.

A. First, NW Natural would like to clarify its Direct Testimony. In testimony, NW Natural described its RNG acquisition approach prior to the Commission's order in its IRP. This prior approach was focused on meeting SB 98 acquisition targets first and then taking subsequent actions to comply with the invalidated CPP, such as the purchase of CCI credits.[36] After that order was issued, however, the Company shifted its approach towards compliance to focus on maximizing CCI credits as directed by the Commission, and then pursuing multiple, simultaneous compliance actions in the coming years to assure compliance even during cold weather, such as investing in RNG.[37] The Company was planning on taking that approach when the CPP was invalidated.

[35] CUB/100, Jenks/21-22.

[36] NW Natural/1500, Kravitz-Chittum/12-13 (citing *In the Matter of Northwest Natural Gas Co., dba NW Natural, 2022 Integrated Resource Plan*, Docket No. LC 79, Order No. 23-281, at 11-12 (Aug. 2, 2023)).

[37] *Id.*

CUB cites the Commission's order in NW Natural's previous general rate case, stating that the Commission was concerned "about the potential incentive created by the availability of an AAC to skew the company's analysis of costs and risks of alternative CPP compliance measures towards RNG projects."[38] NW Natural takes these concerns seriously and notes that in the nearly two years since that order was issued (not six months, as stated by CUB[39]), it has used Schedule 198 once for a single RNG project (Dakota City) that is equal to approximately 0.14 percent of the Company's current Oregon sales load.[40] In addition, the decision to proceed with that project was made in November 2021, nearly a year before the Commission approved Schedule 198. Therefore, Schedule 198 has not been used in the way that the Commission and CUB feared, where its use would "skew" the Company's analysis towards more RNG investments. If NW Natural receives a deferral between an RNG project's in-service date and the rate effective date, it will continue to ensure that this remains the case, while seeking to acquire adequate amounts of RNG in response to state decarbonization policies.

Finally, NW Natural notes that it is seeking a deferral to recover costs associated with meeting the state's decarbonization goals. As I stated above, NW Natural believes it is appropriate to recover the cost of the RNG produced between

[38] CUB/100, Jenks/22-23 (citing *In the Matter of Northwest Natural Gas Co., dba NW Natural, Request for a General Rate Revision,* Docket No. 435, Order No. 22-388, at 83 (Oct. 24, 2022)).

[39] *Id.* at 30.

[40] The Lexington RNG project is also recovered through Schedule 198. However, the Company sought approval of Lexington and Schedule 198 simultaneously in its last general rate case (UG 435). The Company has only sought recovery of one RNG project, Dakota City, through the Schedule 198 that was approved in Order No. 22-388.

the in-service and the rate effective date that is providing customers with a clear benefit—meeting the state's decarbonization goals[41] and complying with future Oregon GHG regulations.

Q. Absent a deferral, is there another way to address the Company's concern?

A. Yes. In Direct Testimony, we stated that Schedule 198 requires NW Natural to make a filing to include new RNG projects in rates by February 28 of each year with a rate effective date of November 1.[42] Instead of a deferral, the fixed February 28 filing date could be made flexible, which would allow the Company to time its Schedule 198 filing so that rates go into effect shortly after the project goes into service.

Q. What are the parties' response to NW Natural's alternative proposal?

A. CUB is the only party that addressed this issue, arguing that "there is no compelling reason to change what has already been agreed to," and it "would place an unnecessary burden on the Commission and Commission stakeholders."[43]

Q. Please respond to CUB's concerns.

A. First, as a threshold matter, the lack of a deferral and a fixed filing date was not "agreed to" by NW Natural in its last general rate case (UG 435). In seeking changes to Schedule 198, NW Natural is not seeking revisions to any stipulation to which it previously agreed.

[41] ORS 468A.205.

[42] NW Natural/1500, Kravitz-Chittum/17-18.

[43] CUB/100, Jenks/28.

Second, there are compelling reasons to change Schedule 198. As I have already stated, NW Natural should have the opportunity to recover costs associated with meeting the state's decarbonization goals. NW Natural has used Schedule 198 sparingly in the nearly two years since it was enacted, and it is not "skewing" its analysis to favor RNG.

Finally, NW Natural acknowledges there may be an additional burden for the Commission and stakeholders associated with the flexible Schedule 198 filing date for new RNG projects, although this issue could be mitigated through the prefiling notification process that already exists in Schedule 198. It also acknowledges that its alternative proposal could lead to multiple rate changes in a year, which the Company seeks to avoid. For these reasons, the Company continues to believe a deferral is preferrable to a flexible Schedule 198 filing date for new RNG projects. However, a flexible filing date is an improvement on the status quo where the Company has no opportunity to recover the cost of the RNG produced between the in-service and the rate effective date, even though it helps the state achieve its decarbonization goals.

Q. What are the parties' positions regarding NW Natural's proposal to set the Schedule 198 earnings test at NW Natural's authorized ROE, which would remove the current deadband of 50 basis points below and 50 basis points above authorized ROE?

A. Staff states that setting the earnings test at 50 basis points below ROE may put the Company in a regulatory bind that should be avoided.[44] Staff believes that a change to Schedule 198 "may be warranted if the Company's characterization of the issue is correct or the magnitude of the costs associated with the volume of RNG is large enough."[45]

CUB, on the other hand, opposes NW Natural's proposal, arguing that it was decided in the last general rate case.[46] AWEC and the Coalition take no position.

Q. Please respond to Staff concerning how NW Natural has characterized this earnings test issue and its magnitude.

A. We continue to believe that higher-than-forecasted RNG production increases the project's overall revenue requirement, even though per-unit costs decline. However, due to the earning test deadbands, NW Natural would not recover these additional costs. The Company agrees with Staff that such treatment puts it in a "regulatory bind."

[44] Staff/900, Dlouhy/19.

[45] *Id.* at 20.

[46] CUB/100, Jenks/29.

NW Natural, however, disagrees with Staff "that these costs are trivial in the context of the overall revenue requirement of the RNG costs and thus do not rise to a high enough level of concern to warrant a change to the existing RNG AAC [Schedule 198]."[47] Although Staff is correct that, in the isolated example of the Tyson RNG projects, the overall revenue requirement and per-unit costs both decrease as volumes increase, that is only possible because of increased physical gas sales. In other words, on off-system projects, NW Natural sells the physical gas to a third party and retains the environmental attributes. This physical gas revenue offsets the increase in variable costs. However, NW Natural would not have this physical gas revenue if the project were on-system or "bundled" (i.e., NW Natural retains both the environmental attributes and the physical gas). In that case, if volumes increased, leading to a decrease in per-unit costs, then overall revenue requirement would increase because, again, it is not being offset by the sale of the physical gas to a third party.

Q. Assuming that the costs are not "trivial," what does Staff recommend?

A. Staff recommends subdividing the earnings test into two parts. The first part would be an earnings test for fixed costs, which would retain the deadband that is currently in place. The second part would be for variable costs, which would be set at the Company's authorized ROE.

[47] Staff/900, Dlouhy/21.

Q. Does NW Natural support Staff's recommendation?

A. No. While NW Natural appreciates Staff's recommendation, we believe it introduces unnecessary complexity into the earnings test. First, NW Natural's fixed costs should remain relatively stable over time and, therefore, not drive material variances between forecasted and actual costs that are subject to the earnings test.

Second, NW Natural does not support applying two separate earnings tests to a single regulatory mechanism. This adds unnecessary complexity to the administration of the AAC and to the monthly accounting monitoring of the earnings test for review of the earnings test.

Q. How does NW Natural's proposal balance the Company's and customers' interests?

A. NW Natural's proposal follows the Commission's direction from UG 435 to apply an earnings test to the RNG AAC, which recognizes that the utility may seek cost recovery for RNG investments outside of a rate case. An earnings test can serve as a proxy to a rate case to test the utility's overall earnings when the utility is seeking cost recovery outside of rate case. NW Natural is not challenging this premise. However, there was clearly an unintended consequence of the Commission's decision that has put NW Natural in a "regulatory bind." Namely, higher costs of production do not necessarily equate to higher per unit cost of RNG. Under the current mechanism, it is possible for the following situation to play out:

- NW Natural sets annual rates for the AAC on November 1 based on its reasonable assumptions of costs and production;

- The costs in the same year are higher than expected;
- The production is higher than expected;
- The per unit cost of RNG is lower than expected;
- NW Natural's actual ROE is underearning its authorized ROE, with an actual ROE between 8.9 percent and 9.4 percent, consequently;
- NW Natural does not recover the incremental costs of production, to the extent the Company is earning at least 8.9 percent (50 basis points below its current authorized ROE).

While the Company's proposal may seem like a relatively inconsequential change to the earnings test to Staff, the Company's proposal fixes the "regulatory bind" that is embedded in the current earnings test, aligns the interests of the Company and customers to incentivize the lowest per unit cost of RNG, and adheres to the Commission's preference to utilize an earnings test for RNG projects brought forward under the RNG AAC.

Q. Please respond to CUB's concerns.

A. CUB quotes extensively from the Commission's order in the last general rate case. However, as noted by Staff, an unintentional effect of the earnings test is that it puts the Company in a "regulatory bind" when the overall revenue requirement increases and per-unit costs decline in certain circumstances. Also, NW Natural notes that its proposal helps to address some of the concerns the Commission expressed concerning the Schedule 198 earnings test. For instance, the Commission set a deadband at 50 basis points above authorized ROE, "despite

some concern that the deadband above authorized ROE could create an incentive for the company to over-forecast the costs of RNG."[48] Under the Company's proposal, there would be no deadband above authorized ROE. Instead, the earnings test would be set at authorized ROE, thereby removing the Commission's (and presumably CUB's) concern that a deadband above ROE could create an incentive to over-forecast costs.

Similarly, removing the deadband that is 50 basis points lower than authorized ROE is necessary for symmetry and, more importantly, would allow the Company to recover incremental costs for RNG projects even though per-unit costs decline. NW Natural reiterates, however, that its proposal is not one-sided. NW Natural's recovery of higher than forecasted RNG costs would be capped at its authorized ROE, which removes the Commission's concern that NW Natural may have an incentive to over-forecast costs.

IV. SHIFT IN RNG ACQUISITIONS

Q. Please summarize your Direct Testimony regarding how the Company plans to acquire RNG.

A. As mentioned above, NW Natural explained that its prior RNG acquisition strategy was focused on meeting SB 98 targets first and then taking subsequent actions to comply with the subsequently invalidated CPP, such as the purchase of CCI credits. In response to the Commission's guidance "to pursue RNG and CCIs in

[48] CUB/100, Jenks/29 (citing *In the Matter of Northwest Natural Gas Co., dba NW Natural, Request for a General Rate Revision*, Docket No. 435, Order No. 22-388, at 82-84 (Oct. 24, 2022)).

the most economical way possible,"[49] the Company signaled that it would instead seek to maximize the purchase of CCI credits and then pursue other compliance actions, such as the acquisition of RNG in Direct Testimony. If instruments similar to CCI credits are part of future Oregon GHG regulations and are an authorized compliance option, then the Company currently plans to continue to maximize these credits prior to taking other compliance actions, such as acquiring RNG, although this is dependent on the cost of such compliance instruments relative to other compliance actions.

The Company also stated that it would abandon its use of the affiliate structure that it used for its initial RNG investments consistent with Commission guidance.

Q. Did Staff respond to NW Natural's shift in approach to acquiring RNG?

A. Yes. Staff sees benefits in no longer using affiliates because it reduces administrative burden. However, Staff also believes that the affiliate could be used more productively if it were part of an offtake agreement between the affiliate and the regulated utility that insulated customers from upside and downside risk. Conversely, Staff states that it would find it acceptable if NW Natural were to house all future RNG investments under the utility's regulated arm, but cautions that this could come with greater scrutiny about the prudency of the Company's investments.

[49] *In the Matter of Northwest Natural Gas Co., dba NW Natural, 2022 Integrated Resource Plan*, Docket No. LC 79, Order No. 23-281, at 11 (Sept. 28, 2023).

Q. What is your reaction to Staff's recommendation?

A. First, NW Natural appreciates Staff's engagement on this issue and for its thoughtful analysis. Second, NW Natural has concerns with the affiliate approach suggested by Staff. Similar to NW Natural's previous use of affiliates, it may create an administrative burden because it would require the filing of an affiliated interest agreement, in addition to a separate docket for cost recovery. As Staff correctly points out, affiliated interest dockets must be resolved within 90 days, which is an accelerated timeline compared to a typical proceeding. However, this accelerated timeline could be made more workable if there was consensus that the utility could satisfy the "lower of cost or market" standard for affiliated interest agreements by demonstrating that the affiliate competed in a competitive procurement process and the utility could demonstrate that the affiliate's proposal is lower than other competitive bids (i.e. the market).[50]

Second, while the Company does not necessarily agree with the Commission's finding, the Commission stated that NW Natural's previous approach to acquiring RNG, including the use of affiliates, improperly shifted risk to customers. In Order No. 23-367, it stated: "We recognize the opportunity to own these projects through the affiliate may tend be favored by Company shareholders. In the complex structure of this deal, project performance risk passes through the Company's affiliate agreement to customers. It lands with those customers in a way that does not mirror traditional ratemaking, in which the utility would need to

[50] OAR 860-027-0048(4)(e).

manage expenses between rate cases."[51] Staff's position appears to be inconsistent with the Commission's direction. Since NW Natural is removing the risk identified by the Commission, the Company would expect Commission scrutiny of RNG projects would not increase.

Q. Does this conclude your Reply Testimony?

A. Yes, it does.

[51] *In the Matter of Northwest Natural Gas Co., dba NW Natural, Renewable Natural Gas Adjustment Mechanism- Dakota City*, Docket No. UG 462, Order No. 23-367, at 3 (Oct. 16, 2023).

III. Account 303.10 Retirements.....4

IV. Meter Modernization Program 4

V. Conclusion 5

I. INTRODUCTION

Q. Please state your name and address.

A. John J. Spanos. My business address is 207 Senate Avenue, Camp Hill, Pennsylvania.

Q. By whom are you employed and in what capacity?

A. I am associated with the firm of Gannett Fleming Valuation and Rate Consultants, LLC ("Gannett Fleming") as President. I have been associated with the firm since June 1986.

Q. Have you previously submitted Direct Testimony on behalf of Northwest Natural Gas Company dba NW Natural ("NW Natural" or the "Company") in this proceeding?

A. Yes. My Direct Testimony is set forth in NW Natural/1600, Spanos.

Q. What is the purpose of your Reply Testimony?

A. The purpose of my Reply Testimony is to address and rebut depreciation and accounting adjustments set forth by the Alliance of Western Energy Consumers ("AWEC") witness Bradley G. Mullins[1] and the Public Utility Commission of Oregon ("OPUC") Staff witness, Curtis Dlouhy.[2] OPUC Staff witness Ming Peng has not proposed any depreciation adjustments at this time.[3] Most specifically, I will address retirements and depreciation expense for computer software applications in Account 303.10, Miscellaneous Intangible Plant - Software. I will also address

[1] AWEC/100, Mullins/36-37.

[2] Staff/900, Dlouhy/57-58.

[3] Staff/1400, Peng/3-13.

the meter modernization program discussed by Staff Witness Dlouhy as it relates to depreciation.

II. PROPER TREATMENT OF ACCOUNT 303.10

Q. Please explain the proper accounting for Account 303.10, Miscellaneous Intangible Plant - Software.

A. The current practice for Account 303.10, Miscellaneous Intangible Plant – Software is to treat this account as a depreciable account just like all other group depreciation asset classes. The same depreciation recovery pattern is recommended in the depreciation study. Therefore, assets should stay on the books until they are retired or taken out of service.

Q. What is the survivor curve being recommended in the depreciation study?

A. The Depreciation Study recommends a 15-SQ type survivor curve. This means the account will have a 15-year average service life with no dispersion expected.

Q. Does a Square curve require retirement of plant at the end of the average service life as AWEC Witness Mullins suggests[4]?

A. Not necessarily. In the case of general plant amortization, there is a practice in place for accounting purposes, which recommends that assets be retired from the accounting records after the determined amortization period regardless if they are still in service. This process is discussed in Part V of the Depreciation Study as well as in my Direct Testimony. The specific general plant accounts are identified in the study. These accounts represent asset classes with many assets with

[4] AWEC/100, Mullins/36-37.

relatively low individual asset value, so it has been a common practice in the industry for over 30 years to amortize these types of assets. NW Natural has had amortization accounting in place for more than 10 years for such accounts.

Q. Does Account 303.10 fall into the general plant amortization category just because of the use of a Square Curve?

A. No. Account 303.10 does not have many small-valued assets. However, the most reasonable recovery pattern is a Square curve. Therefore, the plant in service must be recovered in the same fashion as all other group depreciable accounts that utilize the remaining life method.

Q. Does the rate for Account 303.10 properly reflect the recovery pattern for these assets over the remaining life?

A. Yes. The 16.30 depreciation rate needs to be applied to these assets in order to recover the remaining net plant over the 5-year composite remaining life. The 5-year remaining life is a composite remaining life as is the case for all depreciable accounts. There is $116 million of plant with $22 million of accumulated depreciation. As shown in the detailed depreciation calculation, the weighting of the vintages shows recovery by vintage and in order to be fully recovered over the 15-year life there is a need to recover some vintages more than what theoretically would be expected, and other vintages will have no further recovery. This is group depreciation under the remaining life technique. Looking at the vintage-by-vintage breakdown shows some vintages will be recovered for more than 5 years, which is shown on page IX-2 of the Depreciation Study. As is shown on page IX-2 there

are remaining lives for vintages 2008 through 2023 that range from 0.5 years to 14.5 years with the composite remaining life totaling 5.0 years.

III. ACCOUNT 303.10 RETIREMENTS

Q. Do you agree with AWEC's position[5] of forecasted retirements for the Account 303.10?

A. No. As stated above, this account is not an amortized account where retirements are required based on a set period of time. The square curve does not require retirements each year based on age of assets. There are no forecasted retirements and the rate for the account is based on the composite remaining life. Assets that are older than the 15-year average life do not require a retirement, however, the established rates assume that the 2009 and 2010 vintages will be fully recovered after each year of the forecast.

Q. Does the depreciation rate for the account set forth the composite remaining life rate based on the life characteristics?

A. Yes. The detail vintage balances and vintage remaining life properly reflect recovery patterns as should be recovered, thus AWEC's request of required retirements is not appropriate based on the calculation.

IV. METER MODERNIZATION PROGRAM

Q. Does Staff's criticism of the meter modernization program consider all the parameters of the life estimation for meters within the Depreciation Study?

A. No. The life estimation of all accounts within the Depreciation Study not only

[5] AWEC/100, Mullins/36-37.

considers the historical indications but future expectations. This is how proper life estimation in depreciation studies are performed.

Q. Please explain how life estimation is performed for meters.

A. There are expected to be high levels of retirements for assets that are approaching 20 years old due to failures of meters around age 20 and older going forward. The survivor curve of 30-L1 shows higher levels of retirements than what has historically occurred. Therefore, the 30-L1 curve anticipates higher levels of retirements of meters than what historically occurred. However, this does not reflect that all meters in this age group should be retired. The program only affects residential meters that are a subset of the full asset class. Consequently, when considering group depreciation and establishing survivor curves for existing assets as well as future assets, the 30-L1 curve takes into consideration the concerns that Staff witness Dlouhy has expressed in his testimony.

V. CONCLUSION

Q. Do the criticisms of Staff and AWEC concerning Account 303.10 and meter modernization program have merit?

A. No. As stated in the testimony above, each of the issues raised by Staff or AWEC have been properly addressed in the Depreciation Study. The positions of Staff and AWEC related to Account 303.10 and the recovery of the meter modernization program have been properly considered.

Q. Does this conclude your Reply Testimony?

A. Yes, it does.

I. INTRODUCTION AND SUMMARY

Q. Are you the same Kyle T. Walker who filed Direct Testimony in this proceeding on behalf of Northwest Natural Gas Company dba NW Natural ("NW Natural" or the "Company")?

A. Yes, I presented NW Natural/1700, Walker.

Q. What is the purpose of your Reply Testimony in this proceeding?

A. The purpose of my Reply Testimony is to respond to the adjustments proposed by:

1) Public Utility Commission of Oregon ("Commission") Staff ("Staff") witness Anderson and Alliance of Western Energy Consumers ("AWEC") witness Mullins, regarding the forward test year capital;
2) Staff witness Chipanera and AWEC witness Mullins, regarding cash working capital;
3) Staff witness Moore, regarding materials and supplies;
4) Staff witness Mondragon, regarding excess deferred income taxes ("EDIT") Amortization;
5) Staff witness Chipanera, regarding the Commission Fee;
6) Staff witness Peng, regarding Allowance for Funds Used During Construction ("AFUDC");
7) Staff witness Stevens and Coalition witness Cebulko, regarding the Decoupling mechanism;
8) AWEC witness Mullins, regarding test year revenue and expenses, removal work in progress ("RWIP") forecast, RWIP accumulated deferred income

taxes, average rate assumption method, pre-1981 flow-through items, and UM 2309 amortization; and

9) Staff witness Dyck regarding cloud-based software capitalization.

I also provide an updated revenue requirement that reflects the filed cost of long-term debt stipulation with the Stipulating Parties, errors identified through Parties' Opening Testimony and discovery, updated union labor agreement, and removal of one full-time employee.

II. FORWARD TEST YEAR CAPITAL

Q. Please summarize the Company's approach to reflecting forward test year capital in this rate case.

A. The Company's filed revenue requirement includes a 13-month average of monthly averages ("AMA") for all capital investments that runs from October 2024 through October 2025 ("the Test Year"). This method is consistent with all of NW Natural's recently filed general rate cases in Oregon over at least the last 22 years.[1] NW Natural included Test Year capital projects as follows:

1) We forecasted those costs and revenues that are reasonably certain to occur in the Test Year. NW Natural/3801, Walker details the rigorous capital expenditure budgeting process that develops our forecast of capital in the Test Year with a combination of "discrete" and "non-discrete" capital;

2) We pro-rated the costs of capital investments with the AMA approach to reflect their proportional benefit to customers during the Test Year; and

3) We offset forecasted costs by projected revenues for the Test Year, including new customer additions.

Q. Did the parties provide Opening Testimony addressing the forward test year capital?

A. Yes. AWEC provided Opening Testimony on the forward test year capital,[2] and Staff provided Opening and Supplemental Testimony addressing this issue.[3] My testimony responds to both parties—first Staff and then AWEC.

Q. Please explain how Staff's position regarding forward test year capital evolved over the course of this case.

A. Staff's Opening Testimony, filed on April 18, 2024, recommended that the Commission include non-discrete Test Year investments in rates and remove one discrete project that would enter service after the rate effective date.[4] On May 1, 2024, counsel for Staff communicated that its Opening Testimony contained an error as it related to Staff's position on utility plant in service included in rates during the Test Year. On May 17, 2024, Staff filed Supplemental Testimony with its new position on utility plant in service.[5] Given the limited amount of time the Company

[2] AWEC/100, Mullins.

[3] Staff/600, Anderson; Staff/2300, Anderson.

[4] Staff/600, Anderson/7-8.

[5] Staff/2300, Anderson/5.

had to respond to Staff's Supplemental Testimony, we reserve the right to expand our response regarding this issue in future testimony.

Q. What is Staff's current position provided in Supplemental Testimony regarding the utility plant in service included in rates during the Test Year?

A. Relying on ORS 757.355, Staff states that only capital investments that will be "on-line" prior to the rate effective date should be included in rates.[6] However, Staff explains that: "there is some plant that utilities can be expected to install and deploy on a consistent basis throughout a year. For such plant, it would be lawful to allow the Company to recover a portion of such plant each month. Meaning, if the Company will consistently install $10,000 of plant in each month of the year, it would be permissible for rates collected from ratepayers each month to include such an amount without violating ORS 757.355."[7]

Q. Please describe Staff's adjustment to utility plant in service in the Test Year.

A. Staff's adjustment in the test year results in a reduction of $119.4 million of rate base additions, after removing the North Coast Feeder Section B project that was erroneously included as an adjustment in Staff's Opening Testimony.[8]

[6] Staff/2300, Anderson/2-3.

[7] Staff/2300, Anderson/4.

[8] Staff/2300, Anderson/7. This project was not initially included in revenue requirement by the Company, and therefore, the removal of the project by Staff in Staff's Opening Testimony has been corrected in Staff's Supplemental Testimony.

Q. Did Staff provide a revenue requirement impact for this adjustment?

A. No, Staff did not. Additionally. Staff did not confirm that Staff would utilize "end of period" rate base, as of October 31, 2024, which has historically been Staff's practice.

Q. Was Staff's position in Supplemental Testimony consistent with the calculation of the $119.4 million adjustment in the workpapers Staff provided?

A. No. The calculation underlying Staff's adjustment of $119.4 million is inconsistent with the explanation in Staff's Supplemental Testimony that I described above. After careful review of Staff's workpaper, NW Natural determined that Staff's adjustment removes all capital additions from Federal Energy Regulatory Commission ("FERC") accounts 367 Mains, 376.11 Mains < 4", 376.12 Mains > 4", 378 Measuring and Regulating Equipment, 380 Services and a portion of 382 Meter Installations from November 1, 2024 through the entire calendar year 2025 (including two months after the Test Year). Additionally, Staff made a positive adjustment, netted against the capital addition removals, in the amount of $15 million associated with depreciation on excluded plant.

Q. Please provide an overview of the concerns you identified with Staff's adjustment calculations.

A. We identified several issues with Staff's calculations. First, the adjustment removes capital from November and December 2025 that is not included in the Company's Test Year. Second, the amount of capital additions being removed is an aggregate total and does not reflect the AMA method the Company uses to add

capital to customer rates. Lastly, it is unclear how Staff calculated the offsetting accumulated depreciation portion of its adjustment, as its workpapers included hardcoded numbers without formulae intact.

Q. Regarding the first issue, what period should Staff have been analyzing to calculate its adjustment?

A. As stated in my Direct Testimony, the Company's Test Year is November 1, 2024 through October 31, 2025. No revenue, expenses, or capital should be included beyond that period. Staff's adjustment incorrectly uses *the entire* 2025 calendar year. Because Staff removed capital entering service in November and December 2025, which was not included in NW Natural's revenue requirement, Staff's adjustment is overstated.

Q. Please explain your second concern regarding Staff's adjustment calculation.

A. As stated in Direct Testimony, the Company uses an AMA methodology for all rate base in the Test Year, but Staff's adjustment used the aggregate amount of capital additions. Within the Test Year, we proportionally add capital additions to rate base in the same month we expect the investments to benefit customers. In other words, if plant is placed in service in October 2024, the Company would recover the full amount of that project because it was in service during the entire Test Year. On the other hand, if plant is placed in service in October 2025 (the final month of the Test Year), the Company would only recover approximately 1/24th of that investment reflecting the ratio of time that the plant was in service during the Test Year using a 13-month AMA. However, Staff removed the full amount of capital

additions, rather than the proportion the Company had added into the Test Year. By ignoring the Company's use of an AMA methodology, Staff has significantly overstated its adjustment. To accurately calculate the adjustment, Staff should have removed capital additions in the same proportion that the Company added them into the Test Year. If performed properly, the amount of Staff's adjustment would have been significantly lower.

Q. Please address the third issue you identified—Staff's depreciation offset.

A. As stated above, we are unclear how Staff arrived at its depreciation offset. That said, I anticipate that Staff's depreciation offset may be flawed because it relies on Staff's incorrect adjustment calculation discussed above and potentially because it appears to use an average depreciation rate, rather than specifically calculating the depreciation expense for each FERC account. The Company will follow-up with Staff to better understand this adjustment.

Q. You noted above that Staff's adjustment is based on Staff's interpretation of the used and useful standard reflected in ORS 757.355. How is Staff interpreting the used and useful standard in this case?

A. Staff understands ORS 757.355 to require that plant be in service before the rate effective date if the plant is to be included in rates, although Staff also explains that it may be permissible to include a portion of non-discrete Test Year investment in rate base without violating the statute.[9]

[9] Staff/2300, Anderson/2-3.

Q. Does the Company agree with Staff's interpretation of ORS 757.355?

A. No. Like Staff witness Anderson,[10] I am not a lawyer, and the Company will provide its legal arguments in legal briefing. However, my understanding is that Staff's interpretation of the used and useful standard is unnecessarily narrow. I note also that Staff's position has been inconsistent over time in that Staff has had a different interpretation of the used and useful standard in each of the Company's rate cases since 2011 (UG 221).

Q. How does the Company reasonably implement the used and useful standard for capital that enters service during the Test Year?

A. The Company's 13-month AMA approach uses known forecasted additions and includes a proportion of those capital additions for rate making. The 13-month AMA is specifically designed to implement the used and useful standard by including the costs of Test Year capital projects in rate base only in proportion to the part of the Test Year that these projects provide utility service to customers. See Table 1 below for an example of how the AMA methodology considers capital additions for an investment that becomes used and useful in November 2024, April 2025, and October 2025. The AMA method produces a reasonable and fair proportion of the investment into customer rates.

[10] Staff/2300, Anderson/3.

Table 1

Investment in Service Nov 2024		Investment in Service Apr 2025		Investment in Service Oct 2025	
Oct-24		Oct-24		Oct-24	
Nov-24	$ 1,000,000	Nov-24		Nov-24	
Dec-24	$ 1,000,000	Dec-24		Dec-24	
Jan-25	$ 1,000,000	Jan-25		Jan-25	
Feb-25	$ 1,000,000	Feb-25		Feb-25	
Mar-25	$ 1,000,000	Mar-25		Mar-25	
Apr-25	$ 1,000,000	Apr-25	$ 1,000,000	Apr-25	
May-25	$ 1,000,000	May-25	$ 1,000,000	May-25	
Jun-25	$ 1,000,000	Jun-25	$ 1,000,000	Jun-25	
Jul-25	$ 1,000,000	Jul-25	$ 1,000,000	Jul-25	
Aug-25	$ 1,000,000	Aug-25	$ 1,000,000	Aug-25	
Sep-25	$ 1,000,000	Sep-25	$ 1,000,000	Sep-25	
Oct-25	$ 1,000,000	Oct-25	$ 1,000,000	Oct-25	$ 1,000,000
Rate Base Amount (AMA)	$ 958,333	Rate Base Amount (AMA)	$ 541,667	Rate Base Amount (AMA)	$ 41,667
Investment Amount	$ 1,000,000	Investment Amount	$ 1,000,000	Investment Amount	$ 1,000,000
% of Invest in Rates	95.8%	% of Invest in Rates	54.2%	% of Invest in Rates	4.2%

In all the above examples, the Company takes lag on the investment and does not recover the full amount of the investment in rates because the investment was not in service prior to the rate effective date (prior to November 2024). However, the Company does have the opportunity to recover the investment on a pro-rata share of the time it was in service during the Test Year. This methodology does not allow for the Company to over recover, nor does it eliminate the regulatory lag the Company faces for capital additions. As such, the Company would not recover the unrecovered pro-rata share of the investment until the Company's next rate case, and until that time, the Company would experience regulatory lag on the investment as it depreciates on the Company's books.

Q. Aside from the used and useful standard, is the Company's approach to forward test year capital consistent with other fundamental ratemaking principles?

A. Yes, NW Natural's approach is consistent with the matching principle, whereas Staff's adjustment is not. The matching principle is a fundamental concept in utility ratemaking that aligns all costs from a test year with all revenues from that same test year. This principle is recognized by the Commission in rate-setting dockets[11] and also is reflected, to some extent, in the Commission's ratemaking statutes.[12] The matching principle helps maintain consistency between costs and revenues, contributing to effective rate design and financial stability for utilities. NW Natural's approach aligns with the matching principle because the Company calculates all aspects of rate base based on the Test Year, rather than determining the capital additions using a different time period.

NW Natural also adheres to ratemaking principles by relying upon known and measurable changes that are reasonably certain to occur in the Test Year. Specifically, the Company completes a rigorous capital expenditure budgeting process, which develops a capital forecast that is reasonable and accurately reflects the capital additions customers will benefit from in the Test Year. In contrast, Staff's approach fails to account for reasonably certain capital additions

[11] See, e.g. *In re Avion Water Co.'s Request for a Gen. Rate Revision*, Docket No. UW 171, Order No. 17-496 at 3, 14 (Dec. 11, 2017) (recounting Staff's efforts to make sure that company's revenues from rates are comparable to the expenses incurred during the same time periods, and Commission recognition that this was a significant complication in the case).

[12] See ORS 757.259(2)(e) (describing that deferrals can be used where Commission finds that they are appropriate "to match appropriately the costs borne by and benefits received by ratepayers").

and therefore does not accurately reflect known costs that will benefit customers in the Test Year and thereafter.

Q. You indicated that Staff's recommendation does not follow the matching principle. Please explain.

A. Ratemaking principles were designed to align all costs (expense and capital) and revenues in the same period, the Test Year. This principle ensures that rates reflect the cost of providing utility services when they are incurred, thereby providing an accurate price signal to customers and promoting intergenerational equity. Staff's recommendation to remove some FERC accounts but allow many capital additions in the Test Year does not coincide with the matching principle. The Company's revenue requirement is based on a test Year ending October 31, 2025, and by excluding some capital additions, while including many others, Staff does not achieve an accurate representation of capital additions during the Test Year.

Q. Turning now to AWEC, what is AWEC's position regarding the forward test year capital?

A. AWEC believes the 13-month AMA used by the Company is not consistent with established Oregon policy. Specifically AWEC relies on ORS 757.355(1)'s used and useful standard to support its claim that capital additions must be in service by the rate effective date.[13] AWEC also argues that capital projects must be found prudent before they can be included in customer rates but that prudence cannot

[13] AWEC/100, Mullins/18.

be determined based on forecasted costs.[14] While AWEC agrees that the AMA method is the most reasonable way to measure rate base, AWEC proposes that the capital component of rate base be determined using an AMA that runs from October 2023 through October 2024.

Q. What adjustments did AWEC make regarding the forward test year capital?

A. As noted above, AWEC moves the utility plant-in-service AMA back one full year. AWEC witness Mullins also adjusts accumulated deferred income taxes related to utility plant. These changes prorate capital additions for the 12 months **prior** to the rate effective date. This proration grossly reduces the amount of rate base that is benefiting customers prior to rates going into effect and the associated depreciation expense related to that rate base. AWEC's adjustments do not accurately reflect the Test Year capital costs and essentially eliminate any chance for the Company to earn a reasonable return on rate base during the Test Year. To my knowledge, this approach has never been accepted by the Commission in a NW Natural rate case or otherwise. It is unreasonably punitive and puts the utility in a state of systemic, ongoing lag on all capital investments. As I mentioned above, using an AMA would only allow the utility to recover 1/24th of its investments placed in service in the final month of the AMA. In AWEC's proposal, this would be October 2024. As such, for all investments that are placed in service and used and useful during the entire Test Year, the Company would experience severe

[14] AWEC/100, Mullins/18-19.

regulatory lag and would only recover the full investment in a subsequent rate case. Again, this approach is extreme and cannot be accepted.

Q. Do you agree with AWEC's interpretation of the used and useful standard?

A. No, as I explained above, NW Natural does not recognize the used and useful standard to prohibit the Company's approach to forward test year capital. In reliance on this standard, AWEC defines the capital costs recoverable too narrowly. AWEC also fails to consider how the used-and-useful standard applies to the forward test year and to reconcile its interpretation of the standard with the matching principle.

Q. AWEC claims that the Commission cannot make a prudency determination based on a forecast.[15] What is your response?

A. AWEC's claim regarding forecasts is novel, unsupported, and unreasonable. The Commission has allowed forecasts into rates on many occasions, including the Company's most recent rate cases. Furthermore, the purchased gas adjustment, renewable natural gas ("RNG") automatic adjustment clause, and others are forecasted each year. As the Commission has noted, "All test years are estimates of future conditions for the utility,"[16] and prospective ratemaking appropriately relies on forecasted adjustments that are reasonably certain to occur in the Test Year.[17]

[15] AWEC/100, Mullins/18-19.

[16] *In re US West Communications, Inc., for an Increase in Revenues*, Docket No. UT 80, Order No. 00-191 at 14 (Apr.14, 2000).

[17] *See In re US West Communications, Inc., for an Increase in Revenues*, Docket No. UT 80, Order No. 00-191 at 14-15 (Apr.14, 2000).

Here, the Company's forecasts are based on a robust and reviewable process. Specifically, the details of our budgeting process can be found in NW Natural/3801, Walker. Furthermore, the Company has responded to over 905 data requests thus far in the proceeding, many related to capital additions. The process of this rate case has allowed parties to understand the capital projects and assess their prudency and timing. There is no basis for excluding Test Year capital simply because the costs are forecasts.

III. CASH WORKING CAPITAL

Q. Please summarize the Company's Direct Testimony about cash working capital.

A. Cash working capital is the amount of investor-supplied capital required to fund the day-to-day operations of the company after accounting for the timing differences between booked revenue and expenses (accrual basis) and actual cash flows (cash basis). It represents amounts funded by investors to provide service prior to payment for such service by customers and, therefore, cash working capital typically is a component of a company's rate base. NW Natural completed a lead-lag study, an analysis designed to determine the funding required to operate the Company on a day-to-day basis, to determine the cash working capital requirements for the Test Year. The results of the study show that NW Natural's average daily cash working capital requirement in Oregon for the Test Year is $22.16 million with a cash working capital factor of 2.9 percent.[18]

[18] NW Natural/1700, Walker/39.

Q. Did the parties provide Opening Testimony addressing the cash working capital?

A. Yes. Staff/800, Chipanera and AWEC/100, Mullins addressed the Company's cash working capital.

Q. What is Staff's position regarding cash working capital?

A. Staff witness Chipanera identified two areas in the lead-lag study where he believes the Company overstated its calculations. First, the Company calculated service lag by using a mid-point date, whereas Staff calculates the total number of days in a month and divides that by 2. The difference in these methodologies caused a 0.3-day decrease to the Company's service lag calculation.[19] Second, Staff identified three prepaid information technology contracts that extend into the Test Year and suggests they should be removed from the prepaid information technology expense lead days. This removal reduced prepaid information technology leads days by approximately 10.5 days.[20]

Q. How do you respond to Staff's position?

A. The first adjustment related to the service lag mid-point is reasonable, and the Company will accept this adjustment. The last section of this testimony updates the revenue requirement, which will include this adjustment.

The second adjustment related to the prepaid information technology contracts that extend beyond the Test Year is an overreach. The prepaid

[19] Staff/800, Chipanera/8-9.

[20] Staff/800, Chipanera/10-11.

information technology contracts are unique because they are prepaid. The prepayment has a large impact on the Company's cash flows because the Company pays for a service prior to the contract being fully executed. It is appropriate to include contracts that extend into the Test Year because of this uniqueness, and it reflects the downward cash flow changes for the Company. Therefore, the Company believes that it is appropriate to include contracts that extend into the Test Year because they have cash flow implications before the rate effective date. This issue is not related to the forward test year capital like the previous section and therefore should be dismissed.

Q. What is AWEC's position regarding cash working capital?

A. AWEC witness Mullins identified two areas where AWEC disagrees with the Company's lead-lag study calculations. First, AWEC argues the Company did not include "the rule which only requires estimated tax payments to cover the higher 90% of taxes payables or 100% of the taxes payable on the prior year's return"[21] to the tax lag day calculation. This adjustment results in a 22 day increase to the tax lag days. Second, AWEC believes that the Company is calculating revenue lag days only on a monthly basis, whereas AWEC calculated the lag on an annual basis. AWEC argues that, due to seasonality, the Company is overstating the revenue lag days by approximately 108 days.[22]

[21] AWEC/100, Mullins/35.

[22] AWEC/100, Mullins/33-35.

Q. How do you respond to AWEC's position?

A. The tax rule[23] AWEC identifies is only applicable to individuals, not corporations, and therefore should not be included in the Company's lead-lag study. Regarding revenue lag, AWEC's argument does not reflect the purpose of cash working capital or a lead-lag study. As stated previously, cash working capital accounts for the timing differences of cash inflows and outflows. NW Natural spends cash over a service period as customers use our services but we do not receive the actual cash until the customer pays their bill. This is the revenue lag time, 40.86 lag days, that is calculated in NW Natural's lead-lag study. The purpose of the study is to identify the timing difference between cash inflows and outflows, not to review the Company's volumetric load which is the basis of AWEC's argument. AWEC's position also violates the matching principle. AWEC witness Mullins failed to address seasonality for expenses, nor does AWEC's methodology look at the entire year as it claims. For example, the cost of gas rises significantly during the winter months, but AWEC fails to include that in its analysis. AWEC's analysis also only looks at the first four months of the gas year and does not reflect when customer usage is down, along with revenues. The Company receives less revenues from March through October when the Company continues to have steady operational expenses such as O&M and labor but receives little cash from customer bills, as usage is low. There are many components of the lead/lag study that would need to be adjusted for AWEC's methodology that were not completed

[23] See General Rule Part 2a and 2b. 2024 Form 1040-ES (irs.gov).

causing a mismatch of costs and revenues. Additionally, NW Natural used a lead/lag methodology that has been accepted by the Commission in other Oregon utilities'[24] rate cases and is consistent with best practices. Therefore, NW Natural does not agree with AWEC's methodology and rejects its proposal.

IV. MATERIALS AND SUPPLIES

Q. Please summarize the Company's Direct Testimony about materials and supplies.

A. The forecasted balances that make up the Test Year are based on a linear trend formula which uses the least squares method to calculate a forecast based on the known actuals from January 2019 to September 2023. The Company compared different forecasting methodologies used in UG 388 and UG 435 and found that the UG 388 method using the linear trend formula produced results most similar to actual September 2023 balances. A 13-month AMA of balances is used for the Test Year for a total of $21.8 million.[25]

Q. Did the parties provide Opening Testimony addressing materials and supplies?

A. Yes, Staff/1300, Moore, addressed the Company's materials and supplies.

Q. What is Staff's position regarding materials and supplies?

A. Staff witness Moore starts by doing a simple average of the months within calendar years 2021 through 2023 to get a calendar year average. Then Staff does a simple

[24] Docket No. UE 283, PGE's Lead Lag study for 2015 Test Year Supplemental; Docket No. UG 389, Avista's General Rate Case.

[25] NW Natural/1700, Walker/30; Staff/1302, Moore/3.

average of the 2021 through 2023 calendar years to get a total of $16.98 million. Staff then escalates the $16.98 million by 2.7 percent and again by 2.0 percent to get a recommended total of $17.78 million. Staff's methodology results in a downward adjustment of $4 million.[26]

Q. How do you respond to Staff's position?

A. We reject Staff's adjustment. Staff's proposed $17.8 million Test Year balance is below the Oregon-allocated actual amounts seen in December 2022, prior to the start of the Base Year, and nearly $3 million lower than the known and measurable Oregon-allocated balance as of September 2023. Therefore, Staff's proposal is plainly not representative of the Test Year.

Q. Do you have concerns with Staff's methodology for forecasting materials and supplies balances?

A: Yes. We believe Staff witness Moore's use of a three-year historical average of dollar values is an inappropriate forecasting method as it is backward looking and does not accurately account for growth or inflation seen within the 2021 through 2023 time period. According to the methodology shown in Staff/1304, Moore/Workpaper, Mat and Supplies Tab, the average of the years 2021 through 2023 values would be used as the "Base Year" ending value. Staff's method results in a "Base Year" value of approximately $16.98 million compared to the September 2023 reported actual Oregon-allocated value of approximately $20.5 million. Staff's inflation escalation factors of 2.7 percent and 2 percent are applied

[26] Staff/1300, Moore/6-7.

to the base year value to get the proposed value of $17.8 million, however these escalation factors are not inclusive of any growth in these values that historically has been seen on a year over year basis. By doing a simple average of calendar years 2021 through 2023, the "base year" in Staff's proposal is essentially 2022. This approach skews the figures and ignores the most recent data that is known and measurable on the balance sheet as of September 2023.

Q. What factors other than inflation would impact the materials and supplies balance sheet values?

A. Materials and supplies balances are impacted by many things such as global supply and demand, tariffs, transportation, and raw materials, among others.

Q. Does the Company believe a 13.6 percent increase in the materials and supplies balance as stated in Staff/1300, Moore/6, line 6 and 7 is reasonable?

A. No. Staff witness Moore is using the wrong figures for his calculation. The 13.6 percent was derived by taking the difference between the Company's forecasted simple average of 2025 balance over the forecasted simple average 2023 balance. This is problematic for two reasons. First, using a simple average of 2025 is not the Test Year, so the value is irrelevant. Second, using a forecast as a comparison is not appropriate. Staff should have compared the Test Year value, which is derived using a 13-month AMA, with the September 2023 known and measurable balance.

Q. What is the percentage increase from September 2023 to the Test Year AMA value?

A. The increase is a reasonable 6.39 percent.

Q. If Staff witness Moore used the averaging method with the percentage increases versus using dollars, would that have been appropriate?

A. Yes. See Table 2 below, from Staff/1304, Moore/Workpaper, which calculates year-over-year percentage increases of the calendar year simple averages and highlights that these values have historically increased on an annual basis. In fact, over the 2021 through 2023 period, using the same three-year average method Staff applies to the dollar values, but to the observed year-over-year percentage increase, Staff's table shows the average percentage increase was 11.56 percent over the three years. Applying the 11.56 percent to the known balance as of September 2023, produces a materials and supplies Oregon-allocated balance of $24.6 million on a 13-month AMA basis for the Test Year, or $2.8 million higher than the Company's methodology and proposed amount in this case.

Table 2

Avg of Monthly Averages -Oregon			
		Incr %	3-Yr Avg %
2015	$7,826,360		
2016	$8,570,763	9.51%	
2017	$8,715,618	1.69%	
2018	$10,944,114	25.57%	
2019	$12,787,041	16.84%	
2020	$14,133,563	10.53%	
2021	**$14,350,704**	**1.54%**	
2022	**$17,085,869**	**19.06%**	
2023	**$19,490,075**	**14.07%**	**11.56%**
2024	$20,085,788	3.06%	
2025	$22,148,720	10.27%	

V. EDIT AMORTIZATION

Q. Please summarize the Company's Direct Testimony about EDIT amortization.

A. EDIT amortization is the result of the re-measurement of deferred income taxes following the 2017 federal income tax reform and reduces the EDIT regulatory liability, which is flowed through as a benefit to customers. The amortization included within the revenue requirement is $3.1 million.[27]

Q. Did the parties provide Opening Testimony addressing EDIT amortization?

A. Yes. Staff/200, Mondragon, addressed the Company's EDIT amortization.

Q. What is Staff's position regarding EDIT amortization?

A. Staff proposed increasing the EDIT Amortization from $3.1 million to $3.2 million, which reduces the federal tax expense by $100 thousand per year. In Staff's view, the $100 thousand adjustment balances returning the benefit to customers while also leaving the Company with a reasonable buffer of its normalization flow through.[28]

Q. How do you respond to Staff's position?

A. We accept Staff's proposed adjustment given the $100,000 increase in EDIT amortization does not cause the Company to trigger a normalization violation.

[27] NW Natural/1700, Walker/31-32.

[28] Staff/200, Mondragon/18-19.

VI. OPUC FEES

Q. What was included in the Company's revenue requirement for the OPUC fee?

A. The Company used the current rate at the time of filing, 0.43 percent of Company revenues.[29]

Q. Has the OPUC fee changed since filing the rate case?

A. Yes. In Order No. 24-054, entered on February 22, 2024, the Commission approved an increase, resulting in a new OPUC fee of 0.45 percent of Company revenues.

Q. Are Staff and the Company aligned on using the new OPUC fee percentage?

A. Yes. In Opening Testimony, Staff/800, Chipanera, Staff proposes increasing the fee to the newly approved 0.45 percent of Company revenues,[30] and NW Natural agrees.

VII. ALLOWANCE FOR FUNDS USED DURING CONSTRUCTION ("AFUDC")

Q. Please summarize the Company's Direct Testimony about AFUDC.

A. The Company did not provide Direct Testimony on AFUDC.

Q. Did the parties provide Opening Testimony addressing AFUDC?

A. Yes. Staff/1400, Peng, addresses the Company's AFUDC.

Q. What are Staff's recommendations regarding AFUDC?

A. Staff recommends that the AFUDC rate cannot exceed the overall rate of return applied to rate base to ensure Oregon-jurisdictional rates are just and reasonable.

[29] NW Natural/1700, Walker/25.

[30] Staff/800, Chipanera/13.

As a result, Staff has proposed to cap the AFUDC rate at the Company's Oregon authorized rate of return and defer the excess portion as a regulatory asset for future recovery. Staff also recommends that we check for errors in the Company's capital structure calculation. "For example, a short-term and long-term debts in capital structure, because Oregon's capital structure does not include a short-term debt."[31] Last, Staff witness Peng states: "NWN complied with the OPUC policy to exclude CWIP in the rate base, because Oregon does not allow a utility to recover costs of a plant not yet placed in service in retail rates. The Company's AFUDC calculations meet FERC calculation procedures and meet Oregon regulatory requirements."[32]

Q. How do you respond to Staff's cap of AFUDC at the Company's rate of return on rate base?

A. The Company does not agree with Staff's position as we have not identified an Oregon statute, Oregon rule, or FERC rule stating that the AFUDC rate cannot exceed the overall rate of return.

Q. What do the FERC instructions say about AFUDC?

A. Subchapter F-Accounts of the Natural Gas Act, Part 201, instruction 17(b) states:

> The balances for long-term debt, preferred stock and common equity shall be the actual book balances as of the end of the prior year. The cost rates for long-term debt and preferred stock shall be the weighted average cost determined in the manner indicated in subpart D of part 154 of the Commission's Regulations Under the Natural Gas Act. The cost rate for common equity shall be the rate granted common equity in the last rate proceeding before the

[31] Staff/1400, Peng/18.

[32] Staff/1400, Peng/18.

> ratemaking body having primary rate jurisdiction. If such cost rate is not available, the average rate actually earned during the preceding three years shall be used. The short-term debt balances and related cost and the average balance for construction work in progress shall be estimated for the current year with appropriate adjustments as actual data becomes available.

Q. Do the FERC instructions not allow for the AFUDC rate to exceed the Company's rate of return on rate base?

A. No. The FERC instructions do say that the cost of common equity shall be the rate granted in the last rate proceeding before the rate making body having primary rate jurisdiction, but it says nothing about debt rates or the overall rate of AFUDC. The Company believes the Commission is our primary rate jurisdiction and dictates our cost of common equity.

Q. Does the Company adhere to the FERC instructions stated above? Specifically, how does the Company calculate AFUDC?

A. Yes, the Company adheres to the FERC instructions as stated in Staff's testimony.[33] The Company first utilizes short-term debt to finance its Construction Work In Process ("CWIP") balance. Once its short-term debt balance has been exhausted, it then uses a mix of long-term debt and equity in accordance with FERC instruction stated above. "The balances for long-term debt, preferred stock and common equity shall be the actual book balances as of the end of the prior year."[34] Each month, the Company accrues AFUDC on the CWIP balance using the rates and percentages in accordance with these rules.

[33] Staff/1400, Peng/18.

[34] Natural Gas Act, Part 201, Instruction 17(b).

Q. How does the Company respond to Staff's recommendation that the Company should check for errors in its capital structure calculation?

A. The Company has been calculating its capital structure in the same way for at least the last four rate cases which included short term debt, long term debt, and common equity. As part of the Company's accounting close process, the AFUDC calculations are checked for errors and get audited by our external auditors, Price Waterhouse Coopers. Staff has never had an issue with our capital structure calculation as it relates to AFUDC. Staff witness Peng stated from UG 344: "Staff reviewed Excel spreadsheet files with reference links and calculation formulas, and found that the Company's calculation of its AFUDC rates follow the FERC AFUDC rate formulas without deviation. The calculations assume that short-term debt is the first source of construction funding. If construction funding requirements exceed the balance of short-term debt, NWN assumes the requirements are met proportionally from long-term debt, preferred stock (if any) and common equity."[35]

Q. Does the Company agree with Staff that its "AFUDC calculations meet FERC calculation procedures and meet Oregon regulatory requirements"?

A. Yes.

[35] Docket No. UG 344, Staff/1100, Peng/13.

VIII. DECOUPLING

Q. Please summarize the Company's Direct Testimony about decoupling.

A. Similar to Staff's proposal in our prior rate case (UG 435),[36] the Company proposes to bifurcate existing residential customers from new premises residential customers as of the rate effective date, November 1, 2024. The new premises residential customers decoupling baseline was based off new premises usage data from January 2018 to December 2022, a five-year period, totaling an average use-per-customer ("UPC") of 449.4 therms per year. Every new premises residential customer that gets added to the gas system after November 1, 2024 will be decoupled at the new baseline of 449.4 therms per year. Along with the bifurcation, the Company also proposes to use a weighted average of the new and existing residential customers heating coefficient that converts heating degree days to therms for the weather normalization adjustment. This change also impacts weather adjusted rate mechanism ("WARM") because the same heating coefficient is used in that mechanism. The coefficients should be consistent because both rate mechanisms need to be aligned with the customer usage assumptions that are built into the revenue requirement for the Test Tear. If these mechanisms are not aligned, the Company would over or under collect normalized revenue requirement.[37]

[36] Docket No. UG 435, Staff/1300, Scala/19-28.

[37] NW Natural/1700, Walker/12-15.

Q. Did the parties provide Opening Testimony addressing Decoupling?

A. Yes. Staff/1900, Stevens and Coalition/100, Cebulko, address Decoupling. I respond to Staff, and NW Natural witness Wyman addresses the Coalition's testimony in NW Natural/3900, Wyman.

Q Please summarize Staff's position on Decoupling.

A. First, Staff recommends that the residential class, for purposes of decoupling, be permanently bifurcated going forward. Second, Staff believes "new" customers should be defined as any customer who joined the gas system beginning in 2018 and beyond. Last, Staff recommends the Company calculate separate heating coefficients between the two bifurcated groups of customers.[38]

Q. What is the Company's proposal as it relates to the bifurcated groups going forward?

A. The Company was not clear in Direct Testimony that our proposal includes that new residential customers will not be rolled into the existing residential customer class in each subsequent rate case. These customer classes will perpetually stay bifurcated unless significant changes are observed in usage data. New customers will not transfer into the existing customer class in future rate cases as Staff suggested in its Opening Testimony.[39] Therefore, the Company and Staff are aligned on this issue.

[38] Staff/1900, Stevens/20-24.

[39] Staff/1900, Stevens/21-22.

Q. Staff argues that new residential customers should be defined as a new premises residential customer that joined the system starting in 2018.[40] Do you agree?

A. No. The Company does not agree with Staff's position on defining new customers as of 2018. Staff's argument to define new premises customers as customers who joined the system starting in 2018 does not consider that those customers are already included in the existing residential class UPC of 660.2 therms calculated in NW Natural/1800, Wyman, and have been for two rate cases prior to the current case. These customers should not retroactively be moved into a different decoupling group. If the adjustment is going to be made, it should be on a prospective basis for new customers.

This adjustment would not only impact the existing residential UPCs, but it would also impact the revenue requirement as a whole, an analysis Staff did not provide. If Staff's approach were adopted, the Test Year in Staff's revenue requirement would not match Staff's position of new customers, which would violate the matching principle by failing to align the Test Year for both revenues and expenses. Overall, Staff's analysis is incomplete because Staff does not provide a newly calculated new premises customer UPC that implements Staff's recommendation, nor does Staff provide any analysis on how Staff's proposal would impact this rate case.

[40] Staff/1900, Stevens/23.

Q. Staff believes that the heating coefficients used for new and existing customers should be separate calculations and not a weighted average as the Company suggested.[41] How do you respond?

A. The Company believes using a weighted average is appropriate and would not skew the decoupling deferral in any material way. Furthermore, the Decoupling mechanism could be easily changed to incorporate two heating coefficients, but the WARM program could not.

Q. Please explain why the WARM program would be challenged to have two residential heating coefficients.

A. The Decoupling mechanism is merely an accounting exercise and could easily accommodate two heating coefficients. WARM, on the other hand, is a complex, real-time, mechanism that is conducted and coded in our customer information system. The WARM mechanism has been coded with only one heating coefficient for the residential class. Therefore, the Company has proposed a weighted average heating coefficient for both Decoupling and WARM to properly account for the differences in usage patterns between the two bifurcated groups. The heating coefficient will continue to be updated each rate case with the new weighted average amount.

[41] Staff/1900, Stevens/24.

IX. TEST YEAR REVENUES AND EXPENSES

Q. How does the Company forecast Test Year Revenues and Expenses?

A. The Company uses a variety of methods to calculate the forecasted Test Year Revenue and Expenses in the Revenue Requirement. NW Natural/1700, Walker lays out each of these calculations, which include the following: Sale of Gas, Miscellaneous Revenues, Gas Purchases, Uncollectible, O&M, Federal/State taxes, Property Taxes, Other Taxes, Net Utility Plant, and Other Rate Base Items.

Q. What is AWEC's position regarding the Test Year Revenues and Expenses?

A. AWEC witness Mullins uses the same arguments discussed above for the forecasted test year capital to adjust the Test Year's revenue and expenses. AWEC relies on the matching principle to argue that the Company should adjust the Test Year revenue and expenses from 12 months ending October 31, 2025 to 12 months ending October 31, 2024 to be consistent with rate base. AWEC makes this adjustment by choosing only two sections of the revenue requirement, margin revenues and non-labor O&M expenses, adjusting to 12 months ending October 31, 2024.[42]

Q. How do you respond to AWEC's position?

A. Although AWEC relies on the matching principle for its argument, it completely disregards all other components of revenue requirement that the Company calculates, as stated above. AWEC fails to match all revenues and expenses to 12 months ending October 31, 2024. Its analysis is thus incomplete and contrary

[42] AWEC/100, Mullins/22-25.

to the matching principle on which their argument is based. AWEC states "[i]ncreases in expenses that occur over time, for example, may be offset by increased sales. Lacking consistency between the two, rate payers may be required to pay for increased costs without recognizing the offsetting benefit from increased sales revenues."[43] AWEC's analysis lacks consistency by including a portion of expenses but excluding other pieces of revenue requirement such as other rate base items and taxes, to match all the revenues and expenses in the Test Year.

X. REMOVAL WORK IN PROGRESS ("RWIP") REMOVAL FORECAST

Q. Please summarize the Company's position on the RWIP removal forecast.

A. The Company has forecasted the cost of removals, via the RWIP account, through the Test Year based on a historical trend. The cost of removals is necessary to match additions that are added from October 2023 through the Test Year related to work where pipe and other assets are replacing existing infrastructure or a straight removal is occurring.

Q. What is RWIP and how does it work?

A. RWIP represents the net between the actual cost of removal and the release of the accrued removal cost liability that gets built up over time from the cost of removal portion of depreciation expense. The RWIP account is a contra liability account with a debit balance. Therefore, the RWIP account lowers accumulated depreciation and increases rate base. The debit balance of RWIP indicates that

[43] AWEC/100, Mullins/23.

the actual cost of removal is higher than the estimated amount we have included in our depreciation expense over time.

Q. Did the Company identify any errors in its cost of removal forecast?

A. Yes. The Company inadvertently double counted a portion of removal costs. This double counting increased rate base.

Q. Does the Company propose removing this double count in revenue requirement?

A. Yes. Later in this testimony, I update the revenue requirement for errors, which will remove the double count of RWIP.

Q. What is AWEC's position regarding the RWIP removal forecast?

A. AWEC witness Mullins recommends the Company retain the removals included on the "removals" tab of work paper NW Natural/1713, Walker.[44]

Q. How do you respond to AWEC's position?

A. First, I recognize that my work paper NW Natural/1713, Walker, may have caused some confusion, although I disagree with AWEC's overall recommendation.

The removals included on the "removals" tab of the above workpaper were from a forecast used in 2016. The removals included on the "removals" tab were made in error and should not have been included in the work paper. The RWIP forecast on the "Accum Deprec" tab is the correct forecast and it should be retained.

[44] AWEC/100, Mullins/26.

Q. What is the overall impact to NW Natural's error regarding the RWIP forecast?

A. The error caused an overstatement of rate base and once fixed will reduce revenue requirement by $618 thousand.

XI. RWIP ACCUMULATED DEFERRED INCOME TAX

Q. Please summarize the Company's position on RWIP accumulated deferred income tax.

A. The Company inadvertently failed to include the accumulated deferred income taxes related to forecasted RWIP. It is important to ensure accumulated deferred income taxes match the underlying rate base included in revenue requirement as to adhere to the matching principle. Adding the forecasted RWIP accumulated deferred income taxes will reduce rate base.

Q. Is the Company going to update its revenue requirement for the RWIP accumulated deferred income taxes?

A. Yes. Later in this testimony, I update the revenue requirement for errors, removal of one full time employee, and updated union contract, which will include the forecasted RWIP accumulated deferred tax component of rate base.

Q. What is AWEC's position regarding the RWIP accumulated deferred income taxes?

A. AWEC witness Mullins recommends that the accumulated deferred income taxes associated with RWIP should be included in rate base.[45]

[45] AWEC/100, Mullins/27-28.

Q. How do you respond to AWEC's position?

A. The Company agrees that the accumulated deferred income taxes associated with RWIP should be included in rate base on the same basis as RWIP is included in rate base due to the matching principle.

Q. What is the impact of including the forecasted RWIP accumulated deferred income taxes in rate base?

A. The impact to the Company's revenue requirement is a decrease of $276 thousand.

XII. ARAM ADJUSTMENT

Q. Please summarize the Company's position on the ARAM adjustment.

A. The Company included an ARAM adjustment to rate base of $3.1 million in the Test Year. After the Parties' Opening Testimony, the Company realized this adjustment had already been included in the Company's deferred income tax liability.

Q. Is the Company going to update its revenue requirement for the ARAM adjustment?

A. Yes. Later in this testimony, I update the revenue requirement for errors, which will remove the ARAM adjustment resulting in lower rate base.

Q. What is AWEC's position regarding the ARAM Adjustment?

A. AWEC witness Mullins identifies the double counting of the increase in rate base due to EDIT amortization.[46]

[46] AWEC/100, Mullins/31-32.

Q. How do you respond to AWEC's position?

A. The Company agrees with AWEC's position and will remove the double counting of $3.1 million to rate base.

Q. What is the impact of removing the ARAM adjustment?

A. The impact to revenue requirement is $297 thousand.

XIII. PRE-1981 FLOW THROUGH

Q. Did AWEC provide Opening Testimony regarding tax flow-through items?

A. Yes, AWEC issued data request 51 in this proceeding requesting background on two line items in the revenue requirement income tax calculation titled 'Pre-1981 Depreciation' and 'Pre-1981 Removal Costs.' The Company's reply to that request included references to Orders issued in Washington (UG-080546) and Oregon (UM 1335) proceedings that occurred in 2008 that authorized identical amortization of these items and also included the Company's amortization schedule indicating that amortization would be complete in 2027. AWEC's testimony on these flow-through items included references from the all-party settlement in Order in UM 1335, a note that the Company included the amortization of these items in the current filing, and concern on the timing and amount of these items.[47]

Q. What concerns did AWEC express in their testimony regarding 'Pre-1981 Depreciation'?

A. The first flow-through item, 'Pre-1981 Depreciation,' is an increase to income tax expense in the current filing of $7,350,000 on a gross basis, or approximately

[47] AWEC/100, Mullins/30.

$1.98 million on a net basis (using a 27 percent statutory tax rate). AWEC indicated that the settlement agreement in UM 1335 indicated an amortization period of approximately 25 years and the Company's initial application in UM 1335 had indicated an amortization period of approximately 20 years. The Order itself was silent with respect to the amortization period but was clear on the amount of the annual amortization. AWEC indicated that, based on their rough calculations, the amortization should have been complete sometime in 2023 and should therefore be excluded from inclusion in this current filing.[48]

Q. What concerns did AWEC express in their testimony regarding 'Pre-1981 Removal Costs'?

A. The second flow-through item, 'Pre-1981 Removal Costs,' is a reduction to income tax expense in the current filing of $1,175,000 on a gross basis, or approximately $317 thousand on a net basis (using a 27 percent statutory tax rate). AWEC indicated that the settlement agreement in UM 1335 authorized an annual amortization amount of $2,322,000 and that this larger amount should be included in this current filing.[49]

Q. Does the Company agree with AWEC's position regarding these flow-through items?

A. No. As I will explain in more detail below, the Company does not agree that the 'Pre-1981 Depreciation' flow-through item should be removed from the current

[48] AWEC/100, Mullins/31.

[49] AWEC/100, Mullins/30.

filing or that the 'Pre-1981 Removal Costs' item should be increased to the amount originally authorized in the 2008 UM 1335 Order.

Q. Please explain the Company's position with respect to the 'Pre-1981 Depreciation' flow-through item.

A. The amount included in the original filing in this proceeding is correct and should continue to be amortized through 2027. The Order in UM 1335 authorized recovery of the 'Pre-1981 Flow-Through' balance through annual gross amortization of $7,350,000. This amount has been included in annual amortization since the effective date of the order and will result in full amortization of this flow-through item during calendar year 2027. For reference purposes, NW Natural/3802, Walker to this testimony has been prepared to show the actual calendar year-end account balances from 2014 through 2023 and the expected balances for 2024 through 2027, as well as the changes in those balances for annual amortization and the remeasurement of balances in 2017 as a result of the federal Tax Cuts and Jobs Act. These actual recorded and reported balances are more precise and supportable than AWEC's rough calculations.

Q. Please explain the Company's position with respect to the 'Pre-1981 Removal Cost' flow-through item.

A. The amount included in the original filing in this proceeding is correct and should continue to be amortized through 2027. The Order in UM 1335 authorized recovery of the 'Pre-1981 Removal Cost' balance through annual gross amortization of $2,322,000. However, in UG 221, the annual amount was adjusted to $1,175,000, as explained in the Company's testimony from that docket:

> In Docket UM 1335, the Company modified its permanent difference amounts used to calculate the income tax provision. More specifically, the depreciation component related to pre-1981 assets was changed. In this case, the Company proposes to adjust the removal cost component to a level such that the related deferred taxes are amortized over the same period as the depreciation component.[50]

This adjusted amount has been included in annual amortization since the effective date of the Order in UG 221 and will result in full amortization of this flow-through item during calendar year 2027, which coincides with the full amortization of the depreciation flow-through item. For reference purposes, NW Natural/3802, Walker to this testimony has been prepared to show the actual calendar year-end account balances from 2014 through 2023 and the expected balances for 2024 through 2027, as well as the changes in those balances for annual amortization and the remeasurement of balances in 2017 as a result of the federal Tax Cuts and Jobs Act. These actual recorded and reported balances, as well as the references herein to previous proceedings, are more precise and supportable than AWEC's rough calculations.

XIV. CLOUD-BASED SOFTWARE CAPITALIZATION

Q. Please respond to Staff's request for clarification regarding whether license or hosting fees for cloud-based software projects are included in rate base.[51]

A. Under Accounting Standards Update ("ASU") 2018-05 "Customer's Accounting for Fees Paid in a Cloud Computing Arrangement (CCA)", the treatment of license or

[50] Docket No. UG 221, NW Natural/300, McVay-Siores/10.

[51] Staff/1000, Dyck/5; *see also* UG 490 OPUC DR 493.

hosting fees for cloud-based software depends on specific circumstances. Hosting or subscription fees for cloud-based software arrangements are expensed over the term of the contract and are not capitalized in rate base. However, implementation costs in a hosting arrangement, including the subscription fees for the first year, may be capitalized under the accounting rules. Thus, first-year license costs for such projects are included in rate base. This is in accordance with a 2019 FERC order on ASU 2018-15 to all jurisdictional public utilities and licenses, natural gas companies and centralized service companies.[52] In accordance with the ASU and the FERC ruling, for regulatory accounting, capitalized implementation costs are recorded as utility plant assets in Account 303 (Intangible Plant - Computer Software) and should be amortized over the term of the associated cloud computing arrangement in Account 403 (Depreciation Expense).

XV. UM 2309 AMORTIZATION

Q. Please describe UM 2309.

A. UM 2309 was a deferral application filed by AWEC when the Oregon Court of Appeals ruled the Climate Protection Program ("CPP") invalid. The deferral application asked NW Natural to defer costs allocated to Transportation and Special Contract customers for RNG that the Company was charging for compliance under the CPP. The Commission granted approval of the deferral in Order No. 24-086.

[52] FERC order in docket No. AI20-1-000, dated December 20, 2019.

Q. Please summarize AWEC's proposal for UM 2309 Amortization.

A. AWEC witness Mullins recommends all CPP costs being currently charged to Transportation and Special Contract customers be deferred and amortized back to customers via credits starting November 1, 2024.[53]

Q. How does the Company respond?

A. The Company believes that the purchased gas adjustment ("PGA") and associated filings is the best mechanism to accomplish AWEC's proposal. To the extent that the Commission agrees that these RNG costs should be amortized back to Transportation and Special Contract customers in light of the CPP invalidation, NW Natural would recover these deferred amounts from Sales customers in the upcoming PGA.

Q. What is the Company's proposal?

A. The Company proposes that we continue to defer revenues through October 2024 for the benefit of transport and special contract customers. The Company will make an advice filing in late July 2024 to amortize the June 2024 balance of the deferral, consistent with the PGA and associated filings. Simultaneously, NW Natural will recover these deferred amounts for RNG from Sales customers in the upcoming PGA. For RNG included in the upcoming PGA, NW Natural will change the allocation for RNG to Sales customers starting November 1, 2024 to be consistent with this approach. Any remaining deferred amounts will be captured in the 2025-26 PGA to the benefit of Transportation and Special Contract

[53] AWEC/100, Mullins/41-42.

customers. In the event that NW Natural will need to comply with future greenhouse gas policy in the coming year, NW Natural will likely need to change this allocation again to recover the costs of RNG from all entities for which NW Natural is the point of regulation.

XVI. UPDATED REVENUE REQUIREMENT

Q. Do the Company's responses to the Parties' Opening Testimony and discovery affect the proposed revenue requirement?

A. Yes. Through the Company's responses to the Parties' Opening Testimony and data requests, the Company has made a $2.58 million reduction to revenue requirement.

Q. Please identify all the specific items driving the increases and decreases in revenue requirement.

A. Highly confidential NW Natural/3803, Walker lists the items that were identified and agreed to in the Parties' Opening Testimony, conceded through discovery, recognized as an error contained in the Company's Direct Testimony, or updated by the Company in this Reply Testimony. NW Natural/3804, Walker provides the updated revenue requirement.

Q. Does this conclude your Reply Testimony?

A. Yes, it does.

Rates & Regulatory Affairs
UG 490
Request for a General Rate Revision
Data Request Response

Request No.: UG 490 OPUC DR 206

Please provide a narrative description of NWN's capital budgeting process including but not limited to development responsibilities, load study process, annual timing, and approval process.

Response:

The capital forecast is updated multiple times throughout the year. This forecast incorporates the most recent information based on requirements to maintain a safe and reliable system. Each year's budget is based on the forecast created in December, which is presented to and approved by the Board of Directors.

Finance facilitates the process with the five individual business units that provide those forecasts: Engineering, Customer Acquisition, Information Technologies, Facilities, and Transportation & Meter Shop. Review meetings take place with the managers, directors, and officers where the assumptions and forecast are reviewed and determined. Once approved, each group sends their forecast to Finance for inclusion in our overall forecast. The overall forecast is used to inform various groups on progress, adjust our planned spend and include impact the current and long-range forecast. Finance also facilitates a monthly review of current year variances against the approved budget.

Each business unit uses a bottom-up approach, where they determine required and run rate work in addition to identifying other projects that are needed. Detail is provided for applicants and projects.

Facilities:

Potential projects are identified by the business and/or Facilities department for consideration. The facilities projects steering committee reviews all requests, validates the potential need for the projects and determines if the projects should be added to the facilities 5-year roadmap for further evaluation.

Forecasts for each project are updated quarterly and reviewed by the Facilities Steering Committee, Finance team, and officers.

Transportation and Meters:

Vehicle replacements are evaluated based on a combination of vehicle vintage and mileage. Each year the list of vehicles that meet either the age or mileage limits are evaluated. That list along with department feedback creates the replacement list for the following year. Equipment and Trailers are determined to be replaced based on business need and, on a case-by-case basis. Tools are also requested by departments and are evaluated for business need and included on a list for purchasing the following year.

Meter needs are developed based on current meter inventory, customer growth forecasts, meter change outs, PCC changes as well as factoring in vendor lead times.

Customer Acquisition:

Services and Mains capital spend is forecasted based our customer growth forecast or footage of mains multiplied by estimated cost. Housing start projections from the Oregon Department of Economic Analysis are a key assumption when developing new customer projections. Permits are based on previous year actuals plus inflation. Meter installations are based on estimate number of units times cost per unit.

Engineering:

Planned projects are based on need, resource, and supply chain availability. A significant amount of work is driven by jurisdiction and compliance requirements. Planned capital work is typically identified in advance based on long range plans, Facility assessment reports, Equipment studies, safety plans or DIMP & TIMP plans. Prioritization is given to projects based on urgency or feedback from operations personnel. Nearer term planned work can be due to equipment unexpectedly failing or showing near end of life, avoidance of potential pipeline safety impact due to natural forces, and jurisdictional franchise obligations. Larger, discrete projects are individually assigned projects in our project management office and have capital spend budgets and expected in-service dates that are managed through the duration of the project. Those are all individually tracked through our forecasting process. Forecasts for some categories of work are based on historical spend trends.

IT&S:

The collection of projects reflects various business needs. Enterprise Applications projects are driven by new or changes to existing systems to support new or changed compliance requirements, or to support new business needs. Information Security projects follow the cybersecurity strategic plan. The Enterprise Architecture forecast follows the IT&S 5-year strategic plan and are typically new capabilities driven by business needs focusing on building resilient modern platforms, optimizing value of existing platforms and building new

capabilities as required. Network, Infrastructure and Service delivery typically entail technical refresh cycles. Finally Operational Technology represent engineering projects that require IT&S execution, so this forecast follows the needs and projections of some of the engineering's forecasted capital plan.

The business units where applicable coordinate with the Portfolio Management Committee which meets to discuss, review, prioritize and approve funding for projects and determine if it should be added to the portfolio. Considerations included for discussion are urgency, capital spend and resource constraints. The business units triangulate with the portfolio management committee to ensure that projects are approved and being included in the budget/forecasting process. Following approval, projects are included into the forecast cycle.

Exhibit 3802

	Year-End Account Balance [a]		Change during the Calendar Year				
2014	50,694,812.38						
2015	46,680,812.38		4,014,000.00	[c]			
2016	42,666,726.38	[b]	4,014,086.00	[c]	4,014,086.00	[c]	Change for Amortization
2017	21,265,384.38	[b]	21,401,342.00		17,387,256.00	[d]	Change for TCJA Remeasurement
2018	19,056,958.38		2,208,426.00	[e]	21,401,342.00		
2019	16,848,532.38		2,208,426.00	[e]			
2020	14,640,106.38		2,208,426.00	[e]			
2021	12,431,680.38		2,208,426.00	[e]			
2022	10,223,254.38		2,208,426.00	[e]			
2023	8,014,828.38		2,208,426.00	[e]			
2024	5,806,402.38		2,208,426.00	[e]			
2025	3,597,976.38		2,208,426.00	[e]			
2026	1,389,550.38		2,208,426.00	[e]			
2027	(0.00)		1,389,550.38	[f]			

[a] Actual year-end account balance 2014 through 2023. Expected year-end balances 2024 through 2027.

[b] These balances are reported in our annual 10k report. Here is an example from the 2017 report:

> At December 31, 2017 and 2016, regulatory income tax assets of $21.3 million and $43.0 million, respectively, were recorded, a portion of which is recorded in current assets.

[c] The annual changes in these years, at corporate rates in effect before 2018, reflect the amortization of the 'Pre-1981 Depreciation' and 'Pre-1981 Removal Cost' flow-through items as follows:

'Pre-1981 Depreciation'	'Pre-1981 Removal Costs'	Combined Total	
7,350,000	(1,175,000)	6,175,000	*Gross annual amortization*
39.40%	39.40%	39.40%	*Blended statutory tax rate*
2,895,601	(462,902)	2,432,699	*Net amortization*
165.01%	165.01%	165.01%	*Tax gross up rate*
4,777,900	(763,814)	4,014,086	*Annual amortization in income tax*

[d] This remeasurement of the flow-through items as a result of the 2017 Tax Cuts and Jobs Act (TCJA) was disclosed during the UG344 general rate case. Here is an excerpt from that disclosure (the total was not in the original / added here for ease of reference):

Account		Gross Balance	Original Measurement	Remeasured	Change
283015	Flowthrough	(3,865,263)	(3,865,263)	(2,126,547)	(1,738,716)
283016	Flowthrough	(34,787,377)	(34,787,377)	(19,138,932)	(15,648,445)
					(17,387,161)

[e] The annual changes in these years, at corporate rates in effect after 2017, reflect the amortization of the 'Pre-1981 Depreciation' and 'Pre-1981 Removal Cost' flow-through items as follows:

'Pre-1981 Depreciation'	'Pre-1981 Removal Costs'	Combined Total	
7,350,000	(1,175,000)	6,175,000	*Gross annual amortization*
26.34%	26.34%	26.34%	*Blended statutory tax rate*
1,936,193	(309,527)	1,626,666	*Net amortization*
135.76%	135.76%	135.76%	*Tax gross up rate*
2,628,653	(420,227)	2,208,426	*Annual amortization in income tax*

[f] The remaining balance is fully amortized in calendar year 2027

Total Revenue Requirement
$152,345

[a] Margin increase is calculated by multiplying Test Year Rate Base (line 28 column c) by the Rate of Return (line 29 column e) and comparing the result to Test Year Operating Revenues (line 17 column c). The difference is then grossed up for tax and shown in line 1 of column d. Associated taxes and uncollectibles are calculated based on the revenue increase and the tax rates and uncollectible average as used in this model.

D. Interplay between fixed charge and LEA.....75
V. Rate Spread.....77

I. INTRODUCTION AND SUMMARY

Q. Are you the same Robert J. Wyman who presented Direct Testimony in this proceeding on behalf of Northwest Natural Gas Company dba NW Natural ("NW Natural" or the "Company")?

A. Yes, I presented NW Natural/1800, Wyman.

Q. What is the purpose of your Reply Testimony in this proceeding?

A. I summarize and respond to the issues raised in Opening Testimony by Eric Shierman, Bret Stevens and Michelle Scala on behalf of Commission Staff ("Staff"), Bradley G. Mullins on behalf of the Alliance of Western Energy Consumers ("AWEC"), John Garrett on behalf of the Oregon Citizens' Utility Board ("CUB"), and Bradley Cebulko on behalf of the Coalition[1] ("Coalition") (collectively referred to here as the "Parties") on the topics of the weather normalized use-per-customer load forecast ("UPC Forecast"), Long-Run Incremental Cost ("LRIC") study, and rate spread and rate design proposed by the Company.

Q. Please summarize your Reply Testimony.

A. First, I respond to Staff's testimony regarding the Company's load forecast methodology, referred to here as the UPC Forecast. Second, I review and respond to Staff's and AWEC's testimony regarding the LRIC study methodology. Third, I discuss the Company's rate design proposals and respond to Parties'

[1] The Coalition includes the Coalition of Communities of Color, Climate Solutions, Verde, Columbia Riverkeeper, Oregon Environmental Council, Community Energy Project, and Sierra Club.

testimonies on the matter. Finally, I review and respond to Staff's and AWEC's rate spread proposals.

II. UPC FORECAST

A. Overview of Company's UPC Forecast Methodology

Q. Please briefly describe the purpose of the UPC Forecast.

A. The UPC Forecast uses a time series regression model to estimate the Company's weather normalized usage, or load. The forecast is used to calculate revenues at existing rates in the proposed revenue requirement for the Base Year and Test Year, as presented in NW Natural/1700, Walker and NW Natural/3800, Walker. It is also used to create the design day load factor, which is an important input to the LRIC study.

Q. Please summarize the Company's UPC Forecast methodology.

A. The UPC Forecast estimates weather normalized usage for the Residential and Commercial rate classes on a per customer basis. The forecast relies on the relationship between weather (including temperature, which is translated into heating degree days, or "HDDs", as well as other variables such as precipitation and wind speed) and load by rate schedule and time of year (measured in daily increments).[2] I used load data on a billing cycle basis, and matched actual

[2] The degree day is a unit of measurement based on the difference between the average temperature for a day and a base set point. Degree days are additive in that the sum of the daily degree days over the course of the month is taken to represent that month's weather. The degree day is a common unit of measurement that allows for an analysis of increasing usage as a function of increasingly colder weather. The Company used a 59-degree and 58-degree Fahrenheit base set point for residential and commercial rate classes, respectively. The set point is taken to be the temperature at which customers begin to use energy for heating purposes.

weather observations with the days between cycle meter read dates. This process ensures actual usage recorded for each billing period is appropriately matched to the observed weather for the same period. I then created a weighting of the number of days, customers, and HDDs associated with each billing cycle for each schedule in the Residential and Commercial customer classes. Using an Autoregressive Integrated Moving Average ("ARIMA") time series model, I tested four categories of coefficients that explain usage per customer per day as a function of: (1) weather, including heating usage per HDD per day; (2) base usage by month; (3) non-weather factors that account for the shift in energy usage patterns after the COVID-19 pandemic as well as energy efficiency from ongoing demand side management; and (4) temporal effects on usage from prior periods.[3] Finally, I used the estimated coefficients to build the weather normalized UPC Forecast on a daily basis using the 25-year HDD benchmark.[4]

Q. Please summarize the Company's ARIMA model specification selection process.

A. For every rate schedule modeled, I relied foremost on Durbin-Watson test statistics, r-squared values, and root mean squared error results to assess model

[3] An ARIMA model is a type of time series model specification for data observations that occur across equal intervals of time. The model is used to help forecast future values in the series by each value against a chosen number of lagged values (the autoregressive term); lags of moving averages may be chosen as well. ARIMA models are denoted as ARIMA (p,d,q) where p is the number of time lags in the autoregressive term; d indicates the number of times the independent variables are differenced; and q is the number of lags of moving averages. Together, these terms help fit the time series model by accounting for different temporal effects on usage that are associated with prior periods.

[4] See also NW Natural/1800, Wyman/7-9.

efficacy and choose appropriate ARIMA *p* autoregressive time lags and *q* lags of moving averages terms.[5] I relied on the Augmented Dickey-Fuller test to determine the appropriateness of differencing load forecast data variables with the ARIMA *d* term to ensure model stationarity. Further, I plotted model residuals to check for non-uniformity. I consulted the Akaike Information Criterion ("AIC") and the Bayesian Information Criterion ("BIC") metrics to evaluate the performance of models under varying *p* and *q* term specifications against one another.[6]

Q. Did the Company implement any recommended modifications to the UPC Forecast model specification that Parties raised in its last general rate case (UG 435)?

A. Yes. I incorporated recommendations put forth by Staff and CUB into this iteration of the UPC Forecast. These recommendations included examination of the impacts of the COVID-19 global pandemic, inclusion of additional explanatory weather variables, as well as the addition of a control for days of the week.

B. Reply to Staff Testimony Regarding Company's UPC Forecast Methodology

Q. Did any of the Parties review the Company's UPC Forecast methodology?

A. Yes. Staff reviewed the Company's forecast and indicated it found "no major concerns" with the forecast methodology and noted that the Company "uses

[5] The Durbin-Watson test statistic, which is a test for autocorrelation, takes a value from 0 to 4. A value of 2 indicates no autocorrelation. A value less than 2 indicates positive autocorrelation, and a value greater than 2 indicates negative autocorrelation.

[6] When comparing models with the same variables but different *p* or *q* terms, in general the model with the lower AIC and BIC metric is preferable. See also NW Natural/1800, Wyman/10-21.

industry standard methodologies and is receptive to feedback regarding model improvements."[7] AWEC, CUB, and the Coalition did not provide Opening Testimony on this topic.

Q. Did Staff provide feedback for potential improvements to the Company's UPC Forecast methodology?

A. Yes. Staff made the following recommended changes to the Company's UPC Forecast methodology with the goal of "improving transparency and model flexibility":

1. Algorithmically parameterize ARIMA models as baseline with any deviations justified in testimony.
2. Attempt to use non-linear weather terms when applicable and discuss rationale for excluding these terms.
3. Use monthly dummies as opposed to the natural logarithm of the number of weekend and holiday days in each month.
4. Drop variables with very small effects.

Further, Staff recommended a unique set of model specification changes for each rate class in the UPC Forecast.[8]

Q. How did Staff implement its recommended methodological changes?

A. Staff used an algorithm to automatically select an ARIMA(p,d,q) model parameterization for each rate class. This process, in Staff's view, produced

[7] Staff/1900, Stevens/2-3.

[8] *Id*., Stevens/3.

satisfactory results for RS 2 Residential, RS 27 Dry-Out, and RS 31 Commercial Sales Firm. Where the algorithm performed poorly in parameterizing the overall Commercial class, RS 3 Commercial, and RS 32 Commercial Sales Firm, by forecasting summer load higher than historical consumption norms, Staff overrode the model and selected the parameterization. Staff's manual parameterization introduced multiplicative seasonal components to the ARIMA model in the form of ARIMA(p,d,q)*(P,D,Q)s where s indicates the number of lagged multiplicative seasonal autoregressive P and moving average Q terms, seasonally differenced D times. Staff indicates that where applied, the seasonal differencing parameters account for the seasonal variation in rate class usage instead of the monthly indicator variables which it recommends be removed from the model specification.

Staff recommended modifications to the model specifications that include, depending on the rate class: Changes to (or exclusion of) the monthly indicator variables, addition of a squared HDD term to control for the non-linear effects of weather, and exclusion of various explanatory variables (notably: weather terms) that Staff found did not produce meaningful coefficients.[9]

Q. How did Staff evaluate the performance of its methodological changes?

A. Staff examined the fit of the models as measured by the AIC and BIC metrics, which I referenced above. Staff examined the distribution of residuals between

[9] *Id*., Stevens/4-19.

its models and the Company's, with a distribution closer to a standard distribution indicating a preferable model specification.[10]

Q. How does the Company's evaluation of the performance of its models differ from Staff's evaluation?

A. In addition to the AIC and BIC metrics, I relied on Durbin-Watson test statistics, r-squared values, and mean squared errors to assess my choice of variables in order to optimize model estimation. I also relied on the Augmented Dickey-Fuller test to determine the appropriateness of differencing load forecast data variables with the ARIMA *d* term to ensure model stationarity.[11] Finally, I performed a "backcast" test on each of my models. A backcast test evaluates how well a model can estimate actual known out-of-sample values using historical (actual) data. I performed an analysis using three backcast tests of varying data vintages to compare model forecast performance against actual load data, for both residential and commercial rate schedules. Models are evaluated against each other by calculating and comparing mean absolute percent error ("MAPE") value to test model accuracy.

[10] *Id*., Stevens/4.

[11] Non-stationarity in the UPC Forecast model variables can occur when their statistical properties vary over time. A utility's customer count is an example, for instance, because it generally increases over time but not at a constant rate. New customers spurred by housing construction are more likely to start service in summer months than winter months. For each of the Company's rate schedule models, the Augmented Dickey-Fuller test indicated model stationarity using the selected *p* and *q* terms. Inclusion of the differencing d term degraded all or nearly all test statistics, and therefore I did not employ the *d* term in any model specification.

Q. Did Staff calculate a proposed adjustment to revenue requirement based on its recommended changes?

A. No. Staff estimated regression results for each of the rate schedules in the Company's UPC Forecast but did not evaluate the impact of its results and recommendations on the Company's revenue requirement. Staff notes that it is working with the Company to implement its recommended changes, and that it "does not anticipate that these changes will have a large impact on the proposed rates in this case but it contends that these changes will improve the Company's load forecast."[12]

Q. Has the Company attempted to replicate Staff's results?

A. Yes. Staff produced its regression results using *R*, an open-source statistical computing software, while the Company used a statistical software package called Stata. Using Stata, I have reproduced forecast results for the residential rate class that are close to – but not precisely the same – as Staff's results. Upon conferring with Staff, we believe the difference in results could lie in how *R* and Stata treat the ARIMA *d* differencing term introduced in some of Staff's models; whereas *R* produces a forecast value for the dependent variable, Stata produces a dependent variable forecast value that represents the difference from the prior period forecast value. Staff and the Company have not been able to fully reconcile the models between the two software systems.

[12] Staff/1900, Stevens/3.

Q. What is the Company's response to Staff's recommendations?

A. The Company agrees with Staff's characterization that the Company is receptive to feedback regarding model improvements and that nearly all econometric models have room for improvement. I believe that model replicability and simplicity are important so that results and test statistics can be calculated across software platforms, and so that others can independently verify the results. Further, out-of-sample backcast testing conducted across varying historical data vintages, with comparison of the MAPE across forecasted model results, is a useful tool for understanding model forecasting performance and fit. This is in addition to the examination of forecast residuals presented by Staff, as well as other metrics such as the Durbin-Watson test statistic.

Staff did not propose a revenue requirement adjustment. Given Staff's position that any adjustment would not be significant, as well as the remaining issues of replicability and the need for additional testing of forecast performance and fit (e.g., backcast testing), the Company proposes to further examine Staff's recommendations prior to filing its next general rate case at which time it will address whether it has implemented (or explain its reasoning for not implementing) each recommendation. It is important to fully understand the effects of Staff's recommendations and the impact on the UPC Forecast results – as Staff noted, in the process of implementing its first recommendation, its automatically parameterized ARIMA models derived by an algorithm in *R* produced a summer season forecasts that were either unrealistic or higher than historical consumption for the Commercial rate class as a whole, as well as the

Small Commercial sub-class, and RS 32 Commercial Sales Firm.[13] The Company's proposal is consistent with its commitment to improving its model, as well as prior practices whereby the Company examined and implemented Staff recommendations in subsequent general rate case filings both for this proceeding (UG 490) as well one prior (UG 435).

III. LONG-RUN INCREMENTAL COST (LRIC) STUDY

A. Overview of Company's LRIC Study

Q. Please briefly describe the purpose of the LRIC study.

A. The overall objective of the LRIC study is to apportion the incremental revenue requirement to rate schedules based on each schedule's specific cost to serve. The LRIC study methodology presented in my Direct Testimony is an economics exercise that evaluates how much of the Company's incremental capital investment and carrying costs, and operations and other expenses required to serve its customers, can be directly and indirectly attributable to each rate schedule. By understanding the long run incremental costs by rate schedule, the LRIC study methodology apportions a utility's storage, transmission, and distribution costs, as well as operating expenses (i.e., all of the components of revenue requirement) based on cost causation. The costs and expenses that form a basis for the LRIC study follow the Company's Test Year for the 12 months ended October 31, 2025.

[13] *Id*., Stevens/7, 9 and 17.

After allocating all revenue requirement cost elements, the LRIC study calculates the relative ratio of revenue to incremental costs for each rate schedule at present rates. This ratio is used to understand cross-subsidies between rate schedules at current rates and is used by the Company to inform its rate spread and rate design proposals.

Q. Did your LRIC study methodology differ from the methodology used in the Company's last rate case filing, UG 435?

A. Yes. The LRIC study methodology I presented in my Direct Testimony is similar to the methodology used in the Company's last rate case filing, UG 435. There are two notable modifications, both of which are based on Staff recommendations. The modifications are updates to:

- The maximum daily delivered volume ("MDDV") calculation for design day load factor development, in order to account for changing incremental customer counts through time; and
- The system core main allocation, which now includes interruptible peak day deliveries, adjusted with a 50 percent credit, to calculate weighted peak day deliveries for all rate schedules as a basis for core main cost assignment.[14]

[14] NW Natural/1800, Wyman/33.

B. Reply to Parties' Testimony Regarding LRIC Study Methodology

Q. Did Parties provide feedback on the Company's LRIC study methodology and implementation?

A. Yes. Staff and AWEC provided feedback regarding the Company's filed LRIC study methodology and implementation.

Q. What is Staff's response to your LRIC study modifications based on its recommendations from UG 435?

A. Staff indicates that it examined the Company's LRIC study workpapers and with regards to Staff's recommendations, "it appears to Staff that this feedback was implemented effectively."[15]

Q. What is Staff's response to the Company's overall LRIC study implementation in this proceeding?

A. Staff provides no other feedback with regards to the LRIC study methodology or implementation but indicates it may update its position based on other parties' feedback.[16]

Q. What is AWEC's response to the Company's LRIC study methodology?

A. AWEC raises general concerns and proposes several methodological changes to the Company's LRIC study. AWEC asserts that the Company's LRIC study:

[15] Staff/1800, Shierman/4.

[16] *Id*.

1. Uses a "peak and average" allocation method, which tends to overweight volumes relative to demand compared to an "average and excess" allocation method;[17]
2. Applies a 50 percent demand discount for interruptible rate schedules for some investment types, which does not reflect the risk of service interruption that these customers take and the benefits they provide to the system,[18] and further does not apply any interruptible rate schedule demand discount for regulating equipment and compressor station investments;[19] and
3. Applies an inconsistent methodology for service line allocation that "treats small and large customers differently when allocating costs of services."[20]

I will address each of these points in turn below.

1. *"Peak and average" versus "average and excess" allocation methodology*

Q. What is AWEC's concern with regards to the "peak and average" allocation methodology?

A. AWEC asserts that the Company's LRIC study uses a "peak and average" allocation methodology which is "generally unfavorable towards high volume customer classes relative to other methods such as the average and excess method" and that it "tends to overweight volumes relative to demand."[21] AWEC

[17] AWEC/100, Mullins/43.

[18] AWEC/100, Mullins/45-46.

[19] AWEC/100, Mullins/45.

[20] AWEC/100, Mullins/46.

[21] AWEC/100, Mullins/43-44.

argues that there are issues within the framework of this methodology that drive its LRIC study recommendations.

Q. Does the Company's LRIC study use the "peak and average" allocation methodology or the "average and excess" allocation methodology, or both?

A. The Company uses both methodologies. The design day load factor, which is a ratio measure of each rate schedule's contribution to the design day peak load, is one key input into the LRIC study. A low load factor ratio indicates that a rate schedule has high peaking load relative to normalized average usage (i.e., it indicates the rate schedule has high weather sensitivity as load peaks during cold weather events). A high load factor ratio indicates less weather sensitivity and more predicable base load usage throughout the year. The load factor is the basis for the design day (peak) and annual throughput (average) allocator that the LRIC study uses to allocate (in full or in part) distribution mains and assets, and transmission main investment to each rate schedule. The "peak and average" allocator is a weighted ratio of each rate schedule's contribution to the load factor-derived peak day deliveries and average throughput.[22]

The load factor is also the basis for the "average and excess" allocator that the LRIC study uses to distribute system core mains costs to the rate schedules based on two allocations: total throughput and firm demand. The total throughput allocator is based on the system design day load factor (i.e., the

[22] *See*: "UG 490 - Exh. 1801 - WP6 - Long-Run Incremental Cost Study (LRIC) Model," tab "LRIC Allocators." The design day peak and average allocator is labeled, *Dist-1*.

"average") and distributes costs across all schedules. The firm demand allocator is based on one minus the system design day load factor (i.e., the "excess") and similarly distributes costs across all rate schedules.[23]

I also employ a methodology similar to "average and excess" in this LRIC study for underground gas storage plant costs. I allocated these costs to sales customers only, using a ratio based on Test Year average winter sales that exceed Test Year average summer sales. This measure allocates costs based on contribution to average peak loads compared to a period of average base loads.[24]

Q. What is the Company's response to AWEC's statement that "the peak and average method is not necessarily consistent with cost causation principles, particularly where volumes are overweighted in the allocation factor calculation?"[25]

A. The Company agrees that, on its own, the "peak and average" allocator does not fully capture the entirety of the system's cost causation among all rate schedules, which is why I also employ the "average and excess" and "winter to summer average excess" allocation methodologies in my LRIC study. The Company also agrees that its natural gas system is built based on design day demands, which is why the design day load factor is a key input into the LRIC study cost causation modeling methodology. It follows, however, that cost causation for

[23] *Id*. The system core mains average and excess allocators are labeled *Dist-5* and *Dist-6*.

[24] *Id*. The underground storage average winter to summer sales excess allocator is labeled *Stor-1*.

[25] AWEC/100, Mullins/43.

some investments such as a portion of distribution mains and transmission mains are allocated based on demand throughput based on a rate schedule's contribution to capacity needs. It also follows that cost causation for some investments, such as a portion of distribution (system core) mains and underground storage, are better allocated based on a rate schedule's contribution to capacity demands at peak times. The Company uses both methodologies to balance the assignment of cost causation among disparate investment categories from high volume to lower volume, but peakier, customer classes.

2. Interruptible customer demand discount allocation

Q. What is the interruptible customer demand discount allocation?

A. I introduced the interruptible customer demand discount allocation in the LRIC study filed in this proceeding in response to a Staff recommendation in UG 435. This allocation recognizes, as Staff asserted in testimony, that interruptible customers "receive tangible benefits from peak day planning investments" because they are "seldom, if ever interrupted" and therefore should be allocated a portion of these resource costs.[26] The Company agreed to Staff's recommendation to include an allocation to interruptible customers at 50 percent of the standard firm demand allocation as a reasonable method for allocating some costs that it had previously only allocated to firm customers.[27]

[26] In the Matter of Northwest Natural Gas Company, dba NW Natural, Request for a General Rate Revision, Docket No. UG 435, Staff/1600, Gibbens/13, lines 11-14 (April 22, 2022).

[27] NW Natural/1800, Wyman/33.

Q. What categories of costs does the Company's LRIC study apply to interruptible customers that it had previously only allocated to firm customers?

A. The Company's LRIC study applies the interruptible customer demand discount to system core mains costs using allocators labeled *Dist-5* and *Dist-6*. I also apply the discount to underground storage costs using an allocator labeled *Stor-1*.

Q. Does the Company's LRIC study have allocators for distribution and mains related costs for which it does not apply the 50 percent discount?

A. Yes. AWEC notes that the Company's *Dist-1* allocation factor, which does not provide the 50 percent discount, is applied to investments for other distribution costs including measuring and regulating equipment and compressor stations.[28] Additionally, I assign the remainder of distribution mains costs not subject to the 50 percent discount using direct allocation developed based on studies I conducted using Company data such as job orders, engineering and other Geographic Information Systems ("GIS") data, accounting data, and billing and usage data.[29]

[28] AWEC/100, Mullins/45.

[29] NW Natural/1800, Wyman/30. These allocators are labeled *Dist-2*, *Dist-3*, *Dist-4*, and *Dist-7* in the Company's LRIC study.

Q. How does the Company respond to AWEC's position that the *Dist-1* allocation factor should provide an interruptible rate schedule demand discount for costs such as regulating equipment and compressor stations?

A. I am agreeable to treating costs allocated by *Dist-1* in the same manner as *Dist-5* and *Dist-6* by applying an interruptible rate schedule demand discount (but not, as I explain below, a full discount). Regulating equipment and compressor station investments, I will note, are not just design capacity assets but also help to manage natural gas flows throughout the winter (and the entire year) and therefore do provide benefit for interruptible customers.

Q. Does AWEC agree with the 50 percent interruptible rate schedule demand discount?

A. No. AWEC states "customers that choose to take services on interruptible schedules are fully interruptible, not fifty percent interruptible" and, therefore, it is "most appropriate to provide a demand discount equal to 100% of the customer's requirements."[30]

Q. How does the Company respond to AWEC's assertion that the interruptible rate schedule demand discount should be 100 percent?

A. The LRIC study is a theoretical economic costing exercise that attempts to estimate the point where customers, either individually or as part of a rate class, are paying the costs associated with their service as a basis for discussions of price setting and rate spread. The Company agrees that interruptible customers

[30] AWEC/100, Mullins/45-46.

provide system planning benefits and these benefits are reflected in the rates that are charged to these customers. Valuing and assigning these benefits are not straightforward and raise the question of how (and to what extent) to allocate costs based on requirements and obligations in the tariffed rate compared to how the system is used in practice. On one hand, interruptible customers benefit from the reliability and capacity built for the design day standard of the system. Not all interruptions occur due to capacity constraints from peaking on the system under normal operating conditions; some occur for reasons outside the utility's control (e.g., third-party damage to infrastructure). On the other hand, the Company notes that regardless of the number of demand response events, interruptible customers do present a demand side resource for the sole reason they *can* be interrupted to alleviate supply and capacity constraints.

Q. What is the Company's response to AWEC's recommendation?

A. The Company believes its methodology for allocating distribution costs to interruptible rate schedules, as recommended by Staff, is appropriate for this filing because it balances deliverability requirements for these customers with the practical use of the Company's system. That said, the Company acknowledges that refinement of LRIC study methodologies over time is possible either through peer review of best practices, analysis through the Company's Integrated Resource Planning ("IRP") process, or through actual observation of demand response events.

3. Service line allocation

Q. How did the Company allocate service lines in its LRIC study?

A. I created two allocators for service lines, which I labeled *Line-1* and *Line-2*. I calculated *Line-1* based on the average services cost per foot and the average footage installed derived using eight years of historical accounting data of Oregon services job orders (2015 – 2022) for customer service installations by market segment, inflated to account for costs through the Test Year.[31] Due to the small job sample size for the Commercial and Industrial schedules in the RS 31 and RS 32 rate classes, I used historical data to calculate a weighted median cost per foot.[32] Using a GIS data query for services connection footage by rate schedule historically, I estimated services cost by customer per rate schedule by multiplying the median footage by median cost per foot.[33] I then allocated these costs by applying an "investment carrying charge" to calculate the marginal, not actual, cost.[34] For *Line-1*, I only applied this methodology to RS 2 Residential, RS 3 General Commercial, and RS 27 Dry-Out. Using the indicated marginal cost for these rate schedules, I weighted each schedule's contribution to the overall cost for those schedules and converted it into the *Line-1* allocation factor.

[31] NW Natural/1800, Wyman/47.

[32] NW Natural/1800, Wyman/46-47.

[33] NW Natural/1800, Wyman/47.

[34] NW Natural/1800, Wyman/49. The carrying charge includes cost of capital (debt and equity), taxes, and depreciation to calculate the carrying percentage assigned to each category of investment.

I calculated the *Line-2* allocator based on the replacement service line cost by multiplying the historical installation cost (inflated to the Test Year) by the number of customers for all schedules in RS 31 and RS 32 rate classes.

Q. What was AWEC's feedback on this allocation methodology?

A. AWEC argues that the *Line-1* and *Line-2* allocators allocate service line costs to the RS 31 and RS 32 rate classes differently compared to all other rate schedules. Whereas *Line-1* uses a marginal approach, *Line-2* is based on replacement costs and this difference in approach results in more costs being assigned to the RS 31 and RS 32 rate classes than is necessary.[35] AWEC recommends that all rate schedules be allocated service line costs in a uniform manner based on the *Line-1* methodology.[36]

Q. What is the Company's response to AWEC's service line allocation recommendation?

A. The intention of applying a different allocation methodology to *Line-1* and *Line-2* was to group and weight rate schedules with similar service line costs on a per customer basis (e.g., the residential and general commercial schedules were grouped for *Line-1*, and the large commercial and industrial schedules *Line-2*). Upon review, I understand AWEC's concerns with applying an inconsistent methodology across this investment category. Therefore, I agree to adjust this methodology for the Company's next LRIC study filing.

[35] AWEC/100, Mullins/6-47.

[36] AWEC/100, Mullins/47.

Q. Please summarize the Company's overall response to AWEC's feedback on the LRIC study.

A. Based on AWEC's feedback, I agree to adjust the methodology for the allocators, *Dist-1* and *Line-1*. For *Dist-1*, I will apply an interruptible customer demand discount consistent with *Dist-5* and *Dist-6*. For *Line-1*, I will apply methodology consistently across all rate schedules (and therefore remove the *Line-2* allocator). I intend to implement these recommendations for the Company's next LRIC study filing.

Q. Why are you not updating your LRIC study in Reply Testimony?

A. AWEC calculated and presented modified results of my LRIC study in its Opening Testimony. The largest driver of the change in results is AWEC's application of a 100 percent interruptible customer demand discount, which I do not accept. Even with each of AWEC's modifications, there is very little directional movement in which schedules are under- and over-paying their overall cost of service. For the two rate schedules that showed directional movement from underpaying to overpaying (RS 3 Industrial and RS 32 Industrial Transportation Interruptible), I grouped them with like rate schedules for my rate spread proposal. I allocated a revenue requirement increment for RS 32 Industrial Transportation Interruptible commensurate with all other transportation rate schedules. For RS 3 Industrial, I allocated revenue requirement commensurate with other large commercial and industrial rate schedules that are not transportation service and that are not overpaying their cost of service such that I calculate a parity ratio of 1.75 at present rates. In short, an updated LRIC

study would not cause me to update my rate spread proposal as presented in my Direct Testimony.[37]

IV. RATE DESIGN

Q. What is the purpose of the rate design section in your Reply Testimony?

A. The Company proposed multiple rate design changes in Direct Testimony. In this section, I provide an overview of each of the proposals, summarize the response to each proposal from Parties' Opening Testimony, and present the Company's reply.

Q. Please summarize the Company's rate design proposals.

A. The Company's rate design proposals are as follows. The Company has proposed to:

1. Increase the monthly fixed charge for existing RS 2 Residential customers residing in single-family dwellings from $8.00 to $10.00 in order to collect more of its fixed costs on a per-customer, per-month basis;[38]
2. Maintain the current residential monthly fixed charge of $8.00 for existing RS 2 Residential customers residing in multi-family dwellings to reflect the comparatively lower cost of service for multi-family dwellings in relation to single-family dwellings;[39]
3. Bifurcate the residential class Decoupling Mechanism baseline into two cohorts to account for differences in the usage profiles of existing residential

[37] See NW Natural/1800, Wyman/84-85 for my rate spread proposal methodology.

[38] NW Natural/1800, Wyman/60-61.

[39] NW Natural/1800, Wyman/67-76.

premises compared to new residential premises that are connected to the system at the rate effective date of this proceeding;[40]

4. Set a monthly fixed charge of $26.25 for the new single-family residential premises that equitably recovers the cost to serve these customers at the proposed lower bifurcated Decoupling Mechanism baseline;[41] and
5. Set a monthly fixed charge of $24.25 for new multi-family residential premises which is based on the $26.25 new single-family residential premises monthly fixed charge, less the same $2.00 per month discount applied for existing RS 2 Residential customers residing in multi-family dwellings.[42]

Q. Why do the Company's proposals constitute sound rate design?

A. Together, the rate design proposals better align costs among four types of residential customers based on dwelling type and the date their premises was connected to the Company's system: Single-family and multi-family dwellings, and premises connected on or after the rate effective date of this proceeding ("New Premises") compared to premises connected prior to the rate effective date ("Existing Premises"). Two of the proposals (the lower monthly fixed charge for multi-family dwellings and the Decoupling Mechanism bifurcation) were raised by Staff in UG 435 and further examined by the Company. The purpose of the Company's rate design proposal as a whole is to mitigate residential intra-class subsidies between these four types of residential customers.

[40] NW Natural/1700, Walker/8-15.

[41] NW Natural/1800, Wyman/76-79.

[42] NW Natural/1800, Wyman/78.

Q. More specifically, why does the Company's proposal for the higher new premises monthly fixed charge constitute sound rate design?

A. The Company's proposal for the higher monthly fixed charge on New Premises maintains the same volumetric price signal for the residential rate class in order to promote a fair apportionment of revenue requirement across the Residential rate class, while avoiding different volumetric price signals on an intra-class level. The Company's proposal is responsive to the principle of fairness presented as "Attributes of a Sound Rate Structure" developed by James C. Bonbright ("Bonbright Principles"). The sixth principle seeks to avoid "arbitrariness and capriciousness" while attaining equity in three dimensions: "(1) Horizonal (i.e., equals treated equally); (2) vertical (i.e., unequals treated unequally); and (3) anonymous (i.e., no ratepayer's demands can be diverted away uneconomically from an incumbent by a potential entrant)."[43] The Company's proposal avoids arbitrariness in the volumetric price signal on an intra-class basis while maintaining equity between premises of different vintages (existing vs new) while also apportioning rates that recognize differing costs of service across premises types (single-family vs multi-family) (i.e., four residential sub-classes).

Q. Please summarize the Company's rate design proposal for each of the four residential sub-classes.

A. In Table 1 below, I present the Company's rate design proposal for each of the four residential sub-classes. I present the proposed monthly fixed charge, as

[43] See: Bonbright, James C., Albert L. Danielsen, David R. Kamerschen. *Principles of Public Utility Rates* (Second Edition, 1988). Public Utilities Reports, pages 383-384.

well as two volumetric charges: the base margin rate and the total billing rate which includes all temporaries plus the commodity cost. As shown in Table 1, the volumetric price signal remains the same across all residential sub-classes. Therefore, every residential customer pays the same for an incremental therm so that the Company's fixed costs are not collected through varying volumetric rates throughout the class. The higher monthly fixed charge for the New Premises, as I explain in my testimony below, mitigates intra-class subsidies between the Existing Premises and New Premises residential customer vintages.

Table 1
Residential Class Rate Design Proposal,
Fixed Charge and Volumetric Rates,
by Residential Customer Type[44]

			Volumetric Based Charge	
Residential Vintage	**Dwelling Type**	**Monthly Fixed Charge**	**Base Margin Rate**	**Total Billing Rate**
Existing Premises	Single-Family	$ 10.00	$ 0.90649	$ 1.51976
Existing Premises	Multi-Family	$ 8.00	$ 0.90649	$ 1.51976
New Premises	Single-Family	$ 26.25	$ 0.90649	$ 1.51976
New Premises	Multi-Family	$ 24.25	$ 0.90649	$ 1.51976

[44] For the Company's rate design model, please refer to the submitted workpaper, "UG 490 - Exh. 1803 and 1804 - WP1 - Rate Spread and Rate Allocation Model."

A. Residential single-family dwelling monthly fixed charge

1. Overview of Company's Proposed Modifications to Fixed Charge for Existing Premises Single-Family RS 2 Residential Customers

Q. What is the Company's proposal for its monthly fixed charge for RS 2 Residential customers residing in single-family dwellings?

A. The Company proposed to increase the fixed monthly charge for Existing Premises RS 2 Residential customers residing in single-family dwellings from $8.00 to $10.00. This proposal applies to all single-family residential premises connected to the Company's system prior to November 1, 2024.

Q. What is a single-family residential premises?

A. A single-family residential premises is a detached residential dwelling with a service line and meter.

Q. Why did the Company make this proposal?

A. The LRIC study indicated the fixed monthly charge for the Residential class at the proposed rates in this proceeding should be set at an estimated $37.06 per customer per month. At the current rate of $8.00, the Company would only collect about one-fifth of its fixed costs through the fixed charge component of its Residential rate, relying on collection of the remaining four-fifths through the volumetric rate component that produces revenues that vary seasonally and year-to-year based on weather.[45] The Company's proposal of $10.00 balances the need to increase the fixed charge with principles of gradualism, and results in

[45] NW Natural/1800, Wyman/60.

a more reasonable level of fixed cost recovery that is not contingent on weather. Under this proposal, the Company recovers 27.0 percent of its total fixed costs through the fixed charge. As I demonstrated in my Direct Testimony, the Company's existing monthly RS 2 Residential fixed charge ranks near the bottom of all peer utility residential monthly fixed charges—and would continue to rank near the bottom even with the increase to $10.00.[46]

2. Reply to Parties' Testimony Regarding Modifications to Fixed Charge for Existing Premises Single-Family RS-2 Residential Customers

Q. Did the Parties provide feedback on this proposal?

A. Yes. Staff provided Opening Testimony regarding the modification to increase the fixed charge for Existing Premises single-family customers. CUB and the Coalition did not directly address the Company's proposal in their Opening Testimonies.

Q. What was Staff's feedback?

A. Staff indicated both that it is "supportive" of this proposal "for the time being"[47] and that it "takes no issue with the increase to the [single-family residential] basic charge at this time."[48] Staff notes, however, that affordability concerns "gives reason to consider this proposed increase directly through the lens of customer impacts," and that it may update its position following the Energy Justice Issues

[46] NW Natural/1800, Wyman/75.

[47] Staff/300, Scala/18.

[48] Staff/1800, Shierman/18.

Public Workshop that was held April 25, 2024, as well as based on other Parties' testimony.[49]

Q. Did the Company consider affordability when making this proposal?

A. Yes, affordability for Existing Premises customers was an influence in the Company's decision to graduate the increase in the fixed charge to $10.00, instead of the $37.06 that would otherwise have been the result of the LRIC study. The Company notes, however, that although the higher monthly fixed charge increases the minimum bill amount, it results in a downward pressure on volumetric rates and therefore lower winter bills when all energy bills are higher. I explain this in greater detail later in my testimony.

3. Overview of Company's Proposed Modifications to Fixed Charge for Existing Premises Multi-Family RS 2 Residential Customers

Q. What is the Company's proposal for its monthly fixed charge for Existing Premises RS 2 Residential customers residing in multi-family dwellings?

A. The Company proposed to retain the monthly fixed charge for RS 2 Residential customers residing in multi-family dwellings at $8.00, which is $2.00 lower than the proposed $10.00 single-family residential monthly fixed charge. This proposal applies to all multi-family residential premises connected to the Company's system prior to November 1, 2024.[50]

[49] *Id*., Shierman/18-19.

[50] NW Natural/1800, Wyman/63.

Q. What is a multi-family residential premises?

A. For the purposes of this proposal, multi-family residential premises are dwelling units of two or more attached units including duplexes, apartments, condos, or townhomes that are individually metered on RS 2 Residential. For reference, there are other types of multi-family dwellings on the Company's system that can fall under different rate schedules depending upon the circumstances of the dwelling and service type, which are not included in this proposal:

- Schedule 3 Basic Firm Sales Service Non-Residential (RS 3 Commercial), which includes residents of a multi-family building with natural gas service that is master metered under a commercial rate schedule and, therefore, are not directly charged by the utility and are not utility customers; and
- Schedule 4 Residential Multi-Family Service (RS 4 Multi-Family) for customers that reside in a particular type of multi-family building.
- Additionally, NW Natural also serves master-metered multi-family buildings where a single meter serves the entire building. These multi-family buildings may have several residences served by the single meter, but the customer account and billing are associated with a property management company or landlord. These customers are typically serviced on RS 3 Commercial.[51]

Q. Why did the Company make this proposal?

A. In UG 435 Opening Testimony, Staff indicated interest "in exploring whether or not the Company should separate pricing for multi-family residential customers"

[51] NW Natural/1800, Wyman/68-69.

based on distinctions that could make the fixed costs of serving multi-family premises lower relative to single-family premises.[52] These distinctions are based largely on economic and spatial efficiencies associated with serving customers that are generally clustered, and are located in higher density urban areas within the Company's service territory. Hypothetically, such efficiencies may be due to lower marginal distribution costs on a per multi-family premises basis as it requires fewer average feet of main, for instance, to serve each premises relative to single-family premises due to spatial clustering.[53]

In response to Staff's interest, the Company hosted a workshop and presented results relating to the difference in fixed cost for serving multi-family residential premises compared to single-family residential premises. The results indicated that fixed cost rate component for multi-family residential premises is about 21.2 percent lower compared to single-family residential premises, and I proposed a 20.0 percent reduction as a practical matter to maintain a rounded fixed charge amount for both premises types. I made this proposal in response to the spatial and economic fixed cost efficiencies suggested by the results of this analysis, to be consistent with responses of peer utilities to similar analyses, and because the likelihood that customers residing in multi-family premises live in low

[52] In the Matter of Northwest Natural Gas Company, dba NW Natural, Request for a General Rate Revision, Docket No. UG 435, Staff/1300, Scala/48, lines 18-19 (April 22, 2022).

[53] NW Natural/1800, Wyman/71.

(or lower) income households is slightly higher than that of customers residing in single-family premises.[54]

4. Reply to Parties' Testimony Regarding Proposed Modifications to Fixed Charge for Existing Premises Multi-Family RS 2 Residential Customers

Q. Did the Parties provide feedback on this proposal?

A. Yes. Staff and CUB provided feedback on this proposal.

Q. What was Staff's feedback?

A. Staff is appreciative of the Company for "carrying out the thorough analysis following our recommendation in UG 435"[55] and is supportive of the proposal.[56] Staff notes that although the results of the analysis can be sensitive to assumptions, "Staff is convinced that the Company's modeling is adequate to justify a bifurcated basic charge even if one were to view it through a cost causation lens."[57] Staff expects that the Company's proposal will have positive equity impacts owing to the fact that low-income customers are more likely to live in multi-family dwellings.[58]

[54] NW Natural/1800, Wyman/71-75.

[55] Staff/1800, Shierman/18.

[56] Staff/300, Scala/18.

[57] Staff/1800, Shierman/18.

[58] *Id*.

Q. What was CUB's feedback?

A. CUB indicates its support for the Company's proposal but does not provide any specific feedback.[59]

Q, Does the Company have anything further to add regarding this proposal?

A. The Company appreciates Parties' engagement regarding its proposal to bifurcate the single-family and multi-family monthly fixed charges for Existing Premises and has no further changes to this proposal.

B. Decoupling Mechanism bifurcation

1. Overview of Company's Decoupling Mechanism Bifurcation Proposal

Q. What is the Company's Decoupling Mechanism bifurcation proposal?

A. The Company has proposed to bifurcate its residential Decoupling Mechanism baseline to reflect two cohorts of residential customers based on the premises where they reside:

1. Existing residential premises ("Existing Premises") that either currently take service or will take service on RS 2 Residential prior to November 1, 2024. Customers residing at these premises have an expected average weather normalized UPC of 660.2 therms.
2. New residential premises ("New Premises") that do not currently take any service on the Company's system and are connected on or after November 1, 2024. Premises in this cohort can be connected to the system either as newly constructed homes (by way of greenfield or infill development), or by

[59] CUB/200, Garrett/10.

opting for natural gas conversion for an already existing residential dwelling. There are no customers in this cohort currently. Future customers that will reside at these premises have a forecasted expected average weather normalized UPC of 449.4 therms.

Q. Does the Company discuss its bifurcated Decoupling Mechanism proposal and Parties' response elsewhere in Reply Testimony?

A. Yes. Company witness Kyle T. Walker summarizes the Company's bifurcated Decoupling Mechanism proposal as described in the Company's Direct Testimony and summarizes and responds to Parties' positions in the Company's Reply Testimony at NW Natural/3800, Walker.

Q. How does the bifurcated Decoupling Mechanism proposal impact rate design?

A. In tandem with the Company's proposed New Premises monthly fixed charge proposal, the bifurcated Decoupling Mechanism proposal fundamentally alters how the Company collects its cost of service when usage varies from normal for the New Premises cohort. Staff has argued, and the Company agreed, that customers residing at New Premises dwellings will have lower baseline weather normalized usage due to new residential premises being associated with more energy efficient homes (e.g., tighter building envelop, more up-to-date building standards, etc.) and a mix of higher efficiency / lower use appliances compared to customers residing at Existing Premises dwellings. Under the Company's existing Decoupling Mechanism, all residential customers are decoupled to a

single baseline, which will overstate residential usage between rate case proceedings for New Premises.

This result is problematic, as it drives a larger regulatory asset for the decoupling deferral, which in turn impacts higher use (Existing Premises cohort) customers more than lower use (New Premises cohort) customers because the deferral gets recovered through the volumetric rate. Thus, without intervention, the New Premises cohort will not pay its full cost of service when usage varies from normal, and the Existing Premises cohort will subsidize the New Premises cohort.

The purpose of the bifurcated Decoupling Mechanism proposal is to mitigate this issue by assigning an expected weather normalized usage that is about 31.9 percent lower than the Existing Premises cohort. This bifurcation should minimize the decoupling deferral, reducing the intra-class subsidies that occur through the current Decoupling Mechanism. It is the Company's understanding that this is consistent with Staff's view on the purpose and expected outcome of this proposal.[60]

[60] *See, e.g.* Docket No. UG 435, Staff/1300, Scala/19, 25 ("Staff is concerned that the difference in usage between new customers coming on NW Natural's system and existing customers is too large to ignore. Failure to distinguish between new and established customer usage may overstate the impact of lower average use per customer under certain conditions" * * * * "Staff finds it is appropriate for the Company to distinguish between new and established customers in decoupling calculations.")

Q. How does the bifurcated Decoupling Mechanism proposal in tandem with the introduction of a higher monthly fixed charge equitably assign costs to each cohort on an intra-class basis?

A. The bifurcated Decoupling Mechanism proposal in tandem with the introduction of a higher monthly fixed charge equitably assigns the costs to both cohorts on an intra-class basis using a two-step process:

1. Creates a decoupling baseline based on the expected annual weather normalized forecasted UPC for each cohort. These values, which are presented in the Company's Direct Testimony, are: 660.2 therms for Existing Premises customers and 449.4 therms for New Premises customers.
2. Introduces a higher monthly fixed charge of $26.25 for the New Premises single-family residential and $24.25 for the New Premises multi-family residential cohorts to account for the lower decoupled baseline. These fixed charges are based on the shortfall of decoupled revenues that would be collected from these cohorts compared to the Existing Premises cohorts introduced by Step 1. Step 2, as I explain below, ensures that the New Premises cohorts cover their cost to serve notwithstanding a baseline that is set 31.9 percent (210.8 therms) lower to avoid the issue of intra-class subsidization with the Existing Premises cohorts.

2. Reply to Parties' Testimony Regarding the Company's Decoupling Mechanism Bifurcation Proposal

Q. What is Staff's approach for this proposal?

A. Staff believes that the issue of intra-class subsidization between New Premises and Existing Premises customers can be mitigated through the Decoupling Mechanism (Step 1) and further rate design (Step 2) is not necessary. Staff states: "[NW Natural] is proposing to differentiate between existing and new customers in its decoupling mechanism calculation, however Staff sees the rationale for this proposal as sufficiently different from the rationale for the new premises basic charge."[61]

Q. What is your response?

A. I disagree. I argue that the two steps I described above are needed to avoid intra-class subsidization between New Premises and Existing Premises customers post-bifurcation.

Q. Why is the two-step approach required to avoid intra-class subsidization?

A. As I noted earlier, the bifurcated Decoupling Mechanism proposal fundamentally alters how the Company collects its cost of service when usage varies from normal for the New Premises cohorts. With no change to rate design, the New Premises cohort baselines of 449.4 therms result in the Company recovering about $191 less per New Premises customer in base margin annually compared to an Existing Premises customer at the 660.2 therm baseline at the rates

[61] Staff/1800, Shierman/21.

proposed in this proceeding.[62] The cost to serve a customer in each cohort is similar, however: New and Existing Premises are generally served by the same type (size and operating pressure) and length of service line, similar type of meter and regulator, and have the same or similar customer service, meter reading, billing, and administrative costs. In the absence of any change to the billing determinants (either the monthly fixed charge or the volumetric rate) for the New Premises cohorts, the Company would under-recover the cost of service associated with New Premises customers and over-recover the cost of service associated with Existing Premises customers. This is why simply establishing the two baselines for decoupling (Step 1) alone does not mitigate the issue of intra-class subsidization, and why a rate design modification (Step 2) is necessary.

Q. What is the consequence of bifurcating the Decoupling Mechanism (only taking Step 1) but not making a rate design modification (omitting Step 2)?

A. Without a rate design modification for the New Premises cohort, the Company's base margin volumetric rate would be higher relative to the Company's proposal. The higher volumetric rate would impact higher users the most, including those users who are least able to respond in the short-run to higher price signals with energy efficiency measures such as new appliance purchases and home weatherization. The higher volumetric rate places a higher impact on the higher-use cohort (Existing Premises) which, as I discuss later, has a higher proportion

[62] The proposed base margin is $0.90649. The $191 value is derived by multiplying this amount by the difference in baseline therms between the two cohorts (210.8 therms). $0.90649*210.8 = $191.11.

of lower-income customers compared to the New Premises cohort. With no change to the New Premises rate design, the Company would under-collect about $612 thousand from New Premises cohort customers in the Test Year, which will be collected through the volumetric base margin rate from all (Existing Premises and New Premises) customers with higher users paying more (i.e., intra-class subsidization).

Q. Does this impact any other rate schedules?

A. No. This is an issue of intra-class residential rate design, and therefore does not result in any costs being placed on the volumetric rate of any other rate schedules.

C. New Premises Customer Charge

1. Overview of Company's Proposed New Premises Customer Charge

Q. What New Premises monthly fixed charge rate design has the Company proposed?

A. The Company proposed a higher monthly fixed charge of $26.25 for New Premises single-family cohort customers. This higher monthly fixed charge is set to reflect the difference in the UPC for New Premises customers compared to Existing Premises customers. In other words, the difference in proposed monthly fixed charge between the groups -- $16.25 – roughly covers the cost-of-service

recovery shortfall associated with the 210.8 therm lower New Premises annual weather normalized usage.[63]

The New Premises monthly fixed charge will ensure that new residential customers as a group are providing equivalent contributions for their cost of service as Existing Premises customers. For this reason, and the reasons I discuss below, the Company's proposal promotes fairness and equity in residential rate design.

Q. Are Parties supportive of the Company's rate design modification?

A. Staff, CUB, and the Coalition are not supportive of the Company's New Premises monthly fixed charge rate design modification,[64] as I discuss below.[65] However, the Parties' position on this issue would serve to retain the intra-class subsidy for the benefit of the New Premises cohorts to the detriment of the Existing Premises cohorts.

Q. What is the New Premises monthly fixed charge proposal?

A. The Company proposed to include a higher monthly fixed charge for New Premises customers ("New Premises Customer Charge") added to the system on or after the effective date of rates for this proceeding (November 1, 2024). The Company plans to charge these New Premises customers (i.e., new residential premises added to the system) $26.25 per month. This fixed charge is $16.25

[63] The higher monthly fixed charge amount recovers $195.00 annually ($16.25*12). This is slightly higher than the $191.11 due to rounding of billing determinants.

[64] Staff/900, Dlouhy/44; CUB/200, Garrett/8-10; Coalition/100, Cebulko/6.

[65] Staff/1900, Stevens/20-24.

more per month than the proposed monthly fixed charge for Existing Premises customers. Due to the lower annual average weather normalized UPC associated with New Premises customers relative to Existing Premises customers, the higher fixed charge allows the Company to maintain the same variable price signal for all residential customers on an intra-class level. This higher fixed-to-variable rate design flattens the anticipated delivery margin revenues from New Premises customers while enabling the Company to collect its full cost of service, thereby avoiding an intra-class subsidy between Existing Premises and New Premises residential customers.

Q. Please describe a New Premises customer.

A. A New Premises customer is a customer who purchases, rents, or otherwise occupies a residential dwelling that is connected to the Company's system on or after November 1, 2024, and opens an account at or transfers an account to that premises. A New Premises is a premises that is connected to the system via line extension and can be either new construction, infill development, or a natural gas conversion.

It is important to understand this definition. A customer that is new to NW Natural (i.e., has moved into the Company's service territory from elsewhere) and who moves into a premises that was connected prior to November 1, 2024 (an Existing Premises) is not a New Premises customer and would therefore be subject to the standard RS 2 Residential monthly fixed charge of $10.00 proposed in this proceeding. Likewise, if a customer were to move from a New Premises to an Existing Premises, they would then be subject to the $10.00

monthly fixed charge. The New Premises Customer Charge, therefore, is associated with the premises, not the customer account.

Q. Will any of the Company's existing customers be charged the New Premises Customer Charge at the rate effective date of this proceeding?

A. No. There are no existing customers that will be charged the New Premises Customer Charge beginning November 1, 2024. Only future customers and existing customers who purchase, rent, or otherwise occupy a newly constructed or converted dwelling connected to the system on or after November 1, 2024 will be subject to this charge.

Q. Has the Company analyzed its data to better understand common characteristics of New Premises customers?

A. Yes. While the Company does not have household income or other demographic data on an individual customer basis, we can infer some common characteristics about New Premises customers connected to the Company's system from 2018 through 2023.[66] New Premises connections are:

- Largely single-family dwellings: 92.7 percent during this period were identified as single-family dwellings, and 7.3 percent were multi-family.
- Mostly new construction: 78.4 percent during this period were new construction greenfield or infill development, and 21.6 percent were natural gas conversions at previously constructed dwellings.

[66] These data, except where noted, were sourced using information presented in Exhibits Coalition/106 and Coalition/107.

- Are less likely to request or be enrolled in the bill discount program: 3.5 percent of customers residing at premises connected to the system during this period were enrolled in the bill discount program as of January 2024, compared to 7.2 percent of all Oregon residential customers. Of just single-family residential premises connected from 2018 through 2023, 3.3 percent enrolled, while 5.6 percent of multi-family premises enrolled.
- Are more likely to reside in a Census Tract with a median household income higher than the median household income for Oregon: An average Census Tract median household income of $97,576 compared to a median household income of $75,657 for Oregon (both figures in 2022 dollars).[67]

In summary, New Premises cohort customers who purchase, rent, or otherwise occupy a residential dwelling that is connected to the Company's system on or after November 1, 2024, will have a higher median household income and are more likely to live in newly constructed single-family dwellings compared to customers in the Existing Premises cohort. Most (56.7 percent) of these customers are located in the Portland metro area[68] where the average new construction detached single-family dwelling is listed for $683,602 a new construction attached dwelling is listed for $411,600 as of May 2024.[69] New Premises cohort customers, therefore, are less likely to be lower-income

[67] US Census Bureau. 2022 American Community Survey 1-Year Estimates. *See*: https://data.census.gov/profile/Oregon?g=040XX00US41.

[68] Defined here as located in Multnomah, Washington, or Clackamas counties.

[69] Zonda Market Report for Portland-Vancouver-Hillsboro, OR-WA. May 6, 2024.

compared to Existing Premises customers, and are less likely to enroll in or be eligible for bill assistance programs.

Q. Please summarize how you calculated the New Premises Customer Charge.

A. I apportioned the Test Year Residential class customer count and volumes among the four residential sub-groups: existing single-family, existing multi-family, new premises single-family, and new premises multi-family. Using the class-wide incremental revenue requirement determined through the Company's rate spread proposal, I solved for new premises single- and multi-family fixed monthly charges that would maintain the same volumetric rate across all sub-classes. This calculation results in roughly the same normalized expected revenues per customer between existing and new premises single-family residential customers (as well as the same between existing and new premises multi-family residential customers).

Q. What is the effect of the higher New Premises Customer Charge on the apportionment of revenue requirement to each sub-class given you have proposed to maintain the same volumetric charge?

A. The Company's residential rate design proposal apportions the proposed residential revenue requirement across the four sub-classes. The two Existing Premises sub-classes have expected usage at the 660.2 therm decoupling baseline; the two New Premises sub-classes have expected usage at the 449.4 therm baseline. With the higher New Premises Customer Charge, more of the overall residential revenue requirement is apportioned to new premises than would otherwise be apportioned with a lower monthly fixed charge. The effect on

the residential class of the higher New Premises Customer Charge is zero-sum, reducing how many dollars are allocated for the (singular) volumetric charge. As I discuss in further detail below, the effect of not using the higher fixed monthly charge as proposed would result in an increase in the volumetric allocation for all sub-classes of about $612 thousand assuming the Test Year average new premises customer additions.[70] Using the Test Year end of period customer additions, this value is roughly $1.2 million on an annualized basis, indicating how quickly this value increases as customers are connected to the system. This volumetric allocation would impact the higher use Existing Premises cohort to a greater extent compared to the lower use New Premises cohort.

Q. Did you provide this allocation to Parties with your Direct Testimony?

A. Yes. I provided this allocation in the submitted workpaper, "UG 490 – Exh. 1803 and 1804 – WP1 – Rate Spread and Rate Allocation Model" in a tab labeled "UG 490 Rate Design Proposal."

Q. You mention that the New Premises Customer Charge calculation is based on the overall residential revenue requirement. Does this mean that the actual New Premises Customer Charge will be calculated based on the final authorized revenue requirement from this proceeding?

A. Yes. This is a point that I did not make clear in my Direct Testimony. The Company's higher New Premises Customer Charge for both single- and multi-

[70] Please refer to the submitted workpaper, "UG 490 – Exh. 1803 and 1804 – WP1 – Rate Spread and Rate Allocation Model" tab "UG 490 Rate Design Proposal." The value $612,300 is calculated by multiplying the average Test Year customer additions for the New Premises single-family and multi-family sub-classes by the fixed monthly charge delta from Existing Premises ($16,25) by 12 months.

family residential premises is based on the initially requested $154.9 million revenue requirement, and importantly, is intended to utilize nearly the same volumetric rate as Existing Premises customers so that all residential customers have similar price signals for usage. To the extent the revenue requirement decreases in this proceeding, the Company will proportionately lower the monthly fixed charge for New Premises customers based on that final amount, in accordance with the rate design principles I have explained for this charge.

2. Reply to Parties' Testimony Regarding New Premises Customer Charge

Q. Did Parties provide feedback regarding the New Premises Customer Charge?

A. Yes. Staff, CUB, and the Coalition provided feedback on the Company's proposed New Premises Customer charge.

Q. What was Parties' response to the proposed New Premises Customer Charge?

A. Staff, CUB, and the Coalition rejected the New Premises Customer Charge proposal.

Q. What is CUB's concern with the New Premises Customer Charge?

A. CUB argues that under the Company's proposal, a New Premises customer "will pay about 51 percent more than an existing customer for using the same amount

of gas."[71] CUB is "concerned that charging 'new premise' customers 51 percent more than ~180,000 existing customers with the same usage is discriminatory."[72]

Q. How do you respond to CUB's assertion that a New Premises customer will be charged 51 percent more than an Existing Premises customer?

A. I take issue with the entire premise of CUB's analysis. First, however, I point out that CUB's calculated result is incorrect based on a math error. In CUB/203, Garrett/2, CUB calculates an "Annual Rate ($)" and a "Annual Rate / Therm ($/therm)" for New Premises and Existing Premises customers both assuming an annual usage of 449 therms and the proposed total residential base rate of $0.90649 from this proceeding. CUB calculates an Annual Rate value of $527.01 and $722.01 for Existing Premises and New Premises, respectively. CUB's analysis calculates an Existing Customer Annual Rate per Therm of $1.17 by dividing $527.01 by 449. CUB's analysis inexplicably shows a New Customer Annual Rate per Therm of $1.77 even though using the same methodology to divide $722.01 by 449 results in a New Premises Customer Annual Rate per Therm value of $1.61.[73]

CUB's result, therefore, should have indicated the New Premises customer is paying 37.0 percent more than the Existing Premises customer, not 51 percent. Notwithstanding the math error, it is unclear why CUB takes the

[71] CUB/200, Garrett/8.

[72] *Id*., Garrett/9.

[73] It appears that CUB may have inadvertently used an annual UPC value of 531.16 instead of 449 for this calculation even though this figure does not appear at CUB/203, Garrett/2.

additional step of converting the monthly fixed charge to a per therm amount rather than present the result simply as a cost differential given the cost is what the customer experiences. Furthermore, the premise of the analysis itself is not sound. It would have been more appropriate to use the residential total billing rate proposed in this proceeding of $1.51976 per therm to calculate the cost differential, not the total base rate. The total billing rate reflects the goal of CUB's analysis to show how much one cohort is paying more or less than the other at a given usage level.[74] If CUB had performed this analysis correctly, it would indicate the New Premises cohort paying 24.3 percent more than the Existing Premises cohort at 449.4 therms annually. This assumes the usage of a typical New Premises customer compared to an Existing Premises customer using 31.9 percent less natural gas than is typical for an average customer in that cohort on a weather normalized basis.

Finally, I will point out that CUB's analysis does not even begin to address the question of what the Company's cost to serve an Existing Premises and a New Premises is and what billing determinants are required to achieve rate equity between the two cohorts.

[74] CUB/203, Garrett/2 cites UG 490 CUB DR 9 Attachment 1 as a source for this calculation. In reviewing the data request, I notice that CUB requested projected use-per-therm rates inclusive of the monthly customer charge. The Company responded with a calculation based on the proposed UG 490 Total Base (Margin) Rate. The calculation of an all-inclusive per therm rate should have included temporary rates and the commodity charge, which would have been the total proposed billing rate of $1.51976.

Q. Can you give an example showing why CUB's usage of an annual rate per therm is not a sound methodology?

A. Yes. Consider Customer A that uses 450 therms and Customer B that uses 650 therms. Both customers are billed a $10 monthly fixed rate and a volumetric rate of $1.50 per therm. Customer A would pay $795 annually and Customer B would pay $1,095 annually. Using CUB's methodology, Customer A will pay only 4.9 percent more than Customer B for using the same amount of gas ($1.77 per therm for Customer A compared to $1.68 per therm for Customer B). This ignores the fact that Customer B is paying 37.7 percent more annually ($795 for Customer A compared to $1,095 for Customer B) due only to the fact that Customer B has used more gas. This conclusion also ignores the question of whether Customer A is covering its cost to serve at its usage level given these billing determinants, and whether Customer B is paying too much or just enough.

Q. Why does the Company's proposal result in a cost differential when comparing a *typical* New Premises customer using 449.4 therms against an *atypical* Existing Premises customer using the same amount of therms?

A. As I explained earlier in my testimony, Staff argued in UG 435, and the Company agreed, that there is a fundamental difference between Existing Premises and New Premises usage such that a change – the bifurcation of Decoupling Mechanism – is warranted.[75] This change alters the ratemaking of the residential class, and as I explained earlier, necessitates a rate design modification to avoid

[75] *See, e.g.* Docket No. UG 435, Staff/1300, Scala/19, 25.

intra-class subsidization that more heavily impacts the higher use Existing Premises cohort. It is standard ratemaking practice to calculate billing determinants (the monthly fixed charge and volumetric rates) using the annual weather normalized UPC (i.e., the typical use for an average customer) for each set of customers grouped by common characteristics. Therefore, the ratemaking for the *typical* lower-use New Premises customer is based on 449.4 therms and the *typical* higher-use Existing Premises customer is based on 660.2 therms annually. It would not be sound ratemaking (nor would it be fair or just to customers) to set rates based on the bottom one-third of users just as it would not make sense to set rates based on the top one-third (or one-tenth, for that matter) of users and charge those rates to every customer in the class.[76]

Q. Does the Company have any rates that have the same cost per unit of natural gas consumed compared to any other rate?

A. No, rates are developed based on many factors including cost to serve as indicated by the LRIC study, and number of customers and load profile of the class, temporaries and adjustments that are only applied to specific rate schedules, as well as the outcome of rate case settlement. Total cost per therm

[76] From a practical standpoint, "the attempt to estimate what part of the total cost of operating a utility business constitutes the cost of service each individual ratepayer or class of ratepayers would involve a hopelessly elaborate and expensive type of cost analysis. For this reason alone, the most that can be hoped for is the development of techniques of cost allocation that reflect only the major, more stable, and more predictable cost relationships." See: Bonbright, James C., Albert L. Danielsen, David R. Kamerschen. *Principles of Public Utility Rates* (Second Edition, 1988). Public Utilities Reports, pages 391-392.

of gas consumed, therefore, is not a reasonable measure for comparing intra-class equity between rate schedules or rate classes.

Q. How do you respond to CUB's statement that the Company is charging new premises customers a higher rate for the same amount of gas is "discriminatory," and creates an "intra-class equity concern"?[77]

A. Again, I reject CUB's analysis that converts the fixed monthly charge to a unit of gas rather than using a simple cost comparison. Further, I have multiple issues with CUB's statement that the Company's New Premises Customer Charge is "discriminatory" and creates an "intra-class equity concern."

CUB implies that a non-discriminatory New Premises rate is equal to an Existing Premises rate at any therm amount (e.g., the cost per unit of gas consumed is the same or nearly the same). This is the rate structure that exists today and is the reason why the bifurcated Decoupling Mechanism was proposed in the first place in response to concerns about intra-class subsidization. The bifurcation recognizes that the two cohorts have different baselines of usage and that they should be treated differently in ratemaking. Given the two baselines, 449.4 therms and 660.2 therms, and assuming the same billing determinants are used for a customer at either baseline, CUB does not demonstrate why a *typical*

[77] CUB/200, Garrett/8.

New Premises customer should pay 28.5 percent less than a *typical* Existing Premises customer.[78]

Recall that CUB argued that the Company's proposal would result in New Premises customers paying (the incorrectly calculated) 51 percent more per therm than roughly 180,000 Existing Premises customers. On the other side of the coin, if the Company's New Premises monthly fixed charge proposal were to be rejected, roughly 434,000 Existing Premises customers (about 71.0 percent of all residential customers) will pay *more* than a typical New Premises customer on a total billing basis.[79] As I explained earlier in my testimony, New Premises customers are on average more likely to live in higher-income Census Tracts, are more likely to be owners of newly constructed single-family residences, and are less likely to be enrolled the Company's bill discount program compared to Existing Premises customers on average. Also, as I explained earlier, any shortfalls in the collection of cost of service from New Premises customers will be charged through the residential base volumetric rate which will impact higher use Existing Premises customers more. Therefore, CUB's recommended rejection of the Company's proposal does not address intra-class equity or energy equity concerns, nor does it address "attempts by this Commission to address energy burden."[80]

[78] The 28.5 percent figure is derived using the proposed $10.00 monthly fixed charge and the $1.51976 total volumetric billing rate for both cohorts, with a New Premises customer using 449.4 therms and an Existing Premises customer using 660.2 therms.

[79] I estimate this figure using the same data and methods as shown at CUB/203, Garrett/2.

[80] CUB/200, Garrett/10.

Q. What evidence do you have that New Premises customers would be underpaying their cost to serve at the 449.4 therm baseline given the same rates as Existing Premises customers, and thereby not addressing the issue of intra-class equity concerns?

A. In my Direct Testimony, I presented the results of my LRIC study which indicated that the residential class is underpaying its cost of service at current rates at an average weather normalized UPC of 660.2 therms. I reported a residential class parity ratio of 0.96 at present rates, where a ratio of 1.00 indicates rate parity, and a ratio above and below 1.00 indicates a rate schedule is overpaying and underpaying its LRIC study indicated cost of service, respectively. At an average weather normalized UPC of 449.4 therms, and assuming the same present rates, the revenue shortfall is exacerbated if the bifurcated Decoupling Mechanism proposal is adopted (e.g., revenues are only collected on 449.4 therms instead of 660.2 therms) causing the parity ratio to move further away from 1.00 (i.e., lower).

Q. CUB asserts that by discontinuing gas service, a New Premises customer could save $7,875 by avoiding the New Premises Customer Charge. How do you respond?

A. CUB testifies that over the course of the 25-year repayment period modeled in the Company's line extension allowance ("LEA") proposal, a "new customer could save $7,875 by discontinuing gas service."[81] CUB calculates that amount

[81] CUB/200, Garrett/11.

because the LEA will require repayment over a 25-year period, repayment will cost the New Premises customer approximately $7,875 and the customer can simply save that full amount by electing to forgo gas service.

CUB's analysis is not complete and either lacks important assumptions or does not make its assumptions clear. Given that CUB ties its analysis to the 25-year period for the LEA, I infer that CUB is attempting to compare costs on a New Premises dwelling that is newly constructed. At the outset, natural gas service to a residence is choice, and the option for customers to not pursue natural gas service is always available to them. However, if the New Premises buyer opts not to install a natural gas service line as CUB suggests, to quantify the opportunity cost CUB's analysis would need to offset the cost savings with the energy costs associated with an alternative scenario, such as a fully electric home. If, on the other hand, the natural gas service line and appliances are pre-installed prior to purchase, the buyer would have to tear them out and "terminate NW Natural service within 25 years,"[82] replacing them with non-gas equivalents (such as an electric fireplace or cooktop). In this scenario, CUB's analysis would not only need to account for the energy cost differential, but the cost of the replacement appliances. This exercise would require at a minimum forecasting 25 years of both gas and electric energy costs on an assumed mix of appliance types, which CUB does not attempt to do.

[82] CUB/200, Garrett/18.

Given these limitations and unaddressed assumptions, it is likely that the cost savings (if there were to be any at all) would be lower than CUB's stated value of $7,875.

Q. CUB also states: "The Company's LEA economic justification rests upon the following assumption: even though 'new premise' customers will use distinctly less gas, and quite possibly be less reliant upon NW Natural's service, 100% of them will be willing to pay ~50% more per therm than existing customers."[83] How do you respond in the context of rate design?

A. Again, CUB uses the incorrect and misleading 51 percent figure I discussed earlier. The fact is, under the Company's proposal, a typical New Premises customer using 449.4 therms will pay 11.2 percent *less* annually on a total billing basis compared to a typical Existing Premises customer using 660.2 therms. On a margin revenue basis, the amount collected is nearly the same.[84] The Company addresses CUB's cost competitiveness arguments with regards to its LEA proposal in NW Natural/4000, Therrien.

Q. How does the monthly total billing cost and margin revenues of a typical New Premises customer compare to that of a typical Existing Premises under the Company's proposed rate design?

A. Chart 1 below compares the total billing cost of a typical New Premises customer compared to a typical Existing Premises customer. Due to the higher New

[83] CUB/200, Garrett/18.

[84] There is a one-half of one percent difference due to rounding of the billing determinant values.

Premises Customer Charge and lower usage associated with this cohort, bills are roughly 19 percent ($29.72) lower in the winter months but 17 percent higher ($6.04) in the summer months compared to the Existing Premises cohort. Again, on an annualized basis, the total cost is 11.2 percent lower for the New Premises cohort.

Chart 1

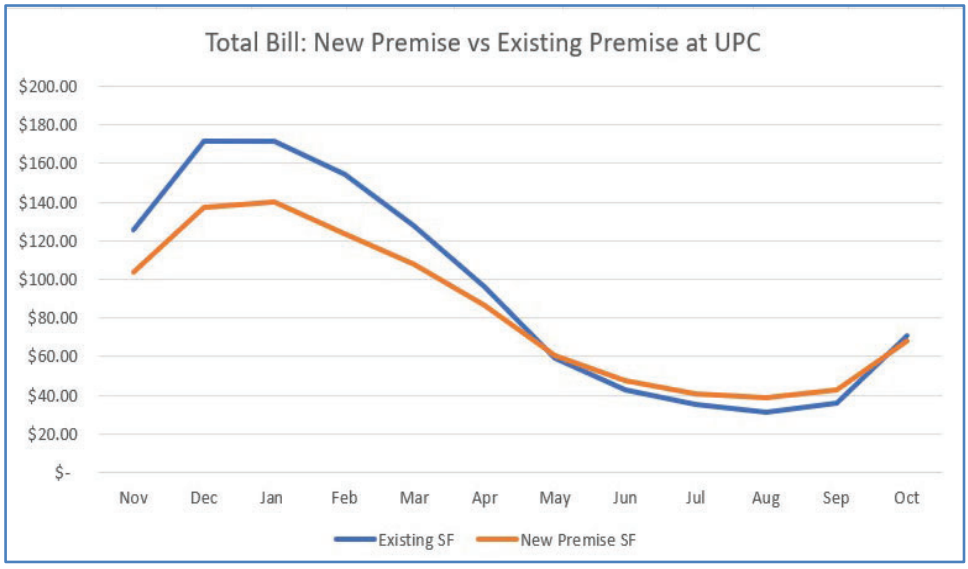

Chart 2 below shows the margin revenues on a per month basis. This chart indicates that the Company is recovering nearly the same cost to serve between both cohorts on an annualized basis. Without the proposed rate design, cost recovery would not be equal between the cohorts on an annualized basis.

Chart 2

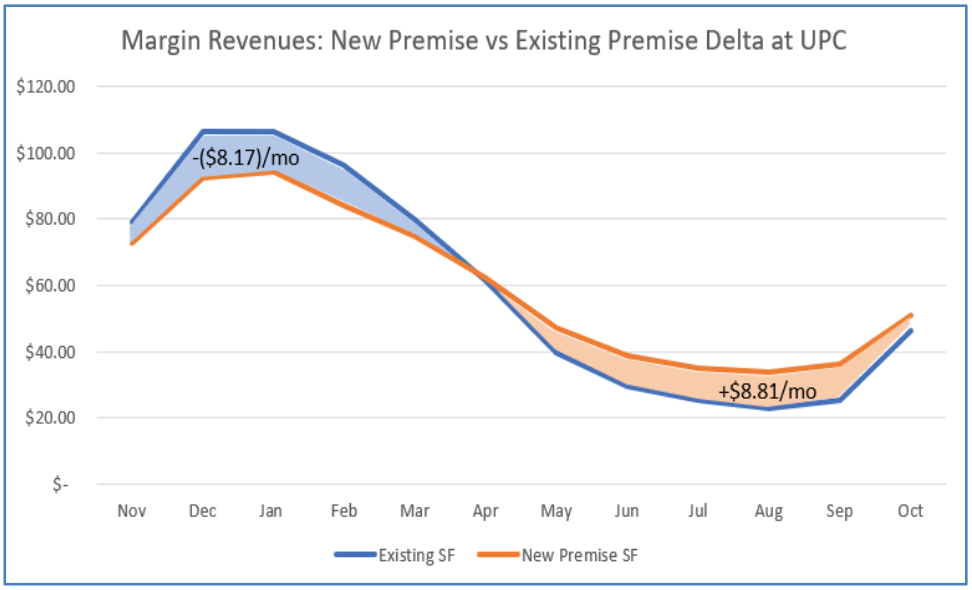

Chart 3 below shows the margin revenue shortfall for each month if no rate design change is made for the New Premises cohort. On an annualized basis, the shortfall is about $191 (or, about $16 per month) – roughly the same as the difference between the proposed New Premises and Existing Premises monthly fixed charge ($16.25 per month). As I explained earlier in my testimony, the shortfall (shown as the striped area in Chart 3) will fall on the base margin volumetric rate thereby impacting the higher-use Existing Premises cohort more than the lower-use New Premises cohort.

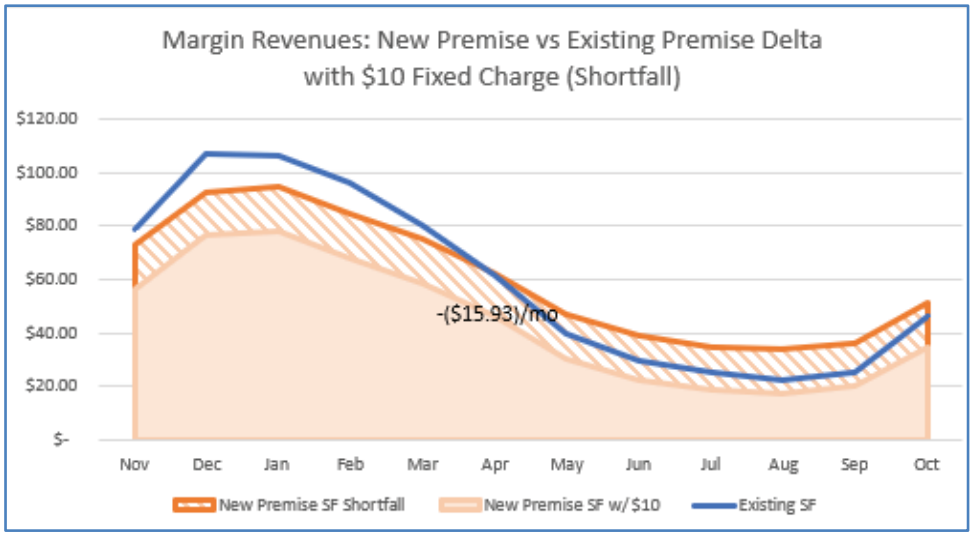
Chart 3



Q. How many annual therms does a New Premises customer need to use to breakeven on total billing cost compared to an Existing Premises customer?

A. If we assume a load profile that follows other New Premises customers, a New Premises customer would have to use about 531.9 therms annually to have the same total billing costs as an Existing Premises customer. This is usage that is about 18.4 percent higher than a typical New Premises customer. Due to the higher monthly fixed charge, this customer would still have winter bills that are roughly 7 percent lower relative to Existing Premises customers.

Q. At what level of usage would a New Premises customer see lower bills during winter months?

A. A New Premises customer will see roughly the same or lower bills in December through March at annual therm loads of 588.7 therms or less relative to an Existing Premises customer using 660.2 therms annually, assuming the New

Premises customer has a similar monthly load shape as an expected weather normalized new premises customer using 449.4 therms.

Q. What is the expected usage of a lower-income New Premises customer?

A. The Company estimates that of customers that are either enrolled in the bill discount program or have received bill assistance in the past 24 months as of March 2024 and that had initial service connection dates from 2013 through 2023 had average annual usage of about 464.7 therms.[85] This value is slightly higher than the expected New Premises UPC of 449.4 therms. The lower-income usage value of 464.7 therms is 12.6 percent lower than the usage level that would result in a total bill similar to that of an Existing Premises customer (531.9 therms) and 21.7 percent lower than the usage level that would result in higher winter bills compared to an Existing Premises customer (588.7 therms) *before* any bill assistance or bill discounts have been applied.

Q. At what therm level would winter bills be higher for a lower-income New Premises customer enrolled in the bill discount program compared to an Existing Premises customer?

A. At every bill discount program tier, winter bills would be lower for New Premises customers using average anticipated weather normalized usage of 464.7 therms relative Existing Premises customers using average annual anticipated weather normalized usage of 660.2 therms. A New Premises customer would need to

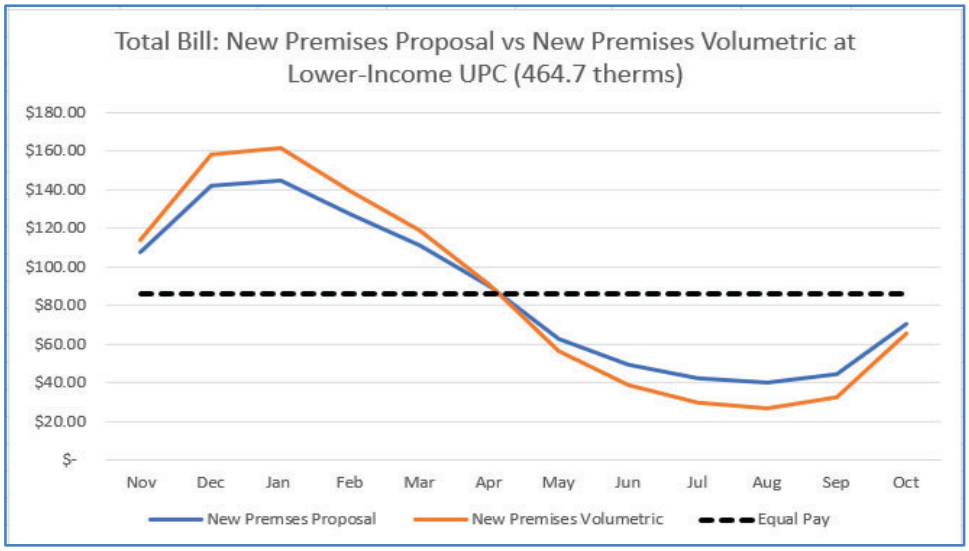
[85] Due to the low number of observations in this dataset, I did not perform a regression analysis similar in methodology to the UPC Forecast. Therefore, this value is not weather normalized, but does represent the average usage across 10 years' of variable (both warmer and colder than normal) weather.

use about 597.1 therms annually in order to have an expected January bill higher than an Existing Premises customer at the lowest bill discount program tier (Tier 3 - 15%). This is usage 28.5 percent higher than expected usage for a lower-income New Premises customer.

Q. What would be the impact of constructing a rate design that recovered the cost of service for New Premises customers on a volumetric, rather than monthly fixed cost, basis?

A. If the Company were to opt to recover the residential New Premises cost of service on the volumetric charge instead of the fixed charge (thus lowering the fixed charge), all New Premises customers (including lower-income customers enrolled at any tier in the bill discount program) would see higher winter bills on average compared to the Company's proposal. Chart 4 below shows the monthly total billing cost for a typical lower-income New Premises customer using 464.7 therms under the Company's proposal compared to a recovery of the same cost of service on a volumetric rate, as well as an "equal pay" scenario where the customer pays the same amount every month. The total annual cost recovery is the same in all three scenarios. As Chart 4 shows, the Company's New Premises proposal with the higher fixed charge results winter bills that are 8.9 percent lower on average compared to the scenario that leaves the monthly fixed charge at $10.00 and collects the remainder on the volumetric rate. The equal pay scenario, which is akin to one hundred percent fixed cost recovery, results in even lower winter bills but higher summer bills.

Chart 4



Since NW Natural only has the winter peaking season for residential customers, a higher monthly fixed charge has the benefit of shifting costs from the winter months when bills are highest to the summer months when bills are lowest. This has the added benefit of shifting costs from months when some customers may be experiencing higher electric utility bills, which can be dual peaking. Chart 5 below shows the same scenarios comparison as Chart 4, but now applies the second highest bill discount program tier (Tier 1 - 40%).

///

///

///

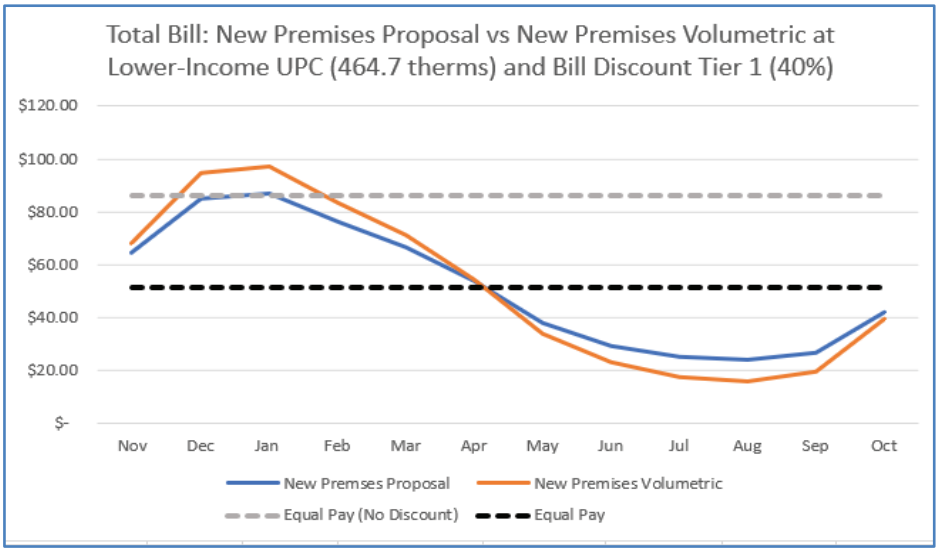
///

///

///

///

Chart 5



As Chart 5 indicates, at bill discount program Tier 1, the relative shape of the total billing costs between the New Premises proposal and New Premises volumetric scenarios is the same as shown in Chart 4. Winter bills under the New Premises proposal with the higher monthly fixed charge are still 8.9 percent lower on average. I have retained the equal pay line shown in Chart 4 as the dashed grey line to illustrate the discount being applied in Chart 5. At the Tier 1 discount, the highest winter bill is roughly equal to the pre-discount equal pay line.

3. Equity Considerations in New Premises Fixed Charge

Q. The Coalition states, "in the same way that it hurts all customers, except by definition, a higher fixed charge hurts more for low income and energy burdened customer as they have less discretionary income."[86] How do you respond?

A. Just as every customer's financial situation and energy costs are different, I am skeptical that the Coalition's declaratory statement, which is offered with no evidence, is true for every customer. As I demonstrated in the charts above, a higher monthly fixed charge can result in lower winter bills when other energy costs may be increasing as well by working to smooth the Company's bills across the entire year. We know, in fact, that not every customer views the trade-off of lower winter bills for higher summer bills as a negative. The Company's Equal Pay plan, which spreads bills evenly throughout the entire year, is in practicality an individualized 100 percent monthly fixed charge (the Company's New Premises Customer Charge, by contrast, is about 31.2 percent for a typical customer). About 12 percent of the Company's Oregon residential customers have opted into paying a fixed bill through the Equal Pay plan, including about 3,300 customers that are also enrolled in the bill discount program.

[86] Coalition/100, Cebulko/53.

Q. Please describe the Coalition's testimony as it relates to principles of equity when considering the Company's proposed New Premises monthly fixed charge.

A. The Coalition testifies that the new premises customer charge is not in the public interest because (1) high customer fixed charges decrease the incentive for customers to efficiently manage their demand; (2) high customer fixed charges disproportionately impact lower-income customers; (3) the Company's proposal is a radical step to address what is at present a minor issue in the decoupling mechanism; (4) the Company's proposal moves away from the existing decoupling policy in favor of a new policy framework for fixed cost recovery – one that relies heavily on fixed charges; and (5) the Company's proposal sends conflicting financial signals to housing developers and customers, when combined with its LEA proposal, and significantly undercuts the value of federal incentive programs under the Inflation Reduction Act ("IRA").[87]

Q. How do you respond?

A. I address each of the Coalition's points regarding the New Premises Customer Charge separately:

1. As I have discussed earlier, the New Premises cohort will be largely comprised of newly constructed single-family residential dwellings. Newly constructed market-rate homes are likely to have highly efficient building envelops and new, high efficiency appliances. These homes essentially

[87] Coalition/100, Cebulko/48-49.

come with weatherization pre-installed and therefore there is a lower ability for customers in this cohort to drive additional conservation through the volumetric rate component. Further, even with the higher monthly fixed charge, about 68.4 percent of a New Premises customer's bill will be based on volumetric charges on an annualized basis. For the four winter months November through February, this ratio is 79.2 percent. This means that a large majority of these customers' bills during the heating season, when usage is the highest, can still be managed through demand side behaviors.

2. As I noted earlier, the New Premises cohort, on average, will be made up of customers that own, rent, or otherwise occupy a newly constructed single-family residential dwelling, live in a Census Tract with a higher household income compared to the statewide median household income, and are less likely to be enrolled in the bill discount program compared to a customer in the Existing Premises cohort. We can expect, however, that there will be some lower-income New Premises customers. I explain below that a higher monthly fixed charge can work to reduce winter bills when demand for energy is peaking and make bills more even and predictable throughout the year. I also explain below that New Premises customers are eligible for the same bill assistance and bill discount program tiers as Existing Premises customers. The bill discount program discounts on a whole-bill basis, therefore the fixed monthly charge is discounted the same amount as if it were a volumetric charge. Finally, I note that the New Premises monthly fixed charge is meant to prevent intra-class subsidization that would shift costs to Existing

Premises, a cohort that has a higher percentage of bill discount program enrollees.

3. As I discussed earlier in my testimony, the bifurcated Decoupling Mechanism alone does not mitigate intra-class subsidization between New Premises and Existing Premises customers. The magnitude of subsidization increases as new premises are connected to the system. It is most efficient, therefore, to pair the decoupling bifurcation with a rate design that avoids this issue now, before New Premises customer rates are established rather than after the lower decoupling baseline has been set. This will ensure New Premises rates, once established, are stable and predictable moving forward.
4. The Company's New Premises Customer Charge proposal is not about fixed cost recovery. The Company's proposal addresses its concerns about intra-class subsidies flowing from higher use Existing Premises customers to lower use New Premises customers employing a rate design that recognizes the fundamental usage differences between these cohorts. Nor is the proposal a "new policy framework for fixed cost recovery." The New Premises Customer Charge is only expected to be applied to about one percent of all Oregon residential customers by the end of the Test Year. Further, the Company has only proposed an Existing Premises monthly fixed charge of $10.00 which still leaves it on the lower end of residential monthly fixed charges among peer utilities.
5. The Company rejects the notion that the New Premises Customer Charge sends conflicting price signals that undercut federal incentive programs under

the IRA. The IRA is targeted to eligible "homeowners, including renters for certain expenditures, who purchase energy and other efficient appliances and products,"[88] whether electric or gas. The program is not targeted to new home buyers who are purchasing a home that already has high-efficient brand-new appliances, doors, and windows.[89] For natural gas conversions, the Company's LEA proposal, as discussed in NW Natural/4000, Therrien, provides for a higher construction allowance for lower expected natural gas usage, therefore incentivizing conversion applicants to install low use natural gas appliances while taking advantage of IRA tax credits for space and/or water heating equipment.

Q. The Coalition states it "imagine[s] the near-term impacts to the decoupling mechanism of adding new premise customers will be *de minimus* [sic]."[90] What do you estimate the impact will be?

A. As I discussed earlier, at the Test Year average new premises customer additions, the New Premises Customer Charge allocation methodology results in about $612 thousand of revenue requirement allocated to New Premises customers that otherwise would be spread to all residential customers on a

[88] US Department of Energy. *Making Our Homes More Efficient: Clean Energy Tax Credits for Consumers.* https://www.energy.gov/policy/articles/making-our-homes-more-efficient-clean-energy-tax-credits-consumers.

[89] The IRA has enhanced and extended the "New Energy Efficient Home Credit" under Internal Revenue Code 45L, which provides a tax credit for builders of new single family and multi-family homes that meet "Energy Star Single-Family New Homes National Program Requirement." The requirements are for good building envelope (windows, doors, insulation, etc.) and good HVAC (efficient gas or electric furnace, hot water, a/c, etc.). https://www.energystar.gov/about/federal-tax-credits/ss-45l-tax-credits-home-builders; https://www.irs.gov/credits-deductions/credit-for-builders-of-energy-efficient-homes.

[90] Coalition/100, Cebulko/51.

volumetric basis. This spread would more greatly impact the higher use Existing Premises cohort. This cohort, based on my previous discussion, is on average, more likely to have customers enrolled in bill discount program. As more New Premises customers connect to the system, in future rate proceedings there will be even more upward pressure on the volumetric rate in the absence of this proposed New Premises monthly fixed charge. The Coalition recognizes this potential longer-term issue, noting "it is also possible this discrepancy could eventually become a meaningful issue for timely cost recovery at some point in the future."[91] Although the $612 thousand impact is a small share of the overall residential class revenue requirement, this value increases to just under $1.2 million using the Test Year end of period customer additions on an annualized basis. This indicates the larger long-term impact in the absence of a rate design intervention as new customers are connected to the system.

Q. The Coalition states it "did not see Company analysis that quantifies the impact of new premise residential customers have on the decoupling mechanism, either in the near term or the long term."[92] How do you respond?

A. While I did not provide this impact figure in my Direct Testimony, I did describe how I apportioned the residential revenue requirement to New Premises

[91] Coalition/100, Cebulko/51.

[92] Coalition/100, Cebulko/51.

customers.[93] Further, I submitted a workpaper titled, "UG 490 – Exh. 1803 and 1804 – WP1 – Rate Spread and Rate Allocation Model" with a tab labeled "UG 490 Rate Design Proposal."

Q. The Coalition states that in "order to mitigate the Company's concerns" "the Company could modify its expected residential use-per-customer in the decoupling mechanism to account for the impact of the new premise residential customers."[94] How do you respond?

A. I discussed earlier in my testimony the need to make a rate design modification after bifurcating the Decoupling Mechanism to properly assign cost of service to the New Premises and Existing Premises customer sub-classes. If the Company begins to under collect its cost of service on all New Premises customers, it is unclear where the Coalition (and other Parties) believe the shortfall in revenue requirement would be allocated. Since revenue requirement is allocated to the residential class and then between new and existing premises, the volumetric rate picks up the remainder that is not allocated through the monthly fixed charge.

[93] NW Natural/1800, Wyman/78-79.

[94] Coalition/100, Cebulko/52.

Q. The Coalition recommends that the Commission not approve the new premises customer charge unless the Company demonstrates "imminent financial harm" without the charge.[95] How do you respond?

A. The Company disagrees with the Coalition's suggestion that rate design be based on an "imminent financial harm" standard. The threshold for sound rate design is not imminent financial harm, it is fairness to our customers. We believe this proposal is in the best interest of our existing and future customers: It results in a fair rate that appropriately apportions cost causality to new customers that join the system without subsidizing existing customers. Also, recall that we proposed a new rate design in this proceeding that provides a monthly fixed charge discount for multi-family residential customers; we made this proposal out of fairness and from listening to feedback from Staff, not because we felt that multi-family customers were at the risk of imminent financial harm if the proposal would not be approved.

///

///

///

///

///

///

///

[95] Coalition/100, Cebulko/50.

Q. The Coalition states: "The Company is seeking permission to charge new premise residential customers $26.25 per month, an $18.25 per month increase (i.e., a 228% increase) over the current customer charge of $8 per month, and $16.25 per month more (i.e., 163% more) than the Company is proposing for existing residential customers in this rate case ($10 per month)."[96] How do you respond?

A. The Coalition's analysis is misleading for a couple of reasons:

1. The New Premises Customer Charge is a new rate that does not yet exist, it is not an increase over any other rate. There is no existing customer that will see the increases stated by the Coalition at the premises in which they currently reside. The charge is expected to largely be assessed to people who are not current customers or are existing customers who likely have usage consistent with the Existing Premises cohort who purchase newly constructed single-family residential homes at which point they are expected to have usage consistent with the New Premises cohort.
2. An appropriate comparison of cost differentials is to look at the entire bill, not just the fixed cost portion. The Coalition's analysis ignores the volumetric portion of the bill multiplied by the expected usage. If a current customer moves from an Existing Premises into a New Premises, their total expected bill would be a *reduction* of 11.2 percent. Of course, the exact number is based on the characteristics of each premises: Square footage, number of

[96] Coalition/100, Cebulko/46.

appliances, whether it has a furnace. On average, however, the New Premises is expected to be more efficient and drive a much lower usage profile compared to the Existing Premises.

Q. In addition to the New Premises Customer Charge for single-family residential customers, did the Company's proposal include a lower fixed charge for New Premises residential multi-family premises?

A. Yes. The Company proposed to apply the same $2.00 reduction to the fixed charge for existing multi-family residential customers to new multi-family residential customers. Therefore, the new multi-family residential fixed monthly charge would be $24.25.

Q. Please explain Parties' testimony on the New Premises Customer Charge as it relates to multi-family premises.

A. Staff is interested in the distribution of environmental justice communities comprising new premises customers with a stated concern as to multi-family units made up of affordable housing.[97]

CUB testifies that it believes 33 percent of new premises customers will be multi-family[98] and notes "this is concerning, since multi-family customers tend to be renters and/or lower-income."[99]

[97] Staff/300, Scala/19.

[98] CUB, citing the Company's response to UG 490 CUB DR 9, derives the 33 percent figure using end of Test Year New Premises customer counts. The value given in the response for New Premises single-family residential customers was 3,081 but should have been 4,607. The ratio for anticipated multi-family customers is therefore closer to 25 percent (1,525 divided by 1,525+4,607=6,132).

[99] CUB/200, Garrett/9-10.

The Coalition testifies the new premises customer charge works against reducing energy burden on low-income customers and is in conflict with the statewide housing goal of producing affordable housing.[100] The Coalition indicates that low-income customers are more likely to be low usage customers and will increase bills substantially for those customers.[101]

Q. What is the Company's response to Parties' concerns?

A. As I discussed earlier in my testimony, New Premises customers are on average more likely to live in Census Tracts that have higher median household incomes compared to the state-wide median and are less likely to be enrolled in the bill discount program relative to Existing Premises customers. With regards to multi-family dwellings, I note that each one must be individually metered for the New Premises Customer Charge to be applicable. Apartment buildings, including apartment buildings that are fully or partially affordable (in furtherance of the statewide housing goal of producing affordable housing), that are served under a master meter on a commercial rate schedule would not be assessed the proposed higher monthly fixed charge. Multi-family dwellings that are individually metered and that are affordable housing units would be eligible for the same energy assistance as all other residential customers as I explain further below. Note also, as I demonstrated in Chart 5 earlier, a higher monthly fixed charge like the proposed New Premises Customer Charge results in lower winter bills

[100] Coalition/100, Cebulko/50; Apter-Connolly/15.

[101] Coalition/100, Cebulko/50.

compared to commensurate rates that collect revenues via higher volumetric charges.

The Coalition states: "Lower-income customers are more likely to be low usage customers. Thus, an increase in the customer charge will increase monthly bills for low-usage customers (and will reduce monthly bills for high-usage customers)."[102] With regards to expected New Premises customers, as I noted earlier, lower-income customers use slightly more than the average New Premises customer (449.4 compared to 464.7 therms). Yet, a lower-income customer moving from an Existing Premises into a New Premises dwelling would be expected to see an overall bill decrease, not increase. A New Premises customer would need to have a 26.7 percent higher usage level to have higher winter bills compared to an Existing Premises customer (588.7 therms), *before* any bill assistance or bill discounts have been applied.

Q. Would low-income multi-family (and single-family) residential New Premises customers be eligible for the same energy assistance and bill discounts as residential Existing Premises customers?

A. Yes. To clarify, new customers (e.g., people who open new accounts) at existing multi-family (and single-family) premises will not be impacted by this proposal. Customers that reside in New Premises multi-family (and single-family) dwellings that are connected to the Company's system on or after November 1, 2024 will be eligible for the bill discount program under the same rules and at the same

[102] *Id*.

tiers as all other residential customers. The percentage of the bill that is discounted includes both the fixed and volumetric portions of the bill. For instance, a $50.00 bill discounted at the current Tier 1 level (25%) is $37.50 regardless of whether the fixed charge is $8.00 or $24.25.

D. Interplay Between New Premises Customer Charge and LEA

Q. What is the relationship between the New Premises Customer Charge and the Company's LEA proposal?

A. The higher New Premises Customer Charge simply ensures that the proposed rate design produces revenues from the new premises customers necessary to fully cover their cost of service. It acts as general input in the Company's LEA model, along with the proposed residential margin rate per therm and assumed customer UPC.[103] Together, these inputs create what the LEA model calls the "Revenue from New Connection Tariff."

///

///

///

///

///

///

///

[103] For instance, see NW Natural/2002, Kravitz-Therrien (Input Output) of the Company's LEA model.

Q. CUB states: "The LEA economic modeling is highly dependent on collecting a much higher customer charge from 'new premise' customers … Without this substantial rate increase for new customers, the Company's LEA economic modeling implodes."[104] Similarly, Staff states: "Staff lowers the basic charge for a newly connected customer from $26.25 to $10.00 … In effect, this lowers the optimal LEA substantially."[105] What is your response?

A. By removing the New Premises Customer Charge, CUB finds that the LEA model "implodes," while Staff finds that that the model outputs a negative LEA value. Neither party appears to examine *why* the model behaves in this manner. As I have explained in my testimony, without rate design intervention, the New Premises cohort ***does not cover its cost to serve*** even with the Decoupling Mechanism bifurcation. This is precisely why the LEA model indicates New Premises customers are uneconomical without the higher new premises fixed charge. Moreover, as I have previously explained, existing customers will continue to subsidize new customers without this intervention.

This modeling result contradicts Staff's statement that "issues with variances in volumetric sales are best solved by the Company's decoupling mechanism rather than a blanket charge that applies to all new customers."[106] If the "issues" were solved by the Decoupling Mechanism alone, this solution is not

[104] CUB/200, Garrett/17.

[105] Staff/900, Dlouhy/44.

[106] Staff/1800, Shierman/20.

reflected in Staff's LEA model modifications that indicate a revenue shortfall for a new customer addition. In a similar vein, the Coalition states: "the Company could modify its expected residential use-per-customer in the decoupling mechanism to account for the impact of the new premise residential customers."[107] Again, if this statement were correct, then this modification should be accounted for in the LEA model. That is, if the Company is recovering its cost to serve New Premises customers at a rate necessary to mitigate intra-class subsidization through its Decoupling Mechanism, not the monthly fixed charge, then the margin revenues commensurate with the new premises connection would need to be reflected in the LEA model.

V. RATE SPREAD

Q. Please summarize the Company's rate spread proposal.

A. The Company proposed to spread incremental revenue requirement in such a manner that is responsive to the results of the LRIC study across all rate classes applying a methodology of caps and floors to both individual rate schedules as well as rate classes based on LRIC study indicated parity ratios. Overall, the Company's proposal equitably distributes the incremental revenue requirement such that the rate classes as a whole are moved closer to parity based on their indicated cost causation. The proposal described above is an incremental approach; it moves all rate classes closer to parity, but does so in a manner that works to minimize rate shock.

[107] Coalition/100, Cebulko/52.

Q. What was the methodology NW Natural proposed to use to spread the $154.9 million incremental revenue requirement?

A. I am reiterating my detailed methodology as presented in my Direct Testimony for ease of reference. NW Natural proposed a multi-step process for spreading the $154.9 million incremental revenue requirement:

1. Apply a cap equal to 1.04 times the overall incremental margin increase of 29.3 percent to RS 2 Residential. This cap is equal to a 30.5 percent margin increase.
2. Apply a cap equal to 1.05 times the overall incremental margin increase to RS 3 Commercial. This cap is equal to a 30.8 percent margin increase.
3. Apply a cap equal to 1.22 times the overall incremental margin increase to RS 27 Dry-Out. This cap is equal to a 35.7 percent margin increase.
4. Apply a floor equal to 0.50 times the overall incremental margin increase of 29.3 percent to the Transportation rate class plus any other rate schedules with a LRIC study indicated parity ratio above 1.75. This floor is equal to a roughly 14.6 percent margin increase.
5. After the caps and floor have been applied, allocate the remaining revenue requirement on an equal percent of margin basis among the remaining rate schedules, which include RS 3 Industrial, RS 31 and RS 32 Commercial Sales, RS 31 Industrial Sales Firm, and RS 32 Industrial Sales Interruptible. This step results in the same proposed margin increase for each of the remaining schedules, equal to roughly a 20.3 percent increase. The effect of

this step would be the same as applying a floor equal to 0.69 times the overall incremental margin increase in this case.

The caps of 1.04 for the Residential class, 1.05 for RS 3C, and 1.22 for RS 27 Dry-Out represent an approximation of the inverse mathematical relationship between the parity ratio of each rate class and schedule and unit parity of 1.00. For instance, Residential class (0.96 parity ratio): 1.00/0.96≈1.04.[108]

Q. Did Parties provide feedback on the Company's rate spread proposal methodology and present their own rate spread proposals?

A. Yes. Staff and AWEC each provided feedback on the Company's rate spread proposal and presented their own proposals.

Q. What is Staff's approach to rate spread?

A. Staff states: "Rate spread is the practice of allocating a company's revenue requirement to its various customer classes. Doing so effectively should balance concerns of economic efficiency, equity and energy justice concerns, and rate shock."[109] Staff agrees that there are many factors that go into balancing these conflicting concerns with "one goal of rate spread is to align the revenue earned from each customer class with the costs to serve each customer class according to the LRIC" and that "it is best practice to make the move towards parity deliberate enough that customers can properly adapt to these new different rates

[108] NW Natural/1800, Wyman/84-85.

[109] Staff/1800, Shierman/6.

and to signal that they are still operating under a regulatorily stable environment."[110]

Q. With regards to equity, Staff states: "to the extent that current modeling approaches employed with the LRIC look only at costs to the system, disparities in the system benefits received by different customer groups remain unaccounted for."[111] What is the Company's response?

A. The LRIC study is an economic modeling exercise that the Company values as a baseline for understanding the basis of cost causality among rate schedules and rate classes. The Company has argued that there are other important factors that should be considered, most importantly the idea that equitable distribution of the rate spread should be balanced with customer rate impacts. The Company's rate spread proposal considers these factors. Additionally, we also note that the Company addresses issues of equity after rate spread is determined (which impacts the rate class) through customer bill relief options, including the bill discount program, Oregon Low Income Gas Assistance, and the Gas Assistance Program, which are also complemented by federal assistance offerings such as LIHEAP.[112].

[110] Staff/1800, Shierman/6.

[111] Staff/1800, Shierman/7.

[112] For further discussion of these programs, please refer to NW Natural/2300, Tanaka.

Q. Does Staff agree with using the LRIC study as a basis for rate spread?

A. Staff "supports the use of LRIC as a baseline resource for rate spread proposals."[113] From that baseline, "evolutions to the rate spread cost allocation from the LRIC can avoid the burden of imposing an increase to a particular customer schedule that is unacceptably out of line with the overall increase and avoid allowing some schedules to receive a rate decrease in the context of a significant increase being imposed on most of the other customer schedules."[114] Staff feels, based on the results from the Company's LRIC study, that deviations appear appropriate as the "impact to customers in terms of price signals, affordability, and reasonableness would be substantial"[115] if the results were strictly followed. Staff notes, as the Company did in Direct Testimony, that Commission precedent is that it is not inclined to raise some rates while lowering others without compelling evidence that immediate action is warranted.[116]

Q. What was Staff's feedback to the Company's rate spread proposal?

A. Staff argues that the Company's rate spread proposal is not fair, stating that "it does not believe that concerns about the relatively large rate increases are properly addressed by the proposed spread of incremental revenue requirement."[117]

---

[113] Staff/1800, Shierman/8.

[114] Staff/1800, Shierman/9.

[115] Staff/1800, Shierman/10.

[116] *Id*.

[117] Staff/1800, Shierman/13.

Q. Does Staff propose an alternative rate spread proposal?

A. Yes. Staff uses the Company's rate spread proposal as a starting point but adjusts the floor to "75 percent of the average percentage increase when determining the lowest possible rate spread allocation to each schedule."[118] The Company's lowest floor in its proposal, for comparison, is 21.8 percent, applied to RS 32 Industrial Sales Firm and RS 32 Industrial Sales Interruptible.

Q. What is the effect of Staff's proposal?

A. Staff's proposal has the effect of raising the allocated revenue requirement for all Schedule 31 and Schedule 32 customers relative to the Company's proposal.[119] Staff's methodology results in a lower rate spread for the RS 2 Residential class compared to the Company's methodology but maintains the same rate spread for the RS 3 General Commercial rate class.

Q. What is Staff's rationale for its rate spread proposal?

A. Staff notes that overall rate increases for all rate schedules should be narrower due to the level of rate increase proposed. Staff argues that the Company's rate spread proposal, in which "some rate schedules experience nearly a 19 percent rate increase, while others see only a 4 percent increase, is inequitable."[120]

Q. What is the Company's response to Staff's proposal?

A. Staff's proposal violates the principle of incrementalism and is unequitable for many customers in the RS 31 and RS 32 rate classes. Staff's mention of 4

[118] *Id*.

[119] *Id*.

[120] Staff/1800, Shierman/14.

percent increases for some rate schedules is based on total revenues and fails to consider the fact that the Company's proposal requests a 20.3 percent margin revenue increase from these same rate schedules. Table 2, provided later in my Reply Testimony, shows the margin and total revenue impacts of Staff's proposal on each rate schedule. Staff's proposal increases rates for many rate schedules in the RS 31 and RS 32 rate classes by more than an equal percent of margin (29.3 percent using the filed $154.9 million incremental revenue requirement). For instance, Staff's proposal would increase margin for RS 32 Industrial Sales Interruptible by 70.0 percent, about 2.4 times the equal percent of margin share, and increases margin for 32 Commercial Sales Interruptible by 65.2 percent (2.22 times the share). This proposal violates incrementalism because it would move these schedules whose parity ratios at current rates are well above 1.00 even further away from 1.00, not closer (an equal percent of margin increase maintains the same relative parity ratio at the proposed rates). The Company's LRIC study produced a 32 Industrial Sales Firm parity ratio at present rates of 1.91 indicating a 32.4 percent margin revenue target *reduction*; Staff's proposal would push the ratio higher with a 50.4 percent margin revenue increase (where a 29.3 percent margin revenue increase would simply maintain the 1.91 parity ratio at proposed rates). This issue persists at any proposed incremental revenue requirement as the relative increases would still remain well above the overall incremental margin increase.

Staff also indicates that the Company's rate spread proposal is "not fair," indicating that "Staff does not believe that concerns about the relatively large rate

increases are properly addressed by the proposed spread of incremental revenue requirement."[121] Staff's proposal, in addressing this concern, adjusts the spread for RS 2 Residential just slightly downward resulting in a $0.96 (or roughly one percent) reduction in an average residential monthly bill.

Q. Does AWEC support the Company's rate spread proposal?

A. No. AWEC states that the Company's rate spread proposal is "too complicated and applies different treatment to similarly situated rate schedules" using caps and floors that "are applied on an ad hoc basis to different rate schedules at differing levels."[122] AWEC indicates that the cap of 1.04 applied to the RS 2 Residential rate class does not have "a meaningful impact on rate class revenues relative to their calculated cost of service."[123]

Q. Does AWEC propose an alternative rate spread proposal?

A. Yes. AWEC proposes "a customer impact offset equal to 1.3 times the average rate increase to mitigate the increase to highly impacts rate schedules"[124] and "a uniform floor at zero percent."[125] AWEC does not indicate how it derived the customer impact offset cap equal to 1.3 times the average rate increase. AWEC applies the floor of zero percent to every rate schedule that the Company's LRIC study indicates is overpaying its cost of service, in addition to RS 3 Industrial and

[121] *Id*.

[122] AWEC/100, Mullins/47.

[123] AWEC/100, Mullins/48.

[124] AWEC/100, Mullins/4.

[125] AWEC/100, Mullins/48.

RS 32 Industrial Transportation Interruptible. AWEC's proposed adjustments to the LRIC study indicate that these two rate schedules are also overpaying their cost of service. AWEC's proposal is in response to what it characterizes as a "major rate increase at issue in this proceeding."[126]

Q. What is the effect of AWEC's proposal?

A. AWEC's proposal results in a rate spread that is 2.4 percent higher relative to the Company's for RS 2 Residential and 20.8 percent higher for RS 3 General Commercial on a total revenue basis. AWEC's proposal, due to application of the zero percent floor, results in no increase for all rate schedules in the RS 31 and RS 32 rate classes plus RS 3 Industrial, whereas the Company's rate spread proposal had revenue increases ranging from 3.6 percent to 14.7 percent for schedules in these rate classes.

Q. What is the Company's response to AWEC's rate spread proposal?

A. The Company's rate spread methodology is directly informed by the results of its LRIC study and was implemented for the purpose of addresses overall rate concerns while balancing principles of rate shock and incrementalism.[127] I will note that AWEC does not indicate how it arrived at a cap of 1.3 times the overall margin revenue increase. Nor does it explain why it reallocates the rate spread such as RS 2 Residential receives an increment at 1.07 times the overall margin revenue increase while giving RS 3 General Commercial (a schedule with a

[126] AWEC/100, Mullins/48.

[127] NW Natural/1800, Wyman/84.

similar parity ratio) an increase of 1.27 times. For comparison, the Company's rate spread proposal applies an increment of 1.04 and 1.05 times overall margin revenue increase for RS 2 Residential and RS 3 General Commercial, respectively.

Q. How does the Company's proposal compare to Staff's and AWEC's?

A. In Table 2 below, I present a comparison of the Company's rate spread to Staff's and AWEC's based on each proposal's effect of the filed $154.9 million incremental revenue requirement spread on percent of margin revenue and total revenue increase. I am using the filed revenue requirement such that I can make a direct comparison across all proposals. I have organized the proposals in order from lowest impact on the residential rate class (left) to the highest (right). As Table 2 shows, the Company's proposal falls in the middle of the proposed rate spreads.

	Total	**$ 528,918,261**	**$ 930,241,019**		**29.3%**	**16.7%**	**29.3%**	**16.7%**	**29.3%**	**16.7%**

As Table 2 indicates, the Company's proposal falls between Staff's and AWEC's when comparing the impact of the filed revenue requirement on percentage of both margin revenue and total revenue increase. Staff's proposal has higher or the same increases for the large commercial and industrial rate schedules in the RS 31 and RS 32 rate classes relative to the Company's proposal and gives higher than equal percent of margin increases to several rate schedules with parity ratios above 1.00 at current rates. Increases for these rate classes are used to offset the increases for RS 2 Residential and RS 27 Dry-Out. AWEC's proposal gives no increment to the RS 31 and RS 32 rate classes,

which puts upward pressure on the revenue increases for RS 2 Residential, RS 3 General Commercial, and RS 27 Dry-Out relative to the Company's proposal.

Q. Is the Company proposing an update to its rate spread methodology?

A. No. As shown above in Table 2, the Company's rate spread approach is the middle ground between all parties that submitted a proposal with regards to impacts to RS 2 Residential. The Company's proposal is the only proposal that equitably distributes the incremental revenue requirement such that the rate classes as a whole are moved closer to parity based on their indicated cost causation (i.e., incrementalism) but does so in a manner that works to minimize rate shock. Staff's proposal, as I explain above, violates incrementalism and does so with a very small reduction to the RS 2 Residential rate relative to the Company's proposal. AWEC's proposal over applies the incrementalism principle which results in larger increases to RS 2 Residential and especially to RS 3 General Commercial that is not responsive to the relative LRIC study indicated parity ratios between these two rate schedules. Both Staff and AWEC present their proposals as a more equitable approach for rate spread yet both approaches differ wildly on the application of incremental revenue requirement to the residential rate class, as well as the large commercial and industry rate classes. The Company's approach, as shown above in Table 2, provides a balance that recognizes the relative cost causation of all rate schedules while attempting to minimize rate shock.

Q. Does this conclude your Reply Testimony?

A. Yes, it does.

VI. Conclusion and Recommendation 45

I. INTRODUCTION AND SUMMARY

Q. Are you the same Gregg H. Therrien who filed Direct Testimony and Supplemental Testimony (jointly with Zachary D. Kravitz), on behalf of Northwest Natural Gas Company dba NW Natural ("NW Natural" or the "Company")?

A. Yes. I presented NW Natural/1900, Therrien, and NW Natural/2000, Kravitz-Therrien.

Q. What is the purpose of your Reply Testimony?

A. The purpose of my Reply Testimony is to address the Public Utility Commission of Oregon ("Commission") Staff, the Oregon Citizens' Utility Board ("CUB") and the Coalition positions that the Company's proposed Line Extension Allowance ("LEA"), as described in my Direct Testimony and our Supplemental Testimony, should be rejected. I will rebut point-by-point to each of these entities' assertions and detail why their criticisms and alternative recommendations are flawed and without merit, and why the innovative approach in the Company's proposed LEA is fair, designed to support the state's decarbonization efforts (i.e., any new/future Oregon greenhouse gas ("GHG") regulations that take the place of the invalidated Oregon Climate Protection Plan ("CPP")), a balanced and economical approach to adding new gas customers that desire service from NW Natural, and should be approved.

Q. Please summarize your testimony.

A. My testimony consists of three main sections: rebuttal of Staff Witness Dlouhy, rebuttal of CUB Witness Garrett and rebuttal of Coalition Witnesses Apter-Connelly

and Cebulko. I conclude with affirmation that the Company's proposed LEA meets the directives of the Commission and should be approved.

Q. Do you sponsor any exhibits with your Reply Testimony?

A. Yes. I am sponsoring the following:

- NW Natural/4001, Therrien: CUB's response to NW Natural DR 2
- NW Natural/4002-4007,Ther rien: Revised LEA DCF Model supporting calculations
- NW Natural/4008, Therrien: Survey of U.S. Line Extension Policies

II. OVERVIEW OF NW NATURAL'S PROPOSED LEA

Q. Please summarize how the Company's LEA proposal includes the costs of complying with Oregon GHG regulations.

A. Pursuant to the Commission's directives in Order No. 22-388, my Direct Testimony included a proposed LEA model that had the Company's best and reasonable estimates of costs of complying with the CPP. The CPP, however, was subsequently invalidated by the Oregon Court of Appeals.[1] After the CPP was invalidated, I updated the LEA model in Supplemental Testimony to include a forecast of complying with future Oregon GHG regulations.[2] The LEA model in Direct Testimony, as well as the update in Supplemental Testimony, rely on first maximizing credits that will likely be available to NW Natural and then utilize Renewable Natural Gas ("RNG") at conservatively high-cost estimates.

[1] NW Natural/1900, Therrien/27-28.

[2] NW Natural/2100, Therrien-Kravitz/23-27.

Q. Please briefly summarize the economic principles underlying the Company's LEA proposal to connect new customers.

A. New premises customers should receive an LEA that is commensurate with the anticipated delivery margin revenues that customer will pay over the LEA term offset by the initial service connection investment as well as on-going variable costs. Usage is an important variable in determining anticipated delivery margin revenues (derived from the per therm distribution margin charge) as well as the variable costs to serve that new premises customer. Notably, the Company included 100 percent of the variable costs of a new premises customer's compliance with a climate policy program (i.e., the per therm Proxy CPP costs) in its proposed LEA model. By incorporating these costs, higher usage new premises customers who bring more emissions to the system will bear more costs to bring these emissions under compliance relative to lower usage new premises customers. Evaluating the delivery margin revenues against the variable costs in the Company's discounted cash flow ("DCF") model produces a mathematical result (i.e., the net present value calculation) that indicates a lower LEA for higher usage new premises customers and a higher LEA for lower usage new premises customers. In other words, while higher usage new premises customers produce more anticipated delivery margin revenues relative to lower usage new premises customers, these higher revenues are more than offset by the additional variable Proxy CPP costs associated with emissions compliance caused with their higher usage. This requires a lower LEA to produce a positive net present value result for higher-usage new premises customers.

Q. Absent the changes included in the Company's LEA proposal, is there a potential for subsidization from new customers to existing customers?

A. Yes. If a new customer paid more than the amount of revenues to clear the project hurdle rate, existing customers would benefit; they would not be harmed. On the other hand, a new customer would be harmed if they paid more than what is financially required of them to prevent existing customers from subsidizing their service connection to the system.

Q. How does the Company's tiered LEA address this issue?

A. The Company has proposed a tiered LEA structure that results in lower usage customers receiving a higher allowance relative to higher usage customers. Under the proposed LEA, higher usage customers receive a lower LEA than lower-use customers. This LEA structure is a function of two drivers in the Company's LEA methodology. First, the LEA methodology captures the expected revenues from a new premises customer who has a higher monthly fixed customer charge than an existing customer. Second, the Company included 100 percent of the costs of a new premises customer's compliance with a climate policy program (i.e., the per therm Proxy CPP costs) in its proposed LEA construct.

Q. Does the new premises customer charge also help to address the potential for subsidization?

A. Yes. As detailed in the Direct and Reply Testimony of Company Witness Wyman,[3] the Company is proposing a new premises Rate Schedule 2 Residential sub-class

[3] NW Natural/1800, Wyman, and NW Natural/3900, Wyman.

rate with a higher monthly fixed charge compared to the existing fixed charge tariff rate. Due to the lower annual average weather normalized use-per-customer associated with new premises customers relative to existing customers, the higher fixed charge allows the Company to maintain the same variable price signal for all residential customers on an intra-class level. This higher fixed-to-variable rate design flattens the anticipated delivery margin revenues from new premises customers while enabling the Company to collect its full cost of service, thereby avoiding an intra-class subsidy between existing and new premises residential customers.

Q. How does the LEA address the future Oregon GHG compliance costs?

A. By incorporating the per therm Proxy CPP costs, higher usage new premises customers who bring more emissions to the system will bear more costs to bring these emissions under compliance relative to lower usage new premises customers. Evaluating the delivery margin revenues against the variable costs in the Company's DCF model produces a mathematical result (i.e., the net present value calculation) that indicates a lower LEA for higher usage new premises customers and a higher LEA for lower usage new premises customers.

Q. Please summarize how the inputs to the LEA model will help avoid intra-class subsidies.

A. The per therm Proxy CPP costs ensure new premises customers are fully covering their costs to comply with a climate policy program prior to connecting to the system, and the higher new premises fixed charge ensures that the proposed rate design produces revenues from the new premises customers necessary to fully

cover their cost of service. Incorporating these two drivers into the Company's LEA proposal works to avoid intra-class subsidies.

Q. Has the Company updated its LEA modeling in response to the testimony provided by other witnesses?

A. Yes. As shown in NW Natural/4002-4007, Therrien, the Company has updated its Discounted Cash Flow ("DCF") modeling assumptions to reflect the following two assumption changes to the DCF:

1. Revised non-growth capital expenditures; and
2. Increase the unit cost of RNG from $22.00 to $25.00 by year 18 of the DCF model.

Q. What are the results of the revised DCF?

A. Table 1 below compares the revised DCF model LEA results to that filed in my Direct Testimony and updated in the Supplemental Testimony:

Table 1: Revised DCF Model LEA Results

UPC (Therms)	0-250	251-450	451-650	651+
Direct Testimony LEA	$3,600	$3,100	$2,600	$1,800
Supplemental Testimony Proposal	**$3,700**	**$3,300**	**$2,950**	**$2,200**
Revised LEA	**$3,400**	**$2,900**	**$2,500**	**$1,700**
Difference: Higher / (Lower)	**($300)**	**($400)**	**($450)**	**($500)**

As Table 1 indicates, the two changes made to the revised DCF calculation reduce the proposed LEA for all four usage tier levels, however, the LEA remains positive.

Q. Did NW Natural update its modeling for illustrative purposes only, or has NW Natural modified its LEA proposal in this Reply Testimony?

A. Table 1 above represents NW Natural's revised proposal.

Q. Is the Company proposing a "set it and forget it" LEA in this case?

A. No. The Company fully recognizes that the assumptions and inputs that inform the LEA may change over time. In particular, the Company expects that there will be greater certainty regarding GHG compliance costs after the Oregon Department of Environmental Quality's ("ODEQ") concludes its rulemaking to establish future Oregon GHG regulations, and that assumptions regarding RNG pricing may evolve as the RNG market matures. Further, routine updates to model assumptions occur as a result of new rates being implemented (e.g., updated DCF cost of capital, billing delivery rates, etc.). Accordingly, the Company expects that it will need to update the LEA with new model inputs periodically and plans to do so at least every time it files a rate case.

III. REPLY TO STAFF WITNESS DLOUHY

Q. Please summarize Staff's Opening Testimony addressing the Company's proposed LEA.

A. Staff questions whether the Company's LEA analysis takes into account the "true" cost of CPP or decarbonization, best practices that Staff has pushed for in other dockets, or findings from other jurisdictions. Staff also questions whether the LEA proposal is a "least regrets" action to reduce customer count. Finally, Staff also expresses concern that the LEA proposal could lead to greater stranded asset costs, to the detriment of customers that may not be able to afford to electrify their homes.[4]

[4] Staff/900, Dlouhy/33.

Staff provides a critique of the Company's LEA modeling assumptions, including: (1) the assumption regarding the use of a 25-year payback period, (2) the assumption regarding RNG cost of $22/MMBtu; (3) the revenue multiplier assumption; (4) the assumptions regarding new non-growth capital expenditures; and (5) the home occupancy assumptions in the first few months following new home construction.[5]

Based on these concerns, Staff recommends that the Commission take one of two actions: (1) eliminate NW Natural's residential LEA entirely, or (2) maintain its previous decision on phasing out residential line extensions to a level equivalent to the 2x margin beginning on November 1, 2025, and then 1x margin on November 1, 2026, then entirely eliminate residential LEAs by November 1, 2027.[6]

I will address Staff's broader arguments, model critiques, and alternative proposals in turn.

A. Reply to Staff's LEA Policy Concerns

Q. Staff broadly asserts that the proposed LEA "fails to take into account the true cost of CPP or decarbonization."[7] What is the basis of Staff's argument?

A. Staff finds fault in several of the Company's modeling assumptions. In short, Staff questions the CPP compliance costs assumed in the model via the price of RNG, questions the payback assumptions, and questions the revenue assumptions from

[5] Staff/900, Dlouhy/36.

[6] Staff/900, Dlouhy/33.

[7] Staff/900, Dlouhy/33.

new customers.[8] Staff's critiques of the modeling are discussed in greater detail below (Section III.B).

Staff also questions whether the Company's assumptions regarding RNG are too optimistic, raising again a concern from NW Natural's Integrated Resource Plan ("IRP"), docket LC 79, and expresses a concern that an LEA policy that continues to support future Company investments increases the potential for future stranded asset risk.[9]

Q. How do you respond?

A. Staff highlights concerns that speak more broadly to questions about the future role of natural gas in the delivery of energy to Oregon customers, availability of RNG, and the possibility that customers may leave the natural gas system. The Reply Testimony of Zachary D. Kravitz[10] addresses these issues, and explains that here, Staff presupposes a worst-case outcome which does not reflect current conditions. NW Natural is not seeing customers leave the system in droves—on the contrary, NW Natural continues to experience growth. Additionally, the Company's assumption about RNG pricing and availability are informed by what we know today. To that end, NW Natural has proposed an LEA that is responsive to the Commission's guidance in Order No. 22-388, and that appropriately reflects the environmental and regulatory context as it exists today.

[8] Staff/900, Dlouhy/34.

[9] Staff/900, Dlouhy/34.

[10] NW Natural/2200, Kravitz.

Staff, on the other hand, seems overly pessimistic and urges planning for a worst case scenario—and one which we are not seeing bear out in the Company's new customer growth.

The Company's LEA analysis does include a proxy for the compliance costs associated with any future Oregon GHG regulations.[11] Table 4 of my Direct Testimony clearly shows the assumed RNG cost per MMBtu added to each year of the LEA DCF model.[12] It bears noting, however, that the model used for the LEA utilizes long-term assumptions that by their nature are uncertain. In my professional experience, long-term forecasting will always be imperfect, regardless of the exercise. To the extent that it seems that NW Natural is doing something new with its LEA that has not yet been done in other dockets, that is precisely the point of the proposal. The Commission charged the Company with specific guidance concerning the development of an alternative LEA approach that takes into account the carbon compliance costs, and that is exactly what the Company has done.

[11] Since the CPP was invalidated, there are no compliance costs associated with it. Therefore, I will be referring to the cost of complying with future Oregon GHG regulations that have not been enacted at the time of this testimony.

[12] See also NW Natural/2000, Kravitz-Therrien/15-19.

Q. Finally, Staff asserts that the Company's proposal does not reflect "findings from other jurisdictions," referencing decisions from the California Public Utilities Commission ("CPUC") and the Washington Utilities and Transportation Commission ("WUTC") that eliminate or propose a shorter term for LEAs.[13] How do you respond?

A. As discussed above, the LEA proposal advanced in this case is, in part, based on specific directives provided by the Oregon Commission. It may be instructive to review the direction and decisions of other state regulatory agencies, but the ultimate policy decided here is to be Oregon's own.

Q. Given Staff's discussion of the CPUC and WUTC decisions, do you have any comments regarding these two jurisdictions?

A. Yes. While I am not a lawyer, there is additional context for the CPUC and WUTC decisions regarding LEAs that Staff did not highlight. In 2022, California recently eliminated residential LEAs and permitted non-residential LEAs only under special circumstances. However, it is my understanding that the CPUC was acting in response to a building decarbonization mandate that established a policy preference for electrification of new buildings. There, the CPUC implemented a policy choice that had been made by the California legislature. It is my understanding that Oregon has no comparable legislative mandate promoting electrification.

[13] Staff/900, Dlouhy/28-29, 33.

With respect to Washington, the WUTC recently modified its LEA policy, but it is my understanding that the LEA policy changes are narrower than what is suggested by Staff. It is my understanding that recent changes in LEAs for Washington utilities are a product of settlement, not WUTC order.

Q. Staff highlights the line extension policies from California and Washington, but does Staff address any other jurisdictions?

A. No. Staff ignores the policies of the vast majority of other states, including many with decarbonization goals. NW Natural/4008, Therrien to this testimony includes a listing of LEA policies across the United States. As this exhibit shows, the vast majority of states continue to employ LEAs, many of them using a consistent construct as that proposed by the Company, which is based on a DCF analysis, and are comparatively less restrictive given the proposed inclusion of compliance costs associated with future Oregon GHG regulations in the proposed NW Natural LEA calculation.

B. Reply to Staff's LEA Model Critiques

Q. Witness Dlouhy lists five "questionable assumptions" in the Company's proposed LEA model.[14] Please respond to the first assumption regarding the Company's choice to use a 25-year payback period.[15]

A. Here, Staff Witness Dlouhy challenges the term of the DCF calculation. In response to concerns raised in the Company's last rate case, the Company

[14] Staff/900, Dlouhy/35-36.

[15] Staff/900, Dlouhy/36-37.

instructed me to model the DCF using a 25-year term, which is five years less than the previous 30-year DCF model term. Now, Staff Witness Dlouhy counters with a *15-year term* recommendation – which is five years fewer than past Staff recommendations.[16] Staff Witness Dlouhy provides no theoretical or analytical support for this new recommendation.

Q. Given the trends NW Natural has experienced with customer retention, is the 25-year term conservative?

A. Yes. As an initial matter, the 30-year assumption previously used by the Company is a conservative approach because the Company's customer count in Oregon has increased for decades and continues to grow. Further, the 25-year term that I proposed in the DCF model is reasonable because of the expected life of appliances, the uncertainty of fuel-switching in the future given historical preference to maintain gas appliances, and the potential high costs to convert a home to all-electric.[17] A recent presentation to the U.S. Energy Information Agency ("EIA") by Guidehouse titled "EIA – Technology Forecast Updates – Residential and Commercial Building Technologies – Advanced Case" (the "Guidehouse Report") states that the average life of a gas furnace is 22.5 years.[18] The proposed 25-year term is also synchronized with the development of revenue

[16] Staff/900, Dlouhy/35.

[17] NW Natural/1900, Therrien/21.

[18] In the Residential Furnaces EERE 2022 Notice of Proposed Rulemaking (NOPR) Technical Support Document (TSD), an average lifetime of 22.5 years is calculated for gas-fired furnaces (North). Lifetime range was calculated using the Weibull Distribution in the Residential Furnaces EERE 2022 NOPR. Guidehouse Report, Appendix B page 11.

requirements for existing system revenue requirements[19] and non-growth capital expenditure revenue requirements[20] used in the proposed DCF analysis.

Q. Please respond to Staff Witness Dlouhy's second assertion that the Company's assumed cost of compliance with future Oregon GHG regulations (RNG at $22.00/MMBtu) is too low and Staff's alternative recommendation to modify the assumed cost to $30.00/MMBtu.[21]

A. First, the proposed DCF model is calculated on a real dollar basis (i.e., adjusted for inflation; a constant dollar basis). Holding the cost of compliance with future Oregon GHG regulations (RNG prices) constant at a unit price considerably higher than previous Company analyses is conservative and appropriate. Second, it is difficult to estimate the cost of a substitute and emerging commodity such as RNG, which can be acquired from several different production means (e.g., wastewater treatment plants, landfills, organic composting, etc.) and a developing supplier base.

While the Company considers the Staff recommendation of $30/MMBtu for RNG to be too high,[22] I have performed an alternative DCF analysis and supporting calculations as shown in Exhibits 4002-4007 that includes a conservative RNG cost assumption, rising from $22.00/MMBtu to $25.00/MMBtu

[19] NW Natural/1903, Therrien.

[22] Staff/900, Dlouhy/38.

over the term of the analysis.[23] The results of this assumption change (as well as other changes described below) is described further below in this Reply Testimony.

Q. Please respond to Staff Witness Dlouhy's third assertion that the future Oregon GHG compliance costs revenue multiplier for a new customer is unknown because of potential future rate design changes.[24]

A. One of the assumptions in the Company's proposed LEA DCF model is that new customers would pay for future Oregon GHG compliance costs, and the costs charged to new customers follow the trajectory of the decreasing emissions cap.[25] Staff Witness Dlouhy asserts that this assumption is a "gross overestimation of revenues"[26] yet offers no alternative assumption or basis for changing the assumption other than the potential for future rate design changes. Without any supporting evidence to the contrary, the assumed new customer revenue assumption for future Oregon GHG compliance costs should remain unchanged (as assumed by Staff Witness Dlouhy for purposes of his Opening Testimony), and the unfounded assertion that the proposed LEA estimates should be interpreted as the "highest possible" LEA should be rejected.

[23] *See* NW Natural/4006, Therrien.

[24] Staff/900, Dlouhy/38-40.

[25] *See* NW Natural/1906, Therrien/Lines 16-18.

[26] Staff/900, Dlouhy/40.

Q. Please respond to Staff Witness Dlouhy's fourth assertion that the assumed non-growth capital expenditures forecast is "exceptionally high".[27]

A. One of the components of the revised LEA model is recognition that a new customer will contribute to the cost of future non-growth capital expenditures, to the benefit of existing customers. This concept is not challenged by Staff Witness Dlouhy; only the amount of the future non-growth capital spending is at issue. In his testimony, Staff Witness Dlouhy suggests that the Company has not adequately removed new customer-related costs (a portion of construction permits and meters). In response, the Company has provided me with a revised non-growth capital expenditure forecast adjusted for lower meter and permit costs,[28] which I have incorporated into the revised DCF calculation. This change has a very minor impact on the results of the various DCF calculation runs supporting the Company's four-tier LEA proposal shown in Table 1 above.

Q. Please respond to Staff Witness Dlouhy's fifth assertion that new customer line extensions will have periods of unoccupied households.[29]

A. In response to Staff DR 135, the Company quantified the time between a line extension installation and the commencement of service at approximately four months. The DCF calculation I have performed in the proposed LEA utilizes the Microsoft Excel© NPV function, which assumes that all investment is made at the

[27] Staff/900, Dlouhy/40-42.

[28] NW Natural/4004.

[29] Staff/900, Dlouhy/42-44.

beginning of the year.[30] This is a conservative financial assumption, as it is far more likely that the new gas installation would be performed in a period less than one year, and in the first year of service. Stated differently, the NPV calculation assumes a "year zero" investment and does not include the value of the new customer revenues until year 1. Therefore, the calculation theoretically would cover any time lag as described by Staff Witness Dlouhy and no further adjustment is warranted.

Additionally, I understand the timing of unoccupied households is mitigated by the Company's Rate Schedule 27, which is its Residential Heating Dry-Out Service. This rate schedule is available to home builders, developers, and contractors during the period that a residential dwelling is under construction. Upon occupancy of the dwelling, Rate Schedule 27 is terminated, and the new occupant is placed on Rate Schedule 2. While there would be differences in expected revenues between these schedules to the extent that a new premises was on Rate Schedule 27 for a short period of time, the impact to the LEA would be de minimis. It is also worth noting that a new residential conversion customer (i.e., establishing gas service to an existing home) would unlikely have any delay in service because that customer is already living in the premises that is converting to natural gas service and would require gas service immediately.

[30] "The NPV investment begins one period before the date of the value1 cash flow and ends with the last cash flow in the list. The NPV calculation is based on future cash flows." Microsoft Excel "Help" function description of the NPV function.

Q. Does Staff Witness Dlouhy propose further modifications to the proposed LEA model assumptions?

A. Yes. Staff Witness Dlouhy recommends that the LEA model should reflect a lower monthly fixed customer charge (reduced from $26.25 to $10.00), noting that this change lowers the LEA substantially, and proposes that the assumed Weighted-Average Cost of Capital ("WACC") should be reduced consistent with Staff's proposed ROE midpoint and the stipulated cost of long-term debt.[31]

Regarding the fixed charge, Staff Witness Dlouhy seems to miss the point of the Company's new premise higher monthly fixed customer charge, which is to ensure that all customers are paying their cost of service and that the Company's existing customers are not unfairly subsidizing the Company's new customers. This updated fixed charge is discussed in the Direct and Reply Testimony of Robert J. Wyman.[32]

Regarding the WACC, I cannot at this time justify any change of WACC assumptions given the stage of the rate case proceeding. The Company will update the final LEA model with the Commission-approved fixed customer charge and WACC during the compliance filing stage of this proceeding.

[31] Staff/900, Dlouhy/44.

[32] NW Natural/1800, Wyman and NW Natural/3900, Wyman.

Q. Staff presents an alternative LEA calculation using NW Natural's DCF model as adjusted for Staff's revised model assumptions which produces a negative LEA.[33] How do you respond?

A. As detailed above, I fundamentally disagree with many of Staff's proposed critiques and modifications to the model and recommend that they be rejected. However, as I previewed in Section II, I updated NW Natural's analysis to reflect revised assumptions for non-growth capital and RNG pricing in the revised DCF calculation, which reduced the proposed LEA for all four usage tier levels. However, the reduction was modest and certainly did not result in a negative LEA. The results of this updated analysis is shown in Table 1 above and NW Natural/4005, Therrien.

C. Reply to Staff's Recommendation

Q. How do you respond to Staff's primary recommendation that the Company eliminate the LEA entirely and Staff claims that this would not result in existing customers subsidizing new customers?[34]

A. NW Natural strongly disagrees with Staff's proposal to eliminate the LEA entirely, and, as I discuss at length in my Direct Testimony, does not agree that an LEA results in a subsidy from existing customers. Staff ignores the fact that under a no-LEA scenario, any possible subsidy would be one-directional, instead flowing only from new customers to existing customers. Eliminating the LEA can only

[33] Staff/900, Dlouhy/44-45.

[34] Staff/900, Dlouhy/46.

result in new customers providing a subsidy to existing customers because new customers will pay 100 percent of their connection costs and existing customers benefit from the revenue these new customers generate that cover common costs of existing customers.[35] NW Natural's LEA proposal, on the other hand, is designed to ensure that existing customers are not subsidizing new customers and vice versa.

Q. How do you respond to Staff's alternative proposal that the Commission continue the path to phasing out the LEA set forth in Order No. 22-388?[36]

A. While this alternative is an improvement over eliminating the LEA entirely, NW Natural does not support this proposal. Instead, the Commission should adopt the Company's thoughtful approach to restructuring its LEA, which carefully takes into account the feedback that the Commission provided to NW Natural in Order No. 22-388 and appropriately reflects the benefits of adding lower use customers to the Company's system.

IV. REPLY TO CUB WITNESS GARRETT

Q. Please summarize CUB Witness Garrett's Opening Testimony on the subject of the LEA.

A. CUB Witness Garrett presents an unsupportable theory that the Company's proposed LEA is somehow linked to a loss of price competitiveness to alternative fuels. Further, he attempts to paint natural gas as a luxury item, and that the

[35] NW Natural/4004, Therrien.

[36] Staff/900, Dlouhy/46.

Company may not be fully transparent in the way it communicates the cost of new gas service (i.e., proposed changes to Residential tariff Schedule 2) to prospective customers. His analysis attempts to quantify "savings" that a prospective customer could enjoy if they avoided gas altogether and (presumably) went to a full-electric appliance household. Lastly, CUB Witness Garrett challenges the assumptions of the DCF model and asserts that the model as proposed will lead to utility stranded costs.[37]

A. Reply to CUB's Policy Concerns

Q. Please summarize CUB Witness Garrett's policy concerns regarding the LEA.

A. CUB Witness Garrett asserts that "[t]he Company's LEA design implies that the product the Company delivers is becoming less cost-competitive, and that the ideal NW Natural customer hooks up to the system but uses little to no therms of gas."[38] Specifically, CUB takes issue with the fact that the LEA incentivizes the connection of lower usage customers, and suggests that the customers that may install these lower usage appliances may not stay on the system in the long term, or for long enough to recover the cost of the LEA.[39] CUB Witness Garrett also comments that the LEA does not necessarily incentivize the installation of higher efficiency

[37] CUB/200, Garrett/10-27.

[38] CUB/200, Garrett/11.

[39] CUB/200, Garrett/14.

appliances, like a high efficiency furnace, because it instead incentivizes low use "luxury" appliances.[40]

Q. How do you respond to CUB's claim that the LEA design demonstrates that natural gas is becoming uncompetitive with electric service?

A. At a basic level, the Company's proposed LEA design reflects new costs that were not previously included in the LEA model—most notably, the Company's estimated costs of compliance with future Oregon GHG obligations. As a result, the output from the new LEA model results in a greater allowance for lower usage customers. This is by design, and specifically responds to the Commission's direction in Order No. 22-388.

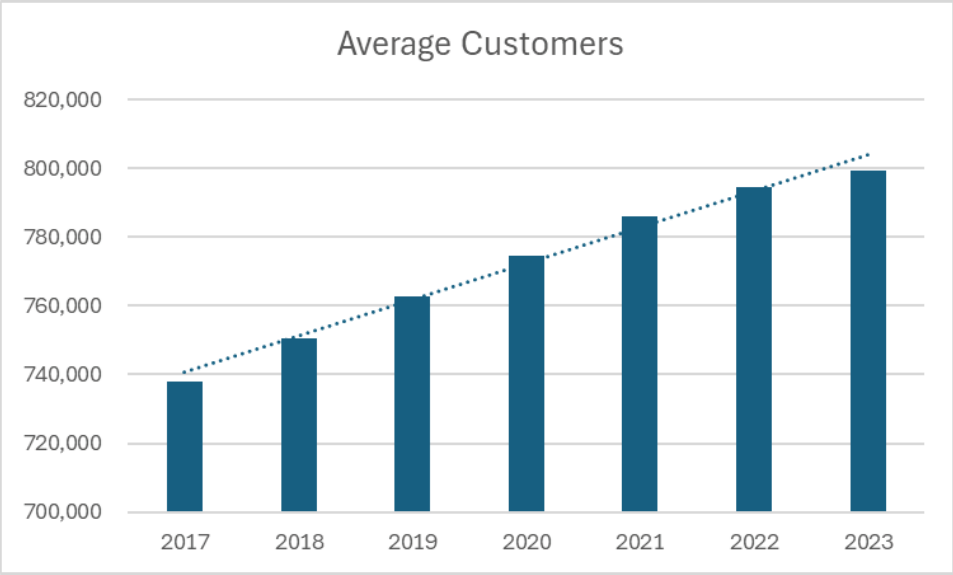
Instead of recognizing the benefits associated with incentivizing lower usage on the Company's system, CUB applies an overly pessimistic lens and claims that this result suggests that natural gas service will not be competitive with electric service. This is contrary to NW Natural's current experience regarding growth on the Company's system.

Q. Please describe the Company's recent experience regarding customer growth and customer choice between natural gas service and all electric homes.

A. As shown in Figure 1, below, NW Natural has continued to experience customer growth in recent years, indicating that customers still value natural gas service and continue to choose natural gas service rather than all-electric homes.

[40] CUB/200, Garrett/14.

Figure 1: NW Natural Average Customer Counts 2014-2023[41]



CUB's argument ignores the reality of consumer choice. If a prospective home buyer prefers an all-electric home, then they will buy one. Over time, if such customer preference is widespread, builders will choose to build all-electric homes in favor of homes that offer natural gas. Currently, this is not the case, as NW Natural's customer base continues to grow.

Q. In asserting that natural gas may be uncompetitive with electric service, did CUB present any analysis of future cost increases for electric service?

A. No. CUB's argument appears to be one-sided, in that it only focuses on the cost of natural gas. It is true that the LEA reflects additional costs that do not exist today for decarbonization via the cost assumptions for future Oregon GHG compliance obligations. However, CUB's argument entirely ignores the fact that

[41] Company SEC Form 10-K reports.

there will likely also be cost increases for electric service as electric utilities increase investment to meet growing customer demand and other costs to achieve their own ambitious decarbonization targets. For example, in Portland General Electric's ("PGE") most recent IRP, the Western Electricity Coordinating Council ("WECC") forecasts large increases in electric generation capacity needs in the next 20 years: "The WECC capacity will nearly double the current level by 2043…"[42]. The failure to acknowledge potential electric cost increases is disingenuous, particularly in view of CUB's vocal criticism of the electric utility rate increases in PGE's recently filed rate case.[43]

As detailed in the testimony of Company Witness Kravitz,[44] NW Natural recognizes that its customers have a choice in selecting natural gas in the first instance, and in remaining on the Company's system once they are customers. Over the years, natural gas service has been a reliable and cost-effective choice for consumers. Although the costs of decarbonization may put additional cost pressures on energy providers, NW Natural expects to continue to remain cost-competitive with electric service into the future.

[42] *In the Matter of Portland General Electric Company, 2023 Clean Energy Plan and Integrated Resource Plan,* Docket No. LC 80, PGE Clean Energy Plan and Integrated Resource Plan 2023 (filed March 31, 2023), p. 79.

[43] *In the Matter of Portland General. Elec. Co., Request for a General Rate Revision*, Docket No. UE 435, Oregon Citizens' Utility Board's Motion to Dismiss or Segregate Certain Issues (Mar. 14, 2024).

[44] NW Natural/2200, Kravitz/37.

Q. Did CUB present any studies or analysis in support of its claim that natural gas is becoming less cost-competitive?

A. No. As detailed in CUB's response to NW Natural DR 2, CUB's statement is based on "the implication of the Company's LEA policy design, not on any external analysis."[45]

Q. Please address CUB Witness Garrett's assertion that "the ideal NW Natural customer hooks up to the system but uses little to no therms of gas."[46]

A. CUB is partially correct—it is fair to say that more efficient customers will receive a higher LEA, and less efficient customers will receive a lower LEA. Notably, however, the slope of the allowance (large allowance for smaller customers to smaller allowances for larger users) is fairly flat yet is a stark contrast from historical LEAs that reward larger users with larger LEAs. This proposed LEA construct is intentional – and financially rewards new customers that are more efficient and generate less emissions.

The primary driver in the new LEA DCF calculation compared to the existing calculation is the inclusion of Proxy CPP costs and a higher fixed charge. The inclusion of Proxy CPP costs sends a clear signal to prospective customers that more efficient appliances and lower emissions are rewarded with a higher LEA. The higher monthly customer charge is designed to address the growing disparity

[45] NW Natural/4001, Therrien.

[46] CUB/200, Garrett/11.

in gas use between the Company's existing customer base and new customers, and to ensure that existing customers do not subsidize new customers.

NW Natural's vision for the future includes customer growth but also contemplates that customers will become more efficient in their gas usage, through both high efficiency and low usage appliances. The LEA and monthly customer charge proposals send the right price signals to achieve this outcome.

Q. Please address CUB Witness Garrett's complaint that "the focus of the LEA design is on lower use appliances and not high efficiency appliances."[47]

A. A portion of CUB Witness Garrett's argument is that lower usage appliances underutilize the gas system and leads to gas being uncompetitive. I find this argument unsupported and completely unpersuasive. Based on Company Witness Wyman's analysis,[48] the expected use per customer for a new customer is approximately 450 therms per year. The Company is clearly still anticipating new customers to join the system with high efficiency appliances, and likely in more weatherized buildings in new construction. However, given the growing recognition of the resiliency benefits of the gas system, the Company can also expect low-use customers to join the system and the tiered LEA design provides an option for this without sacrificing the economically-driven model.

[47] CUB/200, Garrett/14.

[48] NW Natural/1800, Wyman/24.

Q. CUB Witness Garrett also argues that the LEA as designed could incentivize hybrid heating systems ("backup to heat pump") but otherwise questions whether it is the right policy choice.[49] Please respond.

A. NW Natural—like its peer local distribution companies ("LDCs")—is in a transformational moment. As discussed throughout this testimony, the novel LEA design the Company has proposed accounts for future Oregon GHG regulations and charts a course for the acquisition of lower usage customers in the future. It is precisely the right policy choice for the moment.

Q. Please address CUB's claim that the LEA maximally incentivizes low usage luxury appliances that do not reliably tie a customer to the system for long enough to recover the cost of the LEA.[50]

A. Not all low-use natural gas appliances are "luxury" items. In fact, during periods of electric outages, perceived "luxury" items - such as natural gas ranges and fireplaces – become essential. CUB's phrasing blurs the line between "luxury" and simple consumer preferences. .

B. Reply to CUB's LEA Model Critiques

Q. Please summarize CUB's testimony addressing the assumptions in the LEA model.

A. CUB asserts that the LEA model is very complex; that NW Natural should continue to model carbon costs based on the invalidated CPP rather than a proxy; that the

[49] CUB/200, Garrett/14.

[50] CUB/200, Garrett/14.

model assumptions for benefits flowing from new customers are too high; that the new premises customer charge is too high and will cause customers to leave the system; and that the LEA model includes rate increases that will cause customer rates to sharply increase, resulting in customers leaving the system before the break-even point for cost recovery for the LEA, potentially creating stranded assets.[51]

Q. CUB Witness Garrett characterizes the proposed LEA model as "very complex."[52] Do you agree?

A. No, I do not. First, the proposed LEA model is a simple DCF model that uses cash inflows and cash outflows to derive an NPV. If the NPV is positive, then the investment is justified. In the LEA I modeled the maximum amount of investment (cash outflow) that can be supported by the projected cash inflows (revenues and cost avoidances). This maximum investment is the calculated LEA amount at various usage levels. This is not a complicated concept.

Admittedly, the LEA model has more inputs than the prior LEA model, however, this was the necessary result of addressing the Commission's direction in Order No. 22-388.

[51] CUB/200, Garrett/16-17.

[52] CUB/200, Garrett/16.

Q. CUB Witness Garrett asserts "the new benefits were modeled too high."[53] How do you respond?

A. I disagree entirely. The new customer benefits (cash inflows) are modeled accurately and conservatively. I used the proposed new customer tariff values provided by the Company. I used the Company's proposed non-growth capital expenditure forecast from its latest internal Company plan. The forecasted revenues from a new Oregon GHG compliance cost rider matches the expected new customer cost of compliance. The marginal cost of CPP Compliance (RNG) was provided by the Company and has more conservative cost estimates than what was included in the IRP and have been further revised to be even more conservative. There is no basis for CUB Witness Garrett's assertion that these cash inflows are modeled "too high."

Q. CUB Witness Garrett further speculates that the LEA model includes anticipated rate increases for residential customers, and that gas rates will sharply increase.[54] How do you respond?

A. The primary rate change assumption is the Company's proposed new customer Schedule 2 monthly fixed charge. Otherwise, rates are based on the proposed Schedule 2 rates and are held constant (real dollars) throughout the DCF analysis period. Other modeled changes reflect "The company's best reasonable estimate of present and future CPP compliance costs"[55] as shown in NW Natural/4006,

[53] CUB/200, Garrett/16.

[54] CUB/200, Garrett/16.

[55] Order No. 22-388, p. 52.

Therrien. Additionally, the Commission directives also include a requirement to show "the costs and benefits expected in other years, and a demonstration of when rate-based investments for customer additions covered by the LEA are depreciated and removed."[56] The initial construction cost investment is modeled in year 0 of the DCF calculation, and the impact of existing system (non-growth rate base investments and the depreciation of existing rate base over time) are also included in the DCF model,[57] and explained in detail in my Direct Testimony.[58] The anticipated non-growth rate base investments (net of depreciation of existing plant) would be expected with capital intensive industries like utilities (gas or electric). The dollars (including rates) are expressed in real terms, and do not include any "sharp increases."

Q. CUB suggests that the "skyrocketing" gas rates will drive customers from the system, potentially resulting in stranded LEAs.[59] Did CUB raise this argument in the last rate case, docket UG 435?

A. Yes. In Opening Testimony in docket UG 435, CUB recommended gradually phasing out the Company's LEA, and similarly predicted increasing costs, declining customer base, and stranded assets.[60]

[56] Order No. 22-388, p. 52

[57] NW Natural/4004, Therrien.

[58] NW Natural/1900, Therrien.

[59] CUB/200, Garrett/17.

[60] Docket No. UG 435, CUB's Opening Testimony, CUB/100, Jenks/13-17.

Q. Are CUB's predictions of customers leaving the system consistent with NW Natural's recent experience?

A. No, CUB's arguments in the last case and again here are based on pure speculation and are contrary to the Company's recent experience. CUB observes "the Company's declining number of new service connections since 2017, which have especially declined in recent years."[61] It appears that CUB is indicating here that the Company's *rate of growth* is slowing. However, CUB Witness Garrett does not provide any evidence that the Company's customer counts are declining. In fact, they are growing steadily, as shown in Figure 1, above.

Q. Are there other factors that may inform customer growth trends?

A. Yes. The Company's year-over-year rate of growth is influenced by several factors, including economic factors such as new housing starts. Simply put, if there are fewer new homes being built, NW Natural also sees less customer growth.

Q. CUB Witness Garrett argues that the increasing costs modeled in the LEA will drive customers to leave the system, resulting in stranded assets.[62] Do you agree?

A. No, I do not. Again, I believe CUB's view of the future is overly pessimistic and untethered to current conditions. As detailed above, the Company is not currently experiencing customers abandoning natural gas service, and NW Natural continues to expect customer growth into the future. There are no indications that

[61] CUB/200, Garrett/19.

[62] CUB/200, Garrett/22-24.

NW Natural is not a going concern, or that the physical delivery system will be materially different in the near future. Although the Company has indicated that it anticipates system usage and utilization to change in response to policy initiatives, it does not concede or foresee its business closing – quite the opposite – as new customer additions and existing customer preferences for natural gas remain strong.

Q. To CUB's point that a customer could leave the system early, in advance of the 25-year term of the LEA, would you agree that is a possible outcome?

A. Yes, it is possible that a new customer connection may be underutilized or abandoned before its full costs are recovered. However, it is equally possible that customers will remain on the system longer than 25 years, such that the benefits from the new customers accruing to the system would exceed the cost of the LEA. The new customers may actually over-contribute to its required LEA if: 1) their expected revenues exceed that needed to meet a zero NPV requirement, or 2) if the new customers (premises) remain active beyond 25 years.

Q. CUB also questions the new premises customer charge that is integrated into the LEA model and asserts that the Company's economic justification for the LEA rests in part on new premises customers being willing to pay ~50 percent more per therm than existing customers.[63] Is this correct?

A. No. The new premises customer charge is designed to ensure new premises customers pay their full cost of service and are not subsidized by the Company's

[63] CUB/200, Garrett/18.

existing customers. Thus, the new premises customer charge is higher than the customer charge for existing customers. The per therm rate is the same for both existing customers and new premises customers. This issue is addressed in detail in the Reply Testimony of Robert J. Wyman (NW Natural/3900, Wyman).

Q. CUB Witness Garrett asserts that the Company's economic justification rests in part on an assumption that new customers will not terminate service before the "60-year useful life of the LEA is up."[64] Is this correct?

A. No. It appears that CUB Witness Garrett confuses depreciable lives (60 years stated for a natural gas service) with the discounted payback of an LEA (proposed at 25 years).

In the event that the new premises LEA is based on 25 years and there is service (and billing) to the premises for 25 years, then the allowance, or Company investment, is fully paid for, regardless of the book depreciation rate used by the Company. The DCF calculation does not rely on a specified depreciation rate, but instead ensures a full recovery of investment as well as recovery on investment over the term. If the book depreciation rate used by the Company is based on a longer term, it means that the book return during the DCF term is actually higher than required, which benefits the Company and existing customers depending on rate case timing during the period. If the new premises then discontinues service after the assumed 25 years, there may be a remaining level of book investment,

[64] CUB/200, Garrett/18.

but the cost of service on that amount is equal to the over-recovery provided earlier.

Q. CUB also calculated the estimated cost to customers associated with the stranded assets, assuming two different scenarios—the first assuming a 1 percent attrition rate for new customers, resulting in stranded assets of about $43 million, and the second assuming that half of the "new premises" customers that received an LEA in 2025 terminated NW Natural service in 15 years, which is about the time their gas furnace would be replaced, and calculating the net cost of stranded assets for existing customers to be $36 - $44 million.[65] What is your response to CUB's analysis?

A. As an initial matter, there is no evidence that support the premise underlying CUB's scenarios that customers will be leaving the Company's system. Rather, as shown in Figure 1 above, new customer additions remain strong and total customer counts are growing – not shrinking.

Regarding CUB's first scenario, the estimated 1 percent attrition rate is not backed by any historical attrition data, but instead appears to be figure chosen at random.

Regarding CUB's second scenario, CUB assumes that customers will leave the system after the 15-year life of their appliance has ended. Again, CUB's assumption here is based on speculation and a pessimistic view of the future of the natural gas system. Based on my industry experience I believe that it is equally

[65] CUB/200, Garrett/12.

likely that customers will instead continue the pattern of behavior that natural gas companies have seen historically, which is to replace their end-of-life natural gas appliances with newer and more efficient natural gas appliances.

Q. Have you identified any other shortcomings in CUB Witness Garrett's stranded asset scenarios?

A. Yes, I have. As discussed above, CUB Witness Garrett confuses the depreciable life of an asset (e.g., service line 60-year life) with the 25-year DCF analysis. Costs are not stranded if they have been paid for. The fact that there is a timing difference between cost recovery (proved through the LEA DCF analysis) and depreciation (used for general rate-making) does not mean there are stranded costs.

C. Reply to CUB's Recommendation

Q. What is CUB's recommendation?

A. CUB asserts that incentivizing growth of the gas system at this time poses unacceptable risks to existing customers, and NW Natural's LEA should, alongside Avista's LEA, be phased down to $0.00.[66]

Q. How do you respond?

A. Based on my point-by-point rebuttal of CUB Witness Garrett's assertions above, I recommend that the Commission adopt the Company's new LEA proposal. There is no compelling evidence presented by CUB Witness Garrett that warrants an elimination of the LEA. The Company's modified proposal addresses Commission

[66] CUB/200, Garrett/12.

concerns and supports the state's emission reduction goals through a pricing incentive to new customers to install high-efficiency/low use appliances. The revised LEA also supports a transition to a hybrid heating solution whereby the resiliency offered by the natural gas delivery system is retained.

V. REPLY TO COALITION INTERVENORS

Q. Please summarize Coalition Witness Cebulko's Opening Testimony.

A. Coalition Witness Cebulko's arguments are rooted in speculation about the future of gas in the U.S. and Oregon. Similar to CUB, he also relies on unsupported arguments that natural gas is, and will become, uncompetitive with electricity. Coalition Witness Cebulko also claims that continuing the LEA will lead to stranded costs. Lastly, in my opinion, the Coalition appears to misunderstand the financial mechanics of LEAs that underpin jurisdictional approaches across the country. To summarize, Coalition Witness Cebulko, and through Coalition Co-witnesses Apter and Connolly, seek to use the LEA proposal as a platform for public policy arguments and fail to quantitatively support any of their arguments.

///

///

///

///

///

///

///

///

A. Reply to Coalition Regarding Policy and Market Trends

Q. Coalition Witness Cebulko asserts that following the invalidation of the CPP, it is anticipated that ODEQ will promulgate new rules with an enforceable declining cap, and that there is a high likelihood that the Company will face similarly strict emissions reduction mandates to the invalidated CPP.[67] Coalition Witness Cebulko further claims that the Company does not have a reasonable plan for achieving emissions reductions while maintaining or expanding its current distribution system, such that the LEA is directionally inconsistent with the state's future CPP policy.[68] How do you respond?

A. As I have noted in my responses to Staff and CUB, I disagree that the LEA is directionally inconsistent with the state's energy policy. To the contrary, the LEA is designed to help ensure responsible growth on the Company's system in the years to come.

///

///

///

///

///

///

///

[67] Coalition/100, Cebulko/9.
[68] Coalition/100, Cebulko/9.

Q. Coalition Witness Cebulko comments that market shifts are occurring, such that electric appliances are cost competitive with natural gas appliances, relying upon a Sierra Club commissioned report from Synapse Energy Economics, Inc.[69] Have you reviewed this report, and what conclusions do you draw from it?

A. I have reviewed this report, and in my opinion, it contains some aggressive and unrealistic assumptions regarding customer adoption of electric equipment over the next 11 years (to achieve 2035 State of Oregon emission targets) and the following 15 years (to achieve 2050 emissions goals). For example, the Synapse Report establishes two pathways for full electrification (the "2025 Sales Target" and the "2030 Sales Target"). In these examples Synapse shows a chart depicting the necessary sales conversions to electric heat pumps, as shown below in Figure 3:

///

///

///

///

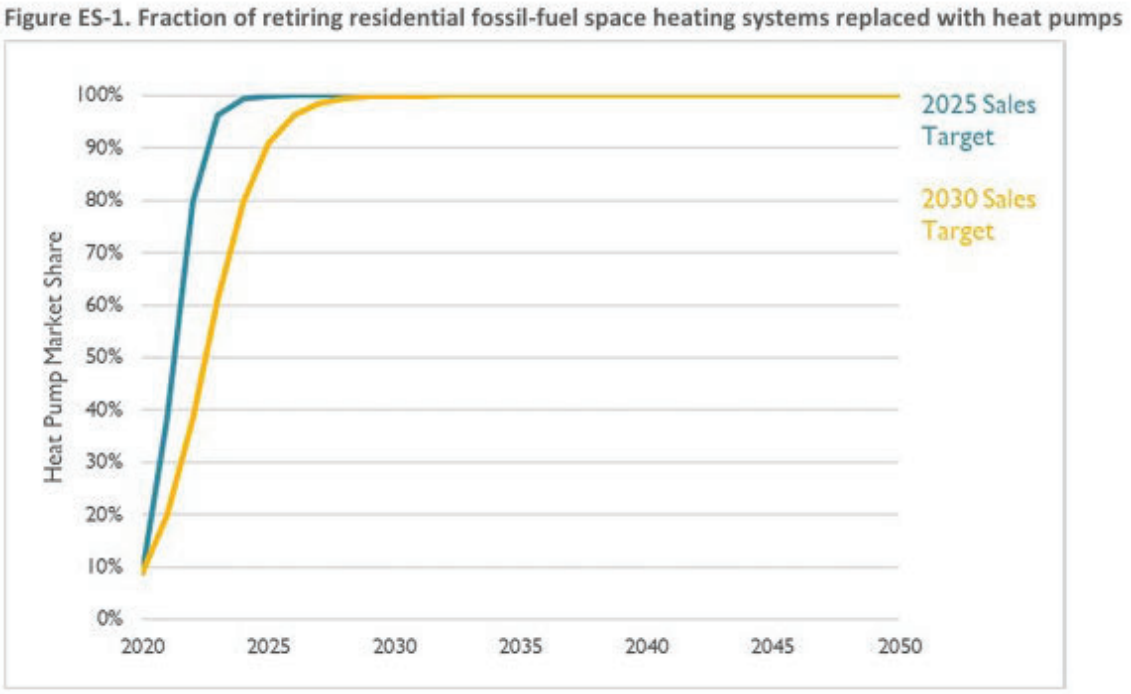
///

///

///

[69] Coalition/100, Cebulko/10. "Toward Net Zero Emissions from Oregon Buildings: Emissions and Cost Analysis of Efficient Electrification Scenarios", prepared for Sierra Club, June 23, 2022 (herein referred to as the "Synapse Report").

Figure 3: Synapse Report Figure ES-1
(reproduced from Synapse Report page ii)



The Synapse Report describes these sales targets ("adoption curves") as "steep", and that "[t]he sales of efficient electrical equipment such as heat pumps have to ramp up very quickly for Oregon to meet its emissions reduction goals."[70] Generally, the Synapse Report is tailored to its client's perspective and, in my opinion, does not represent an independent objective perspective on the future of NW Natural's long-term business prospects. For example, the Synapse Report states: "[i]t is important to note that our payback analysis does not include various other factors that could affect customers' purchase decisions, such as potential electrical panel upgrade costs, future changes in electric and gas prices, and

[70] Synapse Report executive summary page i.
