Interconnection Facilities shall mean the Transmission Provider's Interconnection Facilities and the Interconnection Customer's Interconnection Facilities. Collectively, Interconnection Facilities include all facilities and equipment between the Generating Facility and the Point of Interconnection, including any modification, additions or upgrades that are necessary to physically and electrically interconnect the Generating Facility to the Transmission Provider's Transmission System. Interconnection Facilities are sole use facilities and shall not include Distribution Upgrades, Stand Alone Network Upgrades or Network Upgrades.

Interconnection Facilities Study shall mean a study conducted by the Transmission Provider or a third party consultant for the Interconnection Customer to determine a list of facilities (including Transmission Provider's Interconnection Facilities and Network Upgrades as identified in the Interconnection System Impact Study), the cost of those facilities, and the time required to interconnect the Generating Facility with the Transmission Provider's Transmission System. The scope of the study is defined in Section 43 of the Standard Large Generator Interconnection Procedures.

Interconnection Facilities Study Agreement shall mean the form of agreement contained in Appendix 4 of the Standard Large Generator Interconnection Procedures for conducting the Interconnection Facilities Study.

Interconnection Feasibility Study shall mean a preliminary evaluation of the system impact and cost of interconnecting the Generating Facility to the Transmission Provider's Transmission System, the scope of which is described in Section 41 of the Standard Large Generator Interconnection Procedures.

Interconnection Feasibility Study Agreement shall mean the form of agreement contained in Appendix 2 of the Standard Large Generator Interconnection Procedures for conducting the Interconnection Feasibility Study.

Interconnection Request shall mean an Interconnection Customer's request, in the form of Appendix 1 to the Standard Large Generator Interconnection Procedures, in accordance with the Tariff, to interconnect a new Generating Facility, or to increase the capacity of, or make a Material Modification to the operating characteristics of, an existing Generating Facility that is interconnected with the Transmission Provider's Transmission System.

Interconnection Service shall mean the service provided by the Transmission Provider associated with interconnecting the Interconnection Customer's Generating Facility to the Transmission Provider's Transmission System and enabling it to receive electric energy and capacity from the Generating Facility at the Point of Interconnection, pursuant to the terms of the Standard

Large Generator Interconnection Agreement and, if applicable, the Transmission Provider's Tariff.

Interconnection Study shall mean any of the following studies: the Interconnection Feasibility Study, the Interconnection System Impact Study, and the Interconnection Facilities Study described in the Standard Large Generator Interconnection Procedures.

Interconnection System Impact Study shall mean an engineering study that evaluates the impact of the proposed interconnection on the safety and reliability of Transmission Provider's Transmission System and, if applicable, an Affected System. The study shall identify and detail the system impacts that would result if the Generating Facility were interconnected without project modifications or system modifications, focusing on the Adverse System Impacts identified in the Interconnection Feasibility Study, or to study potential impacts, including but not limited to those identified in the Scoping Meeting as described in the Standard Large Generator Interconnection Procedures.

Interconnection System Impact Study Agreement shall mean the form of agreement contained in Appendix 3 of the Standard Large Generator Interconnection Procedures for conducting the Interconnection System Impact Study.

IRS shall mean the Internal Revenue Service.

Joint Operating Committee shall be a group made up of representatives from Interconnection Customers and the Transmission Provider to coordinate operating and technical considerations of Interconnection Service.

Large Generating Facility shall mean a Generating Facility having a Generating Facility Capacity of more than 20 MW.

Loss shall mean any and all losses relating to injury to or death of any person or damage to property, demand, suits, recoveries, costs and expenses, court costs, attorney fees, and all other obligations by or to third parties, arising out of or resulting from the other Party's performance, or non-performance of its obligations under the Standard Large Generator Interconnection Agreement on behalf of the indemnifying Party, except in cases of gross negligence or intentional wrongdoing by the indemnifying Party.

Material Modification shall mean those modifications that have a material impact on the cost or timing of any Interconnection Request with a later queue priority date.

Metering Equipment shall mean all metering equipment installed or to be installed at the Generating Facility pursuant to the Standard Large Generator Interconnection Agreement at the metering points, including but not limited to instrument transformers, MWh-meters, data acquisition equipment, transducers, remote terminal unit, communications equipment, phone lines, and fiber optics.

NERC shall mean the North American Electric Reliability Council or its successor organization.

Network Resource shall mean any designated generating resource owned, purchased, or leased by a Network Customer under the Network Integration Transmission Service Tariff. Network Resources do not include any resource, or any portion thereof, that is committed for sale to third parties or otherwise cannot be called upon to meet the Network Customer's Network Load on a non-interruptible basis.

Network Resource Interconnection Service shall mean an Interconnection Service that allows the Interconnection Customer to integrate its Large Generating Facility with the Transmission Provider's Transmission System (1) in a manner comparable to that in which the Transmission Provider integrates its generating facilities to serve native load customers; or (2) in an RTO or ISO with market based congestion management, in the same manner as Network Resources. Network Resource Interconnection Service in and of itself does not convey transmission service.

Network Upgrades shall mean the additions, modifications, and upgrades to the Transmission Provider's Transmission System required at or beyond the point at which the Interconnection Facilities connect to the Transmission Provider's Transmission System to accommodate the interconnection of the Large Generating Facility to the Transmission Provider's Transmission System.

Notice of Dispute shall mean a written notice of a dispute or claim that arises out of or in connection with the Standard Large Generator Interconnection Agreement or its performance.

Optional Interconnection Study shall mean a sensitivity analysis based on assumptions specified by the Interconnection Customer in the Optional Interconnection Study Agreement.

Optional Interconnection Study Agreement shall mean the form of agreement contained in Appendix 5 of the Standard Large Generator Interconnection Procedures for conducting the Optional Interconnection Study.

Party or Parties shall mean Transmission Provider, Transmission Owner, Interconnection Customer or any combination of the above.

Point of Change of Ownership shall mean the point, as set forth in Appendix A to the Standard Large Generator Interconnection Agreement, where the Interconnection Customer's Interconnection Facilities connect to the Transmission Provider's Interconnection Facilities.

Point of Interconnection shall mean the point, as set forth in Appendix A to the Standard Large Generator Interconnection Agreement, where the Interconnection Facilities connect to the Transmission Provider's Transmission System.

Queue Position shall mean the order of a valid Interconnection Request, relative to all other pending valid Interconnection Requests, that is established based upon the date and time of receipt of the valid Interconnection Request by the Transmission Provider.

Reasonable Efforts shall mean, with respect to an action required to be attempted or taken by a Party under the Standard Large Generator Interconnection Agreement, efforts that are timely and consistent with Good Utility Practice and are otherwise substantially equivalent to those a Party would use to protect its own interests.

Scoping Meeting shall mean the meeting between representatives of the Interconnection Customer and Transmission Provider conducted for the purpose of discussing alternative interconnection options, to exchange information including any transmission data and earlier study evaluations that would be reasonably expected to impact such interconnection options, to analyze such information, and to determine the potential feasible Points of Interconnection.

Site Control shall mean documentation reasonably demonstrating: (1) ownership of, a leasehold interest in, or a right to develop a site for the purpose of constructing the Generating Facility; (2) an option to purchase or acquire a leasehold site for such purpose; or (3) an exclusivity or other business relationship between Interconnection Customer and the entity having the right to sell, lease or grant Interconnection Customer the right to possess or occupy a site for such purpose.

Small Generating Facility shall mean a Generating Facility that has a Generating Facility Capacity of no more than 20 MW.

Stand Alone Network Upgrades shall mean Network Upgrades that an Interconnection Customer may construct without affecting day-to-day operations of the Transmission System during their construction. Both the Transmission Provider and the Interconnection Customer must agree as to what constitutes Stand Alone Network Upgrades and identify them in Appendix A to the Standard Large Generator Interconnection Agreement.

Standard Large Generator Interconnection Agreement (LGIA) shall mean the form of interconnection agreement applicable to an Interconnection Request pertaining to a Large Generating Facility that is included in the Transmission Provider's Tariff.

Standard Large Generator Interconnection Procedures (LGIP) shall mean the interconnection procedures applicable to an Interconnection Request pertaining to a Large Generating Facility that are included in the Transmission Provider's Tariff.

System Protection Facilities shall mean the equipment, including necessary protection signal communications equipment, required to protect (1) the Transmission Provider's Transmission System from faults or other electrical disturbances occurring at the Generating

Facility and (2) the Generating Facility from faults or other electrical system disturbances occurring on the Transmission Provider's Transmission System or on other delivery systems or other generating systems to which the Transmission Provider's Transmission System is directly connected.

Tariff shall mean the Transmission Provider's Tariff through which open access transmission service and Interconnection Service are offered, as filed with FERC, and as amended or supplemented from time to time, or any successor tariff.

Transmission Owner shall mean an entity that owns, leases or otherwise possesses an interest in the portion of the Transmission System at the Point of Interconnection and may be a Party to the Standard Large Generator Interconnection Agreement to the extent necessary.

Transmission Provider shall mean the public utility (or its designated agent) that owns, controls, or operates transmission or distribution facilities used for the transmission of electricity in interstate commerce and provides transmission service under the Tariff. The term Transmission Provider should be read to include the Transmission Owner when the Transmission Owner is separate from the Transmission Provider.

Transmission Provider's Interconnection Facilities shall mean all facilities and equipment owned, controlled or operated by the Transmission Provider from the Point of Change of Ownership to the Point of Interconnection as identified in Appendix A to the Standard Large Generator Interconnection Agreement, including any modifications, additions or upgrades to such facilities and equipment. Transmission Provider's Interconnection Facilities are sole use facilities and shall not include Distribution Upgrades, Stand Alone Network Upgrades or Network Upgrades.

Transmission System shall mean the facilities owned, controlled or operated by the Transmission Provider or Transmission Owner that are used to provide transmission service under the Tariff.

Trial Operation shall mean the period during which Interconnection Customer is engaged in on-site test operations and commissioning of the Generating Facility prior to Commercial Operation.

Variable Energy Resource shall mean a device for the production of electricity that is characterized by an energy source that: (1) is renewable; (2) cannot be stored by the facility owner or operator; and (3) has variability that is beyond the control of the facility owner or operator.

Article 2. Effective Date, Term, and Termination

2.1 Effective Date. This LGIA shall become effective upon execution by the Parties subject to acceptance by FERC (if applicable), or if filed unexecuted, upon the date specified by FERC. Transmission Provider shall promptly file this LGIA with FERC upon execution in accordance with Article 3.1, if required.

2.2 Term of Agreement. Subject to the provisions of Article 2.3, this LGIA shall remain in effect for a period of ten (10) years from the Effective Date or such other longer period as Interconnection Customer may request (Term to be specified in individual agreements) and shall be automatically renewed for each successive one-year period thereafter.

2.3 Termination Procedures.

2.3.1 Written Notice. This LGIA may be terminated by Interconnection Customer after giving Transmission Provider ninety (90) Calendar Days advance written notice, or by Transmission Provider notifying FERC after the Generating Facility permanently ceases Commercial Operation.

2.3.2 Default. Subject to the terms set forth in Appendix H, either Party may terminate this LGIA in accordance with Article 17.

2.3.3 Notwithstanding Articles 2.3.1 and 2.3.2, no termination shall become effective until the Parties have complied with all Applicable Laws and Regulations applicable to such termination, including the filing with FERC of a notice of termination of this LGIA, which notice has been accepted for filing by FERC.

2.4 Termination Costs. If a Party elects to terminate this Agreement pursuant to Article 2.3 above, each Party shall pay all costs incurred (including any cancellation costs relating to orders or contracts for Interconnection Facilities and equipment) or charges assessed by the other Party, as of the date of the other Party's receipt of such notice of termination, that are the responsibility of the Terminating Party under this LGIA. In the event of termination by a Party, the Parties shall use commercially Reasonable Efforts to mitigate the costs, damages and charges arising as a consequence of termination. Upon termination of this LGIA, unless otherwise ordered or approved by FERC:

2.4.1 With respect to any portion of Transmission Provider's Interconnection Facilities that have not yet been constructed or installed, Transmission Provider shall to the extent possible and with Interconnection Customer's authorization cancel any pending orders of, or return, any materials or equipment for, or contracts for construction of, such facilities; provided that in the event Interconnection Customer elects not to authorize such cancellation, Interconnection Customer shall assume all payment obligations with respect to such materials, equipment, and contracts, and Transmission Provider shall deliver such material and equipment, and, if necessary, assign such contracts, to Interconnection Customer as soon as practicable, at Interconnection Customer's expense. To the extent that Interconnection Customer has already paid Transmission Provider for any or all such costs of materials or equipment not taken by Interconnection Customer, Transmission Provider shall promptly refund such amounts to

Interconnection Customer, less any costs, including penalties incurred by Transmission Provider to cancel any pending orders of or return such materials, equipment, or contracts.

If an Interconnection Customer terminates this LGIA, it shall be responsible for all costs incurred in association with that Interconnection Customer's interconnection, including any cancellation costs relating to orders or contracts for Interconnection Facilities and equipment, and other expenses including any Network Upgrades for which Transmission Provider has incurred expenses and has not been reimbursed by Interconnection Customer.

2.4.2 Transmission Provider may, at its option, retain any portion of such materials, equipment, or facilities that Interconnection Customer chooses not to accept delivery of, in which case Transmission Provider shall be responsible for all costs associated with procuring such materials, equipment, or facilities.

2.4.3 With respect to any portion of the Interconnection Facilities, and any other facilities already installed or constructed pursuant to the terms of this LGIA, Interconnection Customer shall be responsible for all costs associated with the removal, relocation or other disposition or retirement of such materials, equipment, or facilities.

2.5 Disconnection. Upon termination of this LGIA, the Parties will take all appropriate steps to disconnect the Large Generating Facility from the Transmission System to the extent appropriate giving consideration to whether a replacement LGIA is executed for one or more Customer Signatories (as defined in Attachment H hereto). All costs required to effectuate such disconnection shall be borne by the terminating Party, unless such termination resulted from the non-terminating Party's Default of this LGIA or such non-terminating Party otherwise is responsible for these costs under this LGIA.

2.6 Survival. This LGIA shall continue in effect after termination to the extent necessary to provide for final billings and payments and for costs incurred hereunder, including billings and payments pursuant to this LGIA; to permit the determination and enforcement of liability and indemnification obligations arising from acts or events that occurred while this LGIA was in effect; and to permit each Party to have access to the lands of the other Party pursuant to this LGIA or other applicable agreements, to disconnect, remove or salvage its own facilities and equipment.

Article 3. Regulatory Filings

3.1 Filing. Transmission Provider shall file this LGIA (and any amendment hereto) with the appropriate Governmental Authority, if required. Interconnection Customer may request that any information so provided be subject to the confidentiality provisions of Article 22. If Interconnection Customer has executed this LGIA, or any amendment thereto, Interconnection Customer shall reasonably cooperate with Transmission Provider with respect to such filing and to provide any information reasonably requested by Transmission Provider needed to comply with applicable regulatory requirements.

Article 4. Scope of Service

4.1 Interconnection Product Options. Interconnection Customer has selected the following (checked) type of Interconnection Service:

X **4.1.1 Energy Resource Interconnection Service.**

4.1.1.1 The Product. Energy Resource Interconnection Service allows Interconnection Customer to connect the Large Generating

Facility to the Transmission System and be eligible to deliver the Large Generating Facility's output using the existing firm or non-firm capacity of the Transmission System on an "as available" basis. To the extent Interconnection Customer wants to receive Energy Resource Interconnection Service, Transmission Provider shall construct facilities identified in Attachment A.

4.1.1.2 **Transmission Delivery Service Implications.** Under Energy Resource Interconnection Service, Interconnection Customer will be eligible to inject power from the Large Generating Facility into and deliver power across the interconnecting Transmission Provider's Transmission System on an "as available" basis up to the amount of MWs identified in the applicable stability and steady state studies to the extent the upgrades initially required to qualify for Energy Resource Interconnection Service have been constructed. Where eligible to do so (e.g., PJM, ISO-NE, NYISO), Interconnection Customer may place a bid to sell into the market up to the maximum identified Large Generating Facility output, subject to any conditions specified in the interconnection service approval, and the Large Generating Facility will be dispatched to the extent Interconnection Customer's bid clears. In all other instances, no transmission delivery service from the Large Generating Facility is assured, but Interconnection Customer may obtain Point-to-Point Transmission Service, Network Integration Transmission Service, or be used for secondary network transmission service, pursuant to Transmission Provider's Tariff, up to the maximum output identified in the stability and steady state studies. In those instances, in order for Interconnection Customer to obtain the right to deliver or inject energy beyond the Large Generating Facility Point of Interconnection or to improve its ability to do so, transmission delivery service must be obtained pursuant to the provisions of Transmission Provider's Tariff. The Interconnection Customer's ability to inject its Large Generating Facility output beyond the Point of Interconnection, therefore, will depend on the existing capacity of Transmission Provider's Transmission System at such time as a transmission service request is made that would accommodate such delivery. The provision of firm Point-to-Point Transmission Service or Network Integration Transmission Service may require the construction of additional Network Upgrades.

☐ **4.1.2 Network Resource Interconnection Service.**

4.1.2.1 The Product. Transmission Provider must conduct the necessary studies and construct the Network Upgrades needed to integrate the Large Generating Facility (1) in a manner comparable to that in which Transmission Provider integrates its generating facilities to serve native load customers; or (2) in an ISO or RTO with market based congestion management, in the same manner as all Network Resources. To the extent Interconnection Customer wants to receive Network Resource Interconnection Service, Transmission Provider shall construct the facilities identified in Attachment A to this LGIA.

4.1.2.2 **Transmission Delivery Service Implications.** Network Resource Interconnection Service allows Interconnection Customer's Large Generating Facility to be designated by any Network Customer under the Tariff on Transmission Provider's Transmission System as a Network Resource, up to the Large Generating Facility's full output, on the same basis as existing Network Resources interconnected to Transmission Provider's Transmission System, and to be studied as a Network Resource on the assumption that such a designation will occur. Although Network Resource Interconnection Service does not convey a reservation of transmission service, any Network Customer under the Tariff can utilize its network service under the Tariff to obtain delivery of energy from the interconnected Interconnection Customer's Large Generating Facility in the same manner as it accesses Network Resources. A Large Generating Facility receiving Network Resource Interconnection Service may also be used to provide

Ancillary Services after technical studies and/or periodic analyses are performed with respect to the Large Generating Facility's ability to provide any applicable Ancillary Services, provided that such studies and analyses have been or would be required in connection with the provision of such Ancillary Services by any existing Network Resource. However, if an Interconnection Customer's Large Generating Facility has not been designated as a Network Resource by any load, it cannot be required to provide Ancillary Services except to the extent such requirements extend to all generating facilities that are similarly situated. The provision of Network Integration Transmission Service or firm Point-to-Point Transmission Service may require additional studies and the construction of additional upgrades. Because such studies and upgrades would be associated with a request for delivery service under the Tariff, cost responsibility for the studies and upgrades would be in accordance with FERC's policy for pricing transmission delivery services.

Network Resource Interconnection Service does not necessarily provide Interconnection Customer with the capability to physically deliver the output of its Large Generating Facility to any particular load on Transmission Provider's Transmission System without incurring congestion costs. In the event of transmission constraints on

Transmission Provider's Transmission System, Interconnection Customer's Large Generating Facility shall be subject to the applicable congestion management procedures in Transmission Provider's Transmission System in the same manner as Network Resources.

There is no requirement either at the time of study or interconnection, or at any point in the future, that Interconnection Customer's Large Generating Facility be designated as a Network Resource by a Network Service Customer under the Tariff or that Interconnection Customer identify a specific buyer (or sink). To the extent a Network Customer does designate the Large Generating Facility as a Network Resource, it must do so pursuant to Transmission Provider's Tariff.

Once an Interconnection Customer satisfies the requirements for obtaining Network Resource Interconnection Service, any future transmission service request for delivery from the Large Generating Facility within Transmission Provider's Transmission System of any amount of capacity and/or energy, up to the amount initially studied, will not require that any additional studies be performed or that any further upgrades associated with such Large Generating Facility be undertaken, regardless of whether or not such Large Generating Facility is ever designated by a

Network Customer as a Network Resource and regardless of changes in ownership of the Large Generating Facility. However, the reduction or elimination of congestion or redispatch costs may require additional studies and the construction of additional upgrades.

To the extent Interconnection Customer enters into an arrangement for long term transmission service for deliveries from the Large Generating Facility outside Transmission Provider's Transmission System, such request may require additional studies and upgrades in order for Transmission Provider to grant such request.

4.2 Provision of Service. Transmission Provider shall provide Interconnection Service for the Large Generating Facility at the Point of Interconnection.

4.3 Performance Standards. Each Party shall perform all of its obligations under this LGIA in accordance with Applicable Laws and Regulations, Applicable Reliability Standards, and Good Utility Practice, and to the extent a Party is required or prevented or limited in taking any action by such regulations and standards, such Party shall not be deemed to be in Breach of this LGIA for its compliance therewith. If such Party is a Transmission Provider or Transmission Owner, then that Party shall amend the LGIA and submit the amendment to FERC for approval.

4.4 No Transmission Delivery Service. The execution of this LGIA does not constitute a request for, nor the provision of, any transmission delivery service under Transmission Provider's Tariff, and does not convey any right to deliver electricity to any specific customer or Point of Delivery.

4.5 Interconnection Customer Provided Services. The services provided by Interconnection Customer under this LGIA are set forth in Article 9.6 and Article 13.5.1.

Interconnection Customer shall be paid for such services in accordance with Article 11.6.

Article 5. Interconnection Facilities Engineering, Procurement, and Construction

5.1 Options. Unless otherwise mutually agreed to between the Parties, Interconnection Customer shall select the In-Service Date, Initial Synchronization Date, and Commercial Operation Date; and either Standard Option or Alternate Option set forth below for completion of Transmission Provider's Interconnection Facilities and Network Upgrades as set forth in Appendix A, Interconnection Facilities and Network Upgrades, and such dates and selected option shall be set forth in Appendix B, Milestones.

5.1.1 Standard Option. Transmission Provider shall design, procure, and construct Transmission Provider's Interconnection Facilities and Network Upgrades, using Reasonable Efforts to complete Transmission Provider's Interconnection Facilities and Network Upgrades by the dates set forth in Appendix B, Milestones. Transmission Provider shall not be required to undertake any action which is inconsistent with its standard safety practices, its material and equipment specifications, its design criteria and construction procedures, its labor agreements, and Applicable Laws and Regulations. In the event Transmission Provider reasonably expects that it will not be able to complete Transmission Provider's Interconnection Facilities and Network Upgrades by the specified dates, Transmission Provider shall promptly provide written notice to Interconnection Customer and shall undertake Reasonable

Efforts to meet the earliest dates thereafter.

5.1.2 **Alternate Option.** If the dates designated by Interconnection Customer are acceptable to Transmission Provider, Transmission Provider shall so notify Interconnection Customer within thirty (30) Calendar Days, and shall assume responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities by the designated dates.

If Transmission Provider subsequently fails to complete Transmission Provider's Interconnection Facilities by the In-Service Date, to the extent necessary to provide back feed power; or fails to complete Network Upgrades by the Initial Synchronization Date to the extent necessary to allow for Trial Operation at full power output, unless other arrangements are made by the Parties for such Trial Operation; or fails to complete the Network Upgrades by the Commercial Operation Date, as such dates are reflected in Appendix B, Milestones; Transmission Provider shall pay Interconnection Customer liquidated damages in accordance with Article 5.3, Liquidated Damages, provided, however, the dates designated by Interconnection Customer shall be extended day for day for each day that the applicable RTO or ISO refuses to grant clearances to install equipment.

5.1.3 **Option to Build.** If the dates designated by Interconnection Customer are not acceptable to Transmission Provider, Transmission Provider shall so notify Interconnection Customer within thirty (30) Calendar Days, and unless the Parties agree otherwise, Interconnection Customer shall have the option to assume responsibility for the design, procurement and construction of Transmission

Provider's Interconnection Facilities and Stand Alone Network Upgrades on the dates specified in Article 5.1.2. Transmission Provider and Interconnection Customer must agree as to what constitutes Stand Alone Network Upgrades and identify such Stand Alone Network Upgrades in Appendix A. Except for Stand Alone Network Upgrades, Interconnection Customer shall have no right to construct Network Upgrades under this option.

5.1.4 Negotiated Option. If Interconnection Customer elects not to exercise its option under Article 5.1.3, Option to Build, Interconnection Customer shall so notify Transmission Provider within thirty (30) Calendar Days, and the Parties shall in good faith attempt to negotiate terms and conditions (including revision of the specified dates and liquidated damages, the provision of incentives or the procurement and construction of a portion of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades by Interconnection Customer) pursuant to which Transmission Provider is responsible for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Network Upgrades. If the Parties are unable to reach agreement on such terms and conditions, Transmission Provider shall assume responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Network Upgrades pursuant to 5.1.1, Standard Option.

5.2 General Conditions Applicable to Option to Build. If Interconnection Customer assumes responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades,

(1) Interconnection Customer shall engineer, procure equipment, and construct

Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades (or portions thereof) using Good Utility Practice and using standards and specifications provided in advance by Transmission Provider;

(2) Interconnection Customer's engineering, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades shall comply with all requirements of law to which Transmission Provider would be subject in the engineering, procurement or construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades;

(3) Transmission Provider shall review and approve the engineering design, equipment acceptance tests, and the construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades;

(4) prior to commencement of construction, Interconnection Customer shall provide to Transmission Provider a schedule for construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades, and shall promptly respond to requests for information from Transmission Provider;

(5) at any time during construction, Transmission Provider shall have the right to gain unrestricted access to Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades and to conduct inspections of the same;

(6) at any time during construction, should any phase of the engineering, equipment procurement, or construction of Transmission Provider's Interconnection

Facilities and Stand Alone Network Upgrades not meet the standards and specifications provided by Transmission Provider, Interconnection Customer shall be obligated to remedy deficiencies in that portion of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades;

(7) Interconnection Customer shall indemnify Transmission Provider for claims arising from Interconnection Customer's construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades under the terms and procedures applicable to Article 18.1 Indemnity;

(8) Interconnection Customer shall transfer control of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades to Transmission Provider;

(9) Unless Parties otherwise agree, Interconnection Customer shall transfer ownership of Transmission Provider's Interconnection Facilities and Stand-Alone Network Upgrades to Transmission Provider;

(10) Transmission Provider shall approve and accept for operation and maintenance Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades to the extent engineered, procured, and constructed in accordance with this Article 5.2; and

(11) Interconnection Customer shall deliver to Transmission Provider "as-built" drawings, information, and any other documents that are reasonably required by Transmission Provider to assure that the Interconnection Facilities and Stand-Alone Network Upgrades are built to the standards and specifications required by Transmission Provider.

5.3 Liquidated Damages. The actual damages to Interconnection Customer, in the event Transmission Provider's Interconnection Facilities or Network Upgrades are not completed by the dates designated by Interconnection Customer and accepted by Transmission Provider pursuant to subparagraphs 5.1.2 or 5.1.4, above, may include Interconnection Customer's fixed operation and maintenance costs and lost opportunity costs. Such actual damages are uncertain and impossible to determine at this time. Because of such uncertainty, any liquidated damages paid by Transmission Provider to Interconnection Customer in the event that Transmission Provider does not complete any portion of Transmission Provider's Interconnection Facilities or Network Upgrades by the applicable dates, shall be an amount equal to ½ of 1 percent per day of the actual cost of Transmission Provider's Interconnection Facilities and Network Upgrades, in the aggregate, for which Transmission Provider has assumed responsibility to design, procure and construct.

However, in no event shall the total liquidated damages exceed 20 percent of the actual cost of Transmission Provider's Interconnection Facilities and Network Upgrades for which Transmission Provider has assumed responsibility to design, procure, and construct. The foregoing payments will be made by Transmission Provider to Interconnection Customer as just compensation for the damages caused to Interconnection Customer, which actual damages are uncertain and impossible to determine at this time, and as reasonable liquidated damages, but not as a penalty or a method to secure performance of this LGIA. Liquidated damages, when the Parties agree to them, are the exclusive remedy for the Transmission Provider's failure to meet its schedule.

No liquidated damages shall be paid to Interconnection Customer if: (1) Interconnection Customer is not ready to commence use of Transmission Provider's Interconnection Facilities or Network Upgrades to take the delivery of power for the Large Generating Facility's Trial Operation or to export power from the Large Generating Facility on the specified dates, unless Interconnection Customer would have been able to commence use of Transmission

Provider's Interconnection Facilities or Network Upgrades to take the delivery of power for Large Generating Facility's Trial Operation or to export power from the Large Generating Facility, but for Transmission Provider's delay; (2) Transmission Provider's failure to meet the specified dates is the result of the action or inaction of Interconnection Customer or any other Interconnection Customer who has entered into an LGIA with Transmission Provider or any cause beyond Transmission Provider's reasonable control or reasonable ability to cure; (3) the interconnection Customer has assumed responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades; or (4) the Parties have otherwise agreed.

5.4 Power System Stabilizers. The Interconnection Customer shall procure, install, maintain and operate Power System Stabilizers in accordance with the guidelines and procedures established by the Applicable Reliability Council. Transmission Provider reserves the right to reasonably establish minimum acceptable settings for any installed Power System Stabilizers, subject to the design and operating limitations of the Large Generating Facility. If the Large Generating Facility's Power System Stabilizers are removed from service or not capable of automatic operation, Interconnection Customer shall immediately notify Transmission Provider's system operator, or its designated representative. The requirements of this paragraph shall not apply to wind generators.

5.5 Equipment Procurement. If responsibility for construction of Transmission Provider's Interconnection Facilities or Network Upgrades is to be borne by Transmission Provider, then Transmission Provider shall commence design of Transmission Provider's Interconnection Facilities or Network Upgrades and procure necessary equipment as soon as practicable after all of the following conditions are satisfied, unless the Parties otherwise agree in writing:

5.5.1 Transmission Provider has completed the Facilities Study pursuant to the Facilities Study Agreement;

5.5.2 Transmission Provider has received written authorization to proceed with design and procurement from Interconnection Customer by the date specified in Appendix B, Milestones; and

5.5.3 Interconnection Customer has provided security to Transmission Provider in accordance with Article 11.5 by the dates specified in Appendix B, Milestones.

5.6 Construction Commencement. Transmission Provider shall commence construction of Transmission Provider's Interconnection Facilities and Network Upgrades for which it is responsible as soon as practicable after the following additional conditions are satisfied:

5.6.1 Approval of the appropriate Governmental Authority has been obtained for any facilities requiring regulatory approval;

5.6.2 Necessary real property rights and rights-of-way have been obtained, to the extent required for the construction of a discrete aspect of Transmission Provider's Interconnection Facilities and Network Upgrades;

5.6.3 Transmission Provider has received written authorization to proceed with construction from Interconnection Customer by the date specified in Appendix B, Milestones; and

5.6.4 Interconnection Customer has provided security to Transmission Provider in accordance with Article 11.5 by the dates specified in Appendix B, Milestones.

5.7 Work Progress. The Parties will keep each other advised periodically as to the progress of their respective design, procurement and construction efforts. Either Party may, at any time, request a progress report from the other Party. If, at any time, Interconnection Customer determines that the completion of Transmission Provider's Interconnection Facilities will not be required until after the specified In-Service Date, Interconnection Customer will provide written notice to Transmission Provider of such later date upon which the completion of Transmission Provider's Interconnection Facilities will be required.

5.8 **Information Exchange.** As soon as reasonably practicable after the Effective Date, the Parties shall exchange information regarding the design and compatibility of the Parties' Interconnection Facilities and compatibility of the Interconnection Facilities with Transmission Provider's Transmission System, and shall work diligently and in good faith to make any necessary design changes.

5.9 **Limited Operation.** If any of Transmission Provider's Interconnection Facilities or Network Upgrades are not reasonably expected to be completed prior to the Commercial Operation Date of the Large Generating Facility, Transmission Provider shall, upon the request and at the expense of Interconnection Customer, perform operating studies on a timely basis to determine the extent to which the Large Generating Facility and Interconnection Customer's Interconnection Facilities may operate prior to the completion of Transmission Provider's Interconnection Facilities or Network Upgrades consistent with Applicable Laws and Regulations, Applicable Reliability Standards, Good Utility Practice, and this LGIA. Transmission Provider shall permit Interconnection Customer to operate the Large Generating Facility and Interconnection Customer's Interconnection Facilities in accordance with the results of such studies.

5.10 **Interconnection Customer's Interconnection Facilities ('ICIF').** Interconnection Customer shall, at its expense, design, procure, construct, own and install the ICIF, as set forth in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades.

5.10.1 Interconnection Customer's Interconnection Facility Specifications. Interconnection Customer shall submit initial specifications for the ICIF, including System Protection Facilities, to Transmission Provider at least one hundred eighty (180) Calendar Days prior to the Initial Synchronization Date; and final specifications for review and comment at least ninety (90) Calendar Days prior to the Initial Synchronization Date. Transmission Provider shall review such specifications to ensure that the ICIF are compatible with the technical specifications, operational control, and safety requirements of Transmission Provider and comment on such specifications within thirty (30) Calendar Days of Interconnection Customer's submission. All specifications provided hereunder shall be deemed confidential.

5.10.2 Transmission Provider's Review. Transmission Provider's review of Interconnection Customer's final specifications shall not be construed as confirming, endorsing, or providing a warranty as to the design, fitness, safety, durability or reliability of the Large Generating Facility, or the ICIF. Interconnection Customer shall make such changes to the ICIF as may reasonably be required by Transmission Provider, in accordance with Good Utility Practice, to ensure that the ICIF are compatible with the technical specifications, operational control, and safety requirements of Transmission Provider.

5.10.3 ICIF Construction. The ICIF shall be designed and constructed in accordance with Good Utility Practice. Within one hundred twenty (120) Calendar Days after the Commercial Operation Date, unless the Parties agree on another mutually acceptable deadline, Interconnection Customer shall deliver to Transmission

Provider "as-built" drawings, information and documents for the ICIF, such as: a one-line diagram, a site plan showing the Large Generating Facility and the ICIF, plan and elevation drawings showing the layout of the ICIF, a relay functional diagram, relaying AC and DC schematic wiring diagrams and relay settings for all facilities associated with Interconnection Customer's step-up transformers, the facilities connecting the Large Generating Facility to the step-up transformers and the ICIF, and the impedances (determined by factory tests) for the associated step-up transformers and the Large Generating Facility. The Interconnection Customer shall provide Transmission Provider specifications for the excitation system, automatic voltage regulator, Large Generating Facility control and protection settings, transformer tap settings, and communications, if applicable.

5.11 Transmission Provider's Interconnection Facilities Construction. Transmission Provider's Interconnection Facilities shall be designed and constructed in accordance with Good Utility Practice. Upon request, within one hundred twenty (120) Calendar Days after the Commercial Operation Date, unless the Parties agree on another mutually acceptable deadline, Transmission Provider shall deliver to Interconnection Customer the following "as-built" drawings, information and documents for Transmission Provider's Interconnection Facilities [include appropriate drawings and relay diagrams].

Transmission Provider will obtain control of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades upon completion of such facilities.

5.12 Access Rights. Upon reasonable notice and supervision by a Party, and subject to any required or necessary regulatory approvals, a Party ("Granting Party") shall furnish at no cost to the other Party ("Access Party") any rights of use, licenses, rights of way and easements with respect to lands owned or controlled by the Granting Party, its agents (if allowed under the applicable agency agreement), or any Affiliate, that are necessary to enable the Access Party to obtain ingress and egress to construct, operate, maintain, repair, test (or witness testing), inspect, replace or remove facilities and equipment to: (i) interconnect the Large Generating Facility with the Transmission System; (ii) operate and maintain the Large Generating Facility, the Interconnection Facilities and the Transmission System; and (iii) disconnect or remove the Access Party's facilities and equipment upon termination of this LGIA. In exercising such licenses, rights of way and easements, the Access Party shall not unreasonably disrupt or interfere with normal operation of the Granting Party's business and shall adhere to the safety rules and procedures established in advance, as may be changed from time to time, by the Granting Party and provided to the Access Party.

5.13 Lands of Other Property Owners. If any part of Transmission Provider or Transmission Owner's Interconnection Facilities and/or Network Upgrades is to be installed on property owned by persons other than Interconnection Customer or Transmission Provider or Transmission Owner, Transmission Provider or Transmission Owner shall at Interconnection Customer's expense use efforts, similar in nature and extent to those that it typically undertakes on its own behalf or on behalf of its Affiliates, including use of its eminent domain authority, and to the extent consistent with state law, to procure from such persons any rights of use, licenses, rights of way and easements that are necessary to construct, operate, maintain, test, inspect, replace or remove Transmission Provider or Transmission Owner's Interconnection Facilities and/or Network Upgrades upon such property.

5.14 Permits. Transmission Provider or Transmission Owner and Interconnection Customer shall cooperate with each other in good faith in obtaining all permits, licenses and authorizations that are necessary to accomplish the interconnection in compliance with Applicable Laws and Regulations. With respect to this paragraph, Transmission Provider or Transmission

Owner shall provide permitting assistance to Interconnection Customer comparable to that provided to Transmission Provider's own, or an Affiliate's generation.

5.15 Early Construction of Base Case Facilities. Interconnection Customer may request Transmission Provider to construct, and Transmission Provider shall construct, using Reasonable Efforts to accommodate Interconnection Customer's In-Service Date, all or any portion of any Network Upgrades required for Interconnection Customer to be interconnected to the Transmission System which are included in the Base Case of the Facilities Study for Interconnection Customer, and which also are required to be constructed for another Interconnection Customer, but where such construction is not scheduled to be completed in time to achieve Interconnection Customer's In-Service Date.

5.16 Suspension. Interconnection Customer reserves the right, upon written notice to Transmission Provider, to suspend at any time all work by Transmission Provider associated with the construction and installation of Transmission Provider's Interconnection Facilities and/or Network Upgrades required under this LGIA with the condition that Transmission System shall be left in a safe and reliable condition in accordance with Good Utility Practice and Transmission Provider's safety and reliability criteria. In such event, Interconnection Customer shall be responsible for all reasonable and necessary costs which Transmission Provider (i) has incurred pursuant to this LGIA prior to the suspension and (ii) incurs in suspending such work, including any costs incurred to perform such work as may be necessary to ensure the safety of persons and property and the integrity of the Transmission System during such suspension and, if applicable, any costs incurred in connection with the cancellation or suspension of material, equipment and labor contracts which Transmission Provider cannot reasonably avoid; provided, however, that prior to canceling or suspending any such material, equipment or labor contract, Transmission Provider shall obtain Interconnection Customer's authorization to do so.

Transmission Provider shall invoice Interconnection Customer for such costs pursuant to Article 12 and shall use due diligence to minimize its costs. In the event Interconnection Customer suspends work by Transmission Provider required under this LGIA pursuant to this Article 5.16, and has not requested Transmission Provider to recommence the work required under this LGIA on or before the expiration of three (3) years following commencement of such suspension, this LGIA shall be deemed terminated. The three-year period shall begin on the date the suspension is requested, or the date of the written notice to Transmission Provider, if no effective date is specified.

5.17 Taxes.

5.17.1 Interconnection Customer Payments Not Taxable. The Parties intend that all payments or property transfers made by Interconnection Customer to Transmission Provider for the installation of Transmission Provider's Interconnection Facilities and the Network Upgrades shall be non-taxable, either as contributions to capital, or as an advance, in accordance with the Internal Revenue Code and any applicable state income tax laws and shall not be taxable as contributions in aid of construction or otherwise under the Internal Revenue Code and any applicable state income tax laws.

5.17.2 Representations and Covenants. In accordance with IRS Notice 2001-82 and IRS Notice 88-129, Interconnection Customer represents and covenants that (i) ownership of the electricity generated at the Large Generating Facility will pass to another party prior to the transmission of the electricity on the Transmission System, (ii) for income tax purposes, the amount of any payments and the cost of any property transferred to Transmission Provider for Transmission Provider's Interconnection Facilities will be capitalized by Interconnection Customer as an intangible asset and recovered using the straight-line method over a useful life of twenty (20) years, and (iii) any portion of Transmission Provider's Interconnection Facilities that is a "dual-use intertie," within the meaning of IRS Notice 88-129, is reasonably expected to carry only a de minimis amount of electricity in the direction of the Large Generating Facility. For this purpose, "de minimis amount" means no more than 5 percent of the total power flows in both directions, calculated in accordance with the "5 percent test" set forth in IRS Notice 88-129. This is not intended to be an exclusive list of the relevant conditions that must be met to conform to IRS requirements for non-taxable treatment.

At Transmission Provider's request, Interconnection Customer shall provide Transmission Provider with a report from an independent engineer confirming its representation in clause (iii), above. Transmission Provider represents and covenants that the cost of Transmission Provider's Interconnection Facilities paid for by Interconnection Customer will have no net effect on the base upon which rates are determined.

5.17.3 Indemnification for the Cost Consequences of Current Tax Liability Imposed Upon the Transmission Provider. Notwithstanding Article 5.17.1, Interconnection Customer shall protect, indemnify and hold harmless Transmission Provider from the cost consequences of any current tax liability imposed against Transmission Provider as the result of payments or property transfers made by Interconnection Customer to Transmission Provider under this LGIA for Interconnection Facilities, as well as any interest and penalties, other than interest and penalties attributable to any delay caused by Transmission Provider.

Transmission Provider shall not include a gross-up for the cost consequences of any current tax liability in the amounts it charges Interconnection Customer under this LGIA unless (i) Transmission Provider has determined, in good faith, that the payments or property transfers made by Interconnection Customer to Transmission Provider should be reported as income subject to taxation or (ii) any Governmental Authority directs Transmission Provider to report payments or property as income subject to taxation; provided, however, that Transmission Provider may require Interconnection Customer to provide security for Interconnection Facilities, in a form reasonably acceptable to Transmission Provider (such as a parental guarantee or a letter of credit), in an amount equal to the cost consequences of any current tax liability under this Article 5.17. Interconnection Customer shall reimburse Transmission Provider for such costs on a fully grossed-up basis, in accordance with Article 5.17.4, within thirty (30) Calendar Days of receiving written notification from Transmission Provider of the amount due, including detail about how the amount was calculated.

The indemnification obligation shall terminate at the earlier of (1) the expiration of the ten year testing period and the applicable statute of limitation, as it may be extended by Transmission Provider upon request of the IRS, to keep these years open for audit or adjustment, or (2) the occurrence of a subsequent taxable event and the payment of any related indemnification obligations as contemplated by this Article 5.17.

5.17.4 **Tax Gross-Up Amount.** Interconnection Customer's liability for the cost consequences of any current tax liability under this Article 5.17 shall be calculated on a fully grossed-up basis. Except as may otherwise be agreed to by the parties, this means that Interconnection Customer will pay Transmission Provider, in addition to the amount paid for the Interconnection Facilities and Network Upgrades, an amount equal to (1) the current taxes imposed on Transmission Provider ("Current Taxes") on the excess of (a) the gross income realized by Transmission Provider as a result of payments or property transfers made by Interconnection Customer to Transmission Provider under this LGIA (without regard to any payments under this Article 5.17) (the "Gross Income Amount") over (b) the present value of future tax deductions for depreciation that will be available as a result of such payments or property transfers (the "Present Value Depreciation Amount"), plus (2) an additional amount sufficient to permit Transmission Provider to receive and retain, after the payment of all Current Taxes, an amount equal to the net amount described in clause (1).

For this purpose, (i) Current Taxes shall be computed based on Transmission Provider's composite federal and state tax rates at the time the payments or property transfers are received and Transmission Provider will be treated as being subject to tax at the highest marginal rates in effect at that time (the "Current Tax Rate"), and (ii) the Present Value Depreciation Amount shall be computed by discounting Transmission Provider's anticipated tax depreciation deductions as a result of such payments or property transfers by Transmission Provider's current weighted average cost of capital. Thus, the formula for calculating Interconnection Customer's liability to Transmission Owner pursuant to this Article 5.17.4 can be expressed as follows: (Current Tax Rate x (Gross Income Amount – Present Value of Tax Depreciation))/(1-Current Tax Rate). Interconnection Customer's estimated tax liability in the event taxes are imposed shall be stated in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades.

5.17.5 Private Letter Ruling or Change or Clarification of Law. At Interconnection Customer's request and expense, Transmission Provider shall file with the IRS a request for a private letter ruling as to whether any property transferred or sums paid, or to be paid, by Interconnection Customer to Transmission Provider under this LGIA are subject to federal income taxation. Interconnection Customer will prepare the initial draft of the request for a private letter ruling, and will certify under penalties of perjury that all facts represented in such request are true and accurate to the best of Interconnection Customer's knowledge. Transmission Provider and Interconnection Customer shall cooperate in good faith with respect to the submission of such request.

Transmission Provider shall keep Interconnection Customer fully informed of the status of such request for a private letter ruling and shall execute either a privacy act waiver or a limited power of attorney, in a form acceptable to the IRS, that authorizes Interconnection Customer to participate in all discussions with the IRS regarding such request for a private letter ruling. Transmission Provider shall allow Interconnection Customer to attend all meetings with IRS officials about the request and shall permit Interconnection Customer to prepare the initial drafts of any follow-up letters in connection with the request.

5.17.6 **Subsequent Taxable Events.** If, within 10 years from the date on which the relevant Transmission Provider's Interconnection Facilities are placed in service, (i) Interconnection Customer Breaches the covenants contained in Article 5.17.2, (ii) a "disqualification event" occurs within the meaning of IRS Notice 88-129, or (iii) this LGIA terminates and Transmission Provider retains ownership of the Interconnection Facilities and Network Upgrades, Interconnection Customer shall pay a tax gross-up for the cost consequences of any current tax liability imposed on Transmission Provider, calculated using the methodology described in Article 5.17.4 and in accordance with IRS Notice 90-60.

5.17.7 **Contests.** In the event any Governmental Authority determines that Transmission Provider's receipt of payments or property constitutes income that is subject to taxation, Transmission Provider shall notify Interconnection Customer, in writing, within thirty (30) Calendar Days of receiving notification of such determination by a Governmental Authority. Upon the timely written request by Interconnection Customer and at Interconnection Customer's sole expense, Transmission Provider may appeal, protest, seek abatement of, or otherwise oppose such determination. Upon Interconnection Customer's written request and sole expense, Transmission Provider may file a claim for refund with respect to any taxes paid under this Article 5.17, whether or not it has received such a determination. Transmission Provider reserves the right to make all decisions with regard to the prosecution of such appeal, protest, abatement or other contest, including the selection of counsel and compromise or settlement of the claim, but Transmission Provider shall keep Interconnection Customer informed, shall consider in good faith suggestions from Interconnection Customer about the conduct of the contest, and shall reasonably permit Interconnection Customer or an Interconnection Customer representative to attend contest proceedings.

Interconnection Customer shall pay to Transmission Provider on a periodic basis, as invoiced by Transmission Provider, Transmission Provider's documented reasonable costs of prosecuting such appeal, protest, abatement or other contest. At any time during the contest, Transmission Provider may agree to a settlement either with Interconnection Customer's consent or after obtaining written advice from nationally-recognized tax counsel, selected by Transmission Provider, but reasonably acceptable to Interconnection Customer, that the proposed settlement represents a reasonable settlement given the hazards of litigation. Interconnection Customer's obligation shall be based on the amount of the settlement agreed to by Interconnection Customer, or if a higher amount, so much of the settlement that is supported by the written advice from nationally-recognized tax counsel selected under the terms of the preceding sentence. The settlement amount shall be calculated on a fully grossed-up basis to cover any related cost consequences of the current tax liability. Any settlement without Interconnection Customer's consent or such written advice will relieve Interconnection Customer from any obligation to indemnify Transmission Provider for the tax at issue in the contest.

5.17.8 **Refund.** In the event that (a) a private letter ruling is issued to Transmission Provider which holds that any amount paid or the value of any property transferred by Interconnection Customer to

Transmission Provider under the terms of this LGIA is not subject to federal income taxation, (b) any legislative change or administrative announcement, notice, ruling or other determination makes it reasonably clear to Transmission Provider in good faith that any amount paid or the value of any property transferred by Interconnection Customer to Transmission Provider under the terms of this LGIA is not taxable to Transmission Provider, (c) any abatement, appeal, protest, or other contest results in a determination that any payments or transfers made by Interconnection Customer to Transmission Provider are not subject to federal income tax, or (d) if Transmission Provider receives a refund from any taxing authority for any overpayment of tax attributable to any payment or property transfer made by Interconnection Customer to Transmission Provider pursuant to this LGIA, Transmission Provider shall promptly refund to Interconnection Customer the following:

(i) any payment made by Interconnection Customer under this Article 5.17 for taxes that is attributable to the amount determined to be non-taxable, together with interest thereon,

(ii) interest on any amounts paid by Interconnection Customer to Transmission Provider for such taxes which Transmission Provider did not submit to the taxing authority, calculated in accordance with the methodology set forth in FERC's regulations at 18 CFR §35.19a(a)(2)(iii) from the date payment was made by Interconnection Customer to the date Transmission Provider refunds such payment to Interconnection Customer, and

(iii) with respect to any such taxes paid by Transmission Provider, any refund or credit Transmission Provider receives or to which it may be entitled from any Governmental Authority, interest (or that portion thereof attributable to the payment described in clause (i), above) owed to Transmission Provider for such overpayment of taxes (including any reduction in interest otherwise payable by Transmission Provider to any Governmental Authority resulting from an offset or credit); provided, however, that Transmission Provider will remit such amount promptly to Interconnection Customer only after and to the extent that Transmission Provider has received a tax refund, credit or offset from any Governmental Authority for any applicable overpayment of income tax related to Transmission Provider's Interconnection Facilities.

The intent of this provision is to leave the Parties, to the extent practicable, in the event that no taxes are due with respect to any payment for Interconnection Facilities and Network Upgrades hereunder, in the same position they would have been in had no such tax payments been made.

5.17.9 Taxes Other Than Income Taxes. Upon the timely request by Interconnection Customer, and at Interconnection Customer's sole expense, Transmission Provider may appeal, protest, seek abatement of, or otherwise contest any tax (other than federal or state income tax) asserted or assessed against Transmission Provider for which Interconnection

Customer may be required to reimburse Transmission Provider under the terms of this LGIA. Interconnection Customer shall pay to Transmission Provider on a periodic basis, as invoiced by Transmission Provider, Transmission Provider's documented reasonable costs of prosecuting such appeal, protest, abatement, or other contest. Interconnection Customer and Transmission Provider shall cooperate in good faith with respect to any such contest. Unless the payment of such taxes is a prerequisite to an appeal or abatement or cannot be deferred, no amount shall be payable by Interconnection Customer to Transmission Provider for such taxes until they are assessed by a final, non-appealable order by any court or agency of competent jurisdiction. In the event that a tax payment is withheld and ultimately due and payable after appeal, Interconnection Customer will be responsible for all taxes, interest and penalties, other than penalties attributable to any delay caused by Transmission Provider.

5.17.10 Transmission Owners Who Are Not Transmission Providers. If Transmission Provider is not the same entity as the Transmission Owner, then (i) all references in this Article 5.17 to Transmission Provider shall be deemed also to refer to and to include the Transmission Owner, as appropriate, and (ii) this LGIA shall not become effective until such Transmission Owner shall have agreed in writing to assume all of the duties and obligations of Transmission Provider under this Article 5.17 of this LGIA.

5.18 Tax Status. Each Party shall cooperate with the other to maintain the other Party's tax status. Nothing in this LGIA is intended to adversely affect any Transmission Provider's tax exempt status with respect to the issuance of bonds including, but not limited to, Local Furnishing Bonds.

5.19 Modification.

5.19.1 General. Either Party may undertake modifications to its facilities. If a Party plans to undertake a modification that reasonably may be expected to affect the other Party's facilities, that Party shall provide to the other Party sufficient information regarding such modification so that the other Party may evaluate the potential impact of such modification prior to commencement of the work. Such information shall be deemed to be confidential hereunder and shall include information concerning the timing of such modifications and whether such modifications are expected to interrupt the flow of electricity from the Large Generating Facility. The Party desiring to perform such work shall provide the relevant drawings, plans, and specifications to the other Party at least ninety (90) Calendar Days in advance of the commencement of the work or such shorter period upon which the Parties may agree, which agreement shall not unreasonably be withheld, conditioned or delayed.

In the case of Large Generating Facility modifications that do not require Interconnection Customer to submit an Interconnection Request, Transmission Provider shall provide, within thirty (30) Calendar Days (or such other time as the Parties may agree), an estimate of any additional modifications to the Transmission System, Transmission Provider's Interconnection Facilities or Network Upgrades necessitated by such Interconnection Customer modification and a good faith estimate of the costs thereof.

5.19.2 Standards. Any additions, modifications, or replacements made to a Party's facilities shall be designed, constructed and operated in accordance with this LGIA and Good Utility Practice.

5.19.3 Modification Costs. Interconnection Customer shall not be directly assigned for the costs of any additions, modifications, or replacements that Transmission Provider makes to Transmission Provider's Interconnection Facilities or the Transmission System to facilitate the interconnection of a third party to Transmission Provider's Interconnection Facilities or the Transmission System, or to provide transmission service to a third party under Transmission Provider's Tariff. Interconnection Customer shall be responsible for the costs of any additions, modifications, or replacements to Interconnection Customer's Interconnection Facilities that may be necessary to maintain or upgrade such Interconnection Customer's Interconnection Facilities consistent with Applicable Laws and Regulations, Applicable Reliability Standards or Good Utility Practice.

Article 6. Testing and Inspection

6.1 Pre-Commercial Operation Date Testing and Modifications. Prior to the Commercial Operation Date, Transmission Provider shall test Transmission Provider's Interconnection Facilities and Network Upgrades and Interconnection Customer shall test the Large Generating Facility and Interconnection Customer's Interconnection Facilities to ensure their safe and reliable operation. Similar testing may be required after initial operation. Each Party shall make any modifications to its facilities that are found to be necessary as a result of such testing. Interconnection Customer shall bear the cost of all such testing and modifications. Interconnection Customer shall generate test energy at the Large

Generating Facility only if it has arranged for the delivery of such test energy.

6.2 Post-Commercial Operation Date Testing and Modifications. Each Party shall at its own expense perform routine inspection and testing of its facilities and equipment in accordance with Good Utility Practice as may be necessary to ensure the continued interconnection of the Large Generating Facility with the Transmission System in a safe and reliable manner. Each Party shall have the right, upon advance written notice, to require reasonable additional testing of the other Party's facilities, at the requesting Party's expense, as may be in accordance with Good Utility Practice.

6.3 Right to Observe Testing. Each Party shall notify the other Party in advance of its performance of tests of its Interconnection Facilities. The other Party has the right, at its own expense, to observe such testing.

6.4 Right to Inspect. Each Party shall have the right, but shall have no obligation to: (i) observe the other Party's tests and/or inspection of any of its System Protection Facilities and other protective equipment, including Power System Stabilizers; (ii) review the settings of the other Party's System Protection Facilities and other protective equipment; and (iii) review the other Party's maintenance records relative to the Interconnection Facilities, the System Protection Facilities and other protective equipment. A Party may exercise these rights from time to time as it deems necessary upon reasonable notice to the other Party. The exercise or non-exercise by a Party of any such rights shall not be construed as an endorsement or confirmation of any element or condition of the Interconnection Facilities or the System Protection Facilities or other protective equipment or the operation thereof, or as a warranty as to the fitness, safety, desirability, or reliability of same. Any information that a Party obtains through the exercise of any of its rights under this Article 6.4 shall be deemed to be Confidential Information and treated pursuant to Article 22 of this LGIA.

Article 7. Metering

7.1 General. Each Party shall comply with the Applicable Reliability Council requirements. Unless otherwise agreed by the Parties, Transmission Provider shall install Metering Equipment at the Point of Interconnection prior to any operation of the Large Generating Facility and shall own, operate, test and maintain such Metering Equipment. Power flows to and from the Large Generating Facility shall be measured at or, at Transmission Provider's option, compensated to, the Point of Interconnection. Transmission Provider shall provide metering quantities, in analog and/or digital form, to Interconnection Customer upon request. Interconnection Customer shall bear all reasonable documented costs associated with the purchase, installation, operation, testing and maintenance of the Metering Equipment.

7.2 Check Meters. Interconnection Customer, at its option and expense, may install and operate, on its premises and on its side of the Point of Interconnection, one or more check meters to check Transmission Provider's meters. Such check meters shall be for check purposes only and shall not be used for the measurement of power flows for purposes of this LGIA, except as provided in Article 7.4 below. The check meters shall be subject at all reasonable times to inspection and examination by Transmission Provider or its designee. The installation, operation and maintenance thereof shall be performed entirely by Interconnection Customer in accordance with Good Utility Practice.

7.3 Standards. Transmission Provider shall install, calibrate, and test revenue quality Metering Equipment in accordance with applicable ANSI standards.

7.4 Testing of Metering Equipment. Transmission Provider shall inspect and test all Transmission Provider-owned Metering Equipment upon installation and at least once every two (2) years thereafter. If requested to do so by Interconnection Customer, Transmission Provider shall, at Interconnection Customer's expense, inspect or test Metering

Equipment more frequently than every two (2) years. Transmission Provider shall give reasonable notice of the time when any inspection or test shall take place, and Interconnection Customer may have representatives present at the test or inspection. If at any time Metering Equipment is found to be inaccurate or defective, it shall be adjusted, repaired or replaced at Interconnection Customer's expense, in order to provide accurate metering, unless the inaccuracy or defect is due to Transmission Provider's failure to maintain, then Transmission Provider shall pay. If Metering Equipment fails to register, or if the measurement made by Metering Equipment during a test varies by more than two percent from the measurement made by the standard meter used in the test, Transmission Provider shall adjust the measurements by correcting all measurements for the period during which Metering Equipment was in error by using Interconnection Customer's check meters, if installed. If no such check meters are installed or if the period cannot be reasonably ascertained, the adjustment shall be for the period immediately preceding the test of the Metering Equipment equal to one-half the time from the date of the last previous test of the Metering Equipment.

7.5 **Metering Data**. At Interconnection Customer's expense, the metered data shall be telemetered to one or more locations designated by Transmission Provider and one or more locations designated by Interconnection Customer. Such telemetered data shall be used, under normal operating conditions, as the official measurement of the amount of energy delivered from the Large Generating Facility to the Point of Interconnection.

Article 8. Communications

8.1 **Interconnection Customer Obligations**. Interconnection Customer shall maintain satisfactory operating communications with Transmission Provider's Transmission System dispatcher or representative designated by Transmission Provider. Interconnection Customer shall provide standard voice line, dedicated voice line and facsimile communications at its Large

Generating Facility control room or central dispatch facility through use of either the public telephone system, or a voice communications system that does not rely on the public telephone system. Interconnection Customer shall also provide the dedicated data circuit(s) necessary to provide Interconnection Customer data to Transmission Provider as set forth in Appendix D, Security Arrangements Details. The data circuit(s) shall extend from the Large Generating Facility to the location(s) specified by Transmission Provider. Any required maintenance of such communications equipment shall be performed by Interconnection Customer. Operational communications shall be activated and maintained under, but not be limited to, the following events: system paralleling or separation, scheduled and unscheduled shutdowns, equipment clearances, and hourly and daily load data.

8.2 Remote Terminal Unit. Prior to the Initial Synchronization Date of the Large Generating Facility, a Remote Terminal Unit, or equivalent data collection and transfer equipment acceptable to the Parties, shall be installed by Interconnection Customer, or by Transmission Provider at Interconnection Customer's expense, to gather accumulated and instantaneous data to be telemetered to the location(s) designated by Transmission Provider through use of a dedicated point-to-point data circuit(s) as indicated in Article 8.1. The communication protocol for the data circuit(s) shall be specified by Transmission Provider. Instantaneous bi-directional analog real power and reactive power flow information must be telemetered directly to the location(s) specified by Transmission Provider.

Each Party will promptly advise the other Party if it detects or otherwise learns of any metering, telemetry or communications equipment errors or malfunctions that require the attention and/or correction by the other Party. The Party owning such equipment shall correct such error or malfunction as soon as reasonably feasible.

8.3 No Annexation. Any and all equipment placed on the premises of a Party shall be and remain the property of the Party providing such equipment regardless of the mode and manner of annexation or attachment to real property, unless otherwise mutually agreed by the Parties.

8.4 Provision of Data from a Variable Energy Resource. The Interconnection Customer whose Generating Facility is a Variable Energy Resource shall provide meteorological and forced outage data to the Transmission Provider to the extent necessary for the Transmission Provider's development and deployment of power production forecasts for that class of Variable Energy Resources. The Interconnection Customer with a Variable Energy Resource having wind as the energy source, at a minimum, will be required to provide the Transmission Provider with site-specific meteorological data including: temperature, wind speed, wind direction, and atmospheric pressure. The Interconnection Customer with a Variable Energy Resource having solar as the energy source, at a minimum, will be required to provide the Transmission Provider with site-specific meteorological data including: temperature, atmospheric pressure, and irradiance. The Transmission Provider and Interconnection Customer whose Generating Facility is a Variable Energy Resource shall mutually agree to any additional meteorological data that are required for the development and deployment of a power production forecast. The Interconnection Customer whose Generating Facility is a Variable Energy Resource also shall submit data to the Transmission Provider regarding all forced outages to the extent necessary for the Transmission Provider's development and deployment of power production forecasts for that class of Variable Energy Resources. The exact specifications of the meteorological and forced outage data to be provided by the Interconnection Customer to the Transmission Provider, including the frequency and timing of data submittals, shall be made taking into account the size and configuration of the Variable Energy Resource, its characteristics, location, and its importance in maintaining generation resource adequacy and transmission system reliability in its area. All requirements for meteorological and forced outage data must be commensurate with the power production forecasting employed by the Transmission Provider. Such requirements for meteorological and forced outage data are set forth in Appendix C, Interconnection Details, of this LGIA, as they may change from time to time.

Article 9. Operations

9.1 **General.** Each Party shall comply with the Applicable Reliability Council requirements. Each Party shall provide to the other Party all information that may reasonably be required by the other Party to comply with Applicable Laws and Regulations and Applicable Reliability Standards.

9.2 **Control Area Notification**. At least three months before Initial Synchronization Date, Interconnection Customer shall notify Transmission Provider in writing of the Control Area in which the Large Generating Facility will be located. If Interconnection Customer elects to locate the Large Generating Facility in a Control Area other than the Control Area in which the Large Generating Facility is physically located, and if permitted to do so by the relevant transmission tariffs, all necessary arrangements, including but not limited to those set forth in Article 7 and Article 8 of this LGIA, and remote Control Area generator interchange agreements, if applicable, and the appropriate measures under such agreements, shall be executed and implemented prior to the placement of the Large Generating Facility in the other Control Area.

9.3 **Transmission Provider Obligations.** Transmission Provider shall cause the Transmission System and Transmission Provider's Interconnection Facilities to be operated, maintained and controlled in a safe and reliable manner and in accordance with this LGIA. Transmission Provider may provide operating instructions to Interconnection Customer consistent with this LGIA and Transmission Provider's operating protocols and procedures as they may change from time to time. Transmission Provider will consider changes to its operating protocols and procedures proposed by Interconnection Customer.

9.4 **Interconnection Customer Obligations**. Interconnection Customer shall at its own expense operate, maintain and control the Large Generating

Facility and Interconnection Customer's Interconnection Facilities in a safe and reliable manner and in accordance with this LGIA. Interconnection Customer shall operate the Large Generating Facility and Interconnection Customer's Interconnection Facilities in accordance with all applicable requirements of the Control Area of which it is part, as such requirements are set forth in Appendix C, Interconnection Details, of this LGIA. Appendix C, Interconnection Details, will be modified to reflect changes to the requirements as they may change from time to time. Either Party may request that the other Party provide copies of the requirements set forth in Appendix C, Interconnection Details, of this LGIA.

9.5 Start-Up and Synchronization. Consistent with the Parties' mutually acceptable procedures, Interconnection Customer is responsible for the proper synchronization of the Large Generating Facility to Transmission Provider's Transmission System.

9.6 Reactive Power and Primary Frequency Response.

9.6.1 Power Factor Design Criteria. Interconnection Customer shall design the Large Generating Facility to maintain a composite power delivery at continuous rated power output at the Point of Interconnection at a power factor within the range of 0.95 leading to 0.95 lagging, unless Transmission Provider has established different requirements that apply to all generators in the Control Area on a comparable basis. The requirements of this paragraph shall not apply to wind generators.

9.6.1.1 Synchronous Generation. Interconnection Customer shall design the Large Generating Facility to maintain a composite power deliver at continuous rated power output at the Point of Interconnection at a power factor within the range of 0.95 leading to 0.95 lagging, unless the Transmission Provider has established different requirements that apply to all synchronous generators in the Control Area on a comparable basis.

9.6.1.2 Non-Synchronous Generation. Interconnection Customer shall design the Large Generating Facility to maintain composite power delivery at continuous rated power output at the high-side of the generator substation at a power factor within the range of 0.95 leading to 0.95 lagging, unless the Transmission Provider has established a different power factor range that applies to all non-synchronous generators in the Control Area on a comparable basis. This power factor range standard shall be dynamic and can be met using, for example, power electronics designed to supply this level of reactive capability (taking into account any limitations due to voltage level, real power output, etc.) or fixed and switched capacitors, or a combination of the two. This requirement shall only apply to newly interconnecting non-synchronous generators that have not yet executed a Facilities Study Agreement as of the effective date of the Final Rule establishing this requirement (Order No. 827).

9.6.2 Voltage Schedules. Once Interconnection Customer has synchronized the Large Generating Facility with the Transmission System, Transmission Provider shall require Interconnection Customer to operate the Large Generating Facility to produce or absorb reactive power within the design limitations of the Large Generating Facility set forth in Article 9.6.1 (Power Factor Design Criteria). Transmission Provider's voltage schedules shall treat all sources of reactive power in the Control Area in an equitable and not unduly discriminatory manner. Transmission Provider shall exercise Reasonable Efforts to provide Interconnection Customer with such schedules at least one (1) day in advance, and may make changes to such schedules as necessary to maintain the reliability of the Transmission System. Interconnection Customer shall operate the Large Generating Facility to maintain the specified output voltage or power factor at the Point of Interconnection within the design limitations of the Large Generating Facility set forth in Article 9.6.1 (Power Factor Design Criteria). If Interconnection Customer is unable to maintain the specified voltage or power factor, it shall promptly notify the System Operator.

9.6.2.1 Voltage Regulators. Whenever the Large Generating Facility is operated in parallel with the Transmission System and voltage regulators are capable of operation, Interconnection Customer shall operate the Large Generating Facility with its voltage regulators in automatic operation. If the Large Generating Facility's voltage regulators are not capable of such automatic operation, Interconnection Customer shall immediately notify Transmission Provider's system operator, or its designated representative, and ensure that such Large Generating Facility's reactive power production or absorption (measured in MVARs) are within the design capability of the Large Generating Facility's generating unit(s) and steady state stability limits. Interconnection Customer shall not cause its Large Generating Facility to disconnect automatically or instantaneously from the Transmission System or trip any generating unit comprising the Large Generating Facility for an under or over frequency condition unless the abnormal frequency condition persists for a time period beyond the limits set forth in ANSI/IEEE Standard C37.106, or such other standard as applied to other generators in the Control Area on a comparable basis.

9.6.3 Payment for Reactive Power. Transmission Provider is required to pay Interconnection Customer for reactive power that Interconnection Customer provides or absorbs from the Large Generating Facility when Transmission Provider requests Interconnection Customer to operate its Large Generating Facility outside the range specified in Article 9.6.1, provided that if Transmission Provider pays its own or affiliated generators for reactive power service within the specified range, it must also pay Interconnection Customer. Payments shall be pursuant to Article 11.6 or such other agreement to which the Parties have otherwise agreed.

9.6.4 Primary Frequency Response. Interconnection Customer shall ensure the primary frequency response capability of its Large Generating Facility by installing, maintaining, and operating a functioning governor or equivalent controls. The term “functioning governor or equivalent controls” as used herein shall mean the required hardware and/or software that provides frequency responsive real power control with the ability to sense changes in system frequency and autonomously adjust the Large Generating Facility’s real power output in accordance with the droop and deadband parameters and in the direction needed to correct frequency deviations. Interconnection Customer is required to install a governor or equivalent controls with the capability of operating: (1) with a maximum 5 percent droop and ±0.036 Hz deadband; or (2) in accordance with the relevant droop, deadband, and timely and sustained response settings from an approved NERC Reliability Standard providing for equivalent or more stringent parameters. The droop characteristic shall be: (1) based on the nameplate capacity of the Large Generating Facility, and shall be linear in the range of frequencies between 59 to 61 Hz that are outside of the deadband parameter; or (2) based an approved NERC Reliability Standard providing for an equivalent or more stringent parameter. The deadband parameter shall be: the range of frequencies above and below nominal (60 Hz) in which the governor or equivalent controls is not expected to adjust the Large Generating Facility’s real power output in response to frequency deviations. The deadband shall be implemented: (1) without a step to the droop curve, that is, once the frequency deviation exceeds the deadband parameter, the expected change in the Large Generating Facility’s real power output in response to frequency deviations shall start from zero and then increase (for under-frequency deviations) or decrease (for over-frequency deviations) linearly in proportion to the magnitude of the frequency deviation; or (2) in accordance with an approved NERC

Reliability Standard providing for an equivalent or more stringent parameter. Interconnection Customer shall notify Transmission Provider that the primary frequency response capability of the Large Generating Facility has been tested and confirmed during commissioning. Once Interconnection Customer has synchronized the Large Generating Facility with the Transmission System, Interconnection Customer shall operate the Large Generating Facility consistent with the provisions specified in Sections 9.6.4.1 and 9.6.4.2 of this Agreement. The primary frequency response requirements contained herein shall apply to both synchronous and non-synchronous Large Generating Facilities.

9.6.4.1 Governor or Equivalent Controls. Whenever the Large Generating Facility is operated in parallel with the Transmission System, Interconnection Customer shall operate the Large Generating Facility with its governor or equivalent controls in service and responsive to frequency. Interconnection Customer shall: (1) in coordination with Transmission Provider and/or the relevant balancing authority, set the deadband parameter to: (1) a maximum of ±0.036 Hz and set the droop parameter to a maximum of 5 percent; or (2) implement the relevant droop and deadband settings from an approved NERC Reliability Standard that provides for equivalent or more stringent parameters. Interconnection Customer shall be required to provide the status and settings of the governor or equivalent controls to Transmission Provider and/or the relevant balancing authority upon request. If Interconnection

Customer needs to operate the Large Generating Facility with its governor or equivalent controls not in service, Interconnection Customer shall immediately notify Transmission Provider and the relevant balancing authority, and provide both with the following information: (1) the operating status of the governor or equivalent controls (i.e., whether it is currently out of service or when it will be taken out of service); (2) the reasons for removing the governor or equivalent controls from service; and (3) a reasonable estimate of when the governor or equivalent controls will be returned to service. Interconnection Customer shall make Reasonable Efforts to return its governor or equivalent controls into service as soon as practicable. Interconnection Customer shall make Reasonable Efforts to keep outages of the Large Generating Facility's governor or equivalent controls to a minimum whenever the Large Generating Facility is operated in parallel with the Transmission System.

9.6.4.2 Timely and Sustained Response. Interconnection Customer shall ensure that the Large Generating Facility's real power response to sustained frequency deviations outside of the deadband setting is automatically provided and shall begin immediately after frequency deviates outside of the deadband, and to the extent the Large Generating Facility has operating capability in the direction needed to correct the frequency deviation. Interconnection Customer shall not block or otherwise inhibit the ability of the governor or equivalent controls to respond and shall ensure that the response is not inhibited, except under certain operational constraints including, but not limited to, ambient temperature limitations, physical energy limitations, outages of mechanical equipment, or regulatory requirements. The Large Generating Facility shall sustain the real power response at least until system frequency returns to a value within the deadband setting of the governor or equivalent controls. A Commission-approved Reliability Standard with equivalent or more stringent requirements shall supersede the above requirements.

9.6.4.3 Exemptions. Large Generating Facilities that are regulated by the United States Nuclear Regulatory Commission shall be exempt from Sections 9.6.4, 9.6.4.1, and 9.6.4.2 of this Agreement. Large Generating Facilities that are behind the meter generation that is sized-to-load (i.e., the thermal load and the generation are near-balanced in real-time operation and the generation is primarily controlled to maintain the unique thermal, chemical, or mechanical output necessary for the operating requirements of its host facility) shall be required to install primary frequency response capability in accordance with the droop and deadband capability requirements specified in Section 9.6.4, but shall be otherwise exempt from the operating requirements in Sections 9.6.4, 9.6.4.1, 9.6.4.2, and 9.6.4.4 of this Agreement.

9.6.4.4 Electric Storage Resources. Interconnection Customer interconnecting an electric storage resource shall establish an operating range in Appendix C of its LGIA that specifies a minimum state of charge and a maximum state of charge between which the electric storage resource will be required to provide primary frequency response consistent with the conditions set forth in Sections 9.6.4, 9.6.4.1, 9.6.4.2, and 9.6.4.3 of this Agreement. Appendix C shall specify whether the operating range is static or dynamic, and shall consider (1) the expected magnitude of frequency deviations in the interconnection; (2) the expected duration that system frequency will remain outside of the deadband parameter in the interconnection; (3) the expected incidence of frequency deviations outside of the deadband parameter in the interconnection; (4) the physical capabilities of the electric storage resource; (5) operational limitations of the electric storage resource due to manufacturer specifications; and (6) any other relevant factors agreed to by Transmission Provider and Interconnection Customer, and in consultation with the relevant transmission owner or balancing authority as appropriate. If the operating range is dynamic, then Appendix C must establish how frequently the operating range will be reevaluated and the factors that may be considered during its reevaluation.

Interconnection Customer’s electric storage resource is required to provide timely and sustained primary frequency response consistent with Section 9.6.4.2 of this Agreement when it is online and dispatched to inject electricity to the Transmission System and/or receive electricity from the Transmission System. This excludes circumstances when the electric storage resource is not dispatched to inject electricity to the Transmission System and/or dispatched to receive electricity from the Transmission System. If Interconnection Customer’s electric storage resource is charging at the time of a frequency deviation outside of its deadband parameter, it is to increase (for over-frequency deviations) or decrease (for under-frequency deviations) the rate at which it is charging in accordance with its droop parameter. Interconnection Customer’s electric storage resource is not required to change from charging to discharging, or vice versa, unless the response necessitated by the droop and deadband settings requires it to do so and it is technically capable of making such a transition.

9.7 Outages and Interruptions.

9.7.1 Outages.

9.7.1.1 Outage Authority and Coordination. Each Party may in accordance with Good Utility Practice in coordination with the other Party remove from service any of its respective Interconnection Facilities or Network Upgrades that may impact the other Party's facilities as necessary to perform maintenance or testing or to install or replace equipment. Absent an Emergency Condition, the Party scheduling a removal of such facility(ies) from service will use Reasonable Efforts to schedule such removal on a date and time mutually acceptable to the Parties. In all circumstances, any Party planning to remove such facility(ies) from service shall use Reasonable Efforts to minimize the effect on the other Party of such removal.

9.7.1.2 Outage Schedules. Transmission Provider shall post scheduled outages of its transmission facilities on the OASIS. Interconnection Customer shall submit its planned maintenance schedules for the Large Generating Facility to Transmission Provider for a minimum of a rolling twenty-four month period. Interconnection Customer shall update its planned maintenance schedules as necessary. Transmission Provider may request Interconnection Customer to reschedule its maintenance as necessary to maintain the reliability of the Transmission System; provided, however, adequacy of generation supply shall not be a criterion in determining Transmission System reliability. Transmission Provider shall compensate Interconnection Customer for any additional direct costs that Interconnection Customer incurs as a result of having to reschedule maintenance, including any additional overtime, breaking of maintenance contracts or other costs above and beyond the cost Interconnection Customer would have incurred absent Transmission Provider's request to reschedule maintenance. Interconnection Customer will not be eligible to receive compensation, if during the twelve (12) months prior to the date of the scheduled maintenance, Interconnection Customer had modified its schedule of maintenance activities.

9.7.1.3 Outage Restoration. If an outage on a Party's Interconnection Facilities or Network Upgrades adversely affects the other Party's operations or facilities, the Party that owns or controls the facility that is out of service shall use Reasonable Efforts to promptly restore such facility(ies) to a normal operating condition consistent with the nature of the outage. The Party that owns or controls the facility that is out of service shall provide the other Party, to the extent such information is known, information on the nature of the Emergency Condition, an estimated time of restoration, and any corrective actions required. Initial verbal notice shall be followed up as soon as practicable with written notice explaining the nature of the outage.

9.7.2 **Interruption of Service.** If required by Good Utility Practice to do so, Transmission Provider may require Interconnection Customer to interrupt or reduce deliveries of electricity if such delivery of electricity could adversely affect Transmission Provider's ability to perform such activities as are necessary to safely and reliably operate and maintain the Transmission System. The following provisions shall apply to any interruption or reduction permitted under this Article 9.7.2:

9.7.2.1 The interruption or reduction shall continue only for so long as reasonably necessary under Good Utility Practice;

9.7.2.2 Any such interruption or reduction shall be made on an equitable, non-discriminatory basis with respect to all generating facilities directly connected to the Transmission System;

9.7.2.3 When the interruption or reduction must be made under circumstances which do not allow for advance notice, Transmission Provider shall notify Interconnection Customer by telephone as soon as practicable of the reasons for the curtailment, interruption, or reduction, and, if known, its expected duration. Telephone notification shall be followed by written notification as soon as practicable;

9.7.2.4 Except during the existence of an Emergency Condition, when the interruption or reduction can be scheduled without advance notice, Transmission Provider shall notify Interconnection Customer in advance regarding the timing of such scheduling and further notify Interconnection Customer of the expected duration. Transmission Provider shall coordinate with Interconnection Customer using Good Utility Practice to schedule the interruption or reduction during periods of least impact to Interconnection Customer and Transmission Provider;

9.7.2.5 The Parties shall cooperate and coordinate with each other to the extent necessary in order to restore the Large Generating Facility, Interconnection Facilities, and the Transmission System to their normal operating state, consistent with system conditions and Good Utility Practice.

9.7.3 **Under-Frequency and Over Frequency Conditions.** The Transmission System is designed to automatically activate a load-shed program as required by the Applicable Reliability Council in the event of an under-frequency system disturbance. Interconnection Customer shall implement under-frequency and over-frequency relay set points for the Large Generating Facility as required by the Applicable Reliability Council to ensure "ride through" capability of the Transmission System. Large Generating Facility response to frequency deviations of pre-determined magnitudes, both under-frequency and over-frequency deviations, shall be studied and coordinated with Transmission Provider in accordance with Good Utility Practice. The term "ride through" as used herein shall mean the ability of a Generating Facility to stay connected to and synchronized with the Transmission System during system disturbances within a range of under-frequency and over-frequency conditions, in accordance with Good Utility Practice.

9.7.4 System Protection and Other Control Requirements.

9.7.4.1 System Protection Facilities. Interconnection Customer shall, at its expense, install, operate and maintain System Protection Facilities as a part of the Large Generating Facility or Interconnection Customer's Interconnection Facilities. Transmission Provider shall install at Interconnection Customer's expense any System Protection Facilities that may be required on Transmission Provider's Interconnection Facilities or the Transmission System as a result of the interconnection of the Large Generating Facility and Interconnection Customer's Interconnection Facilities.

9.7.4.2 Each Party's protection facilities shall be designed and coordinated with other systems in accordance with Good Utility Practice.

9.7.4.3 Each Party shall be responsible for protection of its facilities consistent with Good Utility Practice.

9.7.4.4 Each Party's protective relay design shall incorporate the necessary test switches to perform the tests required in

Article 6. The required test switches will be placed such that they allow operation of lockout relays while preventing breaker failure schemes from operating and causing unnecessary breaker operations and/or the tripping of Interconnection Customer's units.

9.7.4.5 Each Party will test, operate and maintain System Protection Facilities in accordance with Good Utility Practice.

9.7.4.6 Prior to the In-Service Date, and again prior to the Commercial Operation Date, each Party or its agent shall perform a complete calibration test and functional trip test of the System Protection Facilities. At intervals suggested by Good Utility Practice and following any apparent malfunction of the System Protection Facilities, each Party shall perform both calibration and functional trip tests of its System Protection Facilities. These tests do not require the tripping of any in-service generation unit. These tests do, however, require that all protective relays and lockout contacts be activated.

9.7.5 Requirements for Protection. In compliance with Good Utility Practice, Interconnection Customer shall provide, install, own, and maintain relays, circuit breakers and all other devices necessary to remove any fault contribution of the Large Generating Facility to any short circuit occurring on the Transmission System not otherwise isolated by Transmission Provider's equipment, such that the removal of the fault contribution shall be coordinated with the protective requirements of the Transmission System. Such protective equipment shall include, without limitation, a disconnecting device or switch with load-interrupting capability located between the Large Generating Facility and the Transmission System at a site selected upon mutual agreement (not to be unreasonably withheld, conditioned or delayed) of the Parties. Interconnection Customer shall be responsible for protection of the Large Generating Facility and Interconnection Customer's other equipment from such conditions as negative sequence currents, over- or under-frequency, sudden load rejection, over- or under-voltage, and generator loss-of-field. Interconnection Customer shall be solely responsible to disconnect the Large Generating Facility and Interconnection Customer's other equipment if conditions on the Transmission System could adversely affect the Large Generating Facility.

9.7.6 Power Quality. Neither Party's facilities shall cause excessive voltage flicker nor introduce excessive distortion to the sinusoidal voltage or current waves as defined by ANSI Standard C84.1-1989, in accordance with IEEE Standard 519, or any applicable superseding electric industry standard. In the event of a conflict between ANSI Standard C84.1-1989, or any applicable superseding electric industry standard, ANSI Standard C84.1-1989, or the applicable superseding electric industry standard, shall control.

9.8 Switching and Tagging Rules. Each Party shall provide the other Party a copy of its switching and tagging rules that are applicable to the other Party's activities. Such switching and tagging rules shall be developed on a non-discriminatory basis. The Parties shall comply with applicable switching and tagging rules, as amended from time to time, in

obtaining clearances for work or for switching operations on equipment.

9.9 Use of Interconnection Facilities by Third Parties.

9.9.1 Purpose of Interconnection Facilities. Except as may be required by Applicable Laws and Regulations, or as otherwise agreed to among the Parties, the Interconnection Facilities shall be constructed for the sole purpose of interconnecting the Large Generating Facility to the Transmission System and shall be used for no other purpose.

9.9.2 Third Party Users. If required by Applicable Laws and Regulations or if the Parties mutually agree, such agreement not to be unreasonably withheld, to allow one or more third parties to use Transmission Provider's Interconnection Facilities, or any part thereof, Interconnection Customer will be entitled to compensation for the capital expenses it incurred in connection with the Interconnection Facilities based upon the pro rata use of the Interconnection Facilities by Transmission Provider, all third party users, and Interconnection Customer, in accordance with Applicable Laws and Regulations or upon some other mutually-agreed upon methodology. In addition, cost responsibility for ongoing costs, including operation and maintenance costs associated with the Interconnection Facilities, will be allocated between Interconnection Customer and any third party users based upon the pro rata use of the Interconnection Facilities by Transmission Provider, all third party users, and Interconnection Customer, in accordance with Applicable Laws and Regulations or upon some other mutually agreed upon methodology. If the issue of such compensation or allocation cannot be resolved through such negotiations, it shall be submitted to FERC for resolution.

9.10 Disturbance Analysis Data Exchange. The Parties will cooperate with one another in the analysis of disturbances to either the Large Generating Facility or Transmission Provider's Transmission System by gathering and providing access to any information relating to any disturbance, including information from oscillography, protective relay targets, breaker operations and sequence of events records, and any disturbance information required by Good Utility Practice.

Article 10. Maintenance

10.1 Transmission Provider Obligations. Transmission Provider shall maintain the Transmission System and Transmission Provider's Interconnection Facilities in a safe and reliable manner and in accordance with this LGIA.

10.2 Interconnection Customer Obligations. Interconnection Customer shall maintain the Large Generating Facility and Interconnection Customer's Interconnection Facilities in a safe and reliable manner and in accordance with this LGIA.

10.3 Coordination. The Parties shall confer regularly to coordinate the planning, scheduling and performance of preventive and corrective maintenance on the Large Generating Facility and the Interconnection Facilities.

10.4 Secondary Systems. Each Party shall cooperate with the other in the inspection, maintenance, and testing of control or power circuits that operate below 600 volts, AC or DC, including, but not limited to, any hardware, control or protective devices, cables, conductors, electric raceways, secondary equipment panels, transducers, batteries, chargers, and voltage and current transformers that directly affect the operation of a Party's facilities and equipment which may reasonably be expected to impact the other Party. Each Party shall provide advance notice to the other Party before undertaking any work on such circuits, especially on electrical circuits involving circuit

breaker trip and close contacts, current transformers, or potential transformers.

10.5 Operating and Maintenance Expenses. Subject to the provisions herein addressing the use of facilities by others, and except for operations and maintenance expenses associated with modifications made for providing interconnection or transmission service to a third party and such third party pays for such expenses, Interconnection Customer shall be responsible for all reasonable expenses including overheads, associated with: (1) owning, operating, maintaining, repairing, and replacing Interconnection Customer's Interconnection Facilities; and (2) operation, maintenance, repair and replacement of Transmission Provider's Interconnection Facilities.

Article 11. Performance Obligation

11.1 Interconnection Customer Interconnection Facilities. Interconnection Customer shall design, procure, construct, install, own and/or control Interconnection Customer Interconnection Facilities described in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades, at its sole expense.

11.2 Transmission Provider's Interconnection Facilities. Transmission Provider or Transmission Owner shall design, procure, construct, install, own and/or control the Transmission Provider's Interconnection Facilities described in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades, at the sole expense of the Interconnection Customer.

11.3 Network Upgrades and Distribution Upgrades. Transmission Provider or Transmission Owner shall design, procure, construct, install, and own the Network Upgrades and Distribution Upgrades described in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades. The Interconnection Customer shall be responsible for all costs related to Distribution Upgrades. Unless Transmission Provider or Transmission Owner elects to fund the capital for the Network Upgrades, they shall

be solely funded by Interconnection Customer. In the event that Transmission Provider must change the voltage levels of a discrete portion of the Transmission System to which the Interconnection Customer is connected, Transmission Provider shall give reasonable notice of such change and the Interconnection Customer shall be solely responsible for all costs related to upgrades or modifications to Interconnection Customer's Interconnection Facilities resulting from Transmission Provider's increase in the voltage levels of the Transmission System, in order to remain interconnected with the Transmission System at the new operating voltage. To the extent that the modifications necessary to upgrade Interconnection Facilities qualify as Network Upgrades, Transmission Provider shall be solely responsible for the expense of such modifications or upgrades.

11.4 Transmission Credits.

11.4.1 Repayment of Amounts Advanced for Network Upgrades. Interconnection Customer shall be entitled to a cash repayment, equal to the total amount paid to Transmission Provider and Affected System Operator, if any, for the Network Upgrades, including any tax gross-up or other tax-related payments associated with Network Upgrades, and not refunded to Interconnection Customer pursuant to Article 5.17.8 or otherwise, to be paid to Interconnection Customer on a dollar-for-dollar basis for the non-usage sensitive portion of transmission charges, as payments are made under Transmission Provider's Tariff and Affected System's Tariff for transmission services with respect to the Large Generating Facility. Any repayment shall include interest calculated in accordance with the methodology set forth in FERC=s regulations at 18 C.F.R. § 35.19a(a)(2)(iii) from the date of any payment for Network Upgrades through the date on which the Interconnection Customer receives a repayment of such payment pursuant to this subparagraph.

Interconnection Customer may assign such repayment rights to any person.

Notwithstanding the foregoing, Interconnection Customer, Transmission Provider, and Affected System Operator may adopt any alternative payment schedule that is mutually agreeable so long as Transmission Provider and Affected System Operator take one of the following actions no later than five years from the Commercial Operation Date: (1) return to Interconnection Customer any amounts advanced for Network Upgrades not previously repaid, or (2) declare in writing that Transmission Provider or Affected System Operator will continue to provide payments to Interconnection Customer on a dollar-for-dollar basis for the non-usage sensitive portion of transmission charges, or develop an alternative schedule that is mutually agreeable and provides for the return of all amounts advanced for Network Upgrades not previously repaid; however, full reimbursement shall not extend beyond twenty (20) years from the Commercial Operation Date.

If the Large Generating Facility fails to achieve commercial operation, but it or another Generating Facility is later constructed and makes use of the Network Upgrades, Transmission Provider and Affected System Operator shall at that time reimburse Interconnection Customer for the amounts advanced for the Network Upgrades. Before any such reimbursement can occur, the Interconnection Customer, or the entity that ultimately constructs the Generating Facility, if different, is responsible for identifying the entity to which reimbursement must be made.

11.4.2 Special Provisions for Affected Systems. Unless Transmission Provider provides, under the LGIA, for the repayment of

amounts advanced to Affected System Operator for Network Upgrades, Interconnection Customer and Affected System Operator shall enter into an agreement that provides for such repayment. The agreement shall specify the terms governing payments to be made by Interconnection Customer to the Affected System Operator as well as the repayment by the Affected System Operator.

11.4.3 Notwithstanding any other provision of this LGIA, nothing herein shall be construed as relinquishing or foreclosing any rights, including but not limited to firm transmission rights, capacity rights, transmission congestion rights, or transmission credits, that Interconnection Customer, shall be entitled to, now or in the future under any other agreement or tariff as a result of, or otherwise associated with, the transmission capacity, if any, created by the Network Upgrades, including the right to obtain cash reimbursements or transmission credits for transmission service that is not associated with the Large Generating Facility.

11.5 Provision of Security. At least thirty (30) Calendar Days prior to the commencement of the first of the following to occur: design, procurement, installation, or construction of a discrete portion of a Transmission Provider's Interconnection Facilities, Network Upgrades, or Distribution Upgrades, Interconnection Customer shall provide Transmission Provider, at Interconnection Customer's option, a guarantee, a surety bond, letter of credit or other form of security that is reasonably acceptable to Transmission Provider and is consistent with the Uniform Commercial Code of the jurisdiction identified in Article 14.2.1. Such security for payment shall be in an amount sufficient to cover the costs for constructing, designing, procuring, and installing the applicable portion of Transmission Provider's Interconnection Facilities, Network Upgrades, or Distribution Upgrades and shall be

reduced on a dollar-for-dollar basis for payments made to Transmission Provider for these purposes.

In addition:

11.5.1 The guarantee must be made by an entity that meets the creditworthiness requirements of Transmission Provider, and contain terms and conditions that guarantee payment of any amount that may be due from Interconnection Customer, up to an agreed-to maximum amount.

11.5.2 The letter of credit must be issued by a financial institution reasonably acceptable to Transmission Provider and must indicate that it would only expire upon final payment made to Transmission Provider to cover all relevant costs for designing, procuring, installing, and constructing the applicable portion of Interconnection Facilities, Network Upgrades, or Distribution Upgrades for which the letter of credit was provided.

11.5.3 The surety bond must be issued by an insurer reasonably acceptable to Transmission Provider and must indicate that it would only expire upon final payment made to Transmission Provider to cover all relevant costs for designing, procuring, installing, and constructing the applicable portion of Interconnection Facilities, Network Upgrades, or Distribution Upgrades for which the surety bond was provided.

11.6 Interconnection Customer Compensation. If Transmission Provider requests or directs Interconnection Customer to provide a service pursuant to Articles 9.6.3 (Payment for Reactive Power), or 13.5.1 of this LGIA, Transmission Provider shall compensate Interconnection Customer in accordance with Interconnection Customer's applicable rate schedule then in effect unless the provision of such service(s) is subject to an RTO or ISO FERC-approved rate schedule. Interconnection Customer

shall serve Transmission Provider or RTO or ISO with any filing of a proposed rate schedule at the time of such filing with FERC. To the extent that no rate schedule is in effect at the time the Interconnection Customer is required to provide or absorb any Reactive Power under this LGIA, Transmission Provider agrees to compensate Interconnection Customer in such amount as would have been due Interconnection Customer had the rate schedule been in effect at the time service commenced; provided, however, that such rate schedule must be filed at FERC or other appropriate Governmental Authority within sixty (60) Calendar Days of the commencement of service.

11.6.1 Interconnection Customer Compensation for Actions During Emergency Condition. Transmission Provider or RTO or ISO shall compensate Interconnection Customer for its provision of real and reactive power and other Emergency Condition services that Interconnection Customer provides to support the Transmission System during an Emergency Condition in accordance with Article 11.6.

Article 12. Invoice

12.1 General. Each Party shall submit to the other Party, on a monthly basis, invoices of amounts due for the preceding month. Each invoice shall state the month to which the invoice applies and fully describe the services and equipment provided. The Parties may discharge mutual debts and payment obligations due and owing to each other on the same date through netting, in which case all amounts a Party owes to the other Party under this LGIA, including interest payments or credits, shall be netted so that only the net amount remaining due shall be paid by the owing Party.

12.2 Final Invoice. Within six months after completion of the construction of Transmission Provider's Interconnection Facilities and the Network Upgrades, Transmission Provider shall provide an invoice of the final cost of the construction of Transmission Provider's Interconnection Facilities and the Network Upgrades and shall set forth such costs in sufficient

detail to enable Interconnection Customer to compare the actual costs with the estimates and to ascertain deviations, if any, from the cost estimates. Transmission Provider shall refund to Interconnection Customer any amount by which the actual payment by Interconnection Customer for estimated costs exceeds the actual costs of construction within thirty (30) Calendar Days of the issuance of such final construction invoice.

12.3 Payment. Invoices shall be rendered to the paying Party at the address specified in Appendix F. The Party receiving the invoice shall pay the invoice within thirty (30) Calendar Days of receipt. All payments shall be made in immediately available funds payable to the other Party, or by wire transfer to a bank named and account designated by the invoicing Party. Payment of invoices by either Party will not constitute a waiver of any rights or claims either Party may have under this LGIA.

12.4 Disputes. In the event of a billing dispute between Transmission Provider and Interconnection Customer, Transmission Provider shall continue to provide Interconnection Service under this LGIA as long as Interconnection Customer: (i) continues to make all payments not in dispute; and (ii) pays to Transmission Provider or into an independent escrow account the portion of the invoice in dispute, pending resolution of such dispute. If Interconnection Customer fails to meet these two requirements for continuation of service, then Transmission Provider may provide notice to Interconnection Customer of a Default pursuant to Article 17. Within thirty (30) Calendar Days after the resolution of the dispute, the Party that owes money to the other Party shall pay the amount due with interest calculated in accord with the methodology set forth in FERC's regulations at 18 CFR § 35.19a(a)(2)(iii).

Article 13. Emergencies

13.1 Definition. "Emergency Condition" shall mean a condition or situation: (i) that in the judgment of the Party making the claim is imminently likely to endanger life or property; or (ii) that, in the case

of Transmission Provider, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to the Transmission System, Transmission Provider's Interconnection Facilities or the Transmission Systems of others to which the Transmission System is directly connected; or (iii) that, in the case of Interconnection Customer, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to, the Large Generating Facility or Interconnection Customer's Interconnection Facilities' System restoration and black start shall be considered Emergency Conditions; provided, that Interconnection Customer is not obligated by this LGIA to possess black start capability.

13.2 Obligations. Each Party shall comply with the Emergency Condition procedures of the applicable ISO/RTO, NERC, the Applicable Reliability Council, Applicable Laws and Regulations, and any emergency procedures agreed to by the Joint Operating Committee.

13.3 Notice. Transmission Provider shall notify Interconnection Customer promptly when it becomes aware of an Emergency Condition that affects Transmission Provider's Interconnection Facilities or the Transmission System that may reasonably be expected to affect Interconnection Customer's operation of the Large Generating Facility or Interconnection Customer's Interconnection Facilities. Interconnection Customer shall notify Transmission Provider promptly when it becomes aware of an Emergency Condition that affects the Large Generating Facility or Interconnection Customer's Interconnection Facilities that may reasonably be expected to affect the Transmission System or Transmission Provider's Interconnection Facilities. To the extent information is known, the notification shall describe the Emergency Condition, the extent of the damage or deficiency, the expected effect on the operation of Interconnection Customer's or Transmission Provider's facilities and operations, its anticipated duration and the corrective action taken and/or to be taken. The initial notice shall

be followed as soon as practicable with written notice.

13.4 Immediate Action. Unless, in Interconnection Customer's reasonable judgment, immediate action is required, Interconnection Customer shall obtain the consent of Transmission Provider, such consent to not be unreasonably withheld, prior to performing any manual switching operations at the Large Generating Facility or Interconnection Customer's Interconnection Facilities in response to an Emergency Condition either declared by Transmission Provider or otherwise regarding the Transmission System.

13.5 Transmission Provider Authority.

13.5.1 General. Transmission Provider may take whatever actions or inactions with regard to the Transmission System or Transmission Provider's Interconnection Facilities it deems necessary during an Emergency Condition in order to (i) preserve public health and safety, (ii) preserve the reliability of the Transmission System or Transmission Provider's Interconnection Facilities, (iii) limit or prevent damage, and (iv) expedite restoration of service.

Transmission Provider shall use Reasonable Efforts to minimize the effect of such actions or inactions on the Large Generating Facility or Interconnection Customer's Interconnection Facilities. Transmission Provider may, on the basis of technical considerations, require the Large Generating Facility to mitigate an Emergency Condition by taking actions necessary and limited in scope to remedy the Emergency Condition, including, but not limited to, directing Interconnection Customer to shut-down, start-up, increase or decrease the real or reactive power output of the Large Generating Facility; implementing a

reduction or disconnection pursuant to Article 13.5.2; directing Interconnection Customer to assist with blackstart (if available) or restoration efforts; or altering the outage schedules of the Large Generating Facility and Interconnection Customer's Interconnection Facilities. Interconnection Customer shall comply with all of Transmission Provider's operating instructions concerning Large Generating Facility real power and reactive power output within the manufacturer's design limitations of the Large Generating Facility's equipment that is in service and physically available for operation at the time, in compliance with Applicable Laws and Regulations.

13.5.2 Reduction and Disconnection. Transmission Provider may reduce Interconnection Service or disconnect the Large Generating Facility or Interconnection Customer's Interconnection Facilities, when such, reduction or disconnection is necessary under Good Utility Practice due to Emergency Conditions. These rights are separate and distinct from any right of curtailment of Transmission Provider pursuant to Transmission Provider's Tariff. When Transmission Provider can schedule the reduction or disconnection in advance, Transmission Provider shall notify Interconnection Customer of the reasons, timing and expected duration of the reduction or disconnection. Transmission Provider shall coordinate with Interconnection Customer using Good Utility Practice to schedule the reduction or disconnection during periods of least impact to Interconnection Customer and Transmission Provider. Any reduction or disconnection shall continue only for so long as reasonably necessary under Good Utility Practice. The Parties shall cooperate with each other to restore the Large Generating Facility, the Interconnection Facilities, and the Transmission System to their normal

operating state as soon as practicable consistent with Good Utility Practice.

13.6 Interconnection Customer Authority. Consistent with Good Utility Practice and the LGIA and the LGIP, Interconnection Customer may take actions or inactions with regard to the Large Generating Facility or Interconnection Customer's Interconnection Facilities during an Emergency Condition in order to (i) preserve public health and safety, (ii) preserve the reliability of the Large Generating Facility or Interconnection Customer's Interconnection Facilities, (iii) limit or prevent damage, and (iv) expedite restoration of service. Interconnection Customer shall use Reasonable Efforts to minimize the effect of such actions or inactions on the Transmission System and Transmission Provider's Interconnection Facilities. Transmission Provider shall use Reasonable Efforts to assist Interconnection Customer in such actions.

13.7 Limited Liability. Except as otherwise provided in Article 11.6.1 of this LGIA, neither Party shall be liable to the other for any action it takes in responding to an Emergency Condition so long as such action is made in good faith and is consistent with Good Utility Practice.

Article 14. Regulatory Requirements and Governing Law

14.1 Regulatory Requirements. Each Party's obligations under this LGIA shall be subject to its receipt of any required approval or certificate from one or more Governmental Authorities in the form and substance satisfactory to the applying Party, or the Party making any required filings with, or providing notice to, such Governmental Authorities, and the expiration of any time period associated therewith. Each Party shall in good faith seek and use its Reasonable Efforts to obtain such other approvals. Nothing in this LGIA shall require Interconnection Customer to take any action that could result in its inability to obtain, or its loss of, status or exemption under the Federal Power Act, the Public Utility Holding Company

Act of 1935, as amended, or the Public Utility Regulatory Policies Act of 1978.

14.2 Governing Law.

14.2.1 The validity, interpretation and performance of this LGIA and each of its provisions shall be governed by the laws of the state where the Point of Interconnection is located, without regard to its conflicts of law principles.

14.2.2 This LGIA is subject to all Applicable Laws and Regulations.

14.2.3 Each Party expressly reserves the right to seek changes in, appeal, or otherwise contest any laws, orders, rules, or regulations of a Governmental Authority.

Article 15. Notices.

15.1 General. Unless otherwise provided in this LGIA, any notice, demand or request required or permitted to be given by either Party to the other and any instrument required or permitted to be tendered or delivered by either Party in writing to the other shall be effective when delivered and may be so given, tendered or delivered, by recognized national courier, or by depositing the same with the United States Postal Service with postage prepaid, for delivery by certified or registered mail, addressed to the Party, or personally delivered to the Party, at the address set out in Appendix F, Addresses for Delivery of Notices and Billings.

Either Party may change the notice information in this LGIA by giving five (5) Business Days written notice prior to the effective date of the change.

15.2 Billings and Payments. Billings and payments shall be sent to the addresses set out in Appendix F.

15.3 Alternative Forms of Notice. Any notice or request required or permitted to be given by a Party to the other and not required by this Agreement to be given

in writing may be so given by telephone, facsimile or email to the telephone numbers and email addresses set out in Appendix F.

15.4 Operations and Maintenance Notice. Each Party shall notify the other Party in writing of the identity of the person(s) that it designates as the point(s) of contact with respect to the implementation of Articles 9 and 10.

Article 16. Force Majeure

16.1 Force Majeure.

16.1.1 Economic hardship is not considered a Force Majeure event.

16.1.2 Neither Party shall be considered to be in Default with respect to any obligation hereunder, (including obligations under Article 4), other than the obligation to pay money when due, if prevented from fulfilling such obligation by Force Majeure. A Party unable to fulfill any obligation hereunder (other than an obligation to pay money when due) by reason of Force Majeure shall give notice and the full particulars of such Force Majeure to the other Party in writing or by telephone as soon as reasonably possible after the occurrence of the cause relied upon. Telephone notices given pursuant to this article shall be confirmed in writing as soon as reasonably possible and shall specifically state full particulars of the Force Majeure, the time and date when the Force Majeure occurred and when the Force Majeure is reasonably expected to cease. The Party affected shall exercise due diligence to remove such disability with reasonable dispatch, but shall not be required to accede or agree to any provision not satisfactory to it in order to settle and terminate a strike or other labor disturbance.

Article 17. Default

17.1 Default

17.1.1 General. No Default shall exist where such failure to discharge an obligation (other than the payment of money) is the result of Force Majeure as defined in this LGIA or the result of an act of omission of the other Party. Upon a Breach, the non-breaching Party shall give written notice of such Breach to the breaching Party. Except as provided in Article 17.1.2, the breaching Party shall have thirty (30) Calendar Days from receipt of the Default notice within which to cure such Breach; provided however, if such Breach is not capable of cure within thirty (30) Calendar Days, the breaching Party shall commence such cure within thirty (30) Calendar Days after notice and continuously and diligently complete such cure within ninety (90) Calendar Days from receipt of the Default notice; and, if cured within such time, the Breach specified in such notice shall cease to exist.

17.1.2 Right to Terminate. If a Breach is not cured as provided in this article, or if a Breach is not capable of being cured within the period provided for herein, the non-breaching Party shall have the right to declare a Default and terminate this LGIA by written notice at any time until cure occurs, and be relieved of any further obligation hereunder and, whether or not that Party terminates this LGIA, to recover from the breaching Party all amounts due hereunder, plus all other damages and remedies to which it is entitled at law or in equity. The provisions of this article will survive termination of this LGIA.

Article 18. Indemnity, Consequential Damages and Insurance

18.1 Indemnity. The Parties shall at all times indemnify, defend, and hold the other Party harmless from, any and all damages, losses, claims, including claims and actions relating to injury to or death of any person or damage to property, demand, suits, recoveries, costs and expenses, court costs, attorney fees, and all other obligations by or to third parties, arising out of or resulting from the other Party's action or inactions of its obligations under this LGIA on behalf of the Indemnifying Party, except in cases of gross negligence or intentional wrongdoing by the Indemnified Party.

18.1.1 Indemnified Person. If an Indemnified Person is entitled to indemnification under this Article 18 as a result of a claim by a third party, and the indemnifying Party fails, after notice and reasonable opportunity to proceed under Article 18.1, to assume the defense of such claim, such Indemnified Person may at the expense of the indemnifying Party contest, settle or consent to the entry of any judgment with respect to, or pay in full, such claim.

18.1.2 Indemnifying Party. If an Indemnifying Party is obligated to indemnify and hold any Indemnified Person harmless under this Article 18, the amount owing to the Indemnified Person shall be the amount of such Indemnified Person's actual Loss, net of any insurance or other recovery.

18.1.3 Indemnity Procedures. Promptly after receipt by an Indemnified Person of any claim or notice of the commencement of any action or administrative or legal proceeding or investigation as to which the indemnity provided for in Article 18.1 may apply, the Indemnified Person shall notify the Indemnifying Party of such fact. Any failure of or delay in such notification shall not affect a Party's indemnification obligation unless such failure or delay is materially prejudicial to the indemnifying Party.

The Indemnifying Party shall have the right to assume the defense thereof with counsel designated by such Indemnifying Party and reasonably satisfactory to the Indemnified Person. If the defendants in any such action include one or more Indemnified Persons and the Indemnifying Party and if the Indemnified Person reasonably concludes that there may be legal defenses available to it and/or other Indemnified Persons which are different from or additional to those available to the Indemnifying Party, the Indemnified Person shall have the right to select separate counsel to assert such legal defenses and to otherwise participate in the defense of such action on its own behalf. In such instances, the Indemnifying Party shall only be required to pay the fees and expenses of one additional attorney to represent an Indemnified Person or Indemnified Persons having such differing or additional legal defenses.

The Indemnified Person shall be entitled, at its expense, to participate in any such action, suit or proceeding, the defense of which has been assumed by the Indemnifying Party. Notwithstanding the foregoing, the Indemnifying Party (i) shall not be entitled to assume and control the defense of any such action, suit or proceedings if and to the extent that, in the opinion of the Indemnified Person and its counsel, such action, suit or proceeding involves the potential imposition of criminal liability on the Indemnified Person, or there exists a conflict or adversity of interest between the Indemnified Person and the Indemnifying Party, in such event the Indemnifying Party shall pay the reasonable expenses of the Indemnified Person, and (ii) shall not settle or consent to the entry of any judgment in any action, suit or proceeding without the consent of the Indemnified Person, which shall not be reasonably withheld, conditioned or delayed.

18.2 Consequential Damages. Other than the Liquidated Damages heretofore described, in no event shall either Party be liable under any provision of this LGIA for any losses, damages, costs or expenses for any special, indirect, incidental, consequential, or punitive damages, including but not limited to loss of profit or revenue, loss of the use of equipment, cost of capital, cost of temporary equipment or services, whether based in whole or in part in contract, in tort, including negligence, strict liability, or any other theory of liability; provided, however, that damages for which a Party may be liable to the other Party under another agreement will not be considered to be special, indirect, incidental, or consequential damages hereunder.

18.3 Insurance. Each party shall, at its own expense, maintain in force throughout the period of this LGIA, and until released by the other Party, the following minimum insurance coverages, with insurers authorized to do business in the state where the Point of Interconnection is located:

18.3.1 Employers' Liability and Workers' Compensation Insurance providing statutory benefits in accordance with the laws and regulations of the state in which the Point of Interconnection is located.

18.3.2 Commercial General Liability Insurance including premises and operations, personal injury, broad form property damage, broad form blanket contractual liability coverage (including coverage for the contractual indemnification) products and completed operations coverage, coverage for explosion, collapse and underground hazards, independent contractors coverage, coverage for pollution to the extent normally available and punitive damages to the extent normally available and a cross liability endorsement, with minimum limits of One Million Dollars ($1,000,000) per occurrence/One Million Dollars ($1,000,000) aggregate combined single limit for personal injury, bodily injury, including death and property damage.

18.3.3 Comprehensive Automobile Liability Insurance for coverage of owned and non-owned and hired vehicles, trailers or semi-trailers designed for travel on public roads, with a minimum, combined single limit of One Million Dollars ($1,000,000) per occurrence for bodily injury, including death, and property damage.

18.3.4 Excess Public Liability Insurance over and above the Employers' Liability Commercial General Liability and Comprehensive Automobile Liability Insurance coverage, with a minimum combined single limit of Twenty Million Dollars ($20,000,000) per occurrence/Twenty Million Dollars ($20,000,000) aggregate.

18.3.5 The Commercial General Liability Insurance, Comprehensive Automobile Insurance and Excess Public Liability Insurance policies shall name the other Party, its parent, associated and Affiliate companies and their respective directors, officers, agents, servants and employees ("Other Party Group") as additional insured. All policies shall contain provisions whereby the insurers waive all rights of subrogation in accordance with the provisions of this LGIA against the Other Party Group and provide thirty (30) Calendar Days advance written notice to the Other Party Group prior to anniversary date of cancellation or any material change in coverage or condition.

18.3.6 The Commercial General Liability Insurance, Comprehensive Automobile Liability Insurance and Excess Public Liability Insurance policies shall contain provisions that specify that the policies are primary and shall apply to such extent without consideration for other policies separately carried and shall state that each insured is provided coverage as though a separate policy had been issued to each, except the insurer's liability shall not be increased beyond the amount for which the insurer would have been liable had only one insured been covered. Each Party shall be responsible for its respective deductibles or retentions.

18.3.7 The Commercial General Liability Insurance, Comprehensive Automobile Liability Insurance and Excess Public Liability Insurance policies, if written on a Claims First Made Basis, shall be maintained in full force and effect for two (2) years after termination of this LGIA, which coverage may be in the form of tail coverage or extended reporting period coverage if agreed by the Parties.

18.3.8 The requirements contained herein as to the types and limits of all insurance to be maintained by the Parties are not intended to and shall not in any manner, limit or qualify the liabilities and obligations assumed by the Parties under this LGIA.

18.3.9 Within ten (10) days following execution of this LGIA, and as soon as practicable after the end of each fiscal year or at the renewal of the insurance policy and in any event within ninety (90) days thereafter, each Party shall provide certification of all insurance required in this LGIA, executed by each insurer or by an authorized representative of each insurer.

18.3.10 Notwithstanding the foregoing, each Party may self-insure to meet the minimum insurance requirements of Articles 18.3.2 through 18.3.8 to the extent it maintains a self-insurance program; provided that, such Party's senior secured debt is rated at investment grade or better by Standard & Poor's and that its self-insurance program meets the minimum insurance requirements of Articles 18.3.2 through 18.3.8. For any period of time that a Party's senior secured debt is unrated by Standard & Poor's or is rated at less than investment grade by Standard & Poor's, such Party shall comply with the insurance requirements applicable to it under Articles 18.3.2 through 18.3.9. In the event that a Party is permitted to self-insure pursuant to this article, it shall notify the other Party that it meets the requirements to self-insure and that its self-insurance program meets the minimum insurance requirements in a manner consistent with that specified in Article 18.3.9.

18.3.11 The Parties agree to report to each other in writing as soon as practical all accidents or occurrences resulting in injuries to any person, including death, and any property damage arising out of this LGIA.

Article 19. Assignment

19.1 Assignment. With the exception of the assignment described in Appendix H, clause (d), which assignment the Transmission Provider has already consented to, this LGIA may be assigned by either Party only with the written consent of the other; provided that either Party may assign this LGIA without the consent of the other Party to any Affiliate of the assigning Party with an equal or greater credit rating and with the legal authority and operational ability to satisfy the obligations of the assigning Party under this LGIA; and provided further that Interconnection Customer shall have the right to assign this LGIA, without the consent of Transmission Provider, for collateral security purposes to aid in providing financing for the Large Generating Facility, provided that Interconnection Customer will promptly notify Transmission Provider of any such assignment. Any financing arrangement entered into by Interconnection Customer pursuant to this article will provide that prior to or upon the exercise of the secured Party's, trustee's or mortgagee's assignment rights pursuant to said arrangement, the secured creditor, the trustee or mortgagee will notify Transmission Provider of the date and particulars of any such exercise of assignment right(s), including providing the Transmission Provider with proof that it meets the requirements of Articles 11.5 and 18.3. Any attempted assignment that violates this article is void and ineffective. Any assignment under this LGIA shall not relieve a Party of its obligations, nor shall a Party's obligations be enlarged, in whole or in part, by reason thereof. Where required, consent to assignment will not be unreasonably withheld, conditioned or delayed.

Article 20. Severability

20.1 Severability. If any provision in this LGIA is finally determined to be invalid, void or unenforceable by any court or other Governmental Authority having jurisdiction, such determination shall not invalidate, void or make unenforceable any other provision, agreement or covenant of this LGIA; provided that if Interconnection Customer (or any third party, but only if such third party is not acting at the direction of Transmission Provider) seeks and obtains such a final determination with respect to any provision of the Alternate Option (Article 5.1.2), or the Negotiated Option (Article 5.1.4), then none of these provisions shall thereafter have any force or effect and the Parties' rights and obligations shall be governed solely by the Standard Option (Article 5.1.1).

Article 21. Comparability

21.1 Comparability. The Parties will comply with all applicable comparability and code of conduct laws, rules and regulations, as amended from time to time.

Article 22. Confidentiality

22.1 Confidentiality. Confidential Information shall include, without limitation, all information relating to a Party's technology, research and development, business affairs, and pricing, and any information supplied by either of the Parties to the other prior to the execution of this LGIA.

Information is Confidential Information only if it is clearly designated or marked in writing as confidential on the face of the document, or, if the information is conveyed orally or by inspection, if the Party providing the information orally informs the Party receiving the information that the information is confidential.

If requested by either Party, the other Party shall provide in writing, the basis for asserting that the information referred to in this Article 22 warrants confidential treatment, and the requesting Party may disclose such writing to the appropriate Governmental Authority. Each Party shall be responsible for the costs associated with affording confidential treatment to its information.

22.1.1 Term. During the term of this LGIA, and for a period of three (3) years after the expiration or termination of this LGIA, except as otherwise provided in this Article 22, each Party shall hold in confidence and shall not disclose to any person Confidential Information.

22.1.2 Scope. Confidential Information shall not include information that the receiving Party can demonstrate: (1) is generally available to the public other than as a result of a disclosure by the receiving Party; (2) was in the lawful possession of the receiving Party on a non-confidential basis before receiving it from the disclosing Party; (3) was supplied to the receiving Party without restriction by a third party, who, to the knowledge of the receiving Party after due inquiry, was under no obligation to the disclosing Party to keep such information confidential; (4) was independently developed by the receiving Party without reference to Confidential Information of the disclosing Party; (5) is, or becomes, publicly known, through no wrongful act or omission of the receiving Party or Breach of this LGIA; or (6) is required, in accordance with Article 22.1.7 of the LGIA, Order of Disclosure, to be disclosed by any Governmental Authority or is otherwise required to be disclosed by law or subpoena, or is necessary in any legal proceeding establishing rights and obligations under this LGIA. Information designated as Confidential Information will no longer be deemed confidential if the Party that designated the information as confidential notifies the other Party that it no longer is confidential.

22.1.3 Release of Confidential Information. Neither Party shall release or disclose Confidential Information to any other person, except to its Affiliates (limited by the Standards of Conduct requirements), subcontractors, employees, consultants, or to parties who may be or considering providing financing to or equity participation with Interconnection Customer, or to potential purchasers or assignees of Interconnection Customer, on a need-to-know basis in connection with this LGIA, unless such person has first been advised of the confidentiality provisions of this Article 22 and has agreed to comply with such provisions. Notwithstanding the foregoing, a Party providing Confidential Information to any person shall remain primarily responsible for any release of Confidential

Information in contravention of this Article 22.

22.1.4 **Rights.** Each Party retains all rights, title, and interest in the Confidential Information that each Party discloses to the other Party. The disclosure by each Party to the other Party of Confidential Information shall not be deemed a waiver by either Party or any other person or entity of the right to protect the Confidential Information from public disclosure.

22.1.5 **No Warranties.** By providing Confidential Information, neither Party makes any warranties or representations as to its accuracy or completeness. In addition, by supplying Confidential Information, neither Party obligates itself to provide any particular information or Confidential Information to the other Party nor to enter into any further agreements or proceed with any other relationship or joint venture.

22.1.6 **Standard of Care.** Each Party shall use at least the same standard of care to protect Confidential Information it receives as it uses to protect its own Confidential Information from unauthorized disclosure, publication or dissemination. Each Party may use Confidential Information solely to fulfill its obligations to the other Party under this LGIA or its regulatory requirements.

22.1.7 **Order of Disclosure.** If a court or a Government Authority or entity with the right, power, and apparent authority to do so requests or requires either Party, by subpoena, oral deposition, interrogatories, requests for production of documents, administrative order, or otherwise, to disclose Confidential Information, that Party shall provide the other Party with prompt notice of such

request(s) or requirement(s) so that the other Party may seek an appropriate protective order or waive compliance with the terms of this LGIA.

Notwithstanding the absence of a protective order or waiver, the Party may disclose such Confidential Information which, in the opinion of its counsel, the Party is legally compelled to disclose. Each Party will use Reasonable Efforts to obtain reliable assurance that confidential treatment will be accorded any Confidential Information so furnished.

22.1.8 **Termination of Agreement.** Upon termination of this LGIA for any reason, each Party shall, within ten (10) Calendar Days of receipt of a written request from the other Party, use Reasonable Efforts to destroy, erase, or delete (with such destruction, erasure, and deletion certified in writing to the other Party) or return to the other Party, without retaining copies thereof, any and all written or electronic Confidential Information received from the other Party.

22.1.9 **Remedies.** The Parties agree that monetary damages would be inadequate to compensate a Party for the other Party's Breach of its obligations under this Article 22. Each Party accordingly agrees that the other Party shall be entitled to equitable relief, by way of injunction or otherwise, if the first Party Breaches or threatens to Breach its obligations under this Article 22, which equitable relief shall be granted without bond or proof of damages, and the receiving Party shall not plead in defense that there would be an adequate remedy at law. Such remedy shall not be deemed an exclusive remedy for the Breach of this Article 22, but shall be in addition to all other remedies available at law or in equity. The Parties further acknowledge and agree that the covenants

contained herein are necessary for the protection of legitimate business interests and are reasonable in scope. No Party, however, shall be liable for indirect, incidental, or consequential or punitive damages of any nature or kind resulting from or arising in connection with this Article 22.

22.1.10 **Disclosure to FERC, its Staff, or a State.** Notwithstanding anything in this Article 22 to the contrary, and pursuant to 18 CFR section 1b.20, if FERC or its staff, during the course of an investigation or otherwise, requests information from one of the Parties that is otherwise required to be maintained in confidence pursuant to this LGIA, the Party shall provide the requested information to FERC or its staff, within the time provided for in the request for information. In providing the information to FERC or its staff, the Party must, consistent with 18 CFR section 388.112, request that the information be treated as confidential and non-public by FERC and its staff and that the information be withheld from public disclosure. Parties are prohibited from notifying the other Party to this LGIA prior to the release of the Confidential Information to FERC or its staff. The Party shall notify the other Party to the LGIA when it is notified by FERC or its staff that a request to release Confidential Information has been received by FERC, at which time either of the Parties may respond before such information would be made public, pursuant to 18 CFR section 388.112. Requests from a state regulatory body conducting a confidential investigation shall be treated in a similar manner if consistent with the applicable state rules and regulations.

22.1.11 Subject to the exception in Article 22.1.10, any information that a Party

claims is competitively sensitive, commercial or financial information under this LGIA ("Confidential Information") shall not be disclosed by the other Party to any person not employed or retained by the other Party, except to the extent disclosure is (i) required by law; (ii) reasonably deemed by the disclosing Party to be required to be disclosed in connection with a dispute between or among the Parties, or the defense of litigation or dispute; (iii) otherwise permitted by consent of the other Party, such consent not to be unreasonably withheld; or (iv) necessary to fulfill its obligations under this LGIA or as a transmission service provider or a Control Area operator including disclosing the Confidential Information to an RTO or ISO or to a regional or national reliability organization. The Party asserting confidentiality shall notify the other Party in writing of the information it claims is confidential. Prior to any disclosures of the other Party's Confidential Information under this subparagraph, or if any third party or Governmental Authority makes any request or demand for any of the information described in this subparagraph, the disclosing Party agrees to promptly notify the other Party in writing and agrees to assert confidentiality and cooperate with the other Party in seeking to protect the Confidential Information from public disclosure by confidentiality agreement, protective order or other reasonable measures.

Article 23. Environmental Releases

23.1 Each Party shall notify the other Party, first orally and then in writing, of the release of any Hazardous Substances, any asbestos or lead abatement activities, or any type of remediation activities related to the Large Generating Facility or the

Interconnection Facilities, each of which may reasonably be expected to affect the other Party. The notifying Party shall: (i) provide the notice as soon as practicable, provided such Party makes a good faith effort to provide the notice no later than twenty-four hours after such Party becomes aware of the occurrence; and (ii) promptly furnish to the other Party copies of any publicly available reports filed with any Governmental Authorities addressing such events.

Article 24. Information Requirements

24.1 Information Acquisition. Transmission Provider and Interconnection Customer shall submit specific information regarding the electrical characteristics of their respective facilities to each other as described below and in accordance with Applicable Reliability Standards.

24.2 Information Submission by Transmission Provider. The initial information submission by Transmission Provider shall occur no later than one hundred eighty (180) Calendar Days prior to Trial Operation and shall include Transmission System information necessary to allow Interconnection Customer to select equipment and meet any system protection and stability requirements, unless otherwise agreed to by the Parties. On a monthly basis Transmission Provider shall provide Interconnection Customer a status report on the construction and installation of Transmission Provider's Interconnection Facilities and Network Upgrades, including, but not limited to, the following information: (1) progress to date; (2) a description of the activities since the last report; (3) a description of the action items for the next period; and (4) the delivery status of equipment ordered.

24.3 Updated Information Submission by Interconnection Customer. The updated information submission by Interconnection Customer, including manufacturer information, shall occur no later than one hundred eighty (180) Calendar Days prior to the Trial Operation. Interconnection Customer shall submit a completed copy of the Large Generating Facility data

requirements contained in Appendix 1 to the LGIP. It shall also include any additional information provided to Transmission Provider for the Feasibility and Facilities Study. Information in this submission shall be the most current Large Generating Facility design or expected performance data. Information submitted for stability models shall be compatible with Transmission Provider standard models. If there is no compatible model, Interconnection Customer will work with a consultant mutually agreed to by the Parties to develop and supply a standard model and associated information.

If Interconnection Customer's data is materially different from what was originally provided to Transmission Provider pursuant to the Interconnection Study Agreement between Transmission Provider and Interconnection Customer, then Transmission Provider will conduct appropriate studies to determine the impact on Transmission Provider Transmission System based on the actual data submitted pursuant to this Article 24.3. The Interconnection Customer shall not begin Trial Operation until such studies are completed.

24.4 Information Supplementation. Prior to the Operation Date, the Parties shall supplement their information submissions described above in this Article 24 with any and all "as-built" Large Generating Facility information or "as-tested" performance information that differs from the initial submissions or, alternatively, written confirmation that no such differences exist. The Interconnection Customer shall conduct tests on the Large Generating Facility as required by Good Utility Practice such as an open circuit "step voltage" test on the Large Generating Facility to verify proper operation of the Large Generating Facility's automatic voltage regulator.

Unless otherwise agreed, the test conditions shall include: (1) Large Generating Facility at synchronous speed; (2) automatic voltage regulator on and in voltage control mode; and (3) a five percent change in Large Generating Facility terminal voltage initiated by a change in the voltage regulators reference voltage. Interconnection Customer shall provide validated test recordings showing the

responses of Large Generating Facility terminal and field voltages. In the event that direct recordings of these voltages is impractical, recordings of other voltages or currents that mirror the response of the Large Generating Facility's terminal or field voltage are acceptable if information necessary to translate these alternate quantities to actual Large Generating Facility terminal or field voltages is provided. Large Generating Facility testing shall be conducted and results provided to Transmission Provider for each individual generating unit in a station.

Subsequent to the Operation Date, Interconnection Customer shall provide Transmission Provider any information changes due to equipment replacement, repair, or adjustment. Transmission Provider shall provide Interconnection Customer any information changes due to equipment replacement, repair or adjustment in the directly connected substation or any adjacent Transmission Provider-owned substation that may affect Interconnection Customer's Interconnection Facilities equipment ratings, protection or operating requirements. The Parties shall provide such information no later than thirty (30) Calendar Days after the date of the equipment replacement, repair or adjustment.

Article 25. Information Access and Audit Rights

25.1 Information Access. Each Party (the "disclosing Party") shall make available to the other Party information that is in the possession of the disclosing Party and is necessary in order for the other Party to: (i) verify the costs incurred by the disclosing Party for which the other Party is responsible under this LGIA; and (ii) carry out its obligations and responsibilities under this LGIA. The Parties shall not use such information for purposes other than those set forth in this Article 25.1 and to enforce their rights under this LGIA.

25.2 Reporting of Non-Force Majeure Events. Each Party (the "notifying Party") shall notify the other Party when the notifying Party becomes aware of its inability to comply with the provisions of this LGIA for a reason other than a Force Majeure event. The

Parties agree to cooperate with each other and provide necessary information regarding such inability to comply, including the date, duration, reason for the inability to comply, and corrective actions taken or planned to be taken with respect to such inability to comply. Notwithstanding the foregoing, notification, cooperation or information provided under this article shall not entitle the Party receiving such notification to allege a cause for anticipatory breach of this LGIA.

25.3 Audit Rights. Subject to the requirements of confidentiality under Article 22 of this LGIA, each Party shall have the right, during normal business hours, and upon prior reasonable notice to the other Party, to audit at its own expense the other Party's accounts and records pertaining to either Party's performance or either Party's satisfaction of obligations under this LGIA. Such audit rights shall include audits of the other Party's costs, calculation of invoiced amounts, Transmission Provider's efforts to allocate responsibility for the provision of reactive support to the Transmission System, Transmission Provider's efforts to allocate responsibility for interruption or reduction of generation on the Transmission System, and each Party's actions in an Emergency Condition. Any audit authorized by this article shall be performed at the offices where such accounts and records are maintained and shall be limited to those portions of such accounts and records that relate to each Party's performance and satisfaction of obligations under this LGIA. Each Party shall keep such accounts and records for a period equivalent to the audit rights periods described in Article 25.4.

25.4 Audit Rights Periods.

25.4.1 Audit Rights Period for Construction-Related Accounts and Records. Accounts and records related to the design, engineering, procurement, and construction of Transmission Provider's Interconnection Facilities and Network Upgrades shall be subject to audit for a period of twenty-four months following Transmission

Provider's issuance of a final invoice in accordance with Article 12.2.

25.4.2 Audit Rights Period for All Other Accounts and Records. Accounts and records related to either Party's performance or satisfaction of all obligations under this LGIA other than those described in Article 25.4.1 shall be subject to audit as follows: (i) for an audit relating to cost obligations, the applicable audit rights period shall be twenty-four months after the auditing Party's receipt of an invoice giving rise to such cost obligations; and (ii) for an audit relating to all other obligations, the applicable audit rights period shall be twenty-four months after the event for which the audit is sought.

25.5 Audit Results. If an audit by a Party determines that an overpayment or an underpayment has occurred, a notice of such overpayment or underpayment shall be given to the other Party together with those records from the audit which support such determination.

Article 26. Subcontractors

26.1 General. Nothing in this LGIA shall prevent a Party from utilizing the services of any subcontractor as it deems appropriate to perform its obligations under this LGIA; provided, however, that each Party shall require its subcontractors to comply with all applicable terms and conditions of this LGIA in providing such services and each Party shall remain primarily liable to the other Party for the performance of such subcontractor.

26.2 Responsibility of Principal. The creation of any subcontract relationship shall not relieve the hiring Party of any of its obligations under this LGIA. The hiring Party shall be fully responsible to the other Party for the acts or omissions of any subcontractor the hiring Party hires as if no subcontract had been made; provided, however, that in no event shall Transmission Provider be liable for the actions or

inactions of Interconnection Customer or its subcontractors with respect to obligations of Interconnection Customer under Article 5 of this LGIA. Any applicable obligation imposed by this LGIA upon the hiring Party shall be equally binding upon, and shall be construed as having application to, any subcontractor of such Party.

26.3 No Limitation by Insurance. The obligations under this Article 26 will not be limited in any way by any limitation of subcontractor's insurance.

Article 27. Disputes

27.1 Submission. In the event either Party has a dispute, or asserts a claim, that arises out of or in connection with this LGIA or its performance, such Party (the "disputing Party") shall provide the other Party with written notice of the dispute or claim ("Notice of Dispute"). Such dispute or claim shall be referred to a designated senior representative of each Party for resolution on an informal basis as promptly as practicable after receipt of the Notice of Dispute by the other Party. In the event the designated representatives are unable to resolve the claim or dispute through unassisted or assisted negotiations within thirty (30) Calendar Days of the other Party's receipt of the Notice of Dispute, such claim or dispute may, upon mutual agreement of the Parties, be submitted to arbitration and resolved in accordance with the arbitration procedures set forth below. In the event the Parties do not agree to submit such claim or dispute to arbitration, each Party may exercise whatever rights and remedies it may have in equity or at law consistent with the terms of this LGIA.

27.2 External Arbitration Procedures. Any arbitration initiated under this LGIA shall be conducted before a single neutral arbitrator appointed by the Parties. If the Parties fail to agree upon a single arbitrator within ten (10) Calendar Days of the submission of the dispute to arbitration, each Party shall choose one arbitrator who shall sit on a three-member arbitration panel. The two arbitrators so chosen shall within twenty (20) Calendar Days select a third

arbitrator to chair the arbitration panel. In either case, the arbitrators shall be knowledgeable in electric utility matters, including electric transmission and bulk power issues, and shall not have any current or past substantial business or financial relationships with any party to the arbitration (except prior arbitration). The arbitrator(s) shall provide each of the Parties an opportunity to be heard and, except as otherwise provided herein, shall conduct the arbitration in accordance with the Commercial Arbitration Rules of the American Arbitration Association ("Arbitration Rules") and any applicable FERC regulations or RTO rules; provided, however, in the event of a conflict between the Arbitration Rules and the terms of this Article 27, the terms of this Article 27 shall prevail.

27.3 Arbitration Decisions. Unless otherwise agreed by the Parties, the arbitrator(s) shall render a decision within ninety (90) Calendar Days of appointment and shall notify the Parties in writing of such decision and the reasons therefore. The arbitrator(s) shall be authorized only to interpret and apply the provisions of this LGIA and shall have no power to modify or change any provision of this Agreement in any manner. The decision of the arbitrator(s) shall be final and binding upon the Parties, and judgment on the award may be entered in any court having jurisdiction. The decision of the arbitrator(s) may be appealed solely on the grounds that the conduct of the arbitrator(s), or the decision itself, violated the standards set forth in the Federal Arbitration Act or the Administrative Dispute Resolution Act. The final decision of the arbitrator must also be filed with FERC if it affects jurisdictional rates, terms and conditions of service, Interconnection Facilities, or Network Upgrades.

27.4 Costs. Each Party shall be responsible for its own costs incurred during the arbitration process and for the following costs, if applicable: (1) the cost of the arbitrator chosen by the Party to sit on the three member panel and one half of the cost of the third arbitrator chosen; or (2) one half the cost of the single arbitrator jointly chosen by the Parties.

Article 28. Representations, Warranties, and Covenants

28.1 General. Each Party makes the following representations, warranties and covenants:

28.1.1 Good Standing. Such Party is duly organized, validly existing and in good standing under the laws of the state in which it is organized, formed, or incorporated, as applicable; that it is qualified to do business in the state or states in which the Large Generating Facility, Interconnection Facilities and Network Upgrades owned by such Party, as applicable, are located; and that it has the corporate power and authority to own its properties, to carry on its business as now being conducted and to enter into this LGIA and carry out the transactions contemplated hereby and perform and carry out all covenants and obligations on its part to be performed under and pursuant to this LGIA.

28.1.2 Authority. Such Party has the right, power and authority to enter into this LGIA, to become a Party hereto and to perform its obligations hereunder. This LGIA is a legal, valid and binding obligation of such Party, enforceable against such Party in accordance with its terms, except as the enforceability thereof may be limited by applicable bankruptcy, insolvency, reorganization or other similar laws affecting creditors' rights generally and by general equitable principles (regardless of whether enforceability is sought in a proceeding in equity or at law).

28.1.3 No Conflict. The execution, delivery and performance of this LGIA does not violate or conflict with the organizational or formation documents, or bylaws or operating agreement, of such Party, or any

judgment, license, permit, order, material agreement or instrument applicable to or binding upon such Party or any of its assets.

28.1.4 **Consent and Approval.** Such Party has sought or obtained, or, in accordance with this LGIA will seek or obtain, each consent, approval, authorization, order, or acceptance by any Governmental Authority in connection with the execution, delivery and performance of this LGIA, and it will provide to any Governmental Authority notice of any actions under this LGIA that are required by Applicable Laws and Regulations.

Article 29. Joint Operating Committee

29.1 Joint Operating Committee. Except in the case of ISOs and RTOs, Transmission Provider shall constitute a Joint Operating Committee to coordinate operating and technical considerations of Interconnection Service. At least six (6) months prior to the expected Initial Synchronization Date, Interconnection Customer and Transmission Provider shall each appoint one representative and one alternate to the Joint Operating Committee. Each Interconnection Customer shall notify Transmission Provider of its appointment in writing. Such appointments may be changed at any time by similar notice. The Joint Operating Committee shall meet as necessary, but not less than once each calendar year, to carry out the duties set forth herein. The Joint Operating Committee shall hold a meeting at the request of either Party, at a time and place agreed upon by the representatives. The Joint Operating Committee shall perform all of its duties consistent with the provisions of this LGIA. Each Party shall cooperate in providing to the Joint Operating Committee all information required in the performance of the Joint Operating Committee's duties. All decisions and agreements, if any, made by the Joint Operating Committee, shall be evidenced in writing. The duties of the Joint Operating Committee shall include the following:

29.1.1 Establish data requirements and operating record requirements.

29.1.2 Review the requirements, standards, and procedures for data acquisition equipment, protective equipment, and any other equipment or software.

29.1.3 Annually review the one (1) year forecast of maintenance and planned outage schedules of Transmission Provider's and Interconnection Customer's facilities at the Point of Interconnection.

29.1.4 Coordinate the scheduling of maintenance and planned outages on the Interconnection Facilities, the Large Generating Facility and other facilities that impact the normal operation of the interconnection of the Large Generating Facility to the Transmission System.

29.1.5 Ensure that information is being provided by each Party regarding equipment availability.

29.1.6 Perform such other duties as may be conferred upon it by mutual agreement of the Parties.

Article 30. Miscellaneous

30.1 Binding Effect. This LGIA and the rights and obligations hereof, shall be binding upon and shall inure to the benefit of the successors and assigns of the Parties hereto.

30.2 Conflicts. In the event of a conflict between the body of this LGIA and any attachment, appendices or exhibits hereto the terms and provisions of the body of this LGIA shall prevail and be deemed the final intent of the Parties. Notwithstanding the foregoing, the Parties agree to be bound by the provisions of Appendix H to this LGIA, and such provisions shall prevail to the extent there is a conflict between the body of this LGIA and Appendix H.

30.3 Rules of Interpretation. This LGIA, unless a clear contrary intention appears, shall be construed and interpreted as follows: (1) the singular number includes the plural number and vice versa; (2) reference to any person includes such person's successors and assigns but, in the case of a Party, only if such successors and assigns are permitted by this LGIA, and reference to a person in a particular capacity excludes such person in any other capacity or individually; (3) reference to any agreement (including this LGIA), document, instrument or tariff means such agreement, document, instrument, or tariff as amended or modified and in effect from time to time in accordance with the terms thereof and, if applicable, the terms hereof; (4) reference to any Applicable Laws and Regulations means such Applicable Laws and Regulations as amended, modified, codified, or reenacted, in whole or in part, and in effect from time to time, including, if applicable, rules and regulations promulgated thereunder; (5) unless expressly stated otherwise, reference to any Article, Section or Appendix means such Article of this LGIA or such Appendix to this LGIA, or such Section to the LGIP or such Appendix to the LGIP, as the case may be; (6) "hereunder", "hereof", "herein", "hereto" and words of similar import shall be deemed references to this LGIA as a whole and not to any particular Article or other provision hereof or thereof; (7) "including" (and with correlative meaning "include") means including without limiting the generality of any description preceding such term; and (8) relative to the determination of any period of time, "from" means "from and including", "to" means "to but excluding" and "through" means "through and including".

30.4 Entire Agreement. This LGIA, including all Appendices and Schedules attached hereto, constitutes the entire agreement between the Parties with reference to the subject matter hereof, and supersedes all prior and contemporaneous understandings or agreements, oral or written, between the Parties with respect to the subject matter of this LGIA. There are no other agreements, representations, warranties, or covenants which constitute any part of the consideration for, or any condition to, either Party's compliance with its obligations under this LGIA.

30.5 No Third Party Beneficiaries. This LGIA is not intended to and does not create rights, remedies, or benefits of any character whatsoever in favor of any persons, corporations, associations, or entities other than the Parties, and the obligations herein assumed are solely for the use and benefit of the Parties, their successors in interest and, where permitted, their assigns.

30.6 Waiver. The failure of a Party to this LGIA to insist, on any occasion, upon strict performance of any provision of this LGIA will not be considered a waiver of any obligation, right, or duty of, or imposed upon, such Party. Any waiver at any time by either Party of its rights with respect to this LGIA shall not be deemed a continuing waiver or a waiver with respect to any other failure to comply with any other obligation, right, duty of this LGIA. Termination or Default of this LGIA for any reason by Interconnection Customer shall not constitute a waiver of Interconnection Customer's legal rights to obtain an interconnection from Transmission Provider. Any waiver of this LGIA shall, if requested, be provided in writing.

30.7 Headings. The descriptive headings of the various Articles of this LGIA have been inserted for convenience of reference only and are of no significance in the interpretation or construction of this LGIA.

30.8 Multiple Counterparts. This LGIA may be executed in two or more counterparts, each of which is deemed an original but all constitute one and the same instrument.

30.9 Amendment. The Parties may by mutual agreement amend this LGIA by a written instrument duly executed by the Parties.

30.10 Modification by the Parties. The Parties may by mutual agreement amend the Appendices to this LGIA by a written instrument duly executed by the Parties. Such amendment shall become effective and a part of this LGIA upon satisfaction of all Applicable Laws and Regulations.

30.11 Reservation of Rights. Transmission Provider shall have the right to make a unilateral filing with FERC to modify this LGIA with respect to any rates, terms and conditions, charges, classifications of service, rule or regulation under section 205 or any other applicable provision of the Federal Power Act and FERC's rules and regulations thereunder, and Interconnection Customer shall have the right to make a unilateral filing with FERC to modify this LGIA pursuant to section 206 or any other applicable provision of the Federal Power Act and FERC's rules and regulations thereunder; provided that each Party shall have the right to protest any such filing by the other Party and to participate fully in any proceeding before FERC in which such modifications may be considered. Nothing in this LGIA shall limit the rights of the Parties or of FERC under sections 205 or 206 of the Federal Power Act and FERC's rules and regulations thereunder, except to the extent that the Parties otherwise mutually agree as provided herein.

30.12 No Partnership. This LGIA shall not be interpreted or construed to create an association, joint venture, agency relationship, or partnership between the Parties or to impose any partnership obligation or partnership liability upon either Party. Neither Party shall have any right, power or authority to enter into any agreement or undertaking for, or act on behalf of, or to act as or be an agent or representative of, or to otherwise bind, the other Party.

IN WITNESS WHEREOF, the Parties have executed this LGIA in duplicate originals, each of which shall constitute and be an original effective Agreement between the Parties.

Appendix A to LGIA

Interconnection Facilities, Network Upgrades and Distribution Upgrades

1. Interconnection Facilities:

(a) Interconnection Customer's Interconnection Facilities: consists of approximately 21.6 miles of tie line between Interconnection Customer's Collector Station #1 and the Windstar substation

(b) Transmission Provider's Interconnection Facilities: consists of a new line position and appurtenant equipment (structures, switches, metering) at Windstar substation. Also includes metering for Collector Station #1 and Collector Station #2.

2. Network Upgrades:

(a) Stand Alone Network Upgrades: None

(b) Other Network Upgrades: substation expansion and installation of a new circuit breaker at Windstar substation, new relaying and communications equipment at Aeolus and Shirley Basin substations, new relaying at Standpipe substation, new circuit breakers and switches at Freezeout substation, and reconductoring the Aeolus-Shirley Basin (16 miles), Aeolus-Freezeout (3.5 miles), and the Freezeout-Standpipe (11.5 miles) transmission lines.

3. Distribution Upgrades: None

4. Contingent Facilities: As identified in the Facilities Study for this project dated February 21, 2019 the following Network Upgrades are required to be in-service prior to this project:

- Portions of the Transmission Provider's Energy Gateway Transmission Projects
  - Gateway West segment D2 (Aeolus-Anticline/Bridger) 500 kV transmission line. (2020)
  - A Remedial Action Scheme ("RAS") that will drop approximately 600 MW of generation for various 500

kV outages. (2020)

- A new 230 kV transmission line between Shirley Basin and Aeolus substations assigned to a higher queued project. (2020)

5. Point of Interconnection ("POI"): The point at which Transmission Provider Interconnection Facilities connect to the substation bus at the Windstar substation (see Exhibit 1 to Appendix A).

6. Point of Change of Ownership: The point at which Interconnection Customer and Transmission Provider Interconnection Facilities meet (see Exhibit 1 to Appendix A)

7. One-Line Diagram: is attached to this agreement as Exhibit 1 to Appendix A.

8. Estimated Project Cost: $63,132,000
Direct Assigned: $1,474,000
Network Upgrade: $61,658,000

November 15, 2020

†Financial Security determined to be $10,470,000

*Any design modifications to the Interconnection Customer's Generating Facility after this date requiring updates to the Transmission Provider's network model will result in a minimum of 3 months added to all future milestones including Commercial Operation.

**The Contingent Facilities summarized in Appendix A of this LGIA must be in-service prior to the commencement of generation activities.

Appendix C To LGIA

Interconnection Details

Description of the Large Generating Facility: The Large Generating Facility consists of one hundred eighty-nine (189) GE 2.52 and nineteen (19) GE 2.3 turbines connected to eight (8) 34.5 kV strings for a total generation output of 520 MW as measured at the POI.

- Collector Station #1 has four strings of turbines (117x 2.52 turbines and 11x 2.3 turbines) and one string of 4x 16 MVAR capacitors:
  - 44x 2.52 and 4x 2.3 turbines attached to a 84/112/140 MVA (Z=8%) transformer
  - 73x 2.52 and 7x 2.3 turbines and the capacitors attached to a 135/180/225 MVA (Z=8.5%) transformer
- Collector Station #2 has four strings of turbines (72x 2.52 turbines and 8x 2.3 turbines)
  - All strings attached to a single 135/180/225 MVA (Z=8.5%) transformer

The Collector stations are connected by a 6.1 mile tie line, each transformer has a high side circuit breaker, and a secondary breaker on the connecting tie line.

.

The Large Generating Facility is located in Converse County, Wyoming.

Please see Exhibit 1 to Attachment A.

Control Area Requirements: Interconnection Customer shall interconnect and operate the Large Generating Facility in accordance with the Transmission Provider's Facility Interconnection Requirements for Transmission Systems, as may be revised from time to time, attached hereto as Exhibit 1 to Appendix C and by this reference incorporated herein.

Interconnection Details:
Metering. With reference to Article 7.1, Transmission Provider will own and maintain the bi-directional revenue Metering Equipment in Transmission Provider's Point of Interconnection substation at the Interconnection Customer's expense.

Under Frequency and Over Frequency Conditions. Consistent with LGIA Article 9.7.3, Transmission Provider shall design, procure, install and maintain frequency and voltage protection to trip feeder breakers in accordance with the settings shown in Exhibit 1 to Appendix C.

Reactive Power and Voltage Schedule. All interconnecting synchronous and non-synchronous generators are required to design their Generating Facilities with reactive power capabilities necessary to operate within the full power factor range of 0.95 leading to 0.95 lagging. This power factor range shall be dynamic and can be met using a combination of the inherent dynamic reactive power capability of the generator or inverter, dynamic reactive power devices and static reactive power devices. For non-synchronous generators, the power factor requirement is to be measured at the high-side of the generator substation. The Generating Facility must provide dynamic reactive power to the system over the full range of real power output. If the Generating Facility is not capable of providing positive reactive support (i.e., supplying reactive power to the system) immediately following the removal of a fault or other transient low voltage perturbations, the facility will be required to add dynamic voltage support equipment. These additional dynamic reactive devices shall have correct protection settings such that the devices will remain on line and active during and immediately following a fault event.

Generators shall be equipped with automatic voltage-control equipment and normally operated with the voltage regulation control mode enabled unless written authorization, or directive, from the Transmission Provider is given to operate in another control mode (e.g., constant power factor control). The control mode of generating units shall be accurately represented in operating studies. The generators shall be capable of operating continuously at their rated power output within +/- 5% of its rated terminal voltage. Phasor Measurement Units will be required at any Generating Facilities with an individual or aggregate nameplate capacity of 75 MVA or greater.

As required by NERC standard VAR-001-1a, the Transmission Provider will provide a voltage schedule for the Point of Interconnection. In general, Generating Facilities should be operated so as to maintain the voltage at the Point of Interconnection, or other designated point as deemed appropriated by Transmission Provider, in accordance with Transmission Provider Policy 139.

Generating Facilities capable of operating with a voltage droop are required to do so. Studies will be required to coordinate voltage droop settings if there are other facilities in the area. It will be the Interconnection Customer's responsibility to ensure that a voltage coordination study is performed, in coordination with Transmission Provider, and implemented with appropriate coordination settings prior to unit testing. If the need for a master controller is identified, the cost and all related installation requirements will be the responsibility of the Interconnection Customer. Participation by the Generation Facility in subsequent interaction/coordination studies will be required pre- and post-commercial operation in order ensure system reliability.

All generators must meet the Federal Energy Regulatory Commission (FERC) and WECC low voltage ride-through requirements.

As the Transmission Provider cannot submit a user written model to WECC for inclusion in base cases, a standard model from the WECC Approved Dynamic Model Library is required 180 days prior to trial operation. The list of approved generator models is continually updated and is available on the http://www.WECC.biz website.

<u>Property Requirements</u>. Subject to LGIA Articles 5.12 and 5.13, Interconnection Customer is required to obtain for the benefit of Transmission Provider at Interconnection Customer's sole cost and expense all real property rights, including but not limited to fee ownership, easements and/or rights of way, as applicable, for Transmission Provider owned facilities using forms acceptable to Transmission Provider. Transmission Provider shall not be obligated to accept any such real property right that does not, at Transmission Provider's sole discretion, confer sufficient rights to access, operate, construct, modify, maintain, place and remove Transmission Provider owned facilities or is otherwise conveyed using forms unacceptable to Transmission Provider. Further, all real property on which Transmission Provider's facilities are to be located must be environmentally, physically and operationally acceptable to the Transmission Provider in accordance with Good Utility Practice.

Subject to LGIA Article 5.14, Interconnection Customer is responsible for obtaining all permits required by all relevant jurisdictions for the project, including but not limited to, conditional use permits and construction permits; provided however, Transmission Provider shall obtain, at Interconnection Customer's cost and schedule risk, the permits necessary to construct Transmission Provider's facilities that are to be located on real property currently owned or held in fee or right by Transmission Provider.

Subject to applicable provisions in the Agreement and an express written waiver by an authorized officer of Transmission Provider, all of the foregoing permits and real property rights (conferring rights on real property that is environmentally, physically and operationally acceptable to Transmission Provider) shall be acquired as provided herein as a condition to Transmission Provider's contractual obligation to construct or take possession of facilities to be owned by the Transmission Provider under this Agreement. Transmission Provider shall have no liability for any project delays or cost overruns caused by delays in acquiring any of the foregoing permits and/or real property rights, whether such delay results from the failure to obtain such permits or rights or the failure of such permits or rights to meet the requirements set forth herein. Further, any completion dates, if any, set forth herein with regard to Transmission Provider's obligations shall be equitably extended based on the length and impact of any such delays.

With respect to the fiber optic cable on Interconnection Customer's tie line that will be owned by the Transmission Provider, the Interconnection Customer and the Transmission Provider agree that Transmission Provider's ownership and operation of fiber optic cable that is attached to poles or other structures that are owned or maintained by the Interconnection Customer is subject to LGIA Article 5.12, Good Utility Practice, and Transmission Provider's Interconnection Policy 139 (Exhibit 1 to Appendix C to LGIA).

Appendix D To LGIA

Security Arrangements Details

Infrastructure security of Transmission System equipment and operations and control hardware and software is essential to ensure day-to-day Transmission System reliability and operational security. FERC will expect all Transmission Providers, market participants, and Interconnection Customers interconnected to the Transmission System to comply with the recommendations offered by the President's Critical Infrastructure Protection Board and, eventually, best practice recommendations from the electric reliability authority. All public utilities will be expected to meet basic standards for system infrastructure and operational security, including physical, operational, and cyber-security practices.

Automatic Data Transfer. Throughout the term of this Agreement, Interconnection Customer shall provide the data specified below by automatic data transfer to the Transmission Provider Control Center specified by Transmission Provider or to a Third-Party System Operator designated by Transmission Provider (or both):

From the Interconnection Customer’s collector substation 1:

Analogs:

- o Transformer 1 Real power
- o Transformer 1 Reactive power
- o Transformer 3 Real power
- o Transformer 3 Reactive power
- o Line to collector substation 2 Real power
- o Line to collector substation 2 Reactive power
- o 34.5 kV Reactive power 52F10
- o 34.5 kV Real power 52F11
- o 34.5 kV Reactive power 52F11
- o 34.5 kV Real power 52F12
- o 34.5 kV Reactive power 52F12
- o 34.5 kV Real power 52F31
- o 34.5 kV Reactive power 52F31
- o 34.5 kV Real power 52F32
- o 34.5 kV Reactive power 52F32
- o A phase 230 kV transmission voltage
- o B phase 230 kV transmission voltage
- o C phase 230 kV transmission voltage
- o Average Wind speed

- o Average Plant Atmospheric Pressure (Bar)
- o Average Plant Temperature (Celsius)

Status:

- o 230 kV Transformer Breaker 52T1
- o 230 kV Transformer Breaker 52T3
- o 230 kV Line Breaker 52U
- o 34.5 kV breaker 52F10
- o 34.5 kV breaker 52F11
- o 34.5 kV breaker 52F12
- o 34.5 kV breaker 52F31
- o 34.5 kV breaker 52F32
- o 34.5 kV breaker 52C1
- o 34.5 kV breaker 52C2
- o 34.5 kV breaker 52C3
- o 34.5 kV breaker 52C4

From the Interconnection Customer's collector substation 2:

Analogs:

- o 34.5 kV Real power 52F21
- o 34.5 kV Reactive power 52F21
- o 34.5 kV Real power 52F22
- o 34.5 kV Reactive power 52F22
- o 34.5 kV Real power 52F23
- o 34.5 kV Reactive power 52F23
- o 34.5 kV Real power 52F24
- o 34.5 kV Reactive power 52F24
- o A phase 230 kV transmission voltage
- o B phase 230 kV transmission voltage
- o C phase 230 kV transmission voltage
- o Average Wind speed
- o Average Plant Atmospheric Pressure (Bar)
- o Average Plant Temperature (Celsius)

Status:

- o 230 kV Transformer Breaker 52T2
- o 34.5 kV breaker 52F21
- o 34.5 kV breaker 52F22
- o 34.5 kV breaker 52F23
- o 34.5 kV breaker 52F24

Billing Meter Data. Bi-directional revenue meter at the Point of Interconnection will not be configured to allow direct dial-up access by Interconnection Customer. The Transmission Provider will provide alternatives, at the Interconnection Customer's expense, upon request.

Additional Data. Interconnection Customer shall, at its sole expense, provide any additional Generating Facility data reasonably required and necessary for the Transmission Provider to operate the Transmission System in accordance with Good Utility Practice and Exhibit 1 to Appendix C, Facility Interconnection Requirements for Transmission Systems.

Relay and Control Settings

If Interconnection Customer requires modifications to the settings associated with control/protective devices connected to the distribution and/or transmission system, Interconnection Customer will contact Transmission Provider and provide in writing the justification for the proposed modifications. This will allow Transmission Provider to analyze the modifications and ensure there will be no negative impacts to connected systems and customers.

Appendix G to LGIA

INTERCONNECTION REQUIREMENTS FOR A WIND GENERATING PLANT

Appendix G sets forth requirements and provisions specific to a wind generating plant. All other requirements of this LGIA continue to apply to wind generating plant interconnections.

A. Technical Standards Applicable to a Wind Generating Plant

i. Low Voltage Ride-Through (LVRT) Capability

A wind generating plant shall be able to remain online during voltage disturbances up to the time periods and associated voltage levels set forth in the standard below. The LVRT standard provides for a transition period standard and a post-transition period standard.

Transition Period LVRT Standard

The transition period standard applies to wind generating plants subject to FERC Order 661 that have either: (i) interconnection agreements signed and filed with the Commission, filed with the Commission in unexecuted form, or filed with the Commission as non-conforming agreements between January 1, 2006 and December 31, 2006, with a scheduled in-service date no later than December 31, 2007, or (ii) wind generating turbines subject to a wind turbine procurement contract executed prior to December 31, 2005, for delivery through 2007.

1. Wind generating plants are required to remain in-service during three-phase faults with normal clearing (which is a time period of approximately 4 – 9 cycles) and single line to ground faults with delayed clearing, and subsequent post-fault voltage recovery to prefault voltage unless clearing the fault effectively disconnects the generator from the system. The clearing time requirement for a three-phase fault will be specific to the wind generating plant substation location, as determined by and documented by the transmission provider. The maximum clearing time the wind generating plant shall be required to withstand for a three-phase fault shall be 9 cycles at a voltage as low as 0.15 p.u., as measured at the high side of the wind generating

plant step-up transformer (i.e. the transformer that steps the voltage up to the transmission interconnection voltage or "GSU"), after which, if the fault remains following the location-specific normal clearing time for three-phase faults, the wind generating plant may disconnect from the transmission system.

2. This requirement does not apply to faults that would occur between the wind generator terminals and the high side of the GSU or to faults that would result in a voltage lower than 0.15 per unit on the high side of the GSU serving the facility.

3. Wind generating plants may be tripped after the fault period if this action is intended as part of a special protection system.

4. Wind generating plants may meet the LVRT requirements of this standard by the performance of the generators or by installing additional equipment (e.g., Static VAr Compensator, etc.) within the wind generating plant or by a combination of generator performance and additional equipment.

5. Existing individual generator units that are, or have been, interconnected to the network at the same location at the effective date of the Appendix G LVRT Standard are exempt from meeting the Appendix G LVRT Standard for the remaining life of the existing generation equipment. Existing individual generator units that are replaced are required to meet the Appendix G LVRT Standard.

Post-transition Period LVRT Standard

All wind generating plants subject to FERC Order No. 661 and not covered by the transition period described above must meet the following requirements:

1. Wind generating plants are required to remain in-service during three-phase faults with normal clearing (which is a time period of approximately 4 – 9 cycles) and single line to ground faults with delayed clearing, and subsequent post-fault voltage recovery to prefault voltage unless clearing the

fault effectively disconnects the generator from the system. The clearing time requirement for a three-phase fault will be specific to the wind generating plant substation location, as determined by and documented by the transmission provider. The maximum clearing time the wind generating plant shall be required to withstand for a three-phase fault shall be 9 cycles after which, if the fault remains following the location-specific normal clearing time for three-phase faults, the wind generating plant may disconnect from the transmission system. A wind generating plant shall remain interconnected during such a fault on the transmission system for a voltage level as low as zero volts, as measured at the high voltage side of the wind GSU.

2. This requirement does not apply to faults that would occur between the wind generator terminals and the high side of the GSU.

3. Wind generating plants may be tripped after the fault period if this action is intended as part of a special protection system.

4. Wind generating plants may meet the LVRT requirements of this standard by the performance of the generators or by installing additional equipment (e.g., Static VAr Compensator) within the wind generating plant or by a combination of generator performance and additional equipment.

5. Existing individual generator units that are, or have been, interconnected to the network at the same location at the effective date of the Appendix G LVRT Standard are exempt from meeting the Appendix G LVRT Standard for the remaining life of the existing generation equipment. Existing individual generator units that are replaced are required to meet the Appendix G LVRT Standard.

ii. Power Factor Design Criteria (Reactive Power)

The following reactive power requirements apply only to a newly interconnecting wind generating plant that has executed a Facilities Study Agreement as of the effective

date of the Final Rule establishing the reactive power requirements for non-synchronous generators in section 9.6.1 of this LGIA (Order No. 827). A wind generating plant to which this provision applies shall maintain a power factor within the range of 0.95 leading to 0.95 lagging, measured at the high side of the Interconnection Customer’s GSU transformer as defined in this LGIA, if the Transmission Provider's System Impact Study shows that such a requirement is necessary to ensure safety or reliability. The power factor range standard can be met by using, for example, power electronics designed to supply this level of reactive capability (taking into account any limitations due to voltage level, real power output, etc.) or fixed and switched capacitors if agreed to by the Transmission Provider, or a combination of the two. The Interconnection Customer shall not disable power factor equipment while the wind plant is in operation. Wind plants shall also be able to provide sufficient dynamic voltage support in lieu of the power system stabilizer and automatic voltage regulation at the generator excitation system if the System Impact Study shows this to be required for system safety or reliability.

iii. Supervisory Control and Data Acquisition (SCADA) Capability

The wind plant shall provide SCADA capability to transmit data and receive instructions from the Transmission Provider to protect system reliability. The Transmission Provider and the wind plant Interconnection Customer shall determine what SCADA information is essential for the proposed wind plant, taking into account the size of the plant and its characteristics, location, and importance in maintaining generation resource adequacy and transmission system reliability in its area.

Exhibit 1 to Appendix A to LGIA

One-Line Diagram

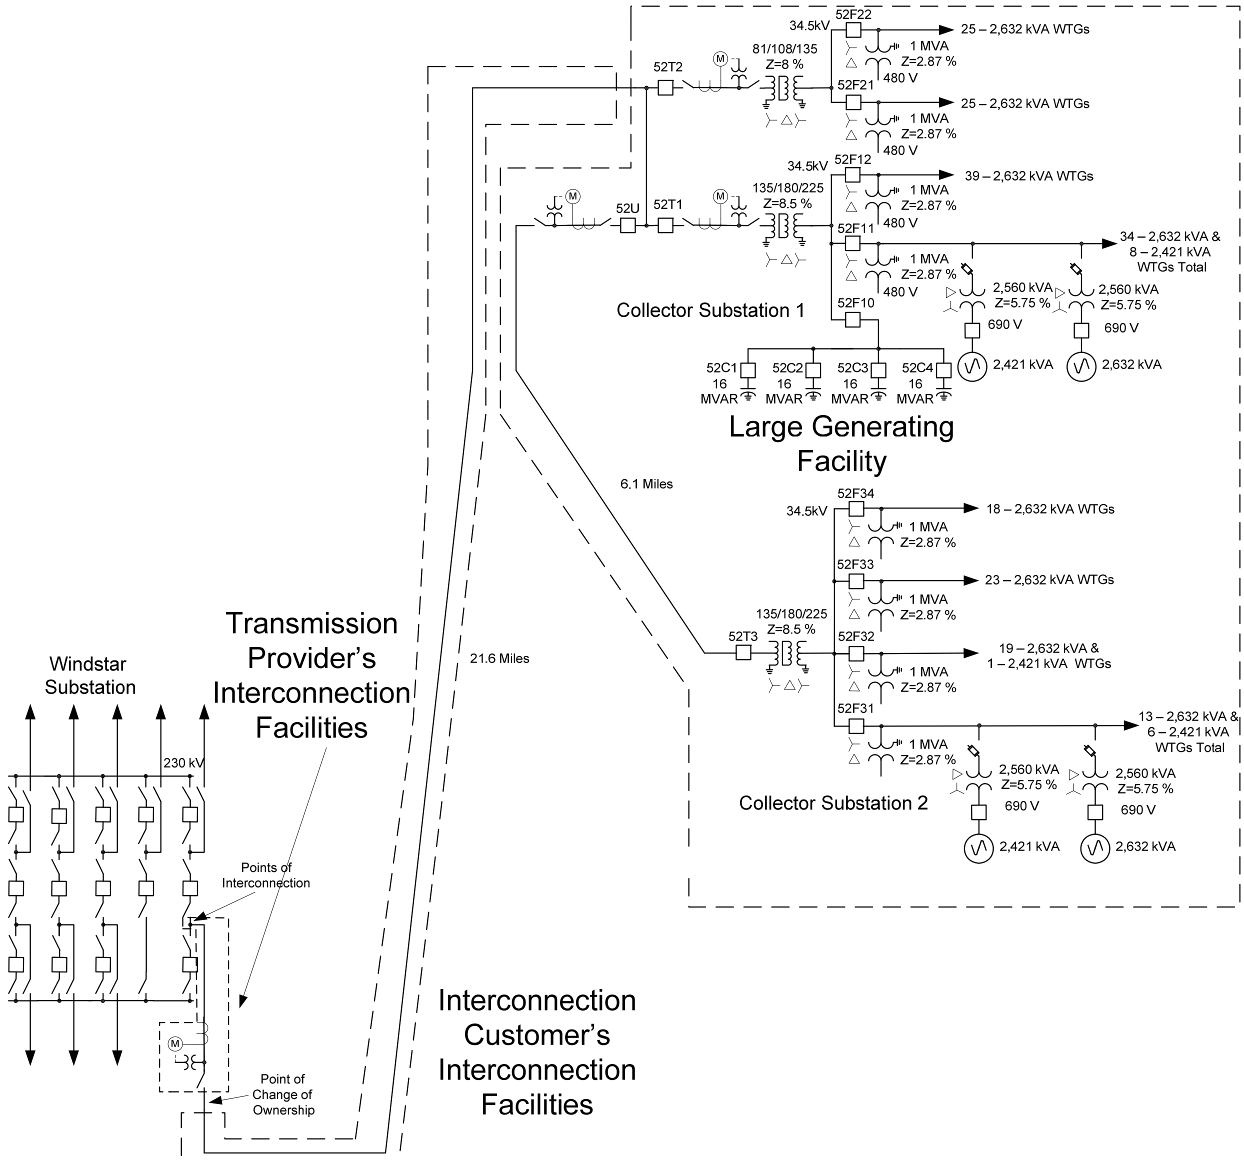

Exhibit 1 to Appendix B to LGIA

Scope of Work

Generating Facility Modifications

The following outlines the design, procurement, construction, installation, and ownership of equipment at the Interconnection Customer's Generating Facility.

Interconnection Customer to be Responsible For

- Design the Generating Facility with reactive power capabilities necessary to operate within the full power factor range of 0.95 leading to 0.95 lagging as measured at the high side of the Interconnection Customer's GSU transformer. This power factor range shall be dynamic and can be met using a combination of the inherent dynamic reactive power capability of the generator or inverter, dynamic reactive power devices and static reactive power devices to make up for losses.
- Design the Generating Facility such that it can provide positive reactive support (i.e., supply reactive power to the system) immediately following the removal of a fault or other transient low voltage perturbations or install dynamic voltage support equipment. These additional dynamic reactive devices shall have correct protection settings such that the devices will remain on line and active during and immediately following a fault event.
- Equip the Generating Facility with automatic voltage-control equipment and operate with the voltage regulation control mode enabled unless explicitly authorized to operate another control mode by the Transmission Provider.
- Install a Phasor Measurement Unit to collect data from the Project. The data must be collected and be able to stream to the Planning Coordinator for each of the Generator Facility's step-up transformers measured on the low side of the GSU at a sample rate of at least 30 samples per second and synchronized within +/- 2 milliseconds of the Coordinated Universal Time (UTC). Initially, the following data must be collected:
  - Three phase voltage and voltage angle (analog)
  - Three phase current (analog)

  Data requirements are subject to change as deemed necessary to comply with local and federal regulations.

- Operate the Generating Facility so as to maintain the voltage at the POI, or other designated point as deemed appropriate by Transmission Provider, at a voltage schedule to be provided by the Transmission Provider following testing. Voltage will typically be required to operate between 1.00 and 1.04 per unit.
- Operate the Generating Facility with a voltage droop.
- Have any Transmission Provider required studies, such as a voltage coordination study, performed and provide results to Transmission Provider. Any additional requirements identified in these studies will be the responsibility of the Interconnection Customer.
- Ensure the Generating Facility is analyzed for Subsynchronous Resonance ("SSR")/ Subsynchronous Control Interaction ("SSCI") issues, if any are identified based on the Transmission Provider's future long term transmission plans.
- Meet the Federal Energy Regulatory Commission (FERC) and WECC low voltage ride-through requirements as specified in the interconnection agreement.
- Provide the Transmission Provider a standard model from the WECC Approved Dynamic Model Library.
- Establish permanent station retail service with the Transmission Provider's retail business unit for power that will flow from the Transmission Provider's system when the Project is not generating.
- Provide any construction or backup retail service necessary for the Project.
- Prior to Commercial Operation provide the Transmission Provider documentation that the Interconnection Customer has registered as both the Generator Owner ("GO") and Generator Operator ("GOP") of the Generating Facility.

Interconnection Customer Collector Substation 1

- Procure, install, own and maintain a set of line relays that will detect and clear all faults on the tie line between the Interconnection Customer's collector 1 and 2 substations in 5 cycles or less.
- Procure, install, own and maintain a set of line relays that will detect and clear all faults on the tie line between the Interconnection Customer's collector 1 substation and the POI substation in 5 cycles or less. The relay settings are to be

coordinated with and approved by the Transmission Provider.

- Design, procure, and install a Transmission Provider approved data concentrator to capture the required Interconnection Customer device data points and to transfer data from the collector substation to the Transmission Provider's POI substation via an optical fiber communications circuit in DNP3 protocol. The Transmission Provider will input and hold the second level passwords for the data concentrator. Password control ensures the Transmission Provider is aware of and is accepting of the changes being requested by the Interconnection Customer.
- Design, procure and install conduit and control cabling and hard wire the Interconnection Customer's source devices to the data concentrator. Replicated values are not acceptable.
- Provide the following points which are based on the Interconnection Customer's most recent design information. Please note that this list of points could change if the Interconnection Customer's final design changes:

  Analogs:
  - Transformer 1 Real power
  - Transformer 1 Reactive power
  - Transformer 3 Real power
  - Transformer 3 Reactive power
  - Line to collector substation 2 Real power
  - Line to collector substation 2 Reactive power
  - 34.5 kV Reactive power 52F10
  - 34.5 kV Real power 52F11
  - 34.5 kV Reactive power 52F11
  - 34.5 kV Real power 52F12
  - 34.5 kV Reactive power 52F12
  - 34.5 kV Real power 52F31
  - 34.5 kV Reactive power 52F31
  - 34.5 kV Real power 52F32
  - 34.5 kV Reactive power 52F32
  - A phase 230 kV transmission voltage
  - B phase 230 kV transmission voltage
  - C phase 230 kV transmission voltage
  - Average Wind speed
  - Average Plant Atmospheric Pressure (Bar)
  - Average Plant Temperature (Celsius)

  Status:
  - 230 kV Transformer Breaker 52T1

  - o 230 kV Transformer Breaker 52T3
  - o 230 kV Line Breaker 52U
  - o 34.5 kV breaker 52F10
  - o 34.5 kV breaker 52F11
  - o 34.5 kV breaker 52F12
  - o 34.5 kV breaker 52F31
  - o 34.5 kV breaker 52F32
  - o 34.5 kV breaker 52C1
  - o 34.5 kV breaker 52C2
  - o 34.5 kV breaker 52C3
  - o 34.5 kV breaker 52C4
- Provide a separate fenced area within the Interconnection Customer’s collector substation control building for the Transmission Provider’ sole use. The Transmission Provider’s section of the control building shall have a separate door with a Transmission Provider lock. The size of the Transmission Provider’s portion of the control building shall be confirmed during detailed design of the facility. Fencing, gates and road access for the control building shall meet Transmission Provider standards.
- Perform a CDEGS grounding analysis for the control building site and provide the results to the Transmission Provider.
- Coordinate with the Transmission Provider on the Interconnection Customer’s provision of all required SCADA data. This could be achieved by providing the data to the Transmission Provider directly into the POI substation or by the installation of fiber optic cable into and out of the Transmission Provider’s portion of the collector 1 substation control building.
- Procure and install Transmission Provider approved structures for each set of the Transmission Provider’s 230 kV instrument transformers, including all hardware for a complete dead-end assembly to and from the instrument transformers. The installation location of each of the structures shall be coordinated with the Transmission Provider.
- Install all Transmission Provider provided instrument transformers.
- Install complete conduit and the control cable provided by the Transmission Provider from all of the Transmission Provider’s instrument

transformers to the Transmission Provider's portion of the collector substation control building.

- Procure, install, own and maintain instrument transformer disconnect switches on each side of each of all Transmission Provider CT/VT instrument transformers.
- Provide Transmission Provider unfettered and maintained access to all of the Transmission Provider's CT/VT instrument transformers and associated equipment.

Interconnection Customer Collector Substation 2

- Procure, install, own and maintain a set of line relays that will detect and clear all faults on the tie line between the Interconnection Customer's collector A and B substations in 5 cycles or less. The relay settings are to be coordinated with and approved by the Transmission Provider.
- Design, procure, and install a Transmission Provider approved data concentrator to capture the required Interconnection Customer device data points and to transfer data from the collector substation to the Transmission Provider's POI substation via an optical fiber communications circuit in DNP3 protocol. The Transmission Provider will input and hold the second level passwords for the data concentrator. Password control ensures the Transmission Provider is aware of and is accepting of the changes being requested by the Interconnection Customer.
- Design, procure and install conduit and control cabling and hard wire the Interconnection Customer's source devices to the data concentrator. Replicated values are not acceptable.
- Provide the following points which are based on the Interconnection Customer's most recent design information. Please note that this list of points could change if the Interconnection Customer's final design changes:

  Analogs:
  - o 34.5 kV Real power 52F21
  - o 34.5 kV Reactive power 52F21
  - o 34.5 kV Real power 52F22
  - o 34.5 kV Reactive power 52F22
  - o 34.5 kV Real power 52F23
  - o 34.5 kV Reactive power 52F23

  - o 34.5 kV Real power 52F24
  - o 34.5 kV Reactive power 52F24
  - o A phase 230 kV transmission voltage
  - o B phase 230 kV transmission voltage
  - o C phase 230 kV transmission voltage
  - o Average Wind speed
  - o Average Plant Atmospheric Pressure (Bar)
  - o Average Plant Temperature (Celsius)

  Status:
  - o 230 kV Transformer Breaker 52T2
  - o 34.5 kV breaker 52F21
  - o 34.5 kV breaker 52F22
  - o 34.5 kV breaker 52F23
  - o 34.5 kV breaker 52F24
- Procure, install, own and maintain Transmission Provider approved fiber optic cable from the data concentrator to a splice on the tie line running from the collector 2 substation to the collector substation 1.
- Coordinate with the Transmission Provider on the Interconnection Customer's provision of all required SCADA data. This could be achieved by providing the data to the Transmission Provider directly into the POI substation or by the installation of fiber optic cable into and out of the Transmission Provider's portion of the collector 1 substation control building.

Interconnection Customer Collector Substation 1-Collector Substation 2 Tie Line

- Procure all necessary permits, property rights and/or rights of way for the new transmission line between the Interconnection Customer's collector 1 and 2 substations. Interconnection Customer will be responsible for all required regulatory or compliance reporting associated with this transmission line.
- Design, construct, own and maintain the 230 kV transmission tie line between the Interconnection Customer's collector 1 and 2 substations.
- Design, procure, install, own and maintain Transmission Provider standard fiber optic cable on the transmission line.
- Splice the fiber to the fiber running from the data concentrator in the collector 2 substation.

Transmission Provider to be Responsible For

- Provide the Interconnection Customer the designated point at which the voltage is to be maintained and the associated voltage schedule.
- Identify any necessary studies that the Interconnection Customer must have performed or participate in.
- Identify the values to be stored in the PMU.
- Coordinate with the Interconnection Customer on the space requirements for the Transmission Provider’s portion of the Interconnection Customer’s collector 1 substation control building. Provide all fencing, gate and road access standards for the building.
- Procure and install a backup DC battery system for the Transmission Provider portion of the collector substation 1 control building.
- Procure and install a communications rack and associated communications equipment in the Transmission Provider’s portion of the control building and coordinate the termination of any fiber runs to be installed by the Interconnection Customer.
- Procure 230 kV instrument transformers for each of the Interconnection Customer’s collector substation 1 step up transformers. Provide to Interconnection Customer and coordinate the installation.
- Procure 230 kV instrument transformers for the line running from the collector 2 substation. Provide to Interconnection Customer and coordinate the installation.
- Procure all conduit and control cable for all Transmission Provider instrument transformers and provide to Interconnection Customer. Coordinate with the Interconnection Customer on the installation of control cable from the Transmission Provider’s instrument transformers to the control building.
- Design, procure and install 3 sets of 230 kV revenue metering equipment including metering panels, primary and secondary revenue quality meters, test switches, junction boxes, routers and secondary metering wire.
- Establish an Ethernet connection for retail sales and generation accounting via the MV-90 translation system.

Tie Line Requirements

The following outlines the design, procurement, construction, installation, and ownership of equipment associated with the radial line connecting the Interconnection Customer's collector substation 1 to the Transmission Provider's POI substation.

Interconnection Customer to be Responsible For

- Procure all necessary permits, property rights and/or rights of way for the new transmission line between the Interconnection Customer's collector substation 1 and POI substation. Interconnection Customer will be responsible for all required regulatory or compliance reporting associated with the tie line.
- Design, construct, own and maintain the 230 kV transmission tie line between the Interconnection Customer's collector substation 1 and the POI substation.
- Design, procure, install, own and maintain Transmission Provider standard fiber optic cable on the transmission tie line. Provide at least one buffer tube with 12 strands of fiber for the Transmission Provider's sole use.
- Splice the fiber running from the Transmission Provider's portion of the collector substation control building to the Transmission Provider's buffer tube of fiber.
- Construct the final structure outside the POI substation to Transmission Provider's current design and installation standards and in a location approved by the Transmission Provider.
- Provide and install conductor, fiber, shield wire and line hardware in sufficient quantities to allow the Transmission Provider to terminate the tie line into POI substation dead-end structure. The Point of Change of Ownership will be at the last Interconnection Customer structure.

Transmission Provider to be Responsible For

- Provide the Interconnection Customer the necessary specifications for the last structure outside the POI substation.

Point of Interconnection

The following outlines the design, procurement, construction, installation, and ownership of equipment at the POI.

Interconnection Customer to be Responsible For

- Test and commission the communication path between the Interconnection Customer's data concentrators and the POI substation.

Transmission Provider to be Responsible For

- Procure all necessary permits, property rights and/or rights of way to allow for the expansion of Windstar substation.
- Design, procure and construct the necessary infrastructure to expand the substation to create a line position including the installation of the following major equipment:
  - (1) – 230 kV, circuit breaker
  - (3) – 230 kV, combined CT/VT metering unit
  - (1) – 230 kV, group operated switch, breaker disconnect
  - (1) – 230 kV, group operated switch, line disconnect
  - (1) – 230 kV, group operated switch, meter disconnect
  - (3) – 230 kV, surge arrester
  - Deadend structure
  - Ground grid and conduit
- Perform a CDEGS grounding analysis.
- Design, procure and install a line current differential relay system for the connection to the Interconnection Customer's tie line.
- Modify protective relay elements in the line relays in Windstar substation to monitor voltage and frequency of the Interconnection Customer's Generating Facility.
- Install fiber from the substation control building to the Interconnection Customer tie line dead end structure and splice to the fiber provided by the Interconnection Customer.
- Install necessary communications equipment to tie the Interconnection Customer's communications path to the Transmission Provider's communications network.
- Include the following data points into the substation RTU:

  Analogs:
  - Net Generation MW
  - Net Generator MVAr
  - Energy Register

- Observe the Interconnection Customer's test of the communications system running from the collector substations to the POI substation and provide acceptance of functionality.
- Design, procure and install 230 kV revenue metering equipment for the Project including two (2) revenue quality meters, test switch, instrument transformers, metering panels, junction box and secondary metering wire.
- Provide and install an Ethernet connection for retail sales and generation accounting via the MV-90 translation system.

Other

The following outlines the design, procurement, construction, installation, and ownership of equipment past the POI.

TRANSMISSION PROVIDER TO BE RESPONSIBLE FOR

- Aeolus-Shirley Basin #1 Transmission Line
  - Procure any required permits, property rights and/or rights-of-way necessary in order for the line to be rebuilt.
  - Rebuild the approximately 16 miles of the transmission line with double bundled 1158.4 ACSS/TW (Hudson) conductor.
  - Procure and install OPGW fiber optic cable on the rebuilt transmission line in the static wire position.
- Aeolus-Freezeout Transmission Line
  - Procure any required permits, property rights and/or rights-of-way necessary in order for the line to be rebuilt.
  - Rebuild the approximately 3.5 miles of the transmission line with bundled 1158.4 ACSS/TW conductor.
  - Procure and install OPGW fiber optic cable on the rebuilt transmission line in the static wire position.
- Freezeout-Standpipe Transmission Line
  - Procure any required permits, property rights and/or rights-of-way necessary in order for the line to be rebuilt.
  - Rebuild the approximately 11.5 miles of the transmission line with bundled 2-1272 ACSR conductor.
- Freezeout substation

  - o Procure the following major equipment to replace existing equipment in the substation:
    - ▪ 3 – 230 kV, circuit breaker
    - ▪ 8 – 230 kV, group operated switch, breaker disconnect
    - ▪ 2 – 230 kV, group operated switch, line disconnect
  - o Perform a CDEGS grounding analysis.
  - o Develop and implement new relay settings for the rebuilt lines to Aeolus and Standpipe substations.
  - o Install conduit and underground fiber optic cable from splices of the newly installed OPGW running from both Standpipe and Aeolus substations and terminate the underground fiber runs in the substation control building.
  - o Install the necessary communications equipment to terminate the new fiber in the substation control building.
- Aeolus substation
  - o Develop and implement new relay settings for the rebuilt line to Freezeout substation.
  - o Install conduit and underground fiber optic cable from splice of the newly installed OPGW running from both Freezeout substation and terminate the underground fiber in the substation control building.
  - o Install the necessary communications equipment to terminate the new fiber in the substation control building.
- Standpipe substation
  - o Develop and implement new relay settings for the rebuilt line to Freezeout substation.
  - o Install conduit and underground fiber optic cable from splice of the newly installed OPGW running from both Freezeout substation and terminate the underground fiber in the substation control building.
  - o Install the necessary communications equipment to terminate the new fiber in the substation control building.
- Shirley Basin substation
  - o Develop and implement new relay settings for the rebuilt line to Aeolus substation.
- System Operations Control Centers

- o Update databases to include Interconnection Customer and Transmission Provider Interconnection Facilities and Network Upgrades.

Exhibit 1 to Appendix C to LGIA

Facility Connection Requirements for Transmission Systems

PacifiCorp Policy 139

(see attached)

Appendix H
Requirements Applicable to
Multiple Interconnection Customer Signatories

Customer Signatory Requirements

a. The Interconnection Customer's rights and obligations under this Amended and Restated Large Generator Interconnection Agreement ("LGIA") shall be held, subject to the provisions of this Appendix H, jointly by Cedar Springs Wind, LLC, Cedar Springs Transmission LLC, and Cedar Springs Wind III, LLC (each, a "Customer Signatory"), who together comprise the Interconnection Customer under this LGIA. Cedar Springs Wind, LLC, owns the 200 MW Cedar Springs 1 Generating Facility ("Cedar Springs I"), Cedar Springs Transmission LLC, owns the 200 MW Cedar Springs 2 Generating Facility ("Cedar Springs II"), and Cedar Springs Wind III, LLC owns the 120 MW Cedar Springs 3 Generating Facility ("Cedar Springs III").

b. Each Customer Signatory shall be jointly and severally liable for all liabilities and obligations of the Interconnection Customer under this LGIA, including all monetary obligations, which includes the funding of all Interconnection Facilities that are required to be funded by the Interconnection Customer in order to accommodate the interconnection of Cedar Springs I, Cedar Springs II, and Cedar Springs III.

c. There shall be no more than three Customer Signatories comprising the Interconnection Customer, and no Customer Signatory may further subdivide, in any manner or form, its interests in this LGIA or in the Interconnection Customer's Interconnection Facilities without the written consent of the other Customer Signatories and the Transmission Provider. Each of the Customer Signatories acknowledges and agrees that the administrative burden to the Transmission Provider to administer this LGIA would be excessive if any Customer Signatory were to further subdivide its interests in this LGIA or in the Interconnection Customer's Interconnection Facilities in violation of this clause (c) of this Appendix H, and any such action would be considered a Breach and, if not cured pursuant to Article 17 of this LGIA, a Default under Article 17 of this LGIA, entitling the Transmission Provider to terminate this LGIA. The Parties acknowledge that each

Customer Signatory may assign its rights in the Interconnection Customer's Interconnection Facilities and this LGIA for collateral security purposes in accordance with Article 19 of this LGIA.

d. In accordance with Section 19 of the LGIA, no Customer Signatory may assign its interests in the Interconnection Customer's Interconnection Facilities or any of its rights and obligations under this LGIA independently of its interest in Cedar Springs I, Cedar Springs II or Cedar Springs III, as the case may be, and then only with the written consent of the Transmission Provider and the other Customer Signatories. Cedar Springs Transmission LLC has already sought Transmission Provider’s consent to assign its rights and obligations under this LGIA and to Interconnection Customer’s Interconnection Facilities to PacifiCorp’s load-serving entity function (i.e. not the Transmission Provider function that is the signatory to this LGIA), which has entered into an agreement to purchase the Cedar Springs II facility, and Transmission Provider hereby memorializes its consent to said assignment which shall be effective upon the sale of Cedar Springs II facility to PacifiCorp’s load-serving entity function.

e. The Customer Signatories shall appoint a manager to serve as the Interconnection Customer's authorized agent and representative for purposes of administering this LGIA (the “Manager”). Pursuant to the SFA, the Customer Signatories will appoint, upon execution of the SFA, Cedar Springs Wind, LLC as the Manager. The Manager’s contact information is as set forth in Appendix F of this LGIA. In accordance with the terms of the SFA, upon replacement of the Manager under the SFA, any Customer Signatory (other than any Customer Signatory that is the Manager) may change the Manager or Manager’s contact information by delivering written notice of such change to the Transmission Provider not less than five Business Days prior to the effective date of the change in accordance with Notices in Appendix F. The Manager will be a single point of contact for the Transmission Provider and will represent Interconnection Customer for notice purposes and all other communications between the Transmission Provider and Interconnection Customer. All payments, indicia of insurance, and indicia of security to be provided by the Interconnection Customer to the Transmission Provider pursuant to this LGIA shall be provided only by the Manager on behalf of all Customer Signatories; provided, however that nothing herein shall be construed as obligating the Manager to obtain a single insurance policy on behalf of the other Customer Signatories or obtain security on behalf of any other Customer Signatory. Any invoices or refunds due to the Interconnection Customer by the Transmission Provider shall be made only to the Manager on behalf of all Customer Signatories. The Manager shall bear all responsibility for disbursing any refunds and disseminating any invoices, notices, or other communications and for facilitating communications between and among the Customer Signatories with respect to this LGIA, and each Customer Signatory hereby waives any right to individual invoice, notice or communication from the Transmission Provider. The Transmission Provider will not be obligated to act on any notice, instruction, or other communication from a Customer Signatory (except to the extent that such Customer Signatory is acting as the Manager). The Manager's actions and representations to the Transmission Provider shall be binding upon the Interconnection Customer and each Customer Signatory. Each Customer Signatory shall be jointly and severally liable and responsible to Transmission Provider for the Manager's actions taken in connection with this LGIA.

f. It is understood that each of the Customer Signatories will enter into a Shared Facilities Agreement ("SFA") governing, among other things, the liabilities and obligations of the Interconnection Customer and Manager under this LGIA and the rights and responsibilities of each Customer Signatory with respect to the other Customer Signatories. The SFA will establish the rights of the Customer Signatories as tenants-in-common with respect to this LGIA, the Interconnection Customer's Interconnection Facilities and other shared infrastructure. While the SFA will address the Customer Signatories' rights and obligations as between themselves with respect to their co-tenancy rights in this LGIA, the Interconnection Customer's Interconnection Facilities and other shared infrastructure, the Customer Signatories remain jointly and severally liable for compliance with all liabilities and obligations of the Interconnection Customer under this LGIA.

g. The Parties agree that the entire 520 MW net generating capacity comprised of the Cedar Springs I, Cedar Springs II, and Cedar Springs III generating facilities shall be considered to be a single Generating Facility for purposes of this LGIA. Except as otherwise set forth in this Appendix H of this LGIA, each Customer Signatory acknowledges and agrees that the Transmission Provider shall not treat any portion of

Cedar Springs I, Cedar Springs II, and Cedar Springs III as a stand-alone Large Generating Facility or differently from any other portion of the Generating Facility. Moreover, the Customer Signatories shall act as a single entity in exercising the rights and performing the obligations of Interconnection Customer under this LGIA. The Transmission Provider shall treat all Customer Signatories comprising the Interconnection Customer as a single entity under this LGIA and bear no obligation or responsibility to any individual Customer Signatory separately from the Interconnection Customer. Interconnection Customer's obligation to perform its obligations under this LGIA shall not be excused by reason of the Customer Signatories’ failure to agree with respect to any obligation of the Interconnection Customer.

h. Notwithstanding Section 17.1.2 of this LGIA, in the event of a Breach by the Interconnection Customer, Transmission Provider will use best efforts to negotiate a replacement LGIA with one or more Customer Signatories if termination of the LGIA as to all Customer Signatories is not required to address such Breach. If Transmission Provider seeks to terminate this LGIA without such a replacement LGIA, Transmission Provider shall include in its LGIA termination filing with the FERC referenced in Section 2.3.3 of this LGIA an explanation to the FERC as to why a replacement LGIA as to one or more Customer Signatories was not executed.

Large Generator Interconnection Agreement Pryor Mountain

February 2020

STANDARD LARGE GENERATOR

INTERCONNECTION AGREEMENT (LGIA)
between
PACIFICORP, on behalf of its Transmission Function
and
PACIFICORP, on behalf of its Marketing Function
PRYOR MOUNTAIN

TABLE OF CONTENTS

STANDARD LARGE GENERATOR INTERCONNECTION AGREEMENT

THIS STANDARD LARGE GENERATOR INTERCONNECTION AGREEMENT ("Agreement") is made and entered into this 12th day of September, 2019 by and between PacifiCorp, on behalf of its Marketing function, a corporation organized and existing under the laws of the State of Oregon ("Interconnection Customer" with a Large Generating Facility), and PacifiCorp, on behalf of its Transmission Function a corporation organized and existing under the laws of the State of Oregon ("Transmission Provider and/or Transmission Owner"). Interconnection Customer and Transmission Provider each may be referred to as a "Party" or collectively as the "Parties."

Recitals

WHEREAS, Transmission Provider operates the Transmission System; and

WHEREAS, Interconnection Customer intends to own, lease and/or control and operate the Generating Facility identified as a Large Generating Facility in Appendix C to this Agreement; and,

WHEREAS, Interconnection Customer and Transmission Provider have agreed to enter into this Agreement for the purpose of interconnecting the Large Generating Facility with the Transmission System;

NOW, THEREFORE, in consideration of and subject to the mutual covenants contained herein, it is agreed:

When used in this Standard Large Generator Interconnection Agreement, terms with initial capitalization that are not defined in Article 1 shall have the meanings specified in the Article in which they are used or the Open Access Transmission Tariff (Tariff).

Article 1. Definitions

Adverse System Impact shall mean the negative effects due to technical or operational limits on conductors or equipment being exceeded that may compromise the safety and reliability of the electric system.

Affected System shall mean an electric system other than the Transmission Provider's Transmission System that may be affected by the proposed interconnection.

Affected System Operator shall mean the entity that operates an Affected System.

Affiliate shall mean, with respect to a corporation, partnership or other entity, each such other corporation, partnership or other entity that directly or indirectly, through one or more intermediaries, controls, is controlled by, or is under common control with, such corporation, partnership or other entity.

Ancillary Services shall mean those services that are necessary to support the transmission of capacity and energy from resources to loads while maintaining reliable operation of the Transmission Provider's Transmission System in accordance with Good Utility Practice.

Applicable Laws and Regulations shall mean all duly promulgated applicable federal, state and local laws, regulations, rules, ordinances, codes, decrees, judgments, directives, or judicial or administrative orders, permits and other duly authorized actions of any Governmental Authority.

Applicable Reliability Council shall mean the reliability council applicable to the Transmission System to which the Generating Facility is directly interconnected.

Applicable Reliability Standards shall mean the requirements and guidelines of NERC, the Applicable Reliability Council, and the Control Area of the Transmission System to which the Generating Facility is directly interconnected.

Base Case shall mean the base case power flow, short circuit, and stability data bases used for the Interconnection Studies by the Transmission Provider or Interconnection Customer.

Breach shall mean the failure of a Party to perform or observe any material term or condition of the Standard Large Generator Interconnection Agreement.

Breaching Party shall mean a Party that is in Breach of the Standard Large Generator Interconnection Agreement.

Business Day shall mean Monday through Friday, excluding Federal Holidays.

Calendar Day shall mean any day including Saturday, Sunday or a Federal Holiday.

Clustering shall mean the process whereby a group of Interconnection Requests is studied together, instead of serially, for the purpose of conducting the Interconnection System Impact Study.

Commercial Operation shall mean the status of a Generating Facility that has commenced generating electricity for sale, excluding electricity generated during Trial Operation.

Commercial Operation Date of a unit shall mean the date on which the Generating Facility commences Commercial Operation as agreed to by the Parties pursuant to Appendix E to the Standard Large Generator Interconnection Agreement.

Confidential Information shall mean any confidential, proprietary or trade secret information of a plan, specification, pattern, procedure, design, device, list, concept, policy or compilation relating to the present or planned business of a Party, which is designated as confidential by the Party supplying the information, whether conveyed orally, electronically, in writing, through inspection, or otherwise.

Control Area shall mean an electrical system or systems bounded by interconnection metering and telemetry, capable of controlling generation to maintain its interchange schedule with other Control Areas and contributing to frequency regulation of the interconnection. A Control Area must be certified by the Applicable Reliability Council.

Default shall mean the failure of a Breaching Party to cure its Breach in accordance with Article 17 of the Standard Large Generator Interconnection Agreement.

Dispute Resolution shall mean the procedure for resolution of a dispute between the Parties in which they will first attempt to resolve the dispute on an informal basis.

Distribution System shall mean the Transmission Provider's facilities and equipment used to transmit electricity to ultimate usage points such as homes and industries directly from nearby generators or from interchanges with higher voltage transmission networks which transport bulk power over longer distances. The voltage levels at which distribution systems operate differ among areas.

Distribution Upgrades shall mean the additions, modifications, and upgrades to the Transmission Provider's Distribution System at or beyond the Point of Interconnection to facilitate interconnection of the Generating Facility and render the transmission service necessary to effect Interconnection Customer's wholesale sale of electricity in interstate commerce. Distribution Upgrades do not include Interconnection Facilities.

Effective Date shall mean the date on which the Standard Large Generator Interconnection Agreement becomes effective upon execution by the Parties subject to acceptance by FERC, or if filed unexecuted, upon the date specified by FERC.

Emergency Condition shall mean a condition or situation: (1) that in the judgment of the Party making the claim is imminently likely to endanger life or property; or (2) that, in the case of a Transmission Provider, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to Transmission Provider's Transmission System, Transmission Provider's Interconnection Facilities or the electric systems of others to which the Transmission Provider's Transmission System is directly connected; or (3) that, in the case of Interconnection Customer, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to, the Generating Facility or

Interconnection Customer's Interconnection Facilities. System restoration and black start shall be considered Emergency Conditions; provided, that Interconnection Customer is not obligated by the Standard Large Generator Interconnection Agreement to possess black start capability.

Energy Resource Interconnection Service shall mean an Interconnection Service that allows the Interconnection Customer to connect its Generating Facility to the Transmission Provider's Transmission System to be eligible to deliver the Generating Facility's electric output using the existing firm or nonfirm capacity of the Transmission Provider's Transmission System on an as available basis. Energy Resource Interconnection Service in and of itself does not convey transmission service.

Engineering & Procurement (E&P) Agreement shall mean an agreement that authorizes the Transmission Provider to begin engineering and procurement of long lead-time items necessary for the establishment of the interconnection in order to advance the implementation of the Interconnection Request.

Environmental Law shall mean Applicable Laws or Regulations relating to pollution or protection of the environment or natural resources.

Federal Power Act shall mean the Federal Power Act, as amended, 16 U.S.C. §§ 791a et seq.

FERC shall mean the Federal Energy Regulatory Commission (Commission) or its successor.

Force Majeure shall mean any act of God, labor disturbance, act of the public enemy, war, insurrection, riot, fire, storm or flood, explosion, breakage or accident to machinery or equipment, any order, regulation or restriction imposed by governmental, military or lawfully established civilian authorities, or any other cause beyond a Party's control. A Force Majeure event does not include acts of negligence or intentional wrongdoing by the Party claiming Force Majeure.

Generating Facility shall mean Interconnection Customer's device for the production and/or storage for later injection of electricity identified in the

Interconnection Request, but shall not include the Interconnection Customer's Interconnection Facilities.

Generating Facility Capacity shall mean the net capacity of the Generating Facility and the aggregate net capacity of the Generating Facility where it includes multiple energy production devices.

Good Utility Practice shall mean any of the practices, methods and acts engaged in or approved by a significant portion of the electric industry during the relevant time period, or any of the practices, methods and acts which, in the exercise of reasonable judgment in light of the facts known at the time the decision was made, could have been expected to accomplish the desired result at a reasonable cost consistent with good business practices, reliability, safety and expedition. Good Utility Practice is not intended to be limited to the optimum practice, method, or act to the exclusion of all others, but rather to be acceptable practices, methods, or acts generally accepted in the region.

Governmental Authority shall mean any federal, state, local or other governmental regulatory or administrative agency, court, commission, department, board, or other governmental subdivision, legislature, rulemaking board, tribunal, or other governmental authority having jurisdiction over the Parties, their respective facilities, or the respective services they provide, and exercising or entitled to exercise any administrative, executive, police, or taxing authority or power; provided, however, that such term does not include Interconnection Customer, Transmission Provider, or any Affiliate thereof.

Hazardous Substances shall mean any chemicals, materials or substances defined as or included in the definition of "hazardous substances," "hazardous wastes," "hazardous materials," "hazardous constituents," "restricted hazardous materials," "extremely hazardous substances," "toxic substances," "radioactive substances," "contaminants," "pollutants," "toxic pollutants" or words of similar meaning and regulatory effect under any applicable Environmental Law, or any other chemical, material or substance, exposure to which is prohibited, limited or regulated by any applicable Environmental Law.

Initial Synchronization Date shall mean the date upon which the Generating Facility is initially synchronized and upon which Trial Operation begins.

In-Service Date shall mean the date upon which the Interconnection Customer reasonably expects it will be ready to begin use of the Transmission Provider's Interconnection Facilities to obtain back feed power.

Interconnection Customer shall mean any entity, including the Transmission Provider, Transmission Owner or any of the Affiliates or subsidiaries of either, that proposes to interconnect its Generating Facility with the Transmission Provider's Transmission System.

Interconnection Customer's Interconnection Facilities shall mean all facilities and equipment, as identified in Appendix A of the Standard Large Generator Interconnection Agreement, that are located between the Generating Facility and the Point of Change of Ownership, including any modification, addition, or upgrades to such facilities and equipment necessary to physically and electrically interconnect the Generating Facility to the Transmission Provider's Transmission System. Interconnection Customer's Interconnection Facilities are sole use facilities.

Interconnection Facilities shall mean the Transmission Provider's Interconnection Facilities and the Interconnection Customer's Interconnection Facilities. Collectively, Interconnection Facilities include all facilities and equipment between the Generating Facility and the Point of Interconnection, including any modification, additions or upgrades that are necessary to physically and electrically interconnect the Generating Facility to the Transmission Provider's Transmission System. Interconnection Facilities are sole use facilities and shall not include Distribution Upgrades, Stand Alone Network Upgrades or Network Upgrades.

Interconnection Facilities Study shall mean a study conducted by the Transmission Provider or a third party consultant for the Interconnection Customer to determine a list of facilities (including Transmission Provider's Interconnection Facilities and Network Upgrades as identified in the Interconnection System Impact Study), the cost of those facilities, and the time required to interconnect the Generating Facility with the Transmission

Provider's Transmission System. The scope of the study is defined in Section 43 of the Standard Large Generator Interconnection Procedures.

Interconnection Facilities Study Agreement shall mean the form of agreement contained in Appendix 4 of the Standard Large Generator Interconnection Procedures for conducting the Interconnection Facilities Study.

Interconnection Feasibility Study shall mean a preliminary evaluation of the system impact and cost of interconnecting the Generating Facility to the Transmission Provider's Transmission System, the scope of which is described in Section 41 of the Standard Large Generator Interconnection Procedures.

Interconnection Feasibility Study Agreement shall mean the form of agreement contained in Appendix 2 of the Standard Large Generator Interconnection Procedures for conducting the Interconnection Feasibility Study.

Interconnection Request shall mean an Interconnection Customer's request, in the form of Appendix 1 to the Standard Large Generator Interconnection Procedures, in accordance with the Tariff, to interconnect a new Generating Facility, or to increase the capacity of, or make a Material Modification to the operating characteristics of, an existing Generating Facility that is interconnected with the Transmission Provider's Transmission System.

Interconnection Service shall mean the service provided by the Transmission Provider associated with interconnecting the Interconnection Customer's Generating Facility to the Transmission Provider's Transmission System and enabling it to receive electric energy and capacity from the Generating Facility at the Point of Interconnection, pursuant to the terms of the Standard Large Generator Interconnection Agreement and, if applicable, the Transmission Provider's Tariff.

Interconnection Study shall mean any of the following studies: the Interconnection Feasibility Study, the Interconnection System Impact Study, and the Interconnection Facilities Study described in the Standard Large Generator Interconnection Procedures.

Interconnection System Impact Study shall mean an engineering study that evaluates the impact of the proposed interconnection on the safety and reliability of Transmission Provider's Transmission System and, if applicable, an Affected System. The study shall identify and detail the system impacts that would result if the Generating Facility were interconnected without project modifications or system modifications, focusing on the Adverse System Impacts identified in the Interconnection Feasibility Study, or to study potential impacts, including but not limited to those identified in the Scoping Meeting as described in the Standard Large Generator Interconnection Procedures.

Interconnection System Impact Study Agreement shall mean the form of agreement contained in Appendix 3 of the Standard Large Generator Interconnection Procedures for conducting the Interconnection System Impact Study.

IRS shall mean the Internal Revenue Service.

Joint Operating Committee shall be a group made up of representatives from Interconnection Customers and the Transmission Provider to coordinate operating and technical considerations of Interconnection Service.

Large Generating Facility shall mean a Generating Facility having a Generating Facility Capacity of more than 20 MW.

Loss shall mean any and all losses relating to injury to or death of any person or damage to property, demand, suits, recoveries, costs and expenses, court costs, attorney fees, and all other obligations by or to third parties, arising out of or resulting from the other Party's performance, or non-performance of its obligations under the Standard Large Generator Interconnection Agreement on behalf of the indemnifying Party, except in cases of gross negligence or intentional wrongdoing by the indemnifying Party.

Material Modification shall mean those modifications that have a material impact on the cost or timing of any Interconnection Request with a later queue priority date.

Metering Equipment shall mean all metering equipment installed or to be installed at the Generating Facility

pursuant to the Standard Large Generator Interconnection Agreement at the metering points, including but not limited to instrument transformers, MWh-meters, data acquisition equipment, transducers, remote terminal unit, communications equipment, phone lines, and fiber optics.

NERC shall mean the North American Electric Reliability Council or its successor organization.

Network Resource shall mean any designated generating resource owned, purchased, or leased by a Network Customer under the Network Integration Transmission Service Tariff. Network Resources do not include any resource, or any portion thereof, that is committed for sale to third parties or otherwise cannot be called upon to meet the Network Customer's Network Load on a non-interruptible basis.

Network Resource Interconnection Service shall mean an Interconnection Service that allows the Interconnection Customer to integrate its Large Generating Facility with the Transmission Provider's Transmission System (1) in a manner comparable to that in which the Transmission Provider integrates its generating facilities to serve native load customers; or (2) in an RTO or ISO with market based congestion management, in the same manner as Network Resources. Network Resource Interconnection Service in and of itself does not convey transmission service.

Network Upgrades shall mean the additions, modifications, and upgrades to the Transmission Provider's Transmission System required at or beyond the point at which the Interconnection Facilities connect to the Transmission Provider's Transmission System to accommodate the interconnection of the Large Generating Facility to the Transmission Provider's Transmission System.

Notice of Dispute shall mean a written notice of a dispute or claim that arises out of or in connection with the Standard Large Generator Interconnection Agreement or its performance.

Optional Interconnection Study shall mean a sensitivity analysis based on assumptions specified by the Interconnection Customer in the Optional Interconnection Study Agreement.

Optional Interconnection Study Agreement shall mean the form of agreement contained in Appendix 5 of the Standard Large Generator Interconnection Procedures for conducting the Optional Interconnection Study.

Party or Parties shall mean Transmission Provider, Transmission Owner, Interconnection Customer or any combination of the above.

Point of Change of Ownership shall mean the point, as set forth in Appendix A to the Standard Large Generator Interconnection Agreement, where the Interconnection Customer's Interconnection Facilities connect to the Transmission Provider's Interconnection Facilities.

Point of Interconnection shall mean the point, as set forth in Appendix A to the Standard Large Generator Interconnection Agreement, where the Interconnection Facilities connect to the Transmission Provider's Transmission System.

Provisional Interconnection Service shall mean Interconnection Service provided by Transmission Provider associated with interconnecting the Interconnection Customer's Generating Facility to Transmission Provider's Transmission System and enabling that Transmission System to receive electric energy and capacity from the Generating Facility at the Point of Interconnection, pursuant to the terms of the Provisional Large Generator Interconnection Agreement and, if applicable, the Tariff.

Provisional Large Generator Interconnection Agreement shall mean the interconnection agreement for Provisional Interconnection Service established between Transmission Provider and/or the Transmission Owner and the Interconnection Customer. This agreement shall take the form of the Large Generator Interconnection Agreement, modified for provisional purposes.

Queue Position shall mean the order of a valid Interconnection Request, relative to all other pending valid Interconnection Requests, that is established based upon the date and time of receipt of the valid Interconnection Request by the Transmission Provider.

Reasonable Efforts shall mean, with respect to an action required to be attempted or taken by a Party under the Standard Large Generator Interconnection Agreement, efforts that are timely and consistent with Good Utility Practice and are otherwise substantially equivalent to those a Party would use to protect its own interests.

Scoping Meeting shall mean the meeting between representatives of the Interconnection Customer and Transmission Provider conducted for the purpose of discussing alternative interconnection options, to exchange information including any transmission data and earlier study evaluations that would be reasonably expected to impact such interconnection options, to analyze such information, and to determine the potential feasible Points of Interconnection.

Site Control shall mean documentation reasonably demonstrating: (1) ownership of, a leasehold interest in, or a right to develop a site for the purpose of constructing the Generating Facility; (2) an option to purchase or acquire a leasehold site for such purpose; or (3) an exclusivity or other business relationship between Interconnection Customer and the entity having the right to sell, lease or grant Interconnection Customer the right to possess or occupy a site for such purpose.

Small Generating Facility shall mean a Generating Facility that has a Generating Facility Capacity of no more than 20 MW.

Stand Alone Network Upgrades shall mean Network Upgrades that are not part of an Affected System that an Interconnection Customer may construct without affecting day-to-day operations of the Transmission System during their construction. Both the Transmission Provider and the Interconnection Customer must agree as to what constitutes Stand Alone Network Upgrades and identify them in Appendix A to the Standard Large Generator Interconnection Agreement. If the Transmission Provider and Interconnection Customer disagree about whether a particular Network Upgrade is a Stand Alone Network Upgrade, the Transmission Provider must provide the Interconnection Customer a written technical explanation outlining why the Transmission Provider does not consider the Network Upgrade to be a Stand Alone Network Upgrade within 15 days of its determination.

Standard Large Generator Interconnection Agreement (LGIA) shall mean the form of interconnection agreement applicable to an Interconnection Request pertaining to a Large Generating Facility that is included in the Transmission Provider's Tariff.

Standard Large Generator Interconnection Procedures (LGIP) shall mean the interconnection procedures applicable to an Interconnection Request pertaining to a Large Generating Facility that are included in the Transmission Provider's Tariff.

Surplus Interconnection Service shall mean any unneeded portion of Interconnection Service established in a Large Generator Interconnection Agreement, such that if Surplus Interconnection Service is utilized the total amount of Interconnection Service at the Point of Interconnection would remain the same.

System Protection Facilities shall mean the equipment, including necessary protection signal communications equipment, required to protect (1) the Transmission Provider's Transmission System from faults or other electrical disturbances occurring at the Generating Facility and (2) the Generating Facility from faults or other electrical system disturbances occurring on the Transmission Provider's Transmission System or on other delivery systems or other generating systems to which the Transmission Provider's Transmission System is directly connected.

Tariff shall mean the Transmission Provider's Tariff through which open access transmission service and Interconnection Service are offered, as filed with FERC, and as amended or supplemented from time to time, or any successor tariff.

Transmission Owner shall mean an entity that owns, leases or otherwise possesses an interest in the portion of the Transmission System at the Point of Interconnection and may be a Party to the Standard Large Generator Interconnection Agreement to the extent necessary.

Transmission Provider shall mean the public utility (or its designated agent) that owns, controls, or operates transmission or distribution facilities used for the transmission of electricity in interstate commerce and provides transmission service under the Tariff. The term Transmission Provider should be read to include the Transmission Owner when the Transmission Owner is separate from the Transmission Provider.

Transmission Provider's Interconnection Facilities shall mean all facilities and equipment owned, controlled or operated by the Transmission Provider from the Point of Change of Ownership to the Point of Interconnection as identified in Appendix A to the Standard Large Generator Interconnection Agreement, including any modifications, additions or upgrades to such facilities and equipment. Transmission Provider's Interconnection Facilities are sole use facilities and shall not include Distribution Upgrades, Stand Alone Network Upgrades or Network Upgrades.

Transmission System shall mean the facilities owned, controlled or operated by the Transmission Provider or Transmission Owner that are used to provide transmission service under the Tariff.

Trial Operation shall mean the period during which Interconnection Customer is engaged in on-site test operations and commissioning of the Generating Facility prior to Commercial Operation.

Variable Energy Resource shall mean a device for the production of electricity that is characterized by an energy source that: (1) is renewable; (2) cannot be stored by the facility owner or operator; and (3) has variability that is beyond the control of the facility owner or operator.

Article 2. Effective Date, Term, and Termination

2.1 Effective Date. This LGIA shall become effective upon execution by the Parties subject to acceptance by FERC (if applicable), or if filed unexecuted, upon the date specified by FERC. Transmission Provider shall promptly file this LGIA with FERC upon execution in accordance with Article 3.1, if required.

2.2 Term of Agreement. Subject to the provisions of Article 2.3, this LGIA shall remain in effect for a period of ten (10) years from the Effective Date or such other longer period as Interconnection Customer may request (Term to be specified in individual agreements) and shall be automatically renewed for each successive one-year period thereafter.

2.3 Termination Procedures.

2.3.1 Written Notice. This LGIA may be terminated by Interconnection Customer after giving Transmission Provider ninety (90) Calendar Days advance written notice, or by Transmission Provider notifying FERC after the Generating Facility permanently ceases Commercial Operation.

2.3.2 Default. Either Party may terminate this LGIA in accordance with Article 17.

2.3.3 Notwithstanding Articles 2.3.1 and 2.3.2, no termination shall become effective until the Parties have complied with all Applicable Laws and Regulations applicable to such termination, including the filing with FERC of a notice of termination of this LGIA, which notice has been accepted for filing by FERC.

2.4 Termination Costs. If a Party elects to terminate this Agreement pursuant to Article 2.3 above, each Party shall pay all costs incurred (including any cancellation costs relating to orders or contracts for Interconnection Facilities and equipment) or charges assessed by the other Party, as of the date of the other Party's receipt of such notice of termination, that are the responsibility of the Terminating Party under this LGIA. In the event of termination by a Party, the Parties shall use commercially Reasonable Efforts to mitigate the costs, damages and charges arising as a consequence of termination. Upon termination of this LGIA, unless otherwise ordered or approved by FERC:

2.4.1 With respect to any portion of Transmission Provider's Interconnection Facilities that have not yet been constructed or installed, Transmission Provider shall to the extent possible and with Interconnection Customer's authorization cancel any pending orders of, or return, any materials or equipment for, or contracts for construction of, such facilities; provided that in the event Interconnection Customer elects not to authorize such cancellation, Interconnection Customer shall assume all payment obligations with respect to such materials, equipment, and contracts, and Transmission Provider shall deliver such material and equipment, and, if necessary, assign such contracts, to Interconnection Customer as soon as practicable, at Interconnection Customer's expense. To the extent that Interconnection Customer has already paid Transmission Provider for any or all such costs of materials or equipment not taken by Interconnection Customer, Transmission Provider shall promptly refund such amounts to Interconnection Customer, less any costs, including penalties incurred by Transmission Provider to cancel any pending orders of or return such materials, equipment, or contracts.

If an Interconnection Customer terminates this LGIA, it shall be responsible for all costs incurred in association with that Interconnection Customer's interconnection, including any cancellation costs relating to orders or contracts for Interconnection Facilities and equipment, and other expenses including any Network Upgrades for which Transmission Provider has incurred expenses and has not been reimbursed by Interconnection Customer.

2.4.2 Transmission Provider may, at its option, retain any portion of such materials, equipment, or facilities that Interconnection Customer chooses not to accept delivery of, in which case Transmission Provider shall be responsible for all costs associated with procuring such materials, equipment, or facilities.

2.4.3 With respect to any portion of the Interconnection Facilities, and any other facilities already installed or constructed pursuant to the terms of this LGIA, Interconnection Customer shall be responsible for all costs associated with the removal, relocation or other disposition or retirement of such materials, equipment, or facilities.

2.5 Disconnection. Upon termination of this LGIA, the Parties will take all appropriate steps to disconnect the Large Generating Facility from the Transmission System. All costs required to effectuate such disconnection shall be borne by the terminating Party, unless such termination resulted from the non-terminating Party's Default of this LGIA or such non-terminating Party otherwise is responsible for these costs under this LGIA.

2.6 Survival. This LGIA shall continue in effect after termination to the extent necessary to provide for final billings and payments and for costs incurred hereunder, including billings and payments pursuant to this LGIA; to permit the determination and enforcement of liability and indemnification obligations arising from acts or events that occurred while this LGIA was in effect; and to permit each Party to have access to the lands of the other Party pursuant to this LGIA or other applicable agreements, to disconnect, remove or salvage its own facilities and equipment.

Article 3. Regulatory Filings

3.1 Filing. Transmission Provider shall file this LGIA (and any amendment hereto) with the appropriate Governmental Authority, if required. Interconnection Customer may request that any information so provided be subject to the confidentiality provisions of Article 22. If Interconnection Customer has executed this LGIA, or any amendment thereto, Interconnection Customer shall reasonably cooperate with Transmission

Provider with respect to such filing and to provide any information reasonably requested by Transmission Provider needed to comply with applicable regulatory requirements.

Article 4. Scope of Service

4.1 **Interconnection Product Options.** Interconnection Customer has selected the following (checked) type of Interconnection Service:

X 4.1.1 **Energy Resource Interconnection Service.**

4.1.1.1 **The Product.** Energy Resource Interconnection Service allows Interconnection Customer to connect the Large Generating Facility to the Transmission System and be eligible to deliver the Large Generating Facility's output using the existing firm or non-firm capacity of the Transmission System on an "as available" basis. To the extent Interconnection Customer wants to receive Energy Resource Interconnection Service, Transmission Provider shall construct facilities identified in Appendix A.

4.1.1.2 **Transmission Delivery Service Implications.** Under Energy Resource Interconnection Service, Interconnection Customer will be eligible to inject power from the Large Generating Facility into and deliver power across the interconnecting Transmission Provider's Transmission System on an "as available" basis up to the amount of MWs identified in the applicable stability and steady state studies to the extent the upgrades initially required to qualify for Energy Resource Interconnection Service have been constructed. Where eligible to do so (e.g., PJM, ISO-NE, NYISO), Interconnection Customer may place a bid to sell into the market up to the maximum identified Large Generating Facility output, subject to any conditions specified in the interconnection service approval, and the Large Generating Facility will be dispatched to the extent Interconnection Customer's bid clears. In all other instances, no transmission delivery service from the Large Generating Facility is assured, but Interconnection Customer may obtain Point-to-Point Transmission Service, Network Integration Transmission Service, or be used for secondary network transmission service, pursuant to Transmission Provider's Tariff, up to the maximum output identified in the stability and steady state studies. In those instances, in order for Interconnection Customer to obtain the right to deliver or inject energy beyond the Large Generating Facility Point of Interconnection or to improve its ability to do so, transmission delivery service must be obtained pursuant to the provisions of Transmission Provider's Tariff. The Interconnection Customer's ability to inject its Large Generating Facility output beyond the Point of Interconnection, therefore, will depend on the existing capacity of Transmission Provider's Transmission System at such time as a transmission service request is made that would accommodate such delivery. The provision of firm Point-to-Point Transmission Service or Network Integration Transmission Service may require the construction of additional Network Upgrades.

☐ **4.1.2 Network Resource Interconnection Service.**

4.1.2.1 The Product. Transmission Provider must conduct the necessary studies and construct the Network Upgrades needed to integrate the Large Generating Facility (1) in a manner comparable to that in which Transmission Provider integrates its generating facilities to serve native load customers; or (2) in an ISO or RTO with market based congestion management, in the same manner as all Network Resources. To the extent Interconnection Customer wants to receive Network Resource Interconnection Service, Transmission Provider shall construct the facilities identified in Appendix A to this LGIA.

4.1.2.2 Transmission Delivery Service Implications. Network Resource Interconnection Service allows Interconnection Customer's Large Generating Facility to be designated by any Network Customer under the Tariff on Transmission Provider's Transmission System as a Network Resource, up to the Large Generating Facility's full output, on the same basis as existing Network Resources interconnected to Transmission

Provider's Transmission System, and to be studied as a Network Resource on the assumption that such a designation will occur. Although Network Resource Interconnection Service does not convey a reservation of transmission service, any Network Customer under the Tariff can utilize its network service under the Tariff to obtain delivery of energy from the interconnected Interconnection Customer's Large Generating Facility in the same manner as it accesses Network Resources. A Large Generating Facility receiving Network Resource Interconnection Service may also be used to provide Ancillary Services after technical studies and/or periodic analyses are performed with respect to the Large Generating Facility's ability to provide any applicable Ancillary Services, provided that such studies and analyses have been or would be required in connection with the provision of such Ancillary Services by any existing Network Resource. However, if an Interconnection Customer's Large Generating Facility has not been designated as a Network Resource by any load, it cannot be required to provide Ancillary Services except to the extent such requirements extend to all generating facilities that are similarly situated. The provision of Network Integration Transmission Service or firm Point-to-Point Transmission Service may require additional studies and the construction of additional upgrades. Because such studies and upgrades would be associated with a request for delivery service under the Tariff, cost responsibility for the studies and upgrades would be in accordance with FERC's policy for pricing transmission delivery services.

Network Resource Interconnection Service does not necessarily provide Interconnection Customer with the capability to physically deliver the output of its Large Generating Facility to any particular load on Transmission Provider's Transmission System without incurring congestion costs. In the event of transmission constraints on Transmission Provider's Transmission System, Interconnection Customer's Large Generating Facility shall be subject to the applicable congestion management procedures in Transmission Provider's Transmission System in the same manner as Network Resources.

There is no requirement either at the time of study or interconnection, or at any point in the future, that Interconnection Customer's Large Generating Facility be designated as a Network Resource by a Network Service Customer under the Tariff or that Interconnection Customer identify a specific buyer (or sink). To the extent a Network Customer does designate the Large Generating Facility as a Network Resource, it must do so pursuant to Transmission Provider's Tariff.

Once an Interconnection Customer satisfies the requirements for obtaining Network Resource Interconnection Service, any future transmission service request for delivery from the Large Generating Facility within Transmission Provider's Transmission System of any amount of capacity and/or energy, up to the amount initially studied, will not require that any additional studies be performed or that any further upgrades associated with such Large Generating Facility be undertaken, regardless of whether or not such Large Generating Facility is ever designated by a Network Customer as a Network Resource and regardless of changes in ownership of the Large Generating Facility. However, the reduction or elimination of congestion or redispatch costs may require additional studies and the construction of additional upgrades.

To the extent Interconnection Customer enters into an arrangement for long term transmission service for deliveries from the Large Generating Facility outside Transmission Provider's Transmission System, such request may require additional studies and upgrades in order for Transmission Provider to grant such request.

4.2 Provision of Service. Transmission Provider shall provide Interconnection Service for the Large Generating Facility at the Point of Interconnection.

4.3 Performance Standards. Each Party shall perform all of its obligations under this LGIA in accordance with Applicable Laws and Regulations, Applicable Reliability Standards, and Good Utility Practice, and to the extent a Party is required or prevented or limited in taking any action by such regulations and standards, such Party shall not be deemed to be in Breach of this LGIA for its compliance therewith. If such Party is a Transmission Provider or Transmission Owner, then that Party shall amend the LGIA and submit the amendment to FERC for approval.

4.4 No Transmission Delivery Service. The execution of this LGIA does not constitute a request for, nor the provision of, any transmission delivery service under Transmission Provider's Tariff, and does not convey any right to deliver electricity to any specific customer or Point of Delivery.

4.5 Interconnection Customer Provided Services. The services provided by Interconnection Customer under this LGIA are set forth in Article 9.6 and Article 13.5.1.

Interconnection Customer shall be paid for such services in accordance with Article 11.6.

Article 5. Interconnection Facilities Engineering, Procurement, and Construction

5.1 Options. Unless otherwise mutually agreed to between the Parties, Interconnection Customer shall select the In-Service Date, Initial Synchronization Date, and Commercial Operation Date; and either the Standard Option or Alternate Option set forth below, and such dates and selected option shall be set forth in Appendix B, Milestones. At the same time, Interconnection Customer shall indicate whether it elects to exercise the Option to Build set forth in Article 5.1.3 below. If the dates designated by Interconnection Customer are not acceptable to Transmission Provider, Transmission Provider shall so notify Interconnection Customer within thirty (30) Calendar Days. Upon receipt of the notification that Interconnection Customer’s designated dates are not acceptable to Transmission Provider, the

Interconnection Customer shall notify Transmission Provider within thirty (30) Calendar Days whether it elects to exercise the Option to Build if it has not already elected to exercise the Option to Build.

5.1.1 **Standard Option.** Transmission Provider shall design, procure, and construct Transmission Provider's Interconnection Facilities and Network Upgrades, using Reasonable Efforts to complete Transmission Provider's Interconnection Facilities and Network Upgrades by the dates set forth in Appendix B, Milestones. Transmission Provider shall not be required to undertake any action which is inconsistent with its standard safety practices, its material and equipment specifications, its design criteria and construction procedures, its labor agreements, and Applicable Laws and Regulations. In the event Transmission Provider reasonably expects that it will not be able to complete Transmission Provider's Interconnection Facilities and Network Upgrades by the specified dates, Transmission Provider shall promptly provide written notice to Interconnection Customer and shall undertake Reasonable Efforts to meet the earliest dates thereafter.

5.1.2 **Alternate Option.** If the dates designated by Interconnection Customer are acceptable to Transmission Provider, Transmission Provider shall so notify Interconnection Customer within thirty (30) Calendar Days, and shall assume responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities by the designated dates.

If Transmission Provider subsequently fails to complete Transmission Provider's Interconnection Facilities by the In-Service Date, to the extent necessary to provide back feed power; or fails to complete Network Upgrades by the Initial

Synchronization Date to the extent necessary to allow for Trial Operation at full power output, unless other arrangements are made by the Parties for such Trial Operation; or fails to complete the Network Upgrades by the Commercial Operation Date, as such dates are reflected in Appendix B, Milestones; Transmission Provider shall pay Interconnection Customer liquidated damages in accordance with Article 5.3, Liquidated Damages, provided, however, the dates designated by Interconnection Customer shall be extended day for day for each day that the applicable RTO or ISO refuses to grant clearances to install equipment.

5.1.3 **Option to Build.** Interconnection Customer shall have the option to assume responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades on the dates specified in Article 5.1.2. Transmission Provider and Interconnection Customer must agree as to what constitutes Stand Alone Network Upgrades and identify such Stand Alone Network Upgrades in Appendix A. Except for Stand Alone Network Upgrades, Interconnection Customer shall have no right to construct Network Upgrades under this option.

5.1.4 **Negotiated Option.** If the dates designated by interconnection Customer are not acceptable to Transmission Provider the Parties shall in good faith attempt to negotiate terms and conditions (including revision of the specified dates and liquidated damages, the provision of incentives, or the procurement and construction of all facilities other than Transmission Provider’s Interconnection Facilities and Stand Alone Network Upgrades if the Interconnection Customer elects to exercise the Option to Build under Article 5.1.3). If the Parties are unable to reach agreement on such terms and conditions, then, pursuant to Article 5.1.1 (Standard Option), Transmission Provider shall assume responsibility for the design, procurement and construction of all facilities other than Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades if the Interconnection Customer elects to exercise the Option to Build.

5.2 General Conditions Applicable to Option to Build. If Interconnection Customer assumes responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades,

(1) Interconnection Customer shall engineer, procure equipment, and construct Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades (or portions thereof) using Good Utility Practice and using standards and specifications provided in advance by Transmission Provider;

(2) Interconnection Customer's engineering, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades shall comply with all requirements of law to which Transmission Provider would be subject in the engineering, procurement or construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades;

(3) Transmission Provider shall review and approve the engineering design, equipment acceptance tests, and the construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades;

(4) prior to commencement of construction, Interconnection Customer shall provide to Transmission Provider a schedule for construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades, and shall promptly respond to requests for information from Transmission Provider;

(5) at any time during construction, Transmission Provider shall have the right to gain unrestricted access to Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades and to conduct inspections of the same;

(6) at any time during construction, should any phase of the engineering, equipment procurement, or construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades not meet the standards and specifications provided by Transmission Provider, Interconnection Customer shall be obligated to remedy deficiencies in that portion of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades;

(7) Interconnection Customer shall indemnify Transmission Provider for claims arising from Interconnection Customer's construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades under the terms and procedures applicable to Article 18.1 Indemnity;

(8) Interconnection Customer shall transfer control of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades to Transmission Provider;

(9) Unless Parties otherwise agree, Interconnection Customer shall transfer ownership of Transmission Provider's

Interconnection Facilities and Stand-Alone Network Upgrades to Transmission Provider;

(10) Transmission Provider shall approve and accept for operation and maintenance Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades to the extent engineered, procured, and constructed in accordance with this Article 5.2; and

(11) Interconnection Customer shall deliver to Transmission Provider "as-built" drawings, information, and any other documents that are reasonably required by Transmission Provider to assure that the Interconnection Facilities and Stand-Alone Network Upgrades are built to the standards and specifications required by Transmission Provider.

(12) If Interconnection Customer exercises the Option to Build pursuant to Article 5.1.3, Interconnection Customer shall pay Transmission Provider the agreed upon amount of [$PLACEHOLDER] for Transmission Provider to execute the responsibilities enumerated to Transmission Provider under Article 5.2. Transmission Provider shall invoice Interconnection Customer for this total amount to be divided on a monthly basis pursuant to Article 12.

5.3 Liquidated Damages. The actual damages to Interconnection Customer, in the event Transmission Provider's Interconnection Facilities or Network Upgrades are not completed by the dates designated by Interconnection Customer and accepted by Transmission Provider pursuant to subparagraphs 5.1.2 or 5.1.4, above, may include Interconnection Customer's fixed operation and maintenance costs and lost opportunity costs. Such actual damages are uncertain and impossible to determine at this time. Because of such uncertainty, any liquidated damages paid by Transmission Provider to Interconnection Customer in the event that Transmission Provider does not complete any portion of Transmission Provider's

Interconnection Facilities or Network Upgrades by the applicable dates, shall be an amount equal to ½ of 1 percent per day of the actual cost of Transmission Provider's Interconnection Facilities and Network Upgrades, in the aggregate, for which Transmission Provider has assumed responsibility to design, procure and construct.

However, in no event shall the total liquidated damages exceed 20 percent of the actual cost of Transmission Provider's Interconnection Facilities and Network Upgrades for which Transmission Provider has assumed responsibility to design, procure, and construct. The foregoing payments will be made by Transmission Provider to Interconnection Customer as just compensation for the damages caused to Interconnection Customer, which actual damages are uncertain and impossible to determine at this time, and as reasonable liquidated damages, but not as a penalty or a method to secure performance of this LGIA. Liquidated damages, when the Parties agree to them, are the exclusive remedy for the Transmission Provider's failure to meet its schedule.

No liquidated damages shall be paid to Interconnection Customer if: (1) Interconnection Customer is not ready to commence use of Transmission Provider's Interconnection Facilities or Network Upgrades to take the delivery of power for the Large Generating Facility's Trial Operation or to export power from the Large Generating Facility on the specified dates, unless Interconnection Customer would have been able to commence use of Transmission Provider's Interconnection Facilities or Network Upgrades to take the delivery of power for Large Generating Facility's Trial Operation or to export power from the Large Generating Facility, but for Transmission Provider's delay; (2) Transmission Provider's failure to meet the specified dates is the result of the action or inaction of Interconnection Customer or any other Interconnection Customer who has entered into an LGIA with Transmission Provider or any cause beyond Transmission Provider's reasonable control or reasonable ability to cure; (3) the interconnection Customer has assumed responsibility for the design, procurement and construction of Transmission Provider's

Interconnection Facilities and Stand Alone Network Upgrades; or (4) the Parties have otherwise agreed.

5.4 **Power System Stabilizers.** The Interconnection Customer shall procure, install, maintain and operate Power System Stabilizers in accordance with the guidelines and procedures established by the Applicable Reliability Council. Transmission Provider reserves the right to reasonably establish minimum acceptable settings for any installed Power System Stabilizers, subject to the design and operating limitations of the Large Generating Facility. If the Large Generating Facility's Power System Stabilizers are removed from service or not capable of automatic operation, Interconnection Customer shall immediately notify Transmission Provider's system operator, or its designated representative. The requirements of this paragraph shall not apply to wind generators.

5.5 **Equipment Procurement.** If responsibility for construction of Transmission Provider's Interconnection Facilities or Network Upgrades is to be borne by Transmission Provider, then Transmission Provider shall commence design of Transmission Provider's Interconnection Facilities or Network Upgrades and procure necessary equipment as soon as practicable after all of the following conditions are satisfied, unless the Parties otherwise agree in writing:

5.5.1 Transmission Provider has completed the Facilities Study pursuant to the Facilities Study Agreement;

5.5.2 Transmission Provider has received written authorization to proceed with design and procurement from Interconnection Customer by the date specified in Appendix B, Milestones; and

5.5.3 Interconnection Customer has provided security to Transmission Provider in accordance with Article 11.5 by the dates specified in Appendix B, Milestones.

5.6 Construction Commencement. Transmission Provider shall commence construction of Transmission Provider's Interconnection Facilities and Network Upgrades for which it is responsible as soon as practicable after the following additional conditions are satisfied:

5.6.1 Approval of the appropriate Governmental Authority has been obtained for any facilities requiring regulatory approval;

5.6.2 Necessary real property rights and rights-of-way have been obtained, to the extent required for the construction of a discrete aspect of Transmission Provider's Interconnection Facilities and Network Upgrades;

5.6.3 Transmission Provider has received written authorization to proceed with construction from Interconnection Customer by the date specified in Appendix B, Milestones; and

5.6.4 Interconnection Customer has provided security to Transmission Provider in accordance with Article 11.5 by the dates specified in Appendix B, Milestones.

5.7 Work Progress. The Parties will keep each other advised periodically as to the progress of their respective design, procurement and construction efforts. Either Party may, at any time, request a progress report from the other Party. If, at any time, Interconnection Customer determines that the completion of Transmission Provider's Interconnection Facilities will not be required until after the specified In-Service Date, Interconnection Customer will provide written notice to Transmission Provider of such later date upon which the completion of Transmission Provider's Interconnection Facilities will be required.

5.8 Information Exchange. As soon as reasonably practicable after the Effective Date, the Parties shall exchange information regarding the design and compatibility of the Parties' Interconnection Facilities and compatibility of the Interconnection

Facilities with Transmission Provider's Transmission System, and shall work diligently and in good faith to make any necessary design changes.

5.9 Other Interconnection Options.

5.9.1 **Limited Operation.** If any of Transmission Provider's Interconnection Facilities or Network Upgrades are not reasonably expected to be completed prior to the Commercial Operation Date of the Large Generating Facility, Transmission Provider shall, upon the request and at the expense of Interconnection Customer, perform operating studies on a timely basis to determine the extent to which the Large Generating Facility and Interconnection Customer's Interconnection Facilities may operate prior to the completion of Transmission Provider's Interconnection Facilities or Network Upgrades consistent with Applicable Laws and Regulations, Applicable Reliability Standards, Good Utility Practice, and this LGIA. Transmission Provider shall permit Interconnection Customer to operate the Large Generating Facility and Interconnection Customer's Interconnection Facilities in accordance with the results of such studies.

5.9.2 **Provisional Interconnection Service.** Upon the request of Interconnection Customer, and prior to completion of requisite Interconnection Facilities, Network Upgrades, Distribution Upgrades, or System Protection Facilities Transmission Provider may execute a Provisional Large Generator Interconnection Agreement or Interconnection Customer may request the filing of an unexecuted Provisional Large Generator Interconnection Agreement with the Interconnection Customer for limited Interconnection Service at the discretion of Transmission Provider based upon an evaluation that will consider the results of available studies. Transmission

Provider shall determine, through available studies or additional studies as necessary, whether stability, short circuit, thermal, and/or voltage issues would arise if Interconnection Customer interconnects without modifications to the Generating Facility or Transmission System. Transmission Provider shall determine whether any Interconnection Facilities, Network Upgrades, Distribution Upgrades, or System Protection Facilities that are necessary to meet the requirements of NERC, or any applicable Regional Entity for the interconnection of a new, modified and/or expanded Generating Facility are in place prior to the commencement of Interconnection Service from the Generating Facility. Where available studies indicate that such, Interconnection Facilities, Network Upgrades, Distribution Upgrades, and/or System Protection Facilities that are required for the interconnection of a new, modified and/or expanded Generating Facility are not currently in place, Transmission Provider will perform a study, at the Interconnection Customer's expense, to confirm the facilities that are required for Provisional Interconnection Service. The maximum permissible output of the Generating Facility in the Provisional Large Generator Interconnection Agreement shall be studied and updated as system conditions warrant (in the determination of the Transmission Provider in its discretion) but no less frequently than annually. Interconnection Customer assumes all risk and liabilities with respect to changes between the Provisional Large Generator Interconnection Agreement and the Large Generator Interconnection Agreement, including changes in output limits and Interconnection Facilities, Network Upgrades, Distribution Upgrades, and/or System Protection Facilities cost responsibilities.

5.10 **Interconnection Customer's Interconnection Facilities ('ICIF').** Interconnection Customer shall, at its expense, design, procure, construct, own and install the ICIF, as set forth in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades.

5.10.1 **Interconnection Customer's Interconnection Facility Specifications.** Interconnection Customer shall submit initial specifications for the ICIF, including System Protection Facilities, to Transmission Provider at least one hundred eighty (180) Calendar Days prior to the Initial Synchronization Date; and final specifications for review and comment at least ninety (90) Calendar Days prior to the Initial Synchronization Date. Transmission Provider shall review such specifications to ensure that the ICIF are compatible with the technical specifications, operational control, and safety requirements of Transmission Provider and comment on such specifications within thirty (30) Calendar Days of Interconnection Customer's submission. All specifications provided hereunder shall be deemed confidential.

5.10.2 **Transmission Provider's Review.** Transmission Provider's review of Interconnection Customer's final specifications shall not be construed as confirming, endorsing, or providing a warranty as to the design, fitness, safety, durability or reliability of the Large Generating Facility, or the ICIF. Interconnection Customer shall make such changes to the ICIF as may reasonably be required by Transmission Provider, in accordance with Good Utility Practice, to ensure that the ICIF are compatible with the technical specifications, operational control, and safety requirements of Transmission Provider.

5.10.3 **ICIF Construction.** The ICIF shall be designed and constructed in accordance with Good Utility Practice. Within one hundred twenty (120) Calendar Days after the Commercial Operation Date, unless the Parties agree on another mutually acceptable deadline, Interconnection Customer shall deliver to Transmission Provider "as-built" drawings, information and documents for the ICIF, such as: a one-line diagram, a site plan showing the Large Generating Facility and the ICIF, plan and elevation drawings showing the layout of the ICIF, a relay functional diagram, relaying AC and DC schematic wiring diagrams and relay settings for all facilities associated with Interconnection Customer's step-up transformers, the facilities connecting the Large Generating Facility to the step-up transformers and the ICIF, and the impedances (determined by factory tests) for the associated step-up transformers and the Large Generating Facility. The Interconnection Customer shall provide Transmission Provider specifications for the excitation system, automatic voltage regulator, Large Generating Facility control and protection settings, transformer tap settings, and communications, if applicable.

5.11 **Transmission Provider's Interconnection Facilities Construction.** Transmission Provider's Interconnection Facilities shall be designed and constructed in accordance with Good Utility Practice. Upon request, within one hundred twenty (120) Calendar Days after the Commercial Operation Date, unless the Parties agree on another mutually acceptable deadline, Transmission Provider shall deliver to Interconnection Customer the following "as-built" drawings, information and documents for Transmission Provider's Interconnection Facilities [include appropriate drawings and relay diagrams].

Transmission Provider will obtain control of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades upon completion of such facilities.

5.12 Access Rights. Upon reasonable notice and supervision by a Party, and subject to any required or necessary regulatory approvals, a Party ("Granting Party") shall furnish at no cost to the other Party ("Access Party") any rights of use, licenses, rights of way and easements with respect to lands owned or controlled by the Granting Party, its agents (if allowed under the applicable agency agreement), or any Affiliate, that are necessary to enable the Access Party to obtain ingress and egress to construct, operate, maintain, repair, test (or witness testing), inspect, replace or remove facilities and equipment to: (i) interconnect the Large Generating Facility with the Transmission System; (ii) operate and maintain the Large Generating Facility, the Interconnection Facilities and the Transmission System; and (iii) disconnect or remove the Access Party's facilities and equipment upon termination of this LGIA. In exercising such licenses, rights of way and easements, the Access Party shall not unreasonably disrupt or interfere with normal operation of the Granting Party's business and shall adhere to the safety rules and procedures established in advance, as may be changed from time to time, by the Granting Party and provided to the Access Party.

5.13 Lands of Other Property Owners. If any part of Transmission Provider or Transmission Owner's Interconnection Facilities and/or Network Upgrades is to be installed on property owned by persons other than Interconnection Customer or Transmission Provider or Transmission Owner, Transmission Provider or Transmission Owner shall at Interconnection Customer's expense use efforts, similar in nature and extent to those that it typically undertakes on its own behalf or on behalf of its Affiliates, including use of its eminent domain authority, and to the extent consistent with state law, to procure from such persons any rights of use, licenses, rights of way and easements that are necessary to construct, operate, maintain, test, inspect, replace or remove Transmission Provider or Transmission Owner's

Interconnection Facilities and/or Network Upgrades upon such property.

5.14 Permits. Transmission Provider or Transmission Owner and Interconnection Customer shall cooperate with each other in good faith in obtaining all permits, licenses and authorizations that are necessary to accomplish the interconnection in compliance with Applicable Laws and Regulations. With respect to this paragraph, Transmission Provider or Transmission Owner shall provide permitting assistance to Interconnection Customer comparable to that provided to Transmission Provider's own, or an Affiliate's generation.

5.15 Early Construction of Base Case Facilities. Interconnection Customer may request Transmission Provider to construct, and Transmission Provider shall construct, using Reasonable Efforts to accommodate Interconnection Customer's In-Service Date, all or any portion of any Network Upgrades required for Interconnection Customer to be interconnected to the Transmission System which are included in the Base Case of the Facilities Study for Interconnection Customer, and which also are required to be constructed for another Interconnection Customer, but where such construction is not scheduled to be completed in time to achieve Interconnection Customer's In-Service Date.

5.16 Suspension. Interconnection Customer reserves the right, upon written notice to Transmission Provider, to suspend
at any time all work by Transmission Provider associated with the construction and installation of Transmission Provider's Interconnection Facilities and/or Network Upgrades required under this LGIA with the condition that Transmission System shall be left in a safe and reliable condition in accordance with Good Utility Practice and Transmission Provider's safety and reliability criteria. In such event, Interconnection Customer shall be responsible for all reasonable and necessary costs which Transmission Provider (i) has incurred pursuant to this LGIA prior to the suspension and (ii) incurs in suspending such work, including any costs incurred to perform such work as may be necessary to ensure the safety of

persons and property and the integrity of the Transmission System during such suspension and, if applicable, any costs incurred in connection with the cancellation or suspension of material, equipment and labor contracts which Transmission Provider cannot reasonably avoid; provided, however, that prior to canceling or suspending any such material, equipment or labor contract, Transmission Provider shall obtain Interconnection Customer's authorization to do so.

Transmission Provider shall invoice Interconnection Customer for such costs pursuant to Article 12 and shall use due diligence to minimize its costs. In the event Interconnection Customer suspends work by Transmission Provider required under this LGIA pursuant to this Article 5.16, and has not requested Transmission Provider to recommence the work required under this LGIA on or before the expiration of three (3) years following commencement of such suspension, this LGIA shall be deemed terminated. The three-year period shall begin on the date the suspension is requested, or the date of the written notice to Transmission Provider, if no effective date is specified.

5.17 Taxes.

5.17.1 Interconnection Customer Payments Not Taxable. The Parties intend that all payments or property transfers made by Interconnection Customer to Transmission Provider for the installation of Transmission Provider's Interconnection Facilities and the Network Upgrades shall be non-taxable, either as contributions to capital, or as an advance, in accordance with the Internal Revenue Code and any applicable state income tax laws and shall not be taxable as contributions in aid of construction or otherwise under the Internal Revenue Code and any applicable state income tax laws.

5.17.2 Representations and Covenants. In accordance with IRS Notice 2001-82 and IRS Notice 88-129, Interconnection Customer represents and covenants that (i) ownership of the electricity generated at the Large Generating Facility will pass to another party prior to the transmission of the electricity on the Transmission System, (ii) for income tax purposes, the amount of any payments and the cost of any property transferred to Transmission Provider for Transmission Provider's Interconnection Facilities will be capitalized by Interconnection Customer as an intangible asset and recovered using the straight-line method over a useful life of twenty (20) years, and (iii) any portion of Transmission Provider's Interconnection Facilities that is a "dual-use intertie," within the meaning of IRS Notice 88-129, is reasonably expected to carry only a de minimis amount of electricity in the direction of the Large Generating Facility. For this purpose, "de minimis amount" means no more than 5 percent of the total power flows in both directions, calculated in accordance with the "5 percent test" set forth in IRS Notice 88-129. This is not intended to be an exclusive list of the relevant conditions that must be met to conform to IRS requirements for non-taxable treatment.

At Transmission Provider's request, Interconnection Customer shall provide Transmission Provider with a report from an independent engineer confirming its representation in clause (iii), above. Transmission Provider represents and covenants that the cost of Transmission Provider's Interconnection Facilities paid for by Interconnection Customer will have no net effect on the base upon which rates are determined.

5.17.3 Indemnification for the Cost Consequences of Current Tax Liability Imposed Upon the Transmission Provider. Notwithstanding Article 5.17.1, Interconnection Customer shall protect, indemnify and hold harmless

Transmission Provider from the cost consequences of any current tax liability imposed against Transmission Provider as the result of payments or property transfers made by Interconnection Customer to Transmission Provider under this LGIA for Interconnection Facilities, as well as any interest and penalties, other than interest and penalties attributable to any delay caused by Transmission Provider.

Transmission Provider shall not include a gross-up for the cost consequences of any current tax liability in the amounts it charges Interconnection Customer under this LGIA unless (i) Transmission Provider has determined, in good faith, that the payments or property transfers made by Interconnection Customer to Transmission Provider should be reported as income subject to taxation or (ii) any Governmental Authority directs Transmission Provider to report payments or property as income subject to taxation; provided, however, that Transmission Provider may require Interconnection Customer to provide security for Interconnection Facilities, in a form reasonably acceptable to Transmission Provider (such as a parental guarantee or a letter of credit), in an amount equal to the cost consequences of any current tax liability under this Article 5.17. Interconnection Customer shall reimburse Transmission Provider for such costs on a fully grossed-up basis, in accordance with Article 5.17.4, within thirty (30) Calendar Days of receiving written notification from Transmission Provider of the amount due, including detail about how the amount was calculated.

The indemnification obligation shall terminate at the earlier of (1) the expiration of the ten year testing period and the applicable statute of limitation, as it may be extended by Transmission

Provider upon request of the IRS, to keep these years open for audit or adjustment, or (2) the occurrence of a subsequent taxable event and the payment of any related indemnification obligations as contemplated by this Article 5.17.

5.17.4 **Tax Gross-Up Amount.** Interconnection Customer's liability for the cost consequences of any current tax liability under this Article 5.17 shall be calculated on a fully grossed-up basis. Except as may otherwise be agreed to by the parties, this means that Interconnection Customer will pay Transmission Provider, in addition to the amount paid for the Interconnection Facilities and Network Upgrades, an amount equal to (1) the current taxes imposed on Transmission Provider ("Current Taxes") on the excess of (a) the gross income realized by Transmission Provider as a result of payments or property transfers made by Interconnection Customer to Transmission Provider under this LGIA (without regard to any payments under this Article 5.17) (the "Gross Income Amount") over (b) the present value of future tax deductions for depreciation that will be available as a result of such payments or property transfers (the "Present Value Depreciation Amount"), plus (2) an additional amount sufficient to permit Transmission Provider to receive and retain, after the payment of all Current Taxes, an amount equal to the net amount described in clause (1).

For this purpose, (i) Current Taxes shall be computed based on Transmission Provider's composite federal and state tax rates at the time the payments or property transfers are received and Transmission Provider will be treated as being subject to tax at the highest marginal rates in effect at that time (the "Current Tax Rate"), and (ii) the Present Value

Depreciation Amount shall be computed by discounting Transmission Provider's anticipated tax depreciation deductions as a result of such payments or property transfers by Transmission Provider's current weighted average cost of capital. Thus, the formula for calculating Interconnection Customer's liability to Transmission Owner pursuant to this Article 5.17.4 can be expressed as follows: (Current Tax Rate x (Gross Income Amount – Present Value of Tax Depreciation))/(1-Current Tax Rate). Interconnection Customer's estimated tax liability in the event taxes are imposed shall be stated in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades.

5.17.5 **Private Letter Ruling or Change or Clarification of Law.** At Interconnection Customer's request and expense, Transmission Provider shall file with the IRS a request for a private letter ruling as to whether any property transferred or sums paid, or to be paid, by Interconnection Customer to Transmission Provider under this LGIA are subject to federal income taxation. Interconnection Customer will prepare the initial draft of the request for a private letter ruling, and will certify under penalties of perjury that all facts represented in such request are true and accurate to the best of Interconnection Customer's knowledge. Transmission Provider and Interconnection Customer shall cooperate in good faith with respect to the submission of such request.

Transmission Provider shall keep Interconnection Customer fully informed of the status of such request for a private letter ruling and shall execute either a privacy act waiver or a limited power of attorney, in a form acceptable to the IRS, that authorizes Interconnection Customer to participate in all discussions with the IRS regarding such request for a private letter ruling. Transmission Provider shall allow Interconnection Customer to attend all meetings with IRS officials about the request and shall permit Interconnection Customer to prepare the initial drafts of any follow-up letters in connection with the request.

5.17.6 **Subsequent Taxable Events.** If, within 10 years from the date on which the relevant Transmission Provider's Interconnection Facilities are placed in service, (i) Interconnection Customer Breaches the covenants contained in Article 5.17.2, (ii) a "disqualification event" occurs within the meaning of IRS Notice 88-129, or (iii) this LGIA terminates and Transmission Provider retains ownership of the Interconnection Facilities and Network Upgrades, Interconnection Customer shall pay a tax gross-up for the cost consequences of any current tax liability imposed on Transmission Provider, calculated using the methodology described in Article 5.17.4 and in accordance with IRS Notice 90-60.

5.17.7 **Contests.** In the event any Governmental Authority determines that Transmission Provider's receipt of payments or property constitutes income that is subject to taxation, Transmission Provider shall notify Interconnection Customer, in writing, within thirty (30) Calendar Days of receiving notification of such determination by a Governmental Authority. Upon the timely written request by Interconnection Customer and at Interconnection Customer's sole expense, Transmission Provider may appeal, protest, seek abatement of, or otherwise oppose such determination. Upon Interconnection Customer's written request and sole expense, Transmission Provider may file a claim for refund with respect to any taxes paid under this Article 5.17, whether or not it has received such a determination. Transmission Provider reserves the right to make all decisions with regard to the prosecution of such appeal, protest, abatement or other contest, including the selection of counsel and compromise or settlement of the claim, but Transmission Provider shall keep Interconnection Customer informed, shall consider in good faith suggestions from Interconnection Customer about the conduct of the contest, and shall reasonably permit Interconnection Customer or an Interconnection Customer representative to attend contest proceedings.

Interconnection Customer shall pay to Transmission Provider on a periodic basis, as invoiced by Transmission Provider, Transmission Provider's documented reasonable costs of prosecuting such appeal, protest, abatement or other contest. At any time during the contest, Transmission Provider may agree to a settlement either with Interconnection Customer's consent or after obtaining written advice from nationally-recognized tax counsel, selected by Transmission Provider, but reasonably acceptable to Interconnection Customer, that the proposed settlement represents a reasonable settlement given the hazards of litigation. Interconnection Customer's obligation shall be based on the amount of the settlement agreed to by Interconnection Customer, or if a higher amount, so much of the settlement that is supported by the written advice from nationally-recognized tax counsel selected under the terms of the preceding sentence. The settlement amount shall be calculated on a fully grossed-up basis to cover any related cost consequences of the current tax liability. Any settlement without Interconnection Customer's consent or such written advice will relieve

Interconnection Customer from any obligation to indemnify Transmission Provider for the tax at issue in the contest.

5.17.8 **Refund.** In the event that (a) a private letter ruling is issued to Transmission Provider which holds that any amount paid or the value of any property transferred by Interconnection Customer to Transmission Provider under the terms of this LGIA is not subject to federal income taxation, (b) any legislative change or administrative announcement, notice, ruling or other determination makes it reasonably clear to Transmission Provider in good faith that any amount paid or the value of any property transferred by Interconnection Customer to Transmission Provider under the terms of this LGIA is not taxable to Transmission Provider, (c) any abatement, appeal, protest, or other contest results in a determination that any payments or transfers made by Interconnection Customer to Transmission Provider are not subject to federal income tax, or (d) if Transmission Provider receives a refund from any taxing authority for any overpayment of tax attributable to any payment or property transfer made by Interconnection Customer to Transmission Provider pursuant to this LGIA, Transmission Provider shall promptly refund to Interconnection Customer the following:

(i) any payment made by Interconnection Customer under this Article 5.17 for taxes that is attributable to the amount determined to be non-taxable, together with interest thereon,

(ii) interest on any amounts paid by Interconnection Customer to Transmission Provider for such taxes which Transmission Provider did not submit to the taxing authority, calculated in accordance with the methodology set forth in FERC's regulations at 18 CFR §35.19a(a)(2)(iii) from the date payment was made by Interconnection Customer to the date Transmission Provider refunds such payment to Interconnection Customer, and

(iii) with respect to any such taxes paid by Transmission Provider, any refund or credit Transmission Provider receives or to which it may be entitled from any Governmental Authority, interest (or that portion thereof attributable to the payment described in clause (i), above) owed to Transmission Provider for such overpayment of taxes (including any reduction in interest otherwise payable by Transmission Provider to any Governmental Authority resulting from an offset or credit); provided, however, that Transmission Provider will remit such amount promptly to Interconnection Customer only after and to the extent that Transmission Provider has received a tax refund, credit or offset from any Governmental Authority for any applicable overpayment of income tax related to Transmission Provider's Interconnection Facilities.

The intent of this provision is to leave the Parties, to the extent practicable, in the event that no taxes are due with respect to any payment for Interconnection Facilities and Network Upgrades hereunder, in the same position they would have been in had no such tax payments been made.

5.17.9 **Taxes Other Than Income Taxes.** Upon the timely request by Interconnection Customer, and at Interconnection Customer's sole expense, Transmission Provider may appeal, protest, seek abatement of, or otherwise contest any tax (other than federal or state income tax) asserted or assessed against Transmission Provider for which Interconnection Customer may be required to reimburse Transmission Provider under the terms of this LGIA. Interconnection Customer shall pay to Transmission Provider on a periodic basis, as invoiced by Transmission Provider, Transmission Provider's documented reasonable costs of prosecuting such appeal, protest, abatement, or other contest. Interconnection Customer and Transmission Provider shall cooperate in good faith with respect to any such contest. Unless the payment of such taxes is a prerequisite to an appeal or abatement or cannot be deferred, no amount shall be payable by Interconnection Customer to Transmission Provider for such taxes until they are assessed by a final, non-appealable order by any court or agency of competent jurisdiction. In the event that a tax payment is withheld and ultimately due and payable after appeal, Interconnection Customer will be responsible for all taxes, interest and penalties, other than penalties attributable to any delay caused by Transmission Provider.

5.17.10 **Transmission Owners Who Are Not Transmission Providers.** If Transmission Provider is not the same entity as the Transmission Owner, then (i) all references in this Article 5.17 to Transmission Provider shall be deemed also to refer to and to include the Transmission Owner, as appropriate, and (ii) this LGIA shall not become effective until such Transmission Owner shall have agreed in writing to assume all of the duties and obligations of Transmission Provider under this Article 5.17 of this LGIA.

5.18 Tax Status. Each Party shall cooperate with the other to maintain the other Party's tax status. Nothing in this LGIA is intended to adversely affect any Transmission Provider's tax exempt status with respect to the issuance of bonds including, but not limited to, Local Furnishing Bonds.

5.19 Modification.

5.19.1 General. Either Party may undertake modifications to its facilities. If a Party plans to undertake a modification that reasonably may be expected to affect the other Party's facilities, that Party shall provide to the other Party sufficient information regarding such modification so that the other Party may evaluate the potential impact of such modification prior to commencement of the work. Such information shall be deemed to be confidential hereunder and shall include information concerning the timing of such modifications and whether such modifications are expected to interrupt the flow of electricity from the Large Generating Facility. The Party desiring to perform such work shall provide the relevant drawings, plans, and specifications to the other Party at least ninety (90) Calendar Days in advance of the commencement of the work or such shorter period upon which the Parties may agree, which agreement shall not unreasonably be withheld, conditioned or delayed.

In the case of Large Generating Facility modifications that do not require Interconnection Customer to submit an Interconnection Request, Transmission Provider shall provide, within thirty (30) Calendar Days (or such other time as the

Parties may agree), an estimate of any additional modifications to the Transmission System, Transmission Provider's Interconnection Facilities or Network Upgrades necessitated by such Interconnection Customer modification and a good faith estimate of the costs thereof.

5.19.2 **Standards.** Any additions, modifications, or replacements made to a Party's facilities shall be designed, constructed and operated in accordance with this LGIA and Good Utility Practice.

5.19.3 **Modification Costs.** Interconnection Customer shall not be directly assigned for the costs of any additions, modifications, or replacements that Transmission Provider makes to Transmission Provider's Interconnection Facilities or the Transmission System to facilitate the interconnection of a third party to Transmission Provider's Interconnection Facilities or the Transmission System, or to provide transmission service to a third party under Transmission Provider's Tariff. Interconnection Customer shall be responsible for the costs of any additions, modifications, or replacements to Interconnection Customer's Interconnection Facilities that may be necessary to maintain or upgrade such Interconnection Customer's Interconnection Facilities consistent with Applicable Laws and Regulations, Applicable Reliability Standards or Good Utility Practice.

Article 6. Testing and Inspection

6.1 **Pre-Commercial Operation Date Testing and Modifications.** Prior to the Commercial Operation Date, Transmission Provider shall test Transmission Provider's Interconnection Facilities and Network Upgrades and Interconnection Customer shall test the

Large Generating Facility and Interconnection Customer's Interconnection Facilities to ensure their safe and reliable operation. Similar testing may be required after initial operation. Each Party shall make any modifications to its facilities that are found to be necessary as a result of such testing. Interconnection Customer shall bear the cost of all such testing and modifications. Interconnection Customer shall generate test energy at the Large Generating Facility only if it has arranged for the delivery of such test energy.

6.2 Post-Commercial Operation Date Testing and Modifications. Each Party shall at its own expense perform routine inspection and testing of its facilities and equipment in accordance with Good Utility Practice as may be necessary to ensure the continued interconnection of the Large Generating Facility with the Transmission System in a safe and reliable manner. Each Party shall have the right, upon advance written notice, to require reasonable additional testing of the other Party's facilities, at the requesting Party's expense, as may be in accordance with Good Utility Practice.

6.3 Right to Observe Testing. Each Party shall notify the other Party in advance of its performance of tests of its Interconnection Facilities. The other Party has the right, at its own expense, to observe such testing.

6.4 Right to Inspect. Each Party shall have the right, but shall have no obligation to: (i) observe the other Party's tests and/or inspection of any of its System Protection Facilities and other protective equipment, including Power System Stabilizers; (ii) review the settings of the other Party's System Protection Facilities and other protective equipment; and (iii) review the other Party's maintenance records relative to the Interconnection Facilities, the System Protection Facilities and other protective equipment. A Party may exercise these rights from time to time as it deems necessary upon reasonable notice to the other Party. The exercise or non-exercise by a Party of any such rights shall not be construed as an endorsement or confirmation of any element or condition of the Interconnection

Facilities or the System Protection Facilities or other protective equipment or the operation thereof, or as a warranty as to the fitness, safety, desirability, or reliability of same. Any information that a Party obtains through the exercise of any of its rights under this Article 6.4 shall be deemed to be Confidential Information and treated pursuant to Article 22 of this LGIA.

Article 7. Metering

7.1 **General.** Each Party shall comply with the Applicable Reliability Council requirements. Unless otherwise agreed by the Parties, Transmission Provider shall install Metering Equipment at the Point of Interconnection prior to any operation of the Large Generating Facility and shall own, operate, test and maintain such Metering Equipment. Power flows to and from the Large Generating Facility shall be measured at or, at Transmission Provider's option, compensated to, the Point of Interconnection. Transmission Provider shall provide metering quantities, in analog and/or digital form, to Interconnection Customer upon request. Interconnection Customer shall bear all reasonable documented costs associated with the purchase, installation, operation, testing and maintenance of the Metering Equipment.

7.2 **Check Meters.** Interconnection Customer, at its option and expense, may install and operate, on its premises and on its side of the Point of Interconnection, one or more check meters to check Transmission Provider's meters. Such check meters shall be for check purposes only and shall not be used for the measurement of power flows for purposes of this LGIA, except as provided in Article 7.4 below. The check meters shall be subject at all reasonable times to inspection and examination by Transmission Provider or its designee. The installation, operation and maintenance thereof shall be performed entirely by Interconnection Customer in accordance with Good Utility Practice.

7.3 **Standards.** Transmission Provider shall install, calibrate, and test revenue quality Metering

Equipment in accordance with applicable ANSI standards.

7.4 **Testing of Metering Equipment.** Transmission Provider shall inspect and test all Transmission Provider-owned Metering Equipment upon installation and at least once every two (2) years thereafter. If requested to do so by Interconnection Customer, Transmission Provider shall, at Interconnection Customer's expense, inspect or test Metering Equipment more frequently than every two (2) years. Transmission Provider shall give reasonable notice of the time when any inspection or test shall take place, and Interconnection Customer may have representatives present at the test or inspection. If at any time Metering Equipment is found to be inaccurate or defective, it shall be adjusted, repaired or replaced at Interconnection Customer's expense, in order to provide accurate metering, unless the inaccuracy or defect is due to Transmission Provider's failure to maintain, then Transmission Provider shall pay. If Metering Equipment fails to register, or if the measurement made by Metering Equipment during a test varies by more than two percent from the measurement made by the standard meter used in the test, Transmission Provider shall adjust the measurements by correcting all measurements for the period during which Metering Equipment was in error by using Interconnection Customer's check meters, if installed. If no such check meters are installed or if the period cannot be reasonably ascertained, the adjustment shall be for the period immediately preceding the test of the Metering Equipment equal to one-half the time from the date of the last previous test of the Metering Equipment.

7.5 **Metering Data.** At Interconnection Customer's expense, the metered data shall be telemetered to one or more locations designated by Transmission Provider and one or more locations designated by Interconnection Customer. Such telemetered data shall be used, under normal operating conditions, as the official measurement of the amount of energy delivered from the Large Generating Facility to the Point of Interconnection.

Article 8. Communications

8.1 Interconnection Customer Obligations. Interconnection Customer shall maintain satisfactory operating communications with Transmission Provider's Transmission System dispatcher or representative designated by Transmission Provider. Interconnection Customer shall provide standard voice line, dedicated voice line and facsimile communications at its Large Generating Facility control room or central dispatch facility through use of either the public telephone system, or a voice communications system that does not rely on the public telephone system. Interconnection Customer shall also provide the dedicated data circuit(s) necessary to provide Interconnection Customer data to Transmission Provider as set forth in Appendix D, Security Arrangements Details. The data circuit(s) shall extend from the Large Generating Facility to the location(s) specified by Transmission Provider. Any required maintenance of such communications equipment shall be performed by Interconnection Customer. Operational communications shall be activated and maintained under, but not be limited to, the following events: system paralleling or separation, scheduled and unscheduled shutdowns, equipment clearances, and hourly and daily load data.

8.2 Remote Terminal Unit. Prior to the Initial Synchronization Date of the Large Generating Facility, a Remote Terminal Unit, or equivalent data collection and transfer equipment acceptable to the Parties, shall be installed by Interconnection Customer, or by Transmission Provider at Interconnection Customer's expense, to gather accumulated and instantaneous data to be telemetered to the location(s) designated by Transmission Provider through use of a dedicated point-to-point data circuit(s) as indicated in Article 8.1. The communication protocol for the data circuit(s) shall be specified by Transmission Provider. Instantaneous bi-directional analog real power and reactive power flow information must be telemetered directly to the location(s) specified by Transmission Provider.

Each Party will promptly advise the other Party if it detects or otherwise learns of any metering, telemetry or communications equipment errors or malfunctions that require the attention and/or correction by the other Party. The Party owning such equipment shall correct such error or malfunction as soon as reasonably feasible.

8.3 **No Annexation.** Any and all equipment placed on the premises of a Party shall be and remain the property of the Party providing such equipment regardless of the mode and manner of annexation or attachment to real property, unless otherwise mutually agreed by the Parties.

8.4 **Provision of Data from a Variable Energy Resource.** The Interconnection Customer whose Generating Facility is a Variable Energy Resource shall provide meteorological and forced outage data to the Transmission Provider to the extent necessary for the Transmission Provider's development and deployment of power production forecasts for that class of Variable Energy Resources. The Interconnection Customer with a Variable Energy Resource having wind as the energy source, at a minimum, will be required to provide the Transmission Provider with site-specific meteorological data including: temperature, wind speed, wind direction, and atmospheric pressure. The Interconnection Customer with a Variable Energy Resource having solar as the energy source, at a minimum, will be required to provide the Transmission Provider with site-specific meteorological data including: temperature, atmospheric pressure, and irradiance. The Transmission Provider and Interconnection Customer whose Generating Facility is a Variable Energy Resource shall mutually agree to any additional meteorological data that are required for the development and deployment of a power production forecast. The Interconnection Customer whose Generating Facility is a Variable Energy Resource also shall submit data to the Transmission Provider regarding all forced outages to the extent necessary for the Transmission Provider's development and deployment of power production forecasts for that class of Variable Energy Resources. The exact specifications of the meteorological and forced outage data to be provided by the Interconnection Customer to the Transmission Provider, including the frequency and timing of data submittals, shall be made taking into account the size and configuration of the Variable Energy Resource, its characteristics, location, and its importance in maintaining generation resource adequacy and transmission system reliability in its area. All requirements for meteorological and forced outage data must be commensurate with the power production forecasting employed by the Transmission Provider. Such requirements for meteorological and forced outage data are set forth in Appendix C, Interconnection Details, of this LGIA, as they may change from time to time.

Article 9. Operations

9.1 **General.** Each Party shall comply with the Applicable Reliability Council requirements. Each Party shall provide to the other Party all information that may reasonably be required by the other Party to comply with Applicable Laws and Regulations and Applicable Reliability Standards.

9.2 **Control Area Notification.** At least three months before Initial Synchronization Date, Interconnection Customer shall notify Transmission Provider in writing of the Control Area in which the Large Generating Facility will be located. If Interconnection Customer elects to locate the Large Generating Facility in a Control Area other than the Control Area in which the Large Generating Facility is physically located, and if permitted to do so by the relevant transmission tariffs, all necessary arrangements, including but not limited to those set forth in Article 7 and Article 8 of this LGIA, and remote Control Area generator interchange agreements, if applicable, and the appropriate measures under such agreements, shall be executed and implemented prior to the placement of the Large Generating Facility in the other Control Area.

9.3 **Transmission Provider Obligations.** Transmission Provider shall cause the Transmission System and Transmission Provider's Interconnection Facilities to be operated, maintained and controlled in a safe and reliable manner and in accordance with this LGIA.

Transmission Provider may provide operating instructions to Interconnection Customer consistent with this LGIA and Transmission Provider's operating protocols and procedures as they may change from time to time. Transmission Provider will consider changes to its operating protocols and procedures proposed by Interconnection Customer.

9.4 Interconnection Customer Obligations. Interconnection Customer shall at its own expense operate, maintain and control the Large Generating Facility and Interconnection Customer's Interconnection Facilities in a safe and reliable manner and in accordance with this LGIA. Interconnection Customer shall operate the Large Generating Facility and Interconnection Customer's Interconnection Facilities in accordance with all applicable requirements of the Control Area of which it is part, as such requirements are set forth in Appendix C, Interconnection Details, of this LGIA. Appendix C, Interconnection Details, will be modified to reflect changes to the requirements as they may change from time to time. Either Party may request that the other Party provide copies of the requirements set forth in Appendix C, Interconnection Details, of this LGIA.

9.5 Start-Up and Synchronization. Consistent with the Parties' mutually acceptable procedures, Interconnection Customer is responsible for the proper synchronization of the Large Generating Facility to Transmission Provider's Transmission System.

9.6 Reactive Power and Primary Frequency Response.

9.6.1 Power Factor Design Criteria. Interconnection Customer shall design the Large Generating Facility to maintain a composite power delivery at continuous rated power output at the Point of Interconnection at a power factor within the range of 0.95 leading to 0.95 lagging, unless Transmission Provider has established different requirements that apply to all generators in the Control Area on a comparable basis. The requirements of this paragraph shall not apply to wind generators.

9.6.1.1 **Synchronous Generation.** Interconnection Customer shall design the Large Generating Facility to maintain a composite power deliver at continuous rated power output at the Point of Interconnection at a power factor within the range of 0.95 leading to 0.95 lagging, unless the Transmission Provider has established different requirements that apply to all synchronous generators in the Control Area on a comparable basis.

9.6.1.2 **Non-Synchronous Generation.** Interconnection Customer shall design the Large Generating Facility to maintain composite power delivery at continuous rated power output at the high-side of the generator substation at a power factor within the range of 0.95 leading to 0.95 lagging, unless the Transmission Provider has established a different power factor range that applies to all non-synchronous generators in the Control Area on a comparable basis. This power factor range standard shall be dynamic and can be met using, for example, power electronics designed to supply this level of reactive capability (taking into account any limitations due to voltage level, real power output, etc.) or fixed and switched capacitors, or a combination of the two. This requirement shall only apply to newly interconnecting non-synchronous generators that have not yet executed a Facilities Study Agreement as of the effective date of the Final Rule establishing this requirement (Order No. 827).

9.6.2 **Voltage Schedules.** Once Interconnection Customer has synchronized the Large Generating Facility with the Transmission System, Transmission Provider shall require Interconnection Customer to operate the Large Generating Facility to produce or absorb reactive power within the design limitations of the Large Generating Facility set forth in Article 9.6.1 (Power Factor Design Criteria). Transmission Provider's voltage schedules shall treat all sources of reactive power in the Control Area in an equitable and not unduly discriminatory manner. Transmission Provider shall exercise Reasonable Efforts to provide Interconnection Customer with such schedules at least one (1) day in advance, and may make changes to such schedules as necessary to maintain the reliability of the Transmission System. Interconnection Customer shall operate the Large Generating Facility to maintain the specified output voltage or power factor at the Point of Interconnection within the design limitations of the Large Generating Facility set forth in Article 9.6.1 (Power Factor Design Criteria). If Interconnection Customer is unable to maintain the specified voltage or power factor, it shall promptly notify the System Operator.

9.6.2.1 **Voltage Regulators.** Whenever the Large Generating Facility is operated in parallel with the Transmission System and voltage regulators are capable of operation, Interconnection Customer shall operate the Large Generating Facility with its voltage regulators in automatic operation. If the Large Generating Facility's voltage regulators are not capable of such automatic operation, Interconnection Customer shall immediately notify Transmission Provider's system operator, or its designated representative, and ensure that such Large Generating Facility's reactive power production or absorption (measured in MVARs) are within the design capability of the Large Generating Facility's generating unit(s) and steady state stability limits. Interconnection Customer shall not cause its Large Generating Facility to disconnect automatically or instantaneously from the Transmission System or trip any generating unit comprising the Large Generating Facility for an under or over frequency condition unless the abnormal frequency condition persists for a time period beyond the limits set forth in ANSI/IEEE Standard C37.106, or such other standard as applied to other generators in the Control Area on a comparable basis.

9.6.3 Payment for Reactive Power. Transmission Provider is required to pay Interconnection Customer for reactive power that Interconnection Customer provides or absorbs from the Large Generating Facility when Transmission Provider requests Interconnection Customer to operate its Large Generating Facility outside the range specified in Article 9.6.1, provided that if Transmission Provider pays its own or affiliated generators for reactive power service within the specified range, it must also pay Interconnection Customer. Payments shall be pursuant to Article 11.6 or such other agreement to which the Parties have otherwise agreed.

9.6.4 Primary Frequency Response. Interconnection Customer shall ensure the primary frequency response capability of its Large Generating Facility by installing, maintaining, and operating a functioning governor or equivalent controls. The term “functioning governor or equivalent controls” as used herein shall mean the required hardware and/or software that provides frequency responsive real power control with the ability to sense changes in system frequency and autonomously adjust the Large Generating Facility’s real power output in accordance with the droop and deadband parameters and in the direction needed to correct frequency deviations. Interconnection Customer is required to install a governor or equivalent controls with the capability of operating: (1) with a maximum 5 percent droop and ±0.036 Hz deadband; or (2) in accordance with the relevant droop, deadband, and timely and sustained response settings from an approved NERC Reliability Standard providing for equivalent or more stringent parameters. The droop characteristic shall be: (1) based on the nameplate capacity of the Large Generating Facility, and shall be linear in the range of frequencies between 59 to 61 Hz that are outside of the deadband parameter; or (2) based an approved NERC Reliability Standard providing for an equivalent or more stringent parameter. The deadband parameter shall be: the range of frequencies above and below nominal (60 Hz) in which the governor or equivalent controls is not expected to adjust the Large Generating Facility’s real power output in response to frequency deviations. The deadband shall be implemented: (1) without a step to the droop curve, that is, once the frequency deviation exceeds the deadband parameter, the expected change in the Large Generating Facility’s real power output in response to frequency deviations shall start from zero and then increase (for under-frequency deviations) or decrease (for over-frequency deviations) linearly in proportion to the magnitude of the frequency deviation; or (2) in accordance with an approved NERC Reliability Standard providing for an equivalent or more stringent parameter. Interconnection Customer shall notify Transmission Provider that the primary frequency response capability of the Large Generating Facility has been tested and confirmed during commissioning. Once Interconnection Customer has synchronized the Large Generating Facility with the Transmission System, Interconnection Customer shall operate the Large Generating Facility consistent with the provisions specified in Sections 9.6.4.1 and 9.6.4.2 of this Agreement. The primary frequency response requirements contained herein shall apply to both synchronous and non-synchronous Large Generating Facilities.

9.6.4.1 Governor or Equivalent Controls. Whenever the Large Generating Facility is operated in parallel with the Transmission System, Interconnection Customer shall operate the Large Generating Facility with its governor or equivalent controls in service and responsive to frequency. Interconnection Customer shall: (1) in coordination with Transmission Provider and/or the relevant balancing authority, set the deadband parameter to: (1) a maximum of ±0.036 Hz and set the droop parameter to a maximum of 5 percent; or (2) implement the relevant droop and deadband settings from an approved NERC Reliability Standard that provides for equivalent or more stringent parameters. Interconnection Customer shall be required to provide the status and settings of the governor or equivalent controls to Transmission Provider and/or the relevant balancing authority upon request. If Interconnection Customer needs to operate the Large Generating Facility with its governor or equivalent controls not in service, Interconnection Customer shall immediately notify Transmission Provider and the relevant balancing authority, and provide both with the following information: (1) the operating status of the governor or equivalent controls (i.e., whether it is currently out of service or when it will be taken out of service); (2) the reasons for removing the governor or equivalent controls from service; and (3) a reasonable estimate of when the governor or equivalent controls will be returned to service. Interconnection Customer shall make Reasonable Efforts to return its governor or equivalent controls into service as soon as practicable. Interconnection Customer shall make Reasonable Efforts to keep outages of the Large Generating Facility's governor or equivalent controls to a minimum whenever the Large Generating Facility is operated in parallel with the Transmission System.

9.6.4.2 **Timely and Sustained Response.** Interconnection Customer shall ensure that the Large Generating Facility's real power response to sustained frequency deviations outside of the deadband setting is automatically provided and shall begin immediately after frequency deviates outside of the deadband, and to the extent the Large Generating Facility has operating capability in the direction needed to correct the frequency deviation. Interconnection Customer shall not block or otherwise inhibit the ability of the governor or equivalent controls to respond and shall ensure that the response is not inhibited, except under certain operational constraints including, but not limited to, ambient temperature limitations, physical energy limitations, outages of mechanical equipment, or regulatory requirements. The Large Generating Facility shall sustain the real power response at least until system frequency returns to a value within the deadband setting of the governor or equivalent controls. A Commission-approved Reliability Standard with equivalent or more stringent requirements shall supersede the above requirements.

9.6.4.3 **Exemptions.** Large Generating Facilities that are regulated by the United States Nuclear Regulatory Commission shall be exempt from Sections 9.6.4, 9.6.4.1, and 9.6.4.2 of this Agreement. Large Generating Facilities that are behind the meter generation that is sized-to-load (i.e., the thermal load and the generation are near-balanced in real-time operation and the generation is primarily controlled to maintain the unique thermal, chemical, or mechanical output necessary for the operating requirements of its host facility) shall be required to install primary frequency response capability in accordance with the droop and deadband capability requirements specified in Section 9.6.4, but shall be otherwise exempt from the operating requirements in Sections 9.6.4, 9.6.4.1, 9.6.4.2, and 9.6.4.4 of this Agreement.

9.6.4.4 Electric Storage Resources. Interconnection Customer interconnecting an electric storage resource shall establish an operating range in Appendix C of its LGIA that specifies a minimum state of charge and a maximum state of charge between which the electric storage resource will be required to provide primary frequency response consistent with the conditions set forth in Sections 9.6.4, 9.6.4.1, 9.6.4.2, and 9.6.4.3 of this Agreement. Appendix C shall specify whether the operating range is static or dynamic, and shall consider (1) the expected magnitude of frequency deviations in the interconnection; (2) the expected duration that system frequency will remain outside of the deadband parameter in the interconnection; (3) the expected incidence of frequency deviations outside of the deadband parameter in the interconnection; (4) the physical capabilities of the electric storage resource; (5) operational limitations of the electric storage resource due to manufacturer specifications; and (6) any other relevant factors agreed to by Transmission Provider and Interconnection Customer, and in consultation with the relevant transmission owner or balancing authority as appropriate. If the operating range is dynamic, then Appendix C must establish how frequently the operating range will be reevaluated and the factors that may be considered during its reevaluation.

Interconnection Customer's electric storage resource is required to provide timely and sustained primary frequency response consistent with Section 9.6.4.2 of this Agreement when it is online and dispatched to inject electricity to the Transmission System and/or receive electricity from the Transmission System. This excludes circumstances when the electric storage resource is not dispatched to inject electricity to the Transmission System and/or dispatched to receive electricity from the Transmission System. If Interconnection Customer's electric storage resource is charging at the time of a frequency deviation outside of its deadband parameter, it is to increase (for over-frequency deviations) or decrease (for under-frequency deviations) the rate at which it is charging in accordance with its droop parameter. Interconnection Customer's electric storage resource is not required to change from charging to discharging, or vice versa, unless the response necessitated by the droop and deadband settings requires it to do so and it is technically capable of making such a transition.

9.7 Outages and Interruptions.

9.7.1 Outages.

9.7.1.1 Outage Authority and Coordination. Each Party may in accordance with Good Utility Practice in coordination with the other Party remove from service any of its respective Interconnection Facilities or Network Upgrades that may impact the other Party's facilities as necessary to perform maintenance or testing or to install or replace equipment. Absent an Emergency Condition, the Party scheduling a removal of such facility(ies) from service will use Reasonable Efforts to schedule such removal on a date and time mutually acceptable to the Parties. In all circumstances, any Party planning to remove such facility(ies) from service shall use Reasonable Efforts to minimize the effect on the other Party of such removal.

9.7.1.2 Outage Schedules. Transmission Provider shall post scheduled outages of its transmission facilities on the OASIS. Interconnection Customer shall submit its planned maintenance schedules for the Large Generating Facility to Transmission Provider for a minimum of a rolling twenty-four month period. Interconnection Customer shall update its planned maintenance schedules as necessary. Transmission Provider may request Interconnection Customer to reschedule its maintenance as necessary to maintain the reliability of the Transmission System; provided, however, adequacy of generation supply shall not be a criterion in determining Transmission System reliability. Transmission Provider shall compensate Interconnection Customer for any additional direct costs that Interconnection Customer incurs as a result of having to reschedule maintenance, including any additional overtime, breaking of maintenance contracts or other costs above and beyond the cost Interconnection Customer would have incurred absent Transmission Provider's request to reschedule maintenance. Interconnection Customer will not be eligible to receive compensation, if during the twelve (12) months prior to the date of the scheduled maintenance, Interconnection Customer had modified its schedule of maintenance activities.

9.7.1.3 **Outage Restoration.** If an outage on a Party's Interconnection Facilities or Network Upgrades adversely affects the other Party's operations or facilities, the Party that owns or controls the facility that is out of service shall use Reasonable Efforts to promptly restore such facility(ies) to a normal operating condition consistent with the nature of the outage. The Party that owns or controls the facility that is out of service shall provide the other Party, to the extent such information is known, information on the nature of the Emergency Condition, an estimated time of restoration, and any corrective actions required. Initial verbal notice shall be followed up as soon as practicable with written notice explaining the nature of the outage.

9.7.2 **Interruption of Service.** If required by Good Utility Practice to do so, Transmission Provider may require Interconnection Customer to interrupt or reduce deliveries of electricity if such delivery of electricity could adversely affect Transmission Provider's ability to perform such activities as are necessary to safely and reliably operate and maintain the Transmission System. The following provisions shall apply to any interruption or reduction permitted under this Article 9.7.2:

9.7.2.1 The interruption or reduction shall continue only for so long as reasonably necessary under Good Utility Practice;

9.7.2.2 Any such interruption or reduction shall be made on an equitable, non-discriminatory basis with respect to all generating facilities directly connected to the Transmission System;

9.7.2.3 When the interruption or reduction must be made under circumstances which do not allow for advance notice, Transmission Provider shall notify Interconnection Customer by telephone as soon as practicable of the reasons for the curtailment, interruption, or reduction, and, if known, its expected duration. Telephone notification shall be followed by written notification as soon as practicable;

9.7.2.4 Except during the existence of an Emergency Condition, when the interruption or reduction can be scheduled without advance notice, Transmission Provider shall notify Interconnection Customer in advance regarding the timing of such scheduling and further notify Interconnection Customer of the expected duration. Transmission Provider shall coordinate with Interconnection Customer using Good Utility Practice to schedule the interruption or reduction during periods of least impact to Interconnection Customer and Transmission Provider;

9.7.2.5 The Parties shall cooperate and coordinate with each other to the extent necessary in order to restore the Large Generating Facility, Interconnection Facilities, and the Transmission System to their normal operating state, consistent with system conditions and Good Utility Practice.

9.7.3 **Under-Frequency and Over Frequency Conditions.** The Transmission System is designed to automatically activate a load-shed program as required by the Applicable Reliability Council in the event of an under-frequency system disturbance. Interconnection Customer shall implement under-frequency and over-frequency relay set points for the Large Generating Facility as required by the Applicable

Reliability Council to ensure "ride through" capability of the Transmission System. Large Generating Facility response to frequency deviations of pre-determined magnitudes, both under-frequency and over-frequency deviations, shall be studied and coordinated with Transmission Provider in accordance with Good Utility Practice. The term "ride through" as used herein shall mean the ability of a Generating Facility to stay connected to and synchronized with the Transmission System during system disturbances within a range of under-frequency and over-frequency conditions, in accordance with Good Utility Practice.

9.7.4 System Protection and Other Control Requirements.

9.7.4.1 System Protection Facilities. Interconnection Customer shall, at its expense, install, operate and maintain System Protection Facilities as a part of the Large Generating Facility or Interconnection Customer's Interconnection Facilities. Transmission Provider shall install at Interconnection Customer's expense any System Protection Facilities that may be required on Transmission Provider's Interconnection Facilities or the Transmission System as a result of the interconnection of the Large Generating Facility and Interconnection Customer's Interconnection Facilities.

9.7.4.2 Each Party's protection facilities shall be designed and coordinated with other systems in accordance with Good Utility Practice.

9.7.4.3 Each Party shall be responsible for protection of its facilities consistent with Good Utility Practice.

9.7.4.4 Each Party's protective relay design shall incorporate the necessary test switches to perform the tests required in Article 6. The required test switches will be placed such that they allow operation of lockout relays while preventing breaker failure schemes from operating and causing unnecessary breaker operations and/or the tripping of Interconnection Customer's units.

9.7.4.5 Each Party will test, operate and maintain System Protection Facilities in accordance with Good Utility Practice.

9.7.4.6 Prior to the In-Service Date, and again prior to the Commercial Operation Date, each Party or its agent shall perform a complete calibration test and functional trip test of the System Protection Facilities. At intervals suggested by Good Utility Practice and following any apparent malfunction of the System Protection Facilities, each Party shall perform both calibration and functional trip tests of its System Protection Facilities. These tests do not require the tripping of any in-service generation unit. These tests do, however, require that all protective relays and lockout contacts be activated.

9.7.5 **Requirements for Protection.** In compliance with Good Utility Practice, Interconnection Customer shall provide, install, own, and maintain relays, circuit breakers and all other devices necessary to remove any fault contribution of the Large Generating Facility to any short circuit occurring on the Transmission System not otherwise isolated by Transmission Provider's equipment, such that the removal of the fault contribution shall be coordinated with the protective requirements of the Transmission System. Such protective equipment shall include, without limitation, a disconnecting device or switch with load-interrupting capability located between the Large Generating Facility and the Transmission System at a site selected upon mutual agreement (not to be unreasonably withheld, conditioned or delayed) of the Parties. Interconnection Customer shall be responsible for protection of the Large Generating Facility and Interconnection Customer's other equipment from such conditions as negative sequence currents, over- or under-frequency, sudden load rejection, over- or under-voltage, and generator loss-of-field. Interconnection Customer shall be solely responsible to disconnect the Large Generating Facility and Interconnection Customer's other equipment if conditions on the Transmission System could adversely affect the Large Generating Facility.

9.7.6 **Power Quality.** Neither Party's facilities shall cause excessive voltage flicker nor introduce excessive distortion to the sinusoidal voltage or current waves as defined by ANSI Standard C84.1-1989, in accordance with IEEE Standard 519, or any applicable superseding electric industry standard. In the event of a conflict between ANSI Standard C84.1-1989, or any applicable superseding electric industry standard, ANSI Standard C84.1-1989, or the applicable superseding electric industry standard, shall control.

9.8 **Switching and Tagging Rules.** Each Party shall provide the other Party a copy of its switching and tagging rules that are applicable to the other Party's activities. Such switching and tagging rules shall be developed on a non-discriminatory basis. The Parties shall comply with applicable switching and tagging rules, as amended from time to time, in

obtaining clearances for work or for switching operations on equipment.

9.9 Use of Interconnection Facilities by Third Parties.

9.9.1 Purpose of Interconnection Facilities. Except as may be required by Applicable Laws and Regulations, or as otherwise agreed to among the Parties, the Interconnection Facilities shall be constructed for the sole purpose of interconnecting the Large Generating Facility to the Transmission System and shall be used for no other purpose.

9.9.2 Third Party Users. If required by Applicable Laws and Regulations or if the Parties mutually agree, such agreement not to be unreasonably withheld, to allow one or more third parties to use Transmission Provider's Interconnection Facilities, or any part thereof, Interconnection Customer will be entitled to compensation for the capital expenses it incurred in connection with the Interconnection Facilities based upon the pro rata use of the Interconnection Facilities by Transmission Provider, all third party users, and Interconnection Customer, in accordance with Applicable Laws and Regulations or upon some other mutually-agreed upon methodology. In addition, cost responsibility for ongoing costs, including operation and maintenance costs associated with the Interconnection Facilities, will be allocated between Interconnection Customer and any third party users based upon the pro rata use of the Interconnection Facilities by Transmission Provider, all third party users, and Interconnection Customer, in accordance with Applicable Laws and Regulations or upon some other mutually agreed upon methodology. If the issue of such compensation or allocation cannot be resolved through such negotiations, it shall be submitted to FERC for resolution.

9.10 Disturbance Analysis Data Exchange. The Parties will cooperate with one another in the analysis of disturbances to either the Large Generating Facility or Transmission Provider's Transmission System by gathering and providing access to any information relating to any disturbance, including information from oscillography, protective relay targets, breaker operations and sequence of events records, and any disturbance information required by Good Utility Practice.

Article 10. Maintenance

10.1 Transmission Provider Obligations. Transmission Provider shall maintain the Transmission System and Transmission Provider's Interconnection Facilities in a safe and reliable manner and in accordance with this LGIA.

10.2 Interconnection Customer Obligations. Interconnection Customer shall maintain the Large Generating Facility and Interconnection Customer's Interconnection Facilities in a safe and reliable manner and in accordance with this LGIA.

10.3 Coordination. The Parties shall confer regularly to coordinate the planning, scheduling and performance of preventive and corrective maintenance on the Large Generating Facility and the Interconnection Facilities.

10.4 Secondary Systems. Each Party shall cooperate with the other in the inspection, maintenance, and testing of control or power circuits that operate below 600 volts, AC or DC, including, but not limited to, any hardware, control or protective devices, cables, conductors, electric raceways, secondary equipment panels, transducers, batteries, chargers, and voltage and current transformers that directly affect the operation of a Party's facilities and equipment which may reasonably be expected to impact the other Party. Each Party shall provide advance notice to the other Party before undertaking any work on such circuits, especially on electrical circuits involving circuit

breaker trip and close contacts, current transformers, or potential transformers.

10.5 **Operating and Maintenance Expenses.** Subject to the provisions herein addressing the use of facilities by others, and except for operations and maintenance expenses associated with modifications made for providing interconnection or transmission service to a third party and such third party pays for such expenses, Interconnection Customer shall be responsible for all reasonable expenses including overheads, associated with: (1) owning, operating, maintaining, repairing, and replacing Interconnection Customer's Interconnection Facilities; and (2) operation, maintenance, repair and replacement of Transmission Provider's Interconnection Facilities.

Article 11. Performance Obligation

11.1 **Interconnection Customer Interconnection Facilities.** Interconnection Customer shall design, procure, construct, install, own and/or control Interconnection Customer Interconnection Facilities described in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades, at its sole expense.

11.2 **Transmission Provider's Interconnection Facilities.** Transmission Provider or Transmission Owner shall design, procure, construct, install, own and/or control the Transmission Provider's Interconnection Facilities described in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades, at the sole expense of the Interconnection Customer.

11.3 **Network Upgrades and Distribution Upgrades.** Transmission Provider or Transmission Owner shall design, procure, construct, install, and own the Network Upgrades and Distribution Upgrades described in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades. The Interconnection Customer shall be responsible for all costs related to Distribution Upgrades. Unless Transmission Provider or Transmission Owner elects to fund the capital for the Network Upgrades, they shall

be solely funded by Interconnection Customer. In the event that Transmission Provider must change the voltage levels of a discrete portion of the Transmission System to which the Interconnection Customer is connected, Transmission Provider shall give reasonable notice of such change and the Interconnection Customer shall be solely responsible for all costs related to upgrades or modifications to Interconnection Customer's Interconnection Facilities resulting from Transmission Provider's increase in the voltage levels of the Transmission System, in order to remain interconnected with the Transmission System at the new operating voltage. To the extent that the modifications necessary to upgrade Interconnection Facilities qualify as Network Upgrades, Transmission Provider shall be solely responsible for the expense of such modifications or upgrades.

11.4 Transmission Credits.

11.4.1 Repayment of Amounts Advanced for Network Upgrades. Interconnection Customer shall be entitled to a cash repayment, equal to the total amount paid to Transmission Provider and Affected System Operator, if any, for the Network Upgrades, including any tax gross-up or other tax-related payments associated with Network Upgrades, and not refunded to Interconnection Customer pursuant to Article 5.17.8 or otherwise, to be paid to Interconnection Customer on a dollar-for-dollar basis for the non-usage sensitive portion of transmission charges, as payments are made under Transmission Provider's Tariff and Affected System's Tariff for transmission services with respect to the Large Generating Facility. Any repayment shall include interest calculated in accordance with the methodology set forth in FERC=s regulations at 18 C.F.R. § 35.19a(a)(2)(iii) from the date of any payment for Network Upgrades through the date on which the Interconnection Customer receives a repayment of such payment pursuant to this subparagraph.

Interconnection Customer may assign such repayment rights to any person.

Notwithstanding the foregoing, Interconnection Customer, Transmission Provider, and Affected System Operator may adopt any alternative payment schedule that is mutually agreeable so long as Transmission Provider and Affected System Operator take one of the following actions no later than five years from the Commercial Operation Date: (1) return to Interconnection Customer any amounts advanced for Network Upgrades not previously repaid, or (2) declare in writing that Transmission Provider or Affected System Operator will continue to provide payments to Interconnection Customer on a dollar-for-dollar basis for the non-usage sensitive portion of transmission charges, or develop an alternative schedule that is mutually agreeable and provides for the return of all amounts advanced for Network Upgrades not previously repaid; however, full reimbursement shall not extend beyond twenty (20) years from the Commercial Operation Date.

If the Large Generating Facility fails to achieve commercial operation, but it or another Generating Facility is later constructed and makes use of the Network Upgrades, Transmission Provider and Affected System Operator shall at that time reimburse Interconnection Customer for the amounts advanced for the Network Upgrades. Before any such reimbursement can occur, the Interconnection Customer, or the entity that ultimately constructs the Generating Facility, if different, is responsible for identifying the entity to which reimbursement must be made.

11.4.2 **Special Provisions for Affected Systems.** Unless Transmission Provider provides, under the LGIA, for the repayment of

amounts advanced to Affected System Operator for Network Upgrades, Interconnection Customer and Affected System Operator shall enter into an agreement that provides for such repayment. The agreement shall specify the terms governing payments to be made by Interconnection Customer to the Affected System Operator as well as the repayment by the Affected System Operator.

11.4.3 Notwithstanding any other provision of this LGIA, nothing herein shall be construed as relinquishing or foreclosing any rights, including but not limited to firm transmission rights, capacity rights, transmission congestion rights, or transmission credits, that Interconnection Customer, shall be entitled to, now or in the future under any other agreement or tariff as a result of, or otherwise associated with, the transmission capacity, if any, created by the Network Upgrades, including the right to obtain cash reimbursements or transmission credits for transmission service that is not associated with the Large Generating Facility.

11.5 Provision of Security. At least thirty (30) Calendar Days prior to the commencement of the first of the following to occur: design, procurement, installation, or construction of a discrete portion of a Transmission Provider's Interconnection Facilities, Network Upgrades, or Distribution Upgrades, Interconnection Customer shall provide Transmission Provider, at Interconnection Customer's option, a guarantee, a surety bond, letter of credit or other form of security that is reasonably acceptable to Transmission Provider and is consistent with the Uniform Commercial Code of the jurisdiction identified in Article 14.2.1. Such security for payment shall be in an amount sufficient to cover the costs for constructing, designing, procuring, and installing the applicable portion of Transmission Provider's Interconnection Facilities, Network Upgrades, or Distribution Upgrades and shall be

reduced on a dollar-for-dollar basis for payments made to Transmission Provider for these purposes.

In addition:

11.5.1 The guarantee must be made by an entity that meets the creditworthiness requirements of Transmission Provider, and contain terms and conditions that guarantee payment of any amount that may be due from Interconnection Customer, up to an agreed-to maximum amount.

11.5.2 The letter of credit must be issued by a financial institution reasonably acceptable to Transmission Provider and must indicate that it would only expire upon final payment made to Transmission Provider to cover all relevant costs for designing, procuring, installing, and constructing the applicable portion of Interconnection Facilities, Network Upgrades, or Distribution Upgrades for which the letter of credit was provided.

11.5.3 The surety bond must be issued by an insurer reasonably acceptable to Transmission Provider and must indicate that it would only expire upon final payment made to Transmission Provider to cover all relevant costs for designing, procuring, installing, and constructing the applicable portion of Interconnection Facilities, Network Upgrades, or Distribution Upgrades for which the surety bond was provided.

11.6 Interconnection Customer Compensation. If Transmission Provider requests or directs Interconnection Customer to provide a service pursuant to Articles 9.6.3 (Payment for Reactive Power), or 13.5.1 of this LGIA, Transmission Provider shall compensate Interconnection Customer in accordance with Interconnection Customer's applicable rate schedule then in effect unless the provision of such service(s) is subject to an RTO or ISO FERC-approved rate schedule. Interconnection Customer

shall serve Transmission Provider or RTO or ISO with any filing of a proposed rate schedule at the time of such filing with FERC. To the extent that no rate schedule is in effect at the time the Interconnection Customer is required to provide or absorb any Reactive Power under this LGIA, Transmission Provider agrees to compensate Interconnection Customer in such amount as would have been due Interconnection Customer had the rate schedule been in effect at the time service commenced; provided, however, that such rate schedule must be filed at FERC or other appropriate Governmental Authority within sixty (60) Calendar Days of the commencement of service.

11.6.1 Interconnection Customer Compensation for Actions During Emergency Condition. Transmission Provider or RTO or ISO shall compensate Interconnection Customer for its provision of real and reactive power and other Emergency Condition services that Interconnection Customer provides to support the Transmission System during an Emergency Condition in accordance with Article 11.6.

Article 12. Invoice

12.1 General. Each Party shall submit to the other Party, on a monthly basis, invoices of amounts due for the preceding month. Each invoice shall state the month to which the invoice applies and fully describe the services and equipment provided. The Parties may discharge mutual debts and payment obligations due and owing to each other on the same date through netting, in which case all amounts a Party owes to the other Party under this LGIA, including interest payments or credits, shall be netted so that only the net amount remaining due shall be paid by the owing Party.

12.2 Final Invoice. Within six months after completion of the construction of Transmission Provider's Interconnection Facilities and the Network Upgrades, Transmission Provider shall provide an invoice of the final cost of the construction of Transmission Provider's Interconnection Facilities and the Network Upgrades and shall set forth such costs in sufficient

detail to enable Interconnection Customer to compare the actual costs with the estimates and to ascertain deviations, if any, from the cost estimates. Transmission Provider shall refund to Interconnection Customer any amount by which the actual payment by Interconnection Customer for estimated costs exceeds the actual costs of construction within thirty (30) Calendar Days of the issuance of such final construction invoice.

12.3 Payment. Invoices shall be rendered to the paying Party at the address specified in Appendix F. The Party receiving the invoice shall pay the invoice within thirty (30) Calendar Days of receipt. All payments shall be made in immediately available funds payable to the other Party, or by wire transfer to a bank named and account designated by the invoicing Party. Payment of invoices by either Party will not constitute a waiver of any rights or claims either Party may have under this LGIA.

12.4 Disputes. In the event of a billing dispute between Transmission Provider and Interconnection Customer, Transmission Provider shall continue to provide Interconnection Service under this LGIA as long as Interconnection Customer: (i) continues to make all payments not in dispute; and (ii) pays to Transmission Provider or into an independent escrow account the portion of the invoice in dispute, pending resolution of such dispute. If Interconnection Customer fails to meet these two requirements for continuation of service, then Transmission Provider may provide notice to Interconnection Customer of a Default pursuant to Article 17. Within thirty (30) Calendar Days after the resolution of the dispute, the Party that owes money to the other Party shall pay the amount due with interest calculated in accord with the methodology set forth in FERC's regulations at 18 CFR § 35.19a(a)(2)(iii).

Article 13. Emergencies

13.1 Definition. "Emergency Condition" shall mean a condition or situation: (i) that in the judgment of the Party making the claim is imminently likely to endanger life or property; or (ii) that, in the case

of Transmission Provider, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to the Transmission System, Transmission Provider's Interconnection Facilities or the Transmission Systems of others to which the Transmission System is directly connected; or (iii) that, in the case of Interconnection Customer, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to, the Large Generating Facility or Interconnection Customer's Interconnection Facilities' System restoration and black start shall be considered Emergency Conditions; provided, that Interconnection Customer is not obligated by this LGIA to possess black start capability.

13.2 Obligations. Each Party shall comply with the Emergency Condition procedures of the applicable ISO/RTO, NERC, the Applicable Reliability Council, Applicable Laws and Regulations, and any emergency procedures agreed to by the Joint Operating Committee.

13.3 Notice. Transmission Provider shall notify Interconnection Customer promptly when it becomes aware of an Emergency Condition that affects Transmission Provider's Interconnection Facilities or the Transmission System that may reasonably be expected to affect Interconnection Customer's operation of the Large Generating Facility or Interconnection Customer's Interconnection Facilities. Interconnection Customer shall notify Transmission Provider promptly when it becomes aware of an Emergency Condition that affects the Large Generating Facility or Interconnection Customer's Interconnection Facilities that may reasonably be expected to affect the Transmission System or Transmission Provider's Interconnection Facilities. To the extent information is known, the notification shall describe the Emergency Condition, the extent of the damage or deficiency, the expected effect on the operation of Interconnection Customer's or Transmission Provider's facilities and operations, its anticipated duration and the corrective action taken and/or to be taken. The initial notice shall

be followed as soon as practicable with written notice.

13.4 Immediate Action. Unless, in Interconnection Customer's reasonable judgment, immediate action is required, Interconnection Customer shall obtain the consent of Transmission Provider, such consent to not be unreasonably withheld, prior to performing any manual switching operations at the Large Generating Facility or Interconnection Customer's Interconnection Facilities in response to an Emergency Condition either declared by Transmission Provider or otherwise regarding the Transmission System.

13.5 Transmission Provider Authority.

13.5.1 General. Transmission Provider may take whatever actions or inactions with regard to the Transmission System or Transmission Provider's Interconnection Facilities it deems necessary during an Emergency Condition in order to (i) preserve public health and safety, (ii) preserve the reliability of the Transmission System or Transmission Provider's Interconnection Facilities, (iii) limit or prevent damage, and (iv) expedite restoration of service.

Transmission Provider shall use Reasonable Efforts to minimize the effect of such actions or inactions on the Large Generating Facility or Interconnection Customer's Interconnection Facilities. Transmission Provider may, on the basis of technical considerations, require the Large Generating Facility to mitigate an Emergency Condition by taking actions necessary and limited in scope to remedy the Emergency Condition, including, but not limited to, directing Interconnection Customer to shut-down, start-up, increase or decrease the real or reactive power output of the Large Generating Facility; implementing a

reduction or disconnection pursuant to Article 13.5.2; directing Interconnection Customer to assist with blackstart (if available) or restoration efforts; or altering the outage schedules of the Large Generating Facility and Interconnection Customer's Interconnection Facilities. Interconnection Customer shall comply with all of Transmission Provider's operating instructions concerning Large Generating Facility real power and reactive power output within the manufacturer's design limitations of the Large Generating Facility's equipment that is in service and physically available for operation at the time, in compliance with Applicable Laws and Regulations.

13.5.2 **Reduction and Disconnection.** Transmission Provider may reduce Interconnection Service or disconnect the Large Generating Facility or Interconnection Customer's Interconnection Facilities, when such, reduction or disconnection is necessary under Good Utility Practice due to Emergency Conditions. These rights are separate and distinct from any right of curtailment of Transmission Provider pursuant to Transmission Provider's Tariff. When Transmission Provider can schedule the reduction or disconnection in advance, Transmission Provider shall notify Interconnection Customer of the reasons, timing and expected duration of the reduction or disconnection. Transmission Provider shall coordinate with Interconnection Customer using Good Utility Practice to schedule the reduction or disconnection during periods of least impact to Interconnection Customer and Transmission Provider. Any reduction or disconnection shall continue only for so long as reasonably necessary under Good Utility Practice. The Parties shall cooperate with each other to restore the Large Generating Facility, the Interconnection Facilities, and the Transmission System to their normal

operating state as soon as practicable consistent with Good Utility Practice.

13.6 **Interconnection Customer Authority.** Consistent with Good Utility Practice and the LGIA and the LGIP, Interconnection Customer may take actions or inactions with regard to the Large Generating Facility or Interconnection Customer's Interconnection Facilities during an Emergency Condition in order to (i) preserve public health and safety, (ii) preserve the reliability of the Large Generating Facility or Interconnection Customer's Interconnection Facilities, (iii) limit or prevent damage, and (iv) expedite restoration of service. Interconnection Customer shall use Reasonable Efforts to minimize the effect of such actions or inactions on the Transmission System and Transmission Provider's Interconnection Facilities. Transmission Provider shall use Reasonable Efforts to assist Interconnection Customer in such actions.

13.7 **Limited Liability.** Except as otherwise provided in Article 11.6.1 of this LGIA, neither Party shall be liable to the other for any action it takes in responding to an Emergency Condition so long as such action is made in good faith and is consistent with Good Utility Practice.

Article 14. Regulatory Requirements and Governing Law

14.1 **Regulatory Requirements.** Each Party's obligations under this LGIA shall be subject to its receipt of any required approval or certificate from one or more Governmental Authorities in the form and substance satisfactory to the applying Party, or the Party making any required filings with, or providing notice to, such Governmental Authorities, and the expiration of any time period associated therewith. Each Party shall in good faith seek and use its Reasonable Efforts to obtain such other approvals. Nothing in this LGIA shall require Interconnection Customer to take any action that could result in its inability to obtain, or its loss of, status or exemption under the Federal Power Act, the Public Utility Holding Company

Act of 1935, as amended, or the Public Utility Regulatory Policies Act of 1978.

14.2 Governing Law.

14.2.1 The validity, interpretation and performance of this LGIA and each of its provisions shall be governed by the laws of the state where the Point of Interconnection is located, without regard to its conflicts of law principles.

14.2.2 This LGIA is subject to all Applicable Laws and Regulations.

14.2.3 Each Party expressly reserves the right to seek changes in, appeal, or otherwise contest any laws, orders, rules, or regulations of a Governmental Authority.

Article 15. Notices.

15.1 General. Unless otherwise provided in this LGIA, any notice, demand or request required or permitted to be given by either Party to the other and any instrument required or permitted to be tendered or delivered by either Party in writing to the other shall be effective when delivered and may be so given, tendered or delivered, by recognized national courier, or by depositing the same with the United States Postal Service with postage prepaid, for delivery by certified or registered mail, addressed to the Party, or personally delivered to the Party, at the address set out in Appendix F, Addresses for Delivery of Notices and Billings.

Either Party may change the notice information in this LGIA by giving five (5) Business Days written notice prior to the effective date of the change.

15.2 Billings and Payments. Billings and payments shall be sent to the addresses set out in Appendix F.

15.3 Alternative Forms of Notice. Any notice or request required or permitted to be given by a Party to the other and not required by this Agreement to be given

in writing may be so given by telephone, facsimile or email to the telephone numbers and email addresses set out in Appendix F.

15.4 Operations and Maintenance Notice. Each Party shall notify the other Party in writing of the identity of the person(s) that it designates as the point(s) of contact with respect to the implementation of Articles 9 and 10.

Article 16. Force Majeure

16.1 Force Majeure.

16.1.1 Economic hardship is not considered a Force Majeure event.

16.1.2 Neither Party shall be considered to be in Default with respect to any obligation hereunder, (including obligations under Article 4), other than the obligation to pay money when due, if prevented from fulfilling such obligation by Force Majeure. A Party unable to fulfill any obligation hereunder (other than an obligation to pay money when due) by reason of Force Majeure shall give notice and the full particulars of such Force Majeure to the other Party in writing or by telephone as soon as reasonably possible after the occurrence of the cause relied upon. Telephone notices given pursuant to this article shall be confirmed in writing as soon as reasonably possible and shall specifically state full particulars of the Force Majeure, the time and date when the Force Majeure occurred and when the Force Majeure is reasonably expected to cease. The Party affected shall exercise due diligence to remove such disability with reasonable dispatch, but shall not be required to accede or agree to any provision not satisfactory to it in order to settle and terminate a strike or other labor disturbance.

Article 17. Default

17.1 Default

17.1.1 **General.** No Default shall exist where such failure to discharge an obligation (other than the payment of money) is the result of Force Majeure as defined in this LGIA or the result of an act of omission of the other Party. Upon a Breach, the non-breaching Party shall give written notice of such Breach to the breaching Party. Except as provided in Article 17.1.2, the breaching Party shall have thirty (30) Calendar Days from receipt of the Default notice within which to cure such Breach; provided however, if such Breach is not capable of cure within thirty (30) Calendar Days, the breaching Party shall commence such cure within thirty (30) Calendar Days after notice and continuously and diligently complete such cure within ninety (90) Calendar Days from receipt of the Default notice; and, if cured within such time, the Breach specified in such notice shall cease to exist.

17.1.2 **Right to Terminate.** If a Breach is not cured as provided in this article, or if a Breach is not capable of being cured within the period provided for herein, the non-breaching Party shall have the right to declare a Default and terminate this LGIA by written notice at any time until cure occurs, and be relieved of any further obligation hereunder and, whether or not that Party terminates this LGIA, to recover from the breaching Party all amounts due hereunder, plus all other damages and remedies to which it is entitled at law or in equity. The provisions of this article will survive termination of this LGIA.

Article 18. Indemnity, Consequential Damages and Insurance

18.1 **Indemnity.** The Parties shall at all times indemnify, defend, and hold the other Party harmless from, any and all damages, losses, claims, including claims and actions relating to injury to or death of any person or damage to property, demand, suits, recoveries, costs and expenses, court costs, attorney fees, and all other obligations by or to third parties, arising out of or resulting from the other Party's action or inactions of its obligations under this LGIA on behalf of the Indemnifying Party, except in cases of gross negligence or intentional wrongdoing by the Indemnified Party.

18.1.1 **Indemnified Person.** If an Indemnified Person is entitled to indemnification under this Article 18 as a result of a claim by a third party, and the indemnifying Party fails, after notice and reasonable opportunity to proceed under Article 18.1, to assume the defense of such claim, such Indemnified Person may at the expense of the indemnifying Party contest, settle or consent to the entry of any judgment with respect to, or pay in full, such claim.

18.1.2 **Indemnifying Party.** If an Indemnifying Party is obligated to indemnify and hold any Indemnified Person harmless under this Article 18, the amount owing to the Indemnified Person shall be the amount of such Indemnified Person's actual Loss, net of any insurance or other recovery.

18.1.3 **Indemnity Procedures.** Promptly after receipt by an Indemnified Person of any claim or notice of the commencement of any action or administrative or legal proceeding or investigation as to which the indemnity provided for in Article 18.1 may apply, the Indemnified Person shall notify the Indemnifying Party of such fact. Any failure of or delay in such notification shall not affect a Party's indemnification obligation unless such failure or delay is materially prejudicial to the indemnifying Party.

The Indemnifying Party shall have the right to assume the defense thereof with counsel designated by such Indemnifying Party and reasonably satisfactory to the Indemnified Person. If the defendants in any such action include one or more Indemnified Persons and the Indemnifying Party and if the Indemnified Person reasonably concludes that there may be legal defenses available to it and/or other Indemnified Persons which are different from or additional to those available to the Indemnifying Party, the Indemnified Person shall have the right to select separate counsel to assert such legal defenses and to otherwise participate in the defense of such action on its own behalf. In such instances, the Indemnifying Party shall only be required to pay the fees and expenses of one additional attorney to represent an Indemnified Person or Indemnified Persons having such differing or additional legal defenses.

The Indemnified Person shall be entitled, at its expense, to participate in any such action, suit or proceeding, the defense of which has been assumed by the Indemnifying Party. Notwithstanding the foregoing, the Indemnifying Party (i) shall not be entitled to assume and control the defense of any such action, suit or proceedings if and to the extent that, in the opinion of the Indemnified Person and its counsel, such action, suit or proceeding involves the potential imposition of criminal liability on the Indemnified Person, or there exists a conflict or adversity of interest between the Indemnified Person and the Indemnifying Party, in such event the Indemnifying Party shall pay the reasonable expenses of the Indemnified

Person, and (ii) shall not settle or consent to the entry of any judgment in any action, suit or proceeding without the consent of the Indemnified Person, which shall not be reasonably withheld, conditioned or delayed.

18.2 Consequential Damages. Other than the Liquidated Damages heretofore described, in no event shall either Party be liable under any provision of this LGIA for any losses, damages, costs or expenses for any special, indirect, incidental, consequential, or punitive damages, including but not limited to loss of profit or revenue, loss of the use of equipment, cost of capital, cost of temporary equipment or services, whether based in whole or in part in contract, in tort, including negligence, strict liability, or any other theory of liability; provided, however, that damages for which a Party may be liable to the other Party under another agreement will not be considered to be special, indirect, incidental, or consequential damages hereunder.

18.3 Insurance. Each party shall, at its own expense, maintain in force throughout the period of this LGIA, and until released by the other Party, the following minimum insurance coverages, with insurers authorized to do business in the state where the Point of Interconnection is located:

18.3.1 Employers' Liability and Workers' Compensation Insurance providing statutory benefits in accordance with the laws and regulations of the state in which the Point of Interconnection is located.

18.3.2 Commercial General Liability Insurance including premises and operations, personal injury, broad form property damage, broad form blanket contractual liability coverage (including coverage for the contractual indemnification) products and completed operations coverage, coverage for explosion, collapse and underground hazards, independent contractors coverage, coverage for pollution to the extent normally available and punitive damages to the extent normally available and a cross liability endorsement, with minimum limits of One Million Dollars ($1,000,000) per occurrence/One Million Dollars ($1,000,000) aggregate combined single limit for personal injury, bodily injury, including death and property damage.

18.3.3 Comprehensive Automobile Liability Insurance for coverage of owned and non-owned and hired vehicles, trailers or semi-trailers designed for travel on public roads, with a minimum, combined single limit of One Million Dollars ($1,000,000) per occurrence for bodily injury, including death, and property damage.

18.3.4 Excess Public Liability Insurance over and above the Employers' Liability Commercial General Liability and Comprehensive Automobile Liability Insurance coverage, with a minimum combined single limit of Twenty Million Dollars ($20,000,000) per occurrence/Twenty Million Dollars ($20,000,000) aggregate.

18.3.5 The Commercial General Liability Insurance, Comprehensive Automobile Insurance and Excess Public Liability Insurance policies shall name the other Party, its parent, associated and Affiliate companies and their respective directors, officers, agents, servants and employees ("Other Party Group") as additional insured. All policies shall contain provisions whereby the insurers waive all rights of subrogation in accordance with the provisions of this LGIA against the Other Party Group and provide thirty (30) Calendar Days advance written notice to the Other Party Group prior to anniversary date of cancellation or any material change in coverage or condition.

18.3.6 The Commercial General Liability Insurance, Comprehensive Automobile Liability Insurance and Excess Public Liability Insurance policies shall contain provisions that specify that the policies are primary and shall apply to such extent without consideration for other policies separately carried and shall state that each insured is provided coverage as though a separate policy had been issued to each, except the insurer's liability shall not be increased beyond the amount for which the insurer would have been liable had only one insured been covered. Each Party shall be responsible for its respective deductibles or retentions.

18.3.7 The Commercial General Liability Insurance, Comprehensive Automobile Liability Insurance and Excess Public Liability Insurance policies, if written on a Claims First Made Basis, shall be maintained in full force and effect for two (2) years after termination of this LGIA, which coverage may be in the form of tail coverage or extended reporting period coverage if agreed by the Parties.

18.3.8 The requirements contained herein as to the types and limits of all insurance to be maintained by the Parties are not intended to and shall not in any manner, limit or qualify the liabilities and obligations assumed by the Parties under this LGIA.

18.3.9 Within ten (10) days following execution of this LGIA, and as soon as practicable after the end of each fiscal year or at the renewal of the insurance policy and in any event within ninety (90) days thereafter, each Party shall provide certification of all insurance required in this LGIA, executed by each insurer or by an authorized representative of each insurer.

18.3.10 Notwithstanding the foregoing, each Party may self-insure to meet the minimum insurance requirements of Articles 18.3.2 through 18.3.8 to the extent it maintains a self-insurance program; provided that, such Party's senior secured debt is rated at investment grade or better by Standard & Poor's and that its self-insurance program meets the minimum insurance requirements of Articles 18.3.2 through 18.3.8. For any period of time that a Party's senior secured debt is unrated by Standard & Poor's or is rated at less than investment grade by Standard & Poor's, such Party shall comply with the insurance requirements applicable to it under Articles 18.3.2 through 18.3.9. In the event that a Party is permitted to self-insure pursuant to this article, it shall notify the other Party that it meets the requirements to self-insure and that its self-insurance program meets the minimum insurance requirements in a manner consistent with that specified in Article 18.3.9.

18.3.11 The Parties agree to report to each other in writing as soon as practical all accidents or occurrences resulting in injuries to any person, including death, and any property damage arising out of this LGIA.

Article 19. Assignment

19.1 **Assignment.** This LGIA may be assigned by either Party only with the written consent of the other; provided that either Party may assign this LGIA without the consent of the other Party to any Affiliate of the assigning Party with an equal or greater credit rating and with the legal authority and operational ability to satisfy the obligations of the assigning Party under this LGIA; and provided further that Interconnection Customer shall have the right to assign this LGIA, without the consent of Transmission Provider, for collateral security purposes to aid in providing financing for the Large Generating Facility, provided that Interconnection Customer will promptly notify Transmission Provider of any such assignment. Any financing arrangement entered into by Interconnection Customer pursuant to this article will provide that prior to or upon the exercise of the secured Party's, trustee's or mortgagee's assignment rights pursuant to said arrangement, the secured creditor, the trustee or mortgagee will notify Transmission Provider of the date and particulars of any such exercise of assignment right(s), including providing the Transmission Provider with proof that it meets the requirements of Articles 11.5 and 18.3. Any attempted assignment that violates this article is void and ineffective. Any assignment under this LGIA shall not relieve a Party of its obligations, nor shall a Party's obligations be enlarged, in whole or in part, by reason thereof. Where required, consent to assignment will not be unreasonably withheld, conditioned or delayed.

Article 20. Severability

20.1 Severability. If any provision in this LGIA is finally determined to be invalid, void or unenforceable by any court or other Governmental Authority having jurisdiction, such determination shall not invalidate, void or make unenforceable any other provision, agreement or covenant of this LGIA; provided that if Interconnection Customer (or any third party, but only if such third party is not acting at the direction of Transmission Provider) seeks and obtains such a final determination with respect to any provision of the Alternate Option (Article 5.1.2), or the Negotiated Option (Article 5.1.4), then none of these provisions shall thereafter have any force or effect and the Parties' rights and obligations shall be governed solely by the Standard Option (Article 5.1.1).

Article 21. Comparability

21.1 Comparability. The Parties will comply with all applicable comparability and code of conduct laws, rules and regulations, as amended from time to time.

Article 22. Confidentiality

22.1 Confidentiality. Confidential Information shall include, without limitation, all information relating to a Party's technology, research and development, business affairs, and pricing, and any information supplied by either of the Parties to the other prior to the execution of this LGIA.

Information is Confidential Information only if it is clearly designated or marked in writing as confidential on the face of the document, or, if the information is conveyed orally or by inspection, if the Party providing the information orally informs the Party receiving the information that the information is confidential.

If requested by either Party, the other Party shall provide in writing, the basis for asserting that the information referred to in this Article 22 warrants confidential treatment, and the requesting Party may disclose such writing to the appropriate Governmental Authority. Each Party shall be responsible for the costs associated with affording confidential treatment to its information.

22.1.1 Term. During the term of this LGIA, and for a period of three (3) years after the expiration or termination of this LGIA, except as otherwise provided in this Article 22, each Party shall hold in confidence and shall not disclose to any person Confidential Information.

22.1.2 Scope. Confidential Information shall not include information that the receiving Party can demonstrate: (1) is generally available to the public other than as a result of a disclosure by the receiving Party; (2) was in the lawful possession of the receiving Party on a non-confidential basis before receiving it from the disclosing Party; (3) was supplied to the receiving Party without restriction by a third party, who, to the knowledge of the receiving Party after due inquiry, was under no obligation to the disclosing Party to keep such information confidential; (4) was independently developed by the receiving Party without reference to Confidential Information of the disclosing Party; (5) is, or becomes, publicly known, through no wrongful act or omission of the receiving Party or Breach of this LGIA; or (6) is required, in accordance with Article 22.1.7 of the LGIA, Order of Disclosure, to be disclosed by any Governmental Authority or is otherwise required to be disclosed by law or subpoena, or is necessary in any legal proceeding establishing rights and obligations under this LGIA. Information designated as Confidential Information will no longer be deemed confidential if the Party that designated the information as confidential notifies the other Party that it no longer is confidential.

22.1.3 Release of Confidential Information. Neither Party shall release or disclose Confidential Information to any other person, except to its Affiliates (limited by the Standards of Conduct requirements), subcontractors, employees, consultants, or to parties who may be or considering providing financing to or equity participation with Interconnection Customer, or to potential purchasers or assignees of Interconnection Customer, on a need-to-know basis in connection with this LGIA, unless such person has first been advised of the confidentiality provisions of this Article 22 and has agreed to comply with such provisions. Notwithstanding the foregoing, a Party providing Confidential Information to any person shall remain primarily responsible for any release of Confidential

Information in contravention of this Article 22.

22.1.4 **Rights.** Each Party retains all rights, title, and interest in the Confidential Information that each Party discloses to the other Party. The disclosure by each Party to the other Party of Confidential Information shall not be deemed a waiver by either Party or any other person or entity of the right to protect the Confidential Information from public disclosure.

22.1.5 **No Warranties.** By providing Confidential Information, neither Party makes any warranties or representations as to its accuracy or completeness. In addition, by supplying Confidential Information, neither Party obligates itself to provide any particular information or Confidential Information to the other Party nor to enter into any further agreements or proceed with any other relationship or joint venture.

22.1.6 **Standard of Care.** Each Party shall use at least the same standard of care to protect Confidential Information it receives as it uses to protect its own Confidential Information from unauthorized disclosure, publication or dissemination. Each Party may use Confidential Information solely to fulfill its obligations to the other Party under this LGIA or its regulatory requirements.

22.1.7 **Order of Disclosure.** If a court or a Government Authority or entity with the right, power, and apparent authority to do so requests or requires either Party, by subpoena, oral deposition, interrogatories, requests for production of documents, administrative order, or otherwise, to disclose Confidential Information, that Party shall provide the other Party with prompt notice of such

request(s) or requirement(s) so that the other Party may seek an appropriate protective order or waive compliance with the terms of this LGIA.

Notwithstanding the absence of a protective order or waiver, the Party may disclose such Confidential Information which, in the opinion of its counsel, the Party is legally compelled to disclose. Each Party will use Reasonable Efforts to obtain reliable assurance that confidential treatment will be accorded any Confidential Information so furnished.

22.1.8 **Termination of Agreement.** Upon termination of this LGIA for any reason, each Party shall, within ten (10) Calendar Days of receipt of a written request from the other Party, use Reasonable Efforts to destroy, erase, or delete (with such destruction, erasure, and deletion certified in writing to the other Party) or return to the other Party, without retaining copies thereof, any and all written or electronic Confidential Information received from the other Party.

22.1.9 **Remedies.** The Parties agree that monetary damages would be inadequate to compensate a Party for the other Party's Breach of its obligations under this Article 22. Each Party accordingly agrees that the other Party shall be entitled to equitable relief, by way of injunction or otherwise, if the first Party Breaches or threatens to Breach its obligations under this Article 22, which equitable relief shall be granted without bond or proof of damages, and the receiving Party shall not plead in defense that there would be an adequate remedy at law. Such remedy shall not be deemed an exclusive remedy for the Breach of this Article 22, but shall be in addition to all other remedies available at law or in equity. The Parties further acknowledge and agree that the covenants

contained herein are necessary for the protection of legitimate business interests and are reasonable in scope. No Party, however, shall be liable for indirect, incidental, or consequential or punitive damages of any nature or kind resulting from or arising in connection with this Article 22.

22.1.10 **Disclosure to FERC, its Staff, or a State.** Notwithstanding anything in this Article 22 to the contrary, and pursuant to 18 CFR section 1b.20, if FERC or its staff, during the course of an investigation or otherwise, requests information from one of the Parties that is otherwise required to be maintained in confidence pursuant to this LGIA, the Party shall provide the requested information to FERC or its staff, within the time provided for in the request for information. In providing the information to FERC or its staff, the Party must, consistent with 18 CFR section 388.112, request that the information be treated as confidential and non-public by FERC and its staff and that the information be withheld from public disclosure. Parties are prohibited from notifying the other Party to this LGIA prior to the release of the Confidential Information to FERC or its staff. The Party shall notify the other Party to the LGIA when it is notified by FERC or its staff that a request to release Confidential Information has been received by FERC, at which time either of the Parties may respond before such information would be made public, pursuant to 18 CFR section 388.112. Requests from a state regulatory body conducting a confidential investigation shall be treated in a similar manner if consistent with the applicable state rules and regulations.

22.1.11 Subject to the exception in Article 22.1.10, any information that a Party

claims is competitively sensitive, commercial or financial information under this LGIA ("Confidential Information") shall not be disclosed by the other Party to any person not employed or retained by the other Party, except to the extent disclosure is (i) required by law; (ii) reasonably deemed by the disclosing Party to be required to be disclosed in connection with a dispute between or among the Parties, or the defense of litigation or dispute; (iii) otherwise permitted by consent of the other Party, such consent not to be unreasonably withheld; or (iv) necessary to fulfill its obligations under this LGIA or as a transmission service provider or a Control Area operator including disclosing the Confidential Information to an RTO or ISO or to a regional or national reliability organization. The Party asserting confidentiality shall notify the other Party in writing of the information it claims is confidential. Prior to any disclosures of the other Party's Confidential Information under this subparagraph, or if any third party or Governmental Authority makes any request or demand for any of the information described in this subparagraph, the disclosing Party agrees to promptly notify the other Party in writing and agrees to assert confidentiality and cooperate with the other Party in seeking to protect the Confidential Information from public disclosure by confidentiality agreement, protective order or other reasonable measures.

Article 23. Environmental Releases

23.1 Each Party shall notify the other Party, first orally and then in writing, of the release of any Hazardous Substances, any asbestos or lead abatement activities, or any type of remediation activities related to the Large Generating Facility or the

Interconnection Facilities, each of which may reasonably be expected to affect the other Party. The notifying Party shall: (i) provide the notice as soon as practicable, provided such Party makes a good faith effort to provide the notice no later than twenty-four hours after such Party becomes aware of the occurrence; and (ii) promptly furnish to the other Party copies of any publicly available reports filed with any Governmental Authorities addressing such events.

Article 24. Information Requirements

24.1 Information Acquisition. Transmission Provider and Interconnection Customer shall submit specific information regarding the electrical characteristics of their respective facilities to each other as described below and in accordance with Applicable Reliability Standards.

24.2 Information Submission by Transmission Provider. The initial information submission by Transmission Provider shall occur no later than one hundred eighty (180) Calendar Days prior to Trial Operation and shall include Transmission System information necessary to allow Interconnection Customer to select equipment and meet any system protection and stability requirements, unless otherwise agreed to by the Parties. On a monthly basis Transmission Provider shall provide Interconnection Customer a status report on the construction and installation of Transmission Provider's Interconnection Facilities and Network Upgrades, including, but not limited to, the following information: (1) progress to date; (2) a description of the activities since the last report; (3) a description of the action items for the next period; and (4) the delivery status of equipment ordered.

24.3 Updated Information Submission by Interconnection Customer. The updated information submission by Interconnection Customer, including manufacturer information, shall occur no later than one hundred eighty (180) Calendar Days prior to the Trial Operation. Interconnection Customer shall submit a completed copy of the Large Generating Facility data

requirements contained in Appendix 1 to the LGIP. It shall also include any additional information provided to Transmission Provider for the Feasibility and Facilities Study. Information in this submission shall be the most current Large Generating Facility design or expected performance data. Information submitted for stability models shall be compatible with Transmission Provider standard models. If there is no compatible model, Interconnection Customer will work with a consultant mutually agreed to by the Parties to develop and supply a standard model and associated information.

If Interconnection Customer's data is materially different from what was originally provided to Transmission Provider pursuant to the Interconnection Study Agreement between Transmission Provider and Interconnection Customer, then Transmission Provider will conduct appropriate studies to determine the impact on Transmission Provider Transmission System based on the actual data submitted pursuant to this Article 24.3. The Interconnection Customer shall not begin Trial Operation until such studies are completed.

24.4 Information Supplementation. Prior to the Operation Date, the Parties shall supplement their information submissions described above in this Article 24 with any and all "as-built" Large Generating Facility information or "as-tested" performance information that differs from the initial submissions or, alternatively, written confirmation that no such differences exist. The Interconnection Customer shall conduct tests on the Large Generating Facility as required by Good Utility Practice such as an open circuit "step voltage" test on the Large Generating Facility to verify proper operation of the Large Generating Facility's automatic voltage regulator.

Unless otherwise agreed, the test conditions shall include: (1) Large Generating Facility at synchronous speed; (2) automatic voltage regulator on and in voltage control mode; and (3) a five percent change in Large Generating Facility terminal voltage initiated by a change in the voltage regulators reference voltage. Interconnection Customer shall provide validated test recordings showing the

responses of Large Generating Facility terminal and field voltages. In the event that direct recordings of these voltages is impractical, recordings of other voltages or currents that mirror the response of the Large Generating Facility's terminal or field voltage are acceptable if information necessary to translate these alternate quantities to actual Large Generating Facility terminal or field voltages is provided. Large Generating Facility testing shall be conducted and results provided to Transmission Provider for each individual generating unit in a station.

Subsequent to the Operation Date, Interconnection Customer shall provide Transmission Provider any information changes due to equipment replacement, repair, or adjustment. Transmission Provider shall provide Interconnection Customer any information changes due to equipment replacement, repair or adjustment in the directly connected substation or any adjacent Transmission Provider-owned substation that may affect Interconnection Customer's Interconnection Facilities equipment ratings, protection or operating requirements. The Parties shall provide such information no later than thirty (30) Calendar Days after the date of the equipment replacement, repair or adjustment.

Article 25. Information Access and Audit Rights

25.1 Information Access. Each Party (the "disclosing Party") shall make available to the other Party information that is in the possession of the disclosing Party and is necessary in order for the other Party to: (i) verify the costs incurred by the disclosing Party for which the other Party is responsible under this LGIA; and (ii) carry out its obligations and responsibilities under this LGIA. The Parties shall not use such information for purposes other than those set forth in this Article 25.1 and to enforce their rights under this LGIA.

25.2 Reporting of Non-Force Majeure Events. Each Party (the "notifying Party") shall notify the other Party when the notifying Party becomes aware of its inability to comply with the provisions of this LGIA for a reason other than a Force Majeure event. The

Parties agree to cooperate with each other and provide necessary information regarding such inability to comply, including the date, duration, reason for the inability to comply, and corrective actions taken or planned to be taken with respect to such inability to comply. Notwithstanding the foregoing, notification, cooperation or information provided under this article shall not entitle the Party receiving such notification to allege a cause for anticipatory breach of this LGIA.

25.3 Audit Rights. Subject to the requirements of confidentiality under Article 22 of this LGIA, each Party shall have the right, during normal business hours, and upon prior reasonable notice to the other Party, to audit at its own expense the other Party's accounts and records pertaining to either Party's performance or either Party's satisfaction of obligations under this LGIA. Such audit rights shall include audits of the other Party's costs, calculation of invoiced amounts, Transmission Provider's efforts to allocate responsibility for the provision of reactive support to the Transmission System, Transmission Provider's efforts to allocate responsibility for interruption or reduction of generation on the Transmission System, and each Party's actions in an Emergency Condition. Any audit authorized by this article shall be performed at the offices where such accounts and records are maintained and shall be limited to those portions of such accounts and records that relate to each Party's performance and satisfaction of obligations under this LGIA. Each Party shall keep such accounts and records for a period equivalent to the audit rights periods described in Article 25.4.

25.4 Audit Rights Periods.

25.4.1 **Audit Rights Period for Construction-Related Accounts and Records.** Accounts and records related to the design, engineering, procurement, and construction of Transmission Provider's Interconnection Facilities and Network Upgrades shall be subject to audit for a period of twenty-four months following Transmission

Provider's issuance of a final invoice in accordance with Article 12.2.

25.4.2 **Audit Rights Period for All Other Accounts and Records.** Accounts and records related to either Party's performance or satisfaction of all obligations under this LGIA other than those described in Article 25.4.1 shall be subject to audit as follows: (i) for an audit relating to cost obligations, the applicable audit rights period shall be twenty-four months after the auditing Party's receipt of an invoice giving rise to such cost obligations; and (ii) for an audit relating to all other obligations, the applicable audit rights period shall be twenty-four months after the event for which the audit is sought.

25.5 **Audit Results.** If an audit by a Party determines that an overpayment or an underpayment has occurred, a notice of such overpayment or underpayment shall be given to the other Party together with those records from the audit which support such determination.

Article 26. Subcontractors

26.1 **General.** Nothing in this LGIA shall prevent a Party from utilizing the services of any subcontractor as it deems appropriate to perform its obligations under this LGIA; provided, however, that each Party shall require its subcontractors to comply with all applicable terms and conditions of this LGIA in providing such services and each Party shall remain primarily liable to the other Party for the performance of such subcontractor.

26.2 **Responsibility of Principal.** The creation of any subcontract relationship shall not relieve the hiring Party of any of its obligations under this LGIA. The hiring Party shall be fully responsible to the other Party for the acts or omissions of any subcontractor the hiring Party hires as if no subcontract had been made; provided, however, that in no event shall Transmission Provider be liable for the actions or

inactions of Interconnection Customer or its subcontractors with respect to obligations of Interconnection Customer under Article 5 of this LGIA. Any applicable obligation imposed by this LGIA upon the hiring Party shall be equally binding upon, and shall be construed as having application to, any subcontractor of such Party.

26.3 No Limitation by Insurance. The obligations under this Article 26 will not be limited in any way by any limitation of subcontractor's insurance.

Article 27. Disputes

27.1 Submission. In the event either Party has a dispute, or asserts a claim, that arises out of or in connection with this LGIA or its performance, such Party (the "disputing Party") shall provide the other Party with written notice of the dispute or claim ("Notice of Dispute"). Such dispute or claim shall be referred to a designated senior representative of each Party for resolution on an informal basis as promptly as practicable after receipt of the Notice of Dispute by the other Party. In the event the designated representatives are unable to resolve the claim or dispute through unassisted or assisted negotiations within thirty (30) Calendar Days of the other Party's receipt of the Notice of Dispute, such claim or dispute may, upon mutual agreement of the Parties, be submitted to arbitration and resolved in accordance with the arbitration procedures set forth below. In the event the Parties do not agree to submit such claim or dispute to arbitration, each Party may exercise whatever rights and remedies it may have in equity or at law consistent with the terms of this LGIA.

27.2 External Arbitration Procedures. Any arbitration initiated under this LGIA shall be conducted before a single neutral arbitrator appointed by the Parties. If the Parties fail to agree upon a single arbitrator within ten (10) Calendar Days of the submission of the dispute to arbitration, each Party shall choose one arbitrator who shall sit on a three-member arbitration panel. The two arbitrators so chosen shall within twenty (20) Calendar Days select a third

arbitrator to chair the arbitration panel. In either case, the arbitrators shall be knowledgeable in electric utility matters, including electric transmission and bulk power issues, and shall not have any current or past substantial business or financial relationships with any party to the arbitration (except prior arbitration). The arbitrator(s) shall provide each of the Parties an opportunity to be heard and, except as otherwise provided herein, shall conduct the arbitration in accordance with the Commercial Arbitration Rules of the American Arbitration Association ("Arbitration Rules") and any applicable FERC regulations or RTO rules; provided, however, in the event of a conflict between the Arbitration Rules and the terms of this Article 27, the terms of this Article 27 shall prevail.

27.3 Arbitration Decisions. Unless otherwise agreed by the Parties, the arbitrator(s) shall render a decision within ninety (90) Calendar Days of appointment and shall notify the Parties in writing of such decision and the reasons therefore. The arbitrator(s) shall be authorized only to interpret and apply the provisions of this LGIA and shall have no power to modify or change any provision of this Agreement in any manner. The decision of the arbitrator(s) shall be final and binding upon the Parties, and judgment on the award may be entered in any court having jurisdiction. The decision of the arbitrator(s) may be appealed solely on the grounds that the conduct of the arbitrator(s), or the decision itself, violated the standards set forth in the Federal Arbitration Act or the Administrative Dispute Resolution Act. The final decision of the arbitrator must also be filed with FERC if it affects jurisdictional rates, terms and conditions of service, Interconnection Facilities, or Network Upgrades.

27.4 Costs. Each Party shall be responsible for its own costs incurred during the arbitration process and for the following costs, if applicable: (1) the cost of the arbitrator chosen by the Party to sit on the three member panel and one half of the cost of the third arbitrator chosen; or (2) one half the cost of the single arbitrator jointly chosen by the Parties.

Article 28. Representations, Warranties, and Covenants

28.1 General. Each Party makes the following representations, warranties and covenants:

28.1.1 Good Standing. Such Party is duly organized, validly existing and in good standing under the laws of the state in which it is organized, formed, or incorporated, as applicable; that it is qualified to do business in the state or states in which the Large Generating Facility, Interconnection Facilities and Network Upgrades owned by such Party, as applicable, are located; and that it has the corporate power and authority to own its properties, to carry on its business as now being conducted and to enter into this LGIA and carry out the transactions contemplated hereby and perform and carry out all covenants and obligations on its part to be performed under and pursuant to this LGIA.

28.1.2 Authority. Such Party has the right, power and authority to enter into this LGIA, to become a Party hereto and to perform its obligations hereunder. This LGIA is a legal, valid and binding obligation of such Party, enforceable against such Party in accordance with its terms, except as the enforceability thereof may be limited by applicable bankruptcy, insolvency, reorganization or other similar laws affecting creditors' rights generally and by general equitable principles (regardless of whether enforceability is sought in a proceeding in equity or at law).

28.1.3 No Conflict. The execution, delivery and performance of this LGIA does not violate or conflict with the organizational or formation documents, or bylaws or operating agreement, of such Party, or any

judgment, license, permit, order, material agreement or instrument applicable to or binding upon such Party or any of its assets.

28.1.4 **Consent and Approval.** Such Party has sought or obtained, or, in accordance with this LGIA will seek or obtain, each consent, approval, authorization, order, or acceptance by any Governmental Authority in connection with the execution, delivery and performance of this LGIA, and it will provide to any Governmental Authority notice of any actions under this LGIA that are required by Applicable Laws and Regulations.

Article 29. Joint Operating Committee

29.1 Joint Operating Committee. Except in the case of ISOs and RTOs, Transmission Provider shall constitute a Joint Operating Committee to coordinate operating and technical considerations of Interconnection Service. At least six (6) months prior to the expected Initial Synchronization Date, Interconnection Customer and Transmission Provider shall each appoint one representative and one alternate to the Joint Operating Committee. Each Interconnection Customer shall notify Transmission Provider of its appointment in writing. Such appointments may be changed at any time by similar notice. The Joint Operating Committee shall meet as necessary, but not less than once each calendar year, to carry out the duties set forth herein. The Joint Operating Committee shall hold a meeting at the request of either Party, at a time and place agreed upon by the representatives. The Joint Operating Committee shall perform all of its duties consistent with the provisions of this LGIA. Each Party shall cooperate in providing to the Joint Operating Committee all information required in the performance of the Joint Operating Committee's duties. All decisions and agreements, if any, made by the Joint Operating Committee, shall be evidenced in writing. The duties of the Joint Operating Committee shall include the following:

29.1.1 Establish data requirements and operating record requirements.

29.1.2 Review the requirements, standards, and procedures for data acquisition equipment, protective equipment, and any other equipment or software.

29.1.3 Annually review the one (1) year forecast of maintenance and planned outage schedules of Transmission Provider's and Interconnection Customer's facilities at the Point of Interconnection.

29.1.4 Coordinate the scheduling of maintenance and planned outages on the Interconnection Facilities, the Large Generating Facility and other facilities that impact the normal operation of the interconnection of the Large Generating Facility to the Transmission System.

29.1.5 Ensure that information is being provided by each Party regarding equipment availability.

29.1.6 Perform such other duties as may be conferred upon it by mutual agreement of the Parties.

Article 30. Miscellaneous

30.1 Binding Effect. This LGIA and the rights and obligations hereof, shall be binding upon and shall inure to the benefit of the successors and assigns of the Parties hereto.

30.2 Conflicts. In the event of a conflict between the body of this LGIA and any attachment, appendices or exhibits hereto, the terms and provisions of the body of this LGIA shall prevail and be deemed the final intent of the Parties.

30.3 Rules of Interpretation. This LGIA, unless a clear contrary intention appears, shall be construed and interpreted as follows: (1) the singular number includes the plural number and vice versa; (2) reference to any person includes such person's successors and assigns but, in the case of a Party, only if such successors and assigns are permitted by this LGIA, and reference to a person in a particular capacity excludes such person in any other capacity or individually; (3) reference to any agreement (including this LGIA), document, instrument or tariff means such agreement, document, instrument, or tariff as amended or modified and in effect from time to time in accordance with the terms thereof and, if applicable, the terms hereof; (4) reference to any Applicable Laws and Regulations means such Applicable Laws and Regulations as amended, modified, codified, or reenacted, in whole or in part, and in effect from time to time, including, if applicable, rules and regulations promulgated thereunder; (5) unless expressly stated otherwise, reference to any Article, Section or Appendix means such Article of this LGIA or such Appendix to this LGIA, or such Section to the LGIP or such Appendix to the LGIP, as the case may be; (6) "hereunder", "hereof", "herein", "hereto" and words of similar import shall be deemed references to this LGIA as a whole and not to any particular Article or other provision hereof or thereof; (7) "including" (and with correlative meaning "include") means including without limiting the generality of any description preceding such term; and (8) relative to the determination of any period of time, "from" means "from and including", "to" means "to but excluding" and "through" means "through and including".

30.4 Entire Agreement. This LGIA, including all Appendices and Schedules attached hereto, constitutes the entire agreement between the Parties with reference to the subject matter hereof, and supersedes all prior and contemporaneous understandings or agreements, oral or written, between the Parties with respect to the subject matter of this LGIA. There are no other agreements, representations, warranties, or covenants which constitute any part of the consideration for, or any condition to, either Party's compliance with its obligations under this LGIA.

30.5 **No Third Party Beneficiaries.** This LGIA is not intended to and does not create rights, remedies, or benefits of any character whatsoever in favor of any persons, corporations, associations, or entities other than the Parties, and the obligations herein assumed are solely for the use and benefit of the Parties, their successors in interest and, where permitted, their assigns.

30.6 **Waiver.** The failure of a Party to this LGIA to insist, on any occasion, upon strict performance of any provision of this LGIA will not be considered a waiver of any obligation, right, or duty of, or imposed upon, such Party. Any waiver at any time by either Party of its rights with respect to this LGIA shall not be deemed a continuing waiver or a waiver with respect to any other failure to comply with any other obligation, right, duty of this LGIA. Termination or Default of this LGIA for any reason by Interconnection Customer shall not constitute a waiver of Interconnection Customer's legal rights to obtain an interconnection from Transmission Provider. Any waiver of this LGIA shall, if requested, be provided in writing.

30.7 **Headings.** The descriptive headings of the various Articles of this LGIA have been inserted for convenience of reference only and are of no significance in the interpretation or construction of this LGIA.

30.8 **Multiple Counterparts.** This LGIA may be executed in two or more counterparts, each of which is deemed an original but all constitute one and the same instrument.

30.9 **Amendment.** The Parties may by mutual agreement amend this LGIA by a written instrument duly executed by the Parties.

30.10 **Modification by the Parties.** The Parties may by mutual agreement amend the Appendices to this LGIA by a written instrument duly executed by the Parties. Such amendment shall become effective and a part of this LGIA upon satisfaction of all Applicable Laws and Regulations.

30.11 Reservation of Rights. Transmission Provider shall have the right to make a unilateral filing with FERC to modify this LGIA with respect to any rates, terms and conditions, charges, classifications of service, rule or regulation under section 205 or any other applicable provision of the Federal Power Act and FERC's rules and regulations thereunder, and Interconnection Customer shall have the right to make a unilateral filing with FERC to modify this LGIA pursuant to section 206 or any other applicable provision of the Federal Power Act and FERC's rules and regulations thereunder; provided that each Party shall have the right to protest any such filing by the other Party and to participate fully in any proceeding before FERC in which such modifications may be considered. Nothing in this LGIA shall limit the rights of the Parties or of FERC under sections 205 or 206 of the Federal Power Act and FERC's rules and regulations thereunder, except to the extent that the Parties otherwise mutually agree as provided herein.

30.12 No Partnership. This LGIA shall not be interpreted or construed to create an association, joint venture, agency relationship, or partnership between the Parties or to impose any partnership obligation or partnership liability upon either Party. Neither Party shall have any right, power or authority to enter into any agreement or undertaking for, or act on behalf of, or to act as or be an agent or representative of, or to otherwise bind, the other Party.

IN WITNESS WHEREOF, the Parties have executed this LGIA in duplicate originals, each of which shall constitute and be an original effective Agreement between the Parties.

PACIFICORP, on behalf of its Transmission function

Appendix A to LGIA

Interconnection Facilities, Network Upgrades, Distribution Upgrades, and Contingent Facilities

1. **Interconnection Facilities:**

   (a) **Interconnection Customer's Interconnection Facilities:** includes one 34.5 kV/230 kV transformer and high-side circuit breaker and a short line segment to the Point of Interconnection.

   (b) **Transmission Provider's Interconnection Facilities:** includes a take-off structure inside the Point of Interconnection substation; 230 kV interchange meter and associated instrument transformers.

2. **Network Upgrades:**

   (a) **Stand Alone Network Upgrades:** includes the installation of a new three-breaker ring bus substation (and appurtenances thereof).

   (b) **Other Network Upgrades:** includes approximately 55 miles of fiber optic cable from Point of Interconnection substation to Frannie and Yellowtail substations; installation of communications equipment at various Transmission Provider locations and a new transmission line loop in/out of the 230 kV Frannie-Yellowtail transmission line to the Point of Interconnection substation.

3. **Distribution Upgrades:** None

4. **Contingent Facilities:** As identified in the System Impact Study for this project dated August 14, 2014 and the Facilities Study dated January 14, 2015, the following Network Upgrades are required to be in-service prior to this project:

   - None identified

5. Point of Interconnection: the point at which Transmission Provider's Interconnection Facilities connect to the Point of Interconnection substation's bus.

6. Point of Change of Ownership: the point at which the conductor from final structure of Interconnection Customer's generation tie line meets Transmission Provider's take-off structure.

7. One-Line Diagram: please see Exhibit 1 to Appendix A to Agreement.

8. Estimated Cost:

Direct Assigned:	$451,000
Network Upgrade:	$13,990,000
Total:	$14,441,000

Appendix B To LGIA

Milestones

Interconnection Customer executes Interconnection Agreement, authorizes the start of engineering and procurement, and provides financial security pursuant to Article 11.5, in the amount of $3,390,000: September 6, 2019

Interconnection Customer and Transmission Provider to begin detailed engineering activities: September 9, 2019

Interconnection Customer to provide Transmission Provider with all required rights of way/easements/permits/property rights: October 16, 2019

Interconnection Customer provides Transmission Provider with required modeling information to satisfy Transmission Provider’s Energy Imbalance Market requirement: October 25, 2019

Transmission Provider Engineering Design Complete: March 19, 2020

Interconnection Customer authorizes construction: April 20, 2020

Transmission Provider commences construction: May 18, 2020

Transmission Provider and Interconnection Customer construction complete: August 3, 2020

Transmission Provider commissioning activities complete: August 25, 2020

Transmission Provider commissioning document review complete: August 28, 2020

Interconnection Customer facility receives backfeed power: September 1, 2020

Interconnection Customer shall request permission to backfeed in writing, including by e-mail, and wait to receive written permission from the Transmission Provider.

Initial Synchronization/Generator Testing Commencement: September 22, 2020

Interconnection Customer shall request permission for initial synchronization in writing, including by e-mail, and wait to receive written permission from the Transmission Provider. Interconnection Customer will be required to demonstrate the reactive capability of the facility and the voltage control system prior to commercial operation.

Commercial Operation Date: September 25, 2020

Interconnection Customer shall request permission for commercial operation in writing, including by e-mail, and wait to receive written permission from the Transmission Provider. As soon as possible Interconnection Customer shall confirm the actual Commercial Operation Date by submitting Appendix E to the Transmission Provider.

Appendix C To LGIA

Interconnection Details

Description of the Large Generating Facility: Consists of 57 Vestas V110-2.0MK10B, 24 Vestas V110-2.2MK10C, 29 Vestas V110-2.2MK10D, and 4 GE2.3-116 wind turbine generators for a full output of 240 MW as measured at the Point of Interconnection. Turbine strings are connected to two 34.5-230 kV, 90/120/150 MVA step up transformer with impedance of 9%.

Please see Exhibit 1 to Attachment A.

Control Area Requirements: Interconnection Customer shall interconnect and operate the Large Generating Facility in accordance with the Transmission Provider's Facility Interconnection Requirements for Transmission Systems, as may be revised from time to time, attached hereto as Exhibit 1 to Appendix C and by this reference incorporated herein.

Interconnection Details:
Metering. With reference to Article 7.1, Transmission Provider will own and maintain the bi-directional revenue Metering Equipment in Transmission Provider's Point of Interconnection substation at the Interconnection Customer's expense.

Under Frequency and Over Frequency Conditions. Consistent with LGIA Article 9.7.3, Transmission Provider shall design, procure, install and maintain frequency and voltage protection to trip feeder breakers in accordance with the settings shown in Exhibit 1 to Appendix C.

Reactive Power and Voltage Schedule. All interconnecting synchronous and non-synchronous generators are required to design their Generating Facilities with reactive power capabilities necessary to operate within the full power factor range of 0.95 leading to 0.95 lagging. This power factor range shall be dynamic and can be met using a combination of the inherent dynamic reactive power capability of the generator or inverter, dynamic reactive power devices and static reactive power devices. For non-synchronous generators, the power factor requirement is to be measured at the high-side of the generator substation. The Generating Facility must provide dynamic reactive power to the system over the full range of real power output. If the Generating

Facility is not capable of providing positive reactive support (i.e., supplying reactive power to the system) immediately following the removal of a fault or other transient low voltage perturbations, the facility will be required to add dynamic voltage support equipment. These additional dynamic reactive devices shall have correct protection settings such that the devices will remain on line and active during and immediately following a fault event.

Generators shall be equipped with automatic voltage-control equipment and normally operated with the voltage regulation control mode enabled unless written authorization, or directive, from the Transmission Provider is given to operate in another control mode (e.g., constant power factor control). The control mode of generating units shall be accurately represented in operating studies. The generators shall be capable of operating continuously at their rated power output within +/- 5% of its rated terminal voltage. Phasor Measurement Units will be required at any Generating Facilities with an individual or aggregate nameplate capacity of 75 MVA or greater.

As required by NERC standard VAR-001-1a, the Transmission Provider will provide a voltage schedule for the Point of Interconnection. In general, Generating Facilities should be operated so as to maintain the voltage at the Point of Interconnection, or other designated point as deemed appropriated by Transmission Provider, in accordance with Transmission Provider Policy 139.

Generating Facilities capable of operating with a voltage droop are required to do so. Studies will be required to coordinate voltage droop settings if there are other facilities in the area. It will be the Interconnection Customer’s responsibility to ensure that a voltage coordination study is performed, in coordination with Transmission Provider, and implemented with appropriate coordination settings prior to unit testing. If the need for a master controller is identified, the cost and all related installation requirements will be the responsibility of the Interconnection Customer. Participation by the Generation Facility in subsequent interaction/coordination studies will be required pre- and post-commercial operation in order ensure system reliability.

All generators must meet the Federal Energy Regulatory Commission (FERC) and WECC low voltage ride-through requirements.

As the Transmission Provider cannot submit a user written model to WECC for inclusion in base cases, a standard model from the WECC Approved Dynamic Model Library is required 180 days prior to trial operation. The list of approved generator models is continually updated and is available on the http://www.WECC.biz website.

Property Requirements. Subject to LGIA Articles 5.12 and 5.13, Interconnection Customer is required to obtain for the benefit of Transmission Provider at Interconnection Customer’s sole cost and expense all real property rights, including but not limited to fee ownership, easements and/or rights of way, as applicable, for Transmission Provider owned facilities using forms acceptable to Transmission Provider. Transmission Provider shall not be obligated to accept any such real property right that does not, at Transmission Provider’s sole discretion, confer sufficient rights to access, operate, construct, modify, maintain, place and remove Transmission Provider owned facilities or is otherwise conveyed using forms unacceptable to Transmission Provider. Further, all real property on which Transmission Provider’s facilities are to be located must be environmentally, physically and operationally acceptable to the Transmission Provider in accordance with Good Utility Practice.

Subject to LGIA Article 5.14, Interconnection Customer is responsible for obtaining all permits required by all relevant jurisdictions for the project, including but not limited to, conditional use permits and construction permits; provided however, Transmission Provider shall obtain, at Interconnection Customer’s cost and schedule risk, the permits necessary to construct Transmission Provider’s facilities that are to be located on real property currently owned or held in fee or right by Transmission Provider.

Subject to applicable provisions in the Agreement and an express written waiver by an authorized officer of Transmission Provider, all of the foregoing permits and real property rights (conferring rights on real property that is environmentally, physically and operationally acceptable to Transmission Provider) shall be acquired as provided herein as a condition to Transmission Provider’s contractual obligation to construct or take possession of facilities to be owned by the Transmission Provider under this Agreement. Transmission Provider shall have no liability for any project delays or cost overruns caused by delays in acquiring any of the foregoing permits and/or real property rights, whether such delay results from the failure to obtain such permits or rights or the failure of such permits or rights to meet the requirements set forth herein. Further, any completion dates, if any, set forth herein with regard to Transmission Provider’s obligations shall be equitably extended based on the length and impact of any such delays.

With respect to the fiber optic cable on Interconnection Customer’s tie line that will be owned by the Transmission Provider, the Interconnection Customer and the Transmission Provider agree that Transmission Provider’s ownership and operation of fiber optic cable that is attached to poles or other structures that are owned or maintained by the Interconnection Customer is subject to LGIA Article 5.12, Good Utility Practice, and Transmission Provider’s Interconnection Policy 139 (Exhibit 1 to Appendix C to LGIA).

Appendix D To LGIA

Security Arrangements Details

Infrastructure security of Transmission System equipment and operations and control hardware and software is essential to ensure day-to-day Transmission System reliability and operational security. FERC will expect all Transmission Providers, market participants, and Interconnection Customers interconnected to the Transmission System to comply with the recommendations offered by the President's Critical Infrastructure Protection Board and, eventually, best practice recommendations from the electric reliability authority. All public utilities will be expected to meet basic standards for system infrastructure and operational security, including physical, operational, and cyber-security practices.

Automatic Data Transfer. Throughout the term of this Agreement, Interconnection Customer shall provide the data specified below by automatic data transfer to the Transmission Provider Control Center specified by Transmission Provider or to a Third-Party System Operator designated by Transmission Provider (or both):

Analogs:

- o Real power flow 34.5 kV line #1
- o Reactive power flow 34.5 kV line #1
- o Real power flow 34.5 kV line #2
- o Reactive power flow 34.5 kV line #2
- o Real power flow 34.5 kV line #3
- o Reactive power flow 34.5 kV line #3
- o Real power flow 34.5 kV line #4
- o Reactive power flow 34.5 kV line #4
- o Real power flow 34.5 kV line #5
- o Reactive power flow 34.5 kV line #5
- o Real power flow 34.5 kV line #6
- o Reactive power flow 34.5 kV line #6
- o Real power flow 34.5 kV line #7
- o Reactive power flow 34.5 kV line #7
- o Real power flow 34.5 kV line #8
- o Reactive power flow 34.5 kV line #8
- o Real power flow 34.5 kV line #9
- o Reactive power flow 34.5 kV line #9
- o Real power flow 34.5 kV line #10
- o Reactive power flow 34.5 kV line #10

- o Average Wind Farm Wind Speed (m/s)
- o Average Wind Farm Atmospheric Pressure (Bar)
- o Average Wind Farm Temperature (Celsius)

Status:

- o 230 kV transformer breaker
- o 34.5 kV transformer breaker
- o 34.5 kV Line #1 breaker
- o 34.5 kV Line #2 breaker
- o 34.5 kV Line #3 breaker
- o 34.5 kV Line #4 breaker
- o 34.5 kV Line #5 breaker
- o 34.5 kV Line #6 breaker
- o 34.5 kV Line #7 breaker
- o 34.5 kV Line #8 breaker
- o 34.5 kV Line #9 breaker
- o 34.5 kV Line #10 breaker

Billing Meter Data. Bi-directional revenue meters at the Point of Interconnection Substation shall not be configured to allow direct dial-up access by Interconnection Customer. The Transmission Provider will provide alternatives at the Interconnection Customer's expense, upon request.

Additional Data. Interconnection Customer shall, at its sole expense, provide any additional Generating Facility data reasonably required and necessary for the Transmission Provider to operate the Transmission System in accordance with Good Utility Practice and Exhibit 1 to Appendix C, Facility Connection Requirements for Transmission Systems.

Relay and Control Settings

If Interconnection Customer requires modifications to the settings associated with control/protective devices connected to the distribution and/or transmission system, Interconnection Customer will contact PacifiCorp and provide in writing the justification for the proposed modifications. This will allow PacifiCorp to analyze the modifications and ensure there will be no negative impacts to connected systems and customers. PacifiCorp will provided timely review of proposed modifications and decisions regarding the proposed modifications thereof.

Appendix E To LGIA

Commercial Operation Date

This Appendix E is a part of the LGIA between Transmission Provider and Interconnection Customer.

Appendix G to LGIA

INTERCONNECTION REQUIREMENTS FOR A WIND GENERATING PLANT

Appendix G sets forth requirements and provisions specific to a wind generating plant. All other requirements of this LGIA continue to apply to wind generating plant interconnections.

A. <u>Technical Standards Applicable to a Wind Generating Plant</u>

i. <u>Low Voltage Ride-Through (LVRT) Capability</u>

A wind generating plant shall be able to remain online during voltage disturbances up to the time periods and associated voltage levels set forth in the standard below. The LVRT standard provides for a transition period standard and a post-transition period standard.

<u>Transition Period LVRT Standard</u>

The transition period standard applies to wind generating plants subject to FERC Order 661 that have either: (i) interconnection agreements signed and filed with the Commission, filed with the Commission in unexecuted form, or filed with the Commission as non-conforming agreements between January 1, 2006 and December 31, 2006, with a scheduled in-service date no later than December 31, 2007, or (ii) wind generating turbines subject to a wind turbine procurement contract executed prior to December 31, 2005, for delivery through 2007.

1. Wind generating plants are required to remain in-service during three-phase faults with normal clearing (which is a time period of approximately 4 – 9 cycles) and single line to ground faults with delayed clearing, and subsequent post-fault voltage recovery to prefault voltage unless clearing the fault effectively disconnects the generator from the system. The clearing time requirement for a three-phase fault will be specific to the wind generating plant substation location, as determined by and documented by the transmission provider. The maximum clearing time the wind generating plant shall be required to withstand for a three-phase fault shall be 9 cycles at a voltage as low as 0.15 p.u., as measured at the high side of the wind generating

plant step-up transformer (i.e. the transformer that steps the voltage up to the transmission interconnection voltage or "GSU"), after which, if the fault remains following the location-specific normal clearing time for three-phase faults, the wind generating plant may disconnect from the transmission system.

2. This requirement does not apply to faults that would occur between the wind generator terminals and the high side of the GSU or to faults that would result in a voltage lower than 0.15 per unit on the high side of the GSU serving the facility.

3. Wind generating plants may be tripped after the fault period if this action is intended as part of a special protection system.

4. Wind generating plants may meet the LVRT requirements of this standard by the performance of the generators or by installing additional equipment (e.g., Static VAr Compensator, etc.) within the wind generating plant or by a combination of generator performance and additional equipment.

5. Existing individual generator units that are, or have been, interconnected to the network at the same location at the effective date of the Appendix G LVRT Standard are exempt from meeting the Appendix G LVRT Standard for the remaining life of the existing generation equipment. Existing individual generator units that are replaced are required to meet the Appendix G LVRT Standard.

Post-transition Period LVRT Standard

All wind generating plants subject to FERC Order No. 661 and not covered by the transition period described above must meet the following requirements:

1. Wind generating plants are required to remain in-service during three-phase faults with normal clearing (which is a time period of approximately 4 – 9 cycles) and single line to ground faults with delayed clearing, and subsequent post-fault voltage recovery to prefault voltage unless clearing the

fault effectively disconnects the generator from the system. The clearing time requirement for a three-phase fault will be specific to the wind generating plant substation location, as determined by and documented by the transmission provider. The maximum clearing time the wind generating plant shall be required to withstand for a three-phase fault shall be 9 cycles after which, if the fault remains following the location-specific normal clearing time for three-phase faults, the wind generating plant may disconnect from the transmission system. A wind generating plant shall remain interconnected during such a fault on the transmission system for a voltage level as low as zero volts, as measured at the high voltage side of the wind GSU.

2. This requirement does not apply to faults that would occur between the wind generator terminals and the high side of the GSU.

3. Wind generating plants may be tripped after the fault period if this action is intended as part of a special protection system.

4. Wind generating plants may meet the LVRT requirements of this standard by the performance of the generators or by installing additional equipment (e.g., Static VAr Compensator) within the wind generating plant or by a combination of generator performance and additional equipment.

5. Existing individual generator units that are, or have been, interconnected to the network at the same location at the effective date of the Appendix G LVRT Standard are exempt from meeting the Appendix G LVRT Standard for the remaining life of the existing generation equipment. Existing individual generator units that are replaced are required to meet the Appendix G LVRT Standard.

ii. <u>Power Factor Design Criteria (Reactive Power)</u>

The following reactive power requirements apply only to a newly interconnecting wind generating plant that has executed a Facilities Study Agreement as of the effective

date of the Final Rule establishing the reactive power requirements for non-synchronous generators in section 9.6.1 of this LGIA (Order No. 827). A wind generating plant to which this provision applies shall maintain a power factor within the range of 0.95 leading to 0.95 lagging, measured at the Point of Interconnection as defined in this LGIA, if the Transmission Provider's System Impact Study shows that such a requirement is necessary to ensure safety or reliability. The power factor range standard can be met by using, for example, power electronics designed to supply this level of reactive capability (taking into account any limitations due to voltage level, real power output, etc.) or fixed and switched capacitors if agreed to by the Transmission Provider, or a combination of the two. The Interconnection Customer shall not disable power factor equipment while the wind plant is in operation. Wind plants shall also be able to provide sufficient dynamic voltage support in lieu of the power system stabilizer and automatic voltage regulation at the generator excitation system if the System Impact Study shows this to be required for system safety or reliability.

iii. Supervisory Control and Data Acquisition (SCADA) Capability

The wind plant shall provide SCADA capability to transmit data and receive instructions from the Transmission Provider to protect system reliability. The Transmission Provider and the wind plant Interconnection Customer shall determine what SCADA information is essential for the proposed wind plant, taking into account the size of the plant and its characteristics, location, and importance in maintaining generation resource adequacy and transmission system reliability in its area.

Exhibit 1 to Appendix A to LGIA

One-Line Diagram

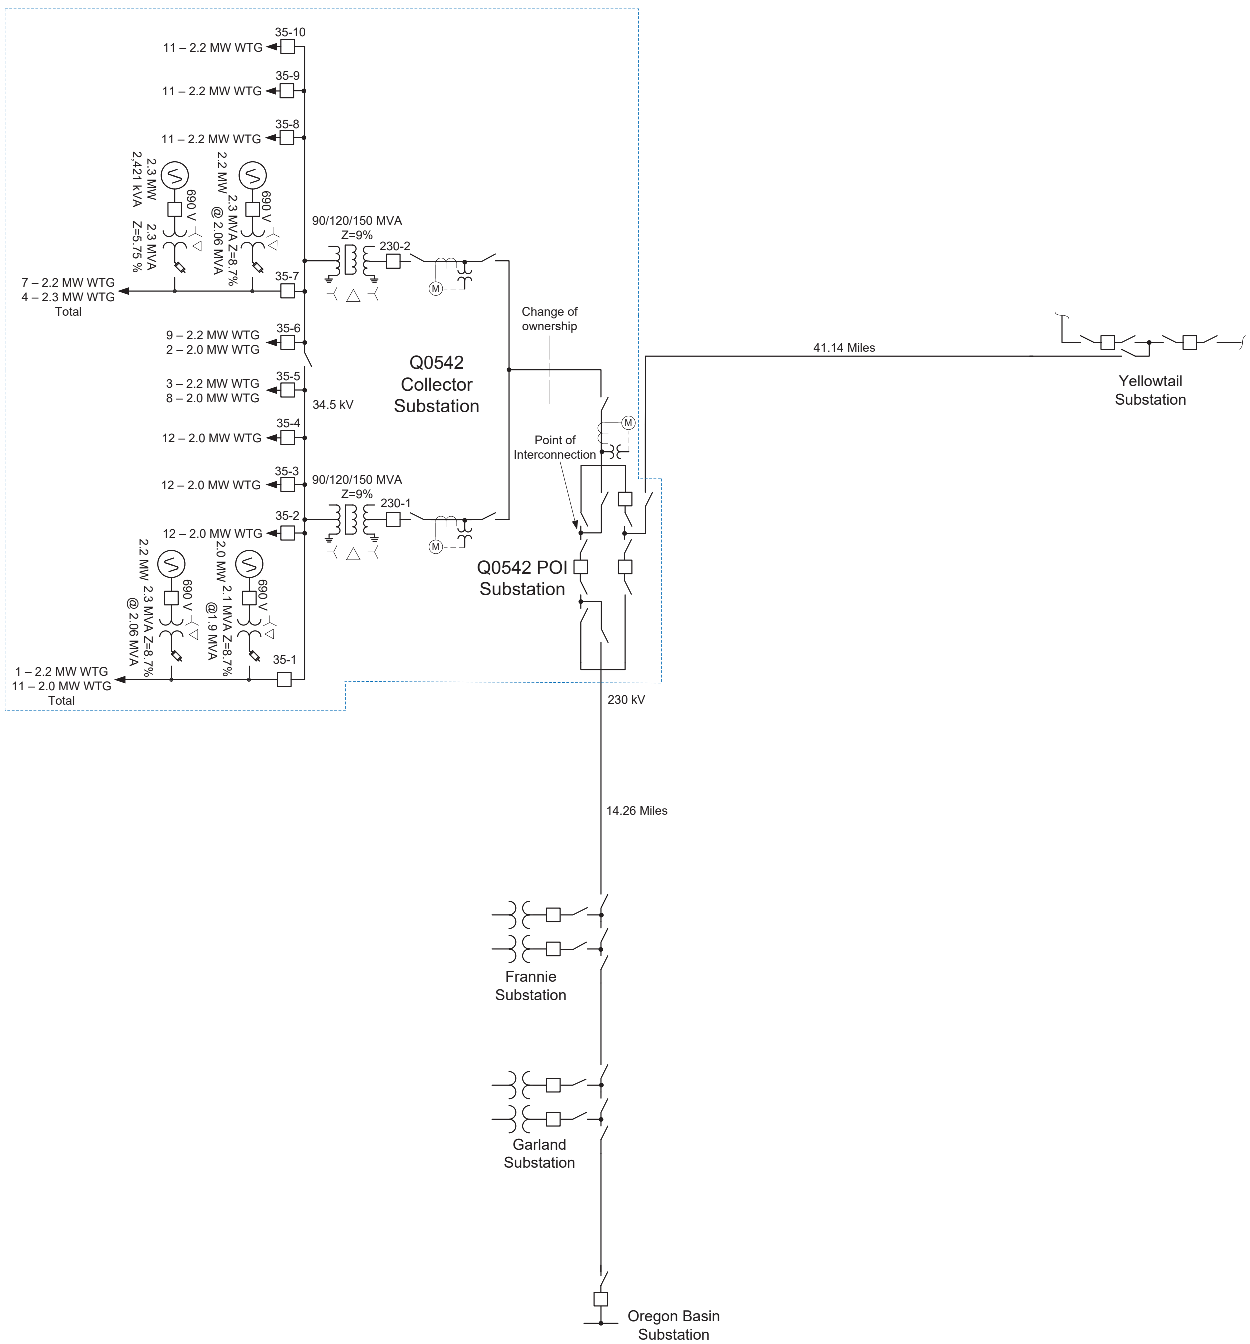

Exhibit 2 to Appendix A to LGIA

Scope of Work

Interconnection Customer Generating Facility and Collector Substation

The following outlines the design, procurement, construction, installation, and ownership of equipment at the Interconnection Customer's Generation Facility and associated collector substation.

Interconnection Customer Requirements

- Procure all necessary permits, lands, rights of way and easements required for the construction and continued maintenance of the Interconnection Customer's Generating Facility and collector substation.
- Design, procure, construct, own and maintain the Interconnection Customer's Generating Facility and associated collector substation. The collector substation is to be constructed adjacent to (within 800' between deadend structures) the new POI substation.
- Design the Generating Facility with reactive power capabilities necessary to operate within the full power factor range of 0.95 leading to 0.95 lagging as measured at the high side of the Interconnection Customer's GSU transformer. This power factor range shall be dynamic and can be met using a combination of the inherent dynamic reactive power capability of the generator or inverter, dynamic reactive power devices and static reactive power devices to make up for losses.
- Design the generating facility such that it can provide positive reactive support (i.e., supply reactive power to the system) immediately following the removal of a fault or other transient low voltage perturbations or install dynamic voltage support equipment. These additional dynamic reactive devices shall have correct protection settings such that the devices will remain on line and active during and immediately following a fault event.
- Equip the Generating Facility with automatic voltage-control equipment and operate with the voltage regulation control mode enabled unless explicitly authorized to operate another control mode by the Transmission Provider.
- Install a Phasor Measurement Unit to collect data from the Project. The data must be collected and be able to stream to the Planning Coordinator for each of the Generator

Facility's step-up transformers measured on the low side of the GSU at a sample rate of at least 60 samples per second and synchronized within +/- 2 milliseconds of the Coordinated Universal Time (UTC). Initially, the following data must be collected:

- o Three phase voltage and voltage angle (analog)
- o Three phase current (analog)

Data requirements are subject to change as deemed necessary to comply with local and federal regulations.

- Operate the Generating Facility so as to maintain the voltage at the Point of Interconnection, or other designated point as deemed appropriate by Transmission Provider, at a voltage schedule to be provided by the Transmission Provider following testing. Voltage will typically be required to operate between 1.00 and 1.04 per unit.
- Operate the Generating Facility with a voltage droop.
- Have any Transmission Provider required studies, such as a voltage coordination study, performed and provide results to Transmission Provider. Any additional requirements identified in these studies will be the responsibility of the Interconnection Customer.
- Meet the Federal Energy Regulatory Commission (FERC) and WECC low voltage ride-through requirements as specified in the interconnection agreement.
- Provide the Transmission Provider a standard model from the WECC Approved Dynamic Model Library.
- Design and construct the collector substation such that the ground grid can be connected to the POI substation ground grid to support the installation of a Transmission Provider owned and maintained bus differential scheme. The Interconnection Customer is responsible to ensure the ground grid design supports safe step and touch potentials.
- Design, provide and install conduits between the Interconnection Customer collector substation and the marshalling cabinet to be installed just inside the fence of the POI substation to support copper circuits installed between the facilities.
- Provide and install two sets of current transformers to be fed into the bus differential relays with a maximum current transformer ratio matching the maximum CT ratio of the breakers at the POI substation. Provide and install conduit and cabling to the POI substation marshalling cabinet with these outputs.
- Design, provide and install control cabling (number and size TBD) and hard wire the Interconnection Customer's

source devices to the marshalling cabinet. Replicated values are not acceptable.

- Provide the following data points from the collector substation via hardwire to the marshalling cabinet located in the POI substation. Please note that these points are based on the most recent design information provided by the Interconnection Customer and could change based on final design:

  Analogs:
    - Real power flow 34.5 kV line #1
    - Reactive power flow 34.5 kV line #1
    - Real power flow 34.5 kV line #2
    - Reactive power flow 34.5 kV line #2
    - Real power flow 34.5 kV line #3
    - Reactive power flow 34.5 kV line #3
    - Real power flow 34.5 kV line #4
    - Reactive power flow 34.5 kV line #4
    - Real power flow 34.5 kV line #5
    - Reactive power flow 34.5 kV line #5
    - Real power flow 34.5 kV line #6
    - Reactive power flow 34.5 kV line #6
    - Real power flow 34.5 kV line #7
    - Reactive power flow 34.5 kV line #7
    - Real power flow 34.5 kV line #8
    - Reactive power flow 34.5 kV line #8
    - Real power flow 34.5 kV line #9
    - Reactive power flow 34.5 kV line #9
    - Real power flow 34.5 kV line #10
    - Reactive power flow 34.5 kV line #10
    - Average Wind Farm Wind Speed (m/s)
    - Average Wind Farm Atmospheric Pressure (Bar)
    - Average Wind Farm Temperature (Celsius)

  Status:
    - 230 kV transformer breaker
    - 34.5 kV transformer breaker
    - 34.5 kV Line #1 breaker
    - 34.5 kV Line #2 breaker
    - 34.5 kV Line #3 breaker
    - 34.5 kV Line #4 breaker
    - 34.5 kV Line #5 breaker
    - 34.5 kV Line #6 breaker
    - 34.5 kV Line #7 breaker
    - 34.5 kV Line #8 breaker
    - 34.5 kV Line #9 breaker
    - 34.5 kV Line #10 breaker
- Provide and install conductor, shield wire and line hardware in sufficient quantities to allow the Transmission

Provider to terminate the segment running from the collector substation deadend structure into the POI substation deadend structure. The last segment will be owned by the Transmission Provider.

- Procure and install Transmission Provider approved H-Frame structures for both sets of the Transmission Provider's 230 kV instrument transformers to be installed on the high side of both of the Interconnection Customer's main step up transformers. The installation location shall be coordinated with the Transmission Provider.
- Install the Transmission Provider's provided instrument transformers.
- Install complete conduit and control cable provided by the Transmission Provider from both sets of the Transmission Provider's instrument transformers to the Transmission Provider's POI substation fence line.
- Provide Transmission Provider unfettered and maintained access to the Transmission Provider's instrument transformers.
- Arrange for and provide permanent retail service for power that will flow from the Transmission Provider's system when the Project is not generating with the retail service provider in this area. This will require the retail service provider to obtain transmission service from the Transmission Provider. These arrangements must be in place prior to approval for backfeed.
- Provide any construction or backup retail service necessary for the Project.

Transmission Provider Requirements

- Provide the Interconnection Customer the designated point at which the voltage is to be maintained and the associated voltage schedule.
- Identify any necessary studies that the Interconnection Customer must have performed.
- Identify the values to be stored in the PMU.
- Provide the Interconnection Customer the necessary specifications to allow the ground grid of the Interconnection Customer's collector substation and the POI substation to be tied together.
- Provide the Interconnection Customer the necessary specifications for the bus between the Interconnection Customer's collector substation and the new POI substation to be connected.

- Coordinate with Interconnection Customer on the location, size, and types of conduits and control cables between the POI substation and the collector substation.
- Provide the Interconnection Customer the specifications for the instrument transformer structures.
- Provide the control cable to be installed by the Interconnection Customer from the instrument transformers to the Transmission Provider’s POI substation fence and coordinate on the location of the cable.
- Procure and provide to the Interconnection Customer the 230 kV instrument transformers to be installed on the high side of both the Interconnection Customer’s main step up transformers.

Point of Interconnection Substation

The following outlines the design, procurement, construction, installation, and ownership of equipment at the new Point of Interconnection substation.

Interconnection Customer Requirements

- Provide all necessary easements, rights of way, and land acquisition on Transmission Provider’s standard forms as required to facilitate the construction of the Transmission Provider’s new POI substation.
- Provide a separate graded, grounded and fenced area adjacent to (sharing a common fence) the Interconnection Customer’s collector substation for the Transmission Provider’s POI substation as required by the Transmission Provider’s site work design specifications and drawings.

Transmission Provider Requirements

- Support the Interconnection Customer’s efforts to procure all necessary easements, rights of way and land acquisition for the construction of the new POI substation.
- Design, procure and construct a new 230 kV three breaker ring bus substation adjacent to the Interconnection Customer’s collector substation which will include the following major pieces of equipment:
    - (3) – 230kV, breaker
    - (6) – 230kV, CCVT
    - (3) – 230kV, combined CT/VT metering unit
    - (8) – 230kV, switch, breaker disconnect
    - (3) – 230kV, switch, line disconnect
    - (1) – 230 kV, switch, meter disconnect
    - (9) – 230kV, lightning arrester
    - (1) – 230 kV, SSVT

   - (1) – control house

- Perform a CDEGS grounding analysis to determine requirements for both the Interconnection Customer collector substation and Transmission Provider POI substation. Provide requirements to Interconnection Customer.
- Terminate the transmission lines running from Frannie and Yellowtail substations into the POI substation dead-end structures.
- Terminate the last bus/line segment running from the Interconnection Customer's collector substation deadend structure into the POI substation deadend structure using Interconnection Customer provided and installed conductor, shield wire and line hardware.
- Design, procure and install a marshalling cabinet near the Interconnection Customer's collector substation shared fence line.
- Provide and install conduit and control cabling between the marshalling cabinet and the control building and bus differential cabinet.
- Design, procure and install a redundant bus differential relay system for the connection to the Interconnection Customer's collector substation.
- Procure and install a relay for under/over voltage and over/under frequency protection of the system.
- Procure and install a set of line current differential relay systems for the lines to both Frannie and Yellowtail substations. The relays will use permissive overreaching transfer trip logic.
- Include the following data points from the new POI substation into the new substation RTU:
  <u>Analogs:</u>
   - Net Generation MW
   - Net Generator MVAR
   - Interchange metering kWH
- Procure and install the necessary communication equipment to tie the new POI substation RTU into the Transmission Provider's communications network including fiber nodes, multiplex, router, battery system and charger.
- Provide and install fiber between the control building and the OPGW to be installed on the line to Frannie substation.
- Provide and install fiber between the control building and the OPGW to be installed on the line to Yellowtail substation.

- Install line loss logic equipment to support the required remedial action scheme ("RAS").
- Design, procure and install 230 kV revenue metering equipment including two (2) revenue quality meters, test switch, instrument transformers, metering panels, junction box and secondary metering wire at the Point of Interconnection.
- Design, procure and install two sets of 230 kV revenue metering equipment including revenue quality meters, test switches, metering panels, junction boxes and secondary metering wire for each of the two Interconnection Customer step up transformers.
- Provide and install an Ethernet connection for retail sales and generation accounting via the MV-90 translation system.
- Procure and install AC and DC service for the new POI substation.
- If requested, install a metering cabinet on the exterior of the POI substation fence in order to provide a Modbus or DNP output from the bidirectional meters to the retail service provider. The Transmission Provider will install an underground communication wire from the POI substation control building to the meter panel.

Other Substations/Remote Sites

The following outlines the design, procurement, construction, installation, and ownership of equipment at locations past the Point of Interconnection on the Transmission Provider's system.

<u>Work to be completed by the Transmission Provider</u>

- Oregon Basin-Yellowtail Transmission Line
    - Loop the line in and out of the new Point of Interconnection substation which will require the installation of four transmission structures and approximately 800 feet of conductor.
    - Install approximately 14 miles of fiber optic cable from the new Point of Interconnection substation to Frannie substation in place of one of the existing shield wires. Splice to fiber running from the substation control buildings. This will require the correction of approximately 15 structural defects.
    - Install approximately 41 miles of fiber optic cable from the new Point of Interconnection substation to Yellowtail substation in place of

  one of the existing shield wires. Splice to fiber running from the substation control buildings. This will require the correction of approximately 40 structural defects.
  - Remove the existing power line carrier and utilize mirrored bits to interface with McCullough Peak communications site.

- Frannie Substation
  - Provide and install fiber between the control building and the OPGW to be installed on the line to the new Point of Interconnection substation.
  - Install the necessary communications equipment to tie in the new fiber optic cable.
  - Modify relay settings to coordinate with the relays in the Point of Interconnection substation.
  - Procure and install a microwave system including tower, communications equipment and backup power system.
  - Remove existing wave trap and power line carrier equipment.

- Yellowtail Substation
  - Provide and install fiber between the substation control building and the OPGW to be installed on the line to the new POI substation.
  - Install the necessary communications equipment to tie in the fiber optic cable.
  - Remove existing wave trap and power line carrier equipment.
  - Modify relay settings to coordinate with the relays in the Point of Interconnection substation.
  - Install a line loss logic panel to support the RAS.

- Oregon Basin Substation
  - Procure any necessary property rights in order to allow for the substation fence to be expanded.
  - Expand the substation fence as necessary to develop sufficient space for the installation of a new control building and microwave tower.
  - Move existing substation infrastructure to allow for the construction of a new control building adjacent to the existing substation control building.
  - Procure and install a microwave system including tower, communications equipment and backup power system.

  - o Remove existing wave trap and power line carrier equipment.

- McCullough Peak Communications Site
  - o Procure and install the necessary communications equipment to interface with the new microwave systems being installed at various substations.

- Cody Service Center
  - o Procure and install a microwave system including tower, communications equipment and backup power system.

- Casper Service Center
  - o Modify the existing communications equipment to allow data from the Generating Facility to be captured.

- Remedial Action Scheme
  - o Design and implement a RAS to disconnect the Interconnection Customer's Large Generating Facility for an outage of the transmission line between the new POI substation and Yellowtail substation under certain heavy load, heavy generation conditions.
  - o If necessary, present for approval any generator tripping/load reduction schemes to the WECC Remedial Action Scheme Reliability Subcommittee ("RASRS").

- System Operations Centers
  - o Update databases to include the Interconnection Customer's Generating Facility along with Interconnection Facilities and Network Upgrades.

PacifiCorp Letter to Wyoming Department of Environmental Quality Air Quality Division

February 2020

MIDAMERICAN
ENERGY HOLDINGS COMPANY

March 5, 2013

Ms. Nancy E. Vehr
Sr. Asst. Attorney General
Wyoming Attorney General's Office
123 Capitol Building
Cheyenne, WY 82002

Mr. Steven A. Dietrich
Air Quality Division Administrator
Wyoming Dept. of Environmental Quality
122 West 25th Street
Cheyenne, WY 82002

Dear Ms. Vehr and Mr. Dietrich:

As a result of the Environmental Protection Agency's upcoming re-proposal of its action on the Wyoming Regional Haze State Implementation Plan (SIP), significant questions have arisen regarding PacifiCorp's obligations to comply with the current compliance deadlines for selective catalytic reduction (SCR) controls at Jim Bridger Units 3 and 4 as contained in the SIP and the Settlement Agreement entered into by PacifiCorp and the Wyoming Department of Environmental Quality in November 2010. The agreements referenced require installation of SCR at Jim Bridger Units 3 and 4 by December 31, 2015, and December 31, 2016, respectively.

During our meeting on January 4, 2013, PacifiCorp posed the following questions to the Wyoming Department of Environmental Quality, Air Quality Division: (1) Does PacifiCorp need to comply with all terms and conditions of the Wyoming SIP prior to EPA action; and (2) will the Air Quality Division consider extending the deadlines for the installation of the SCR at Jim Bridger Units 3 and 4. The Air Quality Division responded that (1) under state regulations, PacifiCorp is required to comply with all terms and conditions of the Wyoming SIP notwithstanding the fact that EPA has not taken action; and (2) that the Air Quality Division considers the requirements to install the Jim Bridger Units 3 and 4 SCR controls as being independently legally enforceable and that the timing of the reductions are necessary to meet the state's requirements to achieve reasonable progress under the regional haze program's requirements.

PacifiCorp hereby requests that the Wyoming Air Quality Division reconsider PacifiCorp's request to change the deadlines for installation of the Jim Bridger Units 3 and 4 SCR controls from December 31, 2015 and December 31, 2016, to five years after EPA's approval of the Wyoming SIP or FIP issuance.

Your prompt response to this request is most appreciated.

Sincerely,

Cathy S. Woollums

RE: Jim Bridger Units 3 & 4 SCR Controls

Dear Ms. Woollums:

Thank you for your letter, dated March 5, 2013, regarding your concerns about Wyoming's Regional Haze SIP and the November 2010 Settlement Agreement for Jim Bridger Units 3 and 4. In short your concern focuses on the deadline to install selective catalytic reduction (SCR) on these Jim Bridger units.

To start with, DEQ –AQD has stated previously that the terms and conditions of the Wyoming Regional Haze SIP are requirements that PacifiCorp still needs to meet. Under the Wyoming Regional Haze SIP that the State of Wyoming submitted to the EPA in January 2011, PacifiCorp is required to:

> (i) install SCR; (ii) install alternative add-on NOx control systems; or (iii) otherwise reduce NOx emissions to achieve a 0.07 lb/MMBtu 30-day rolling average NOx emissions rate. These installations shall occur, and/or this emission rate will be achieved on Unit 3 prior to December 31, 2015 and Unit 4 prior to December 31, 2016.

See Wyoming State Implementation Plan, Regional Haze, Addressing Regional Haze Requirements for Wyoming mandatory Federal Class I Areas Under 40 CFR 51.309(g), § 8.3.3 Long-Term Control Strategies for BART Facilities (January 7, 2011). Therefore, a change at this time to these requirements would entail a revision to our overall SIP with the EPA. This is one step that the DEQ-AQD does not intend to undertake at this time.

Secondly, you have requested that DEQ reconsider extending the Settlement Agreement deadlines for Jim Bridger Units 3 and 4. Under the Settlement Agreement, PacifiCorp must:

> (i) Install SCR; (ii) install alternative add-on NOx control systems; or (iii) otherwise reduce NOx emissions to achieve a 0.07 lb/mmBtu 30-day rolling average NOx emissions rate. These installations shall occur, and/or this emission rate will be achieved, on Unit 3 prior to December 31, 2015 and Unit 4 prior to December 31, 2016.

See In re: Appeal and Petition for Review of BART Permit No. MD-6040 (Jim Bridger Power Plant); and BART Permit No. MD-6042 (Naughton Power Plant), EQC Docket No. 10-2801, BART Appeal Settlement Agreement, ¶ 4(c) (filed Nov. 9, 2010). The Settlement Agreement may be modified if future changes in: "(i) federal or state requirements or (ii) technology would materially alter the emissions controls and rates that otherwise are required hereunder." *Id.* at ¶ 7. At this time, DEQ-AQD is unaware of any change in federal or state requirements, or technology, that would materially alter the required emissions controls or rates for Jim Bridger Units 3 and 4. Therefore, the DEQ-AQD continues to stand by its January 4, 2013 decision declining to extend the Settlement Agreement deadlines applicable to Jim Bridger Units 3 and 4.

If you would like more information or have additional questions, please contact me by phone at 307-777-7391. We appreciate your continued interest in Wyoming's environment.

Sincerely,

Steven A. Dietrich

Additional Background Regarding the Regional Haze Compliance Obligations Facing Hunter Unit 1

February 2020

History of Hunter 1 Regional Haze Compliance Obligations

When discussing efforts to establish environmental compliance schedules for PacifiCorp's coal-fueled resources, including Hunter Unit 1, it is imperative to understand the fact that Regional Haze compliance strategies for units across the western U.S. (including Hunter and Huntington) were established via a collective agency, industry and stakeholder approach beginning around the 1999 timeframe (i.e. Western Regional Air Partnership), and with the Regional Haze Rules as they generally exist today promulgated and adopted by the agencies in 2005. Therefore, PacifiCorp's efforts to influence appropriate compliance technologies, compliance deadlines and installation schedules for its individual units affected by Regional Haze Rules began years ago. As a participant in the Western Regional Air Partnership (WRAP) process, the Utah Division of Air Quality established requirements that pollution control equipment, including the installation of the baghouse and LNBs at Hunter 1, would be installed by 2013 (i.e., the end of the 2008 to 2013 Regional Haze Rules BART planning period). PacifiCorp's participation in the WRAP process and Regional Haze planning activities resulted in identifying appropriate emissions control technologies and establishing equipment installation schedules that met the requirements of the state of Utah for Hunter and Huntington and occurred during the units' normally scheduled major overhauls to minimize costs by reducing overall unit down-time and power purchases necessitated by additional outages.

With respect to PacifiCorp's specific efforts to negotiate deferred installation of emissions control equipment on Hunter Unit 1, delays associated with obtaining an approval order and finalizing the Utah Regional Haze State Implementation Plan in the 2008 timeframe made it extremely difficult for PacifiCorp to cost-effectively install the required equipment during the unit's 2010 overhaul, which would have allowed the equipment to be installed in alignment with Utah Regional Haze compliance timeframe requirements prior to 2013. As a result of negotiations with the Utah Division of Air Quality, the Company was allowed to delay the installation of the control equipment on Hunter Unit 1 until the unit's 2014 overhaul. As part of the agreement to delay the installation of the control equipment, PacifiCorp was required to submit semi-annual reports to the state beginning in 2010 demonstrating that continual progress towards completing the installation by 2014 is occurring, and that certain annual emission rates are being met.

With the negotiated 2014 compliance deadline for the baghouse and LNB projects, PacifiCorp completed detailed economic analysis of the Hunter Unit 1 compliance investments in 2012 prior to entering into engineering, procurement, and construction contracts for the multi-year project, incorporating then-current assumptions for forward gas prices, forward market prices, and proxy compliance costs for emerging environmental regulations with the potential to impact the unit. The results of PacifiCorp's economic analyses completed in the 2012 timeframe (and included in Confidential Volume III of the Company's 2013 IRP filing) support investment in the environmental compliance projects, even when considering the reasonably anticipated and generally quantifiable uncertainties regarding emerging environmental compliance obligations for the unit, and continued operation of this low cost resource through its depreciable life.

As has been demonstrated by the EPA's continually delayed and deferred actions regarding Regional Haze Rule action in the state of Wyoming, and with a similar process playing out regarding EPA's delayed and deferred actions on Utah Regional Haze Rule administration, neither Utah nor Wyoming has waited to implement their Regional Haze State Implementation Plans. Instead each state has delivered upon the plans they developed within the construct of the Regional Haze Rules and established timely and enforceable requirements for PacifiCorp's units affected by the rules. The concept of negotiating away compliance obligations while waiting for certainty regarding a myriad of emerging environmental policies and ever changing market conditions is not an approach that the states of Utah and Wyoming have engaged in, particularly without state policy drivers targeting accelerated retirement of the affected low cost resources in question.

ATTACHED EXHIBITS

Exhibit PAC/901—Major Components of a Wind Turbine Generator

Exhibit PAC/902—Foote Creek I Repowering Project

Confidential Exhibit PAC/903—Foote Creek I Repowering Project Details, Capital Costs, and In-Service Date

I. INTRODUCTION AND QUALIFICATIONS

Q. Please state your name, business address, and present position with PacifiCorp.

A. My name is Timothy J. Hemstreet. My business address is 825 NE Multnomah Street, Suite 1800, Portland, Oregon 97232. My title is Managing Director of Renewable Energy Development for PacifiCorp. I am testifying for PacifiCorp d/b/a Pacific Power (PacifiCorp or the Company).

Q. Briefly describe your education and professional experience.

A. I hold a Bachelor of Science degree in Civil Engineering from the University of Notre Dame in Indiana and a Master of Science degree in Civil Engineering from the University of Texas at Austin. I am also a Registered Professional Engineer in the state of Oregon. Before joining PacifiCorp in 2004, I held positions in engineering consulting at CH2M HILL (now Jacobs Engineering, Inc.) and environmental compliance at RR Donnelley Norwest, Inc. Since joining PacifiCorp, I have held positions in environmental policy and compliance, engineering, project management, and hydroelectric project licensing and program management. In 2016, I assumed a role in renewable energy development, focusing on PacifiCorp's wind repowering effort, and assumed my current role in June 2019, in which I oversee the development of renewable energy resources that enhance and complement PacifiCorp's existing renewable energy resource portfolio.

Q. Have you testified in previous regulatory proceedings?

A. Yes. I have previously sponsored testimony in California, Idaho, Oregon, Utah, Washington, and Wyoming.

II. PURPOSE OF TESTIMONY

Q. What is the purpose of your testimony in this proceeding?

A. To demonstrate that PacifiCorp's upgrades to "repower" the Foote Creek I wind facility[1] is prudent and in the public interest, my testimony provides the following information:

- The scope of the Foote Creek I repowering project;
- The financial benefits of repowering resulting from the qualification for federal production tax credits (PTCs);
- The increased energy benefits following repowering;
- The reduced ongoing operating costs following repowering;
- The extension of the wind facility asset life after repowering;
- Project implementation status and construction schedule; and
- The disposition of removed equipment.

In addition to cost recovery for repowering the Foote Creek I wind facility, my testimony will describe the Company's hydroelectric generation facilities on the Lewis River in Southwest Washington and the Merwin Fish Collection and Sorting Facility project. My testimony will demonstrate why the Merwin Fish Collection and Sorting Facility project was reasonable and prudent, and should be included in the Company's revenue requirement in this case.

[1] My testimony focuses on Foote Creek 1, the last wind facility to be repowered in PacifiCorp's wind fleet. PacifiCorp filed for recovery of its other repowered wind facilities through its Renewable Adjustment Clause filings in Docket Nos. UE 352 and UE 369.

III. SUMMARY OF TESTIMONY

Q. Please summarize your testimony.

A. Through its wind repowering project, PacifiCorp is leveraging past investments in its wind fleet and enhancing the future value of these resources for the benefit of its customers. The Company's repowering project is concluding with the Foote Creek I facility—the oldest resource in the Company's wind fleet. Repowering provides a unique opportunity to take advantage of efficiency and reliability improvements in wind generation technology and return PacifiCorp's wind fleet to like-new condition while enhancing performance and minimizing maintenance expenditures.

By incorporating recent technical advances that allow for installation of taller towers, longer blades and nacelles with higher capacity generators, repowering Foote Creek I will result in more low-cost energy for customers. Further, repowering with new equipment will extend the asset life of the wind facility by 21 years, allowing the wind facility to continue serving customers well into the future.

Finally, these repowering benefits can be delivered to customers while reducing, rather than increasing, costs to customers, as further described in the testimony of Mr. Rick T. Link.

In docket UE 352, PacifiCorp received a determination that repowering Glenrock I, Seven Mile Hill I, Seven Mile Hill II, High Plains, McFadden Ridge, Marengo I, Marengo II, Goodnoe Hills, and Leaning Juniper was prudent and is receiving or will receive cost recovery of those facilities as they are placed in service.[2] PacifiCorp has requested cost recovery and a determination that repowering

[2] *In the matter of PacifiCorp, dba Pacific Power, 2019 Renewable Adjustment Clause,* Docket No. UE 352, Order No. 19-304 (Sept. 16, 2019) (adopting all-party stipulation issued September 16, 2019).

the Glenrock III and Dunlap wind facilities is prudent in docket UE 369.[3] PacifiCorp's request in this general rate case is for a prudence determination and cost recovery for repowering the Foote Creek I wind facility which is the final facility in PacifiCorp's wind fleet to be repowered.

Following my testimony regarding the wind repowering project, I will describe the Lewis River hydroelectric projects, specifically the Merwin Fish Collection and Sorting Facility project. The Merwin Fish Collection and Sorting Facility project was required by the Lewis River Settlement Agreement and the Federal Energy Regulatory Commission (FERC) licenses issued to the Company for the Merwin, Yale and Swift No. 1 Hydroelectric Projects. Compliance with these license requirements allows customers to continue to benefit from these low-cost, zero-emission hydroelectric resources on the Lewis River during the 50-year license term for these projects.

IV. OVERVIEW OF WIND REPOWERING AND PROJECT SCOPE

Q. Please briefly describe what repowering a wind facility entails.

A. Repowering broadly describes the upgrade of an existing, operating wind facility with new wind-turbine-generator (WTG) equipment that can increase a facility's generating capacity and the amount of electrical generation produced from the facility. Specifically, PacifiCorp's repowering effort has involved replacing the nacelle, hub and rotor of the WTG at all facilities, except the Foote Creek I facility, where repowering will involve replacement of the existing WTGs, including the foundations and towers. *See* Exhibit PAC/901 for a depiction of a wind turbine and

[3] *In the matter of PacifiCorp, dba Pacific Power, 2020 Renewable Adjustment Clause,* Docket No. UE 369, Stipulation (Jan. 31, 2020).

its various components.

Q. Which facilities have been or will be repowered?

A. PacifiCorp has or will repower the facilities known as High Plains, Glenrock I, Glenrock III, Goodnoe Hills, Leaning Juniper, Marengo I, Marengo II, McFadden Ridge, Rolling Hills, Seven Mile Hill I, Seven Mile Hill II, Dunlap, and Foote Creek I.

Q. How many megawatts (MW) of installed wind capacity is PacifiCorp repowering?

A. PacifiCorp is repowering all of its 13 wind facilities in 2019 and 2020, representing 1,040 MW of installed wind capacity. Detailed information about the wind facilities was provided in dockets UE 352 and UE 369.[4] Detailed information about Foote Creek I is included in Exhibit PAC/902.

Q. Please explain what repowering at the Foote Creek I wind facility involves.

A. The wind facilities PacifiCorp is repowering began commercial operations between 1999 and 2010. Aside from the Foote Creek I facility, the facilities in PacifiCorp's wind fleet have been economically repowered, or upgraded, with new technology that improves their efficiency and increases their generation output, without incurring the cost to replace the existing towers, foundations, and energy collection systems, which are of sufficient design to accommodate more modern equipment now available. The existing foundations and towers, although more than 10 years old in some instances, are adequately designed to accommodate larger, more modern WTG equipment and still have a sufficient remaining useful life to economically justify the associated

[4] *See* Docket No. UE 352, Exhibit PAC/203; and Docket No. UE 369, Exhibit PAC/204.

investment.

In contrast, at the Foote Creek I facility developed more than 20 years ago, the WTG equipment has a low generating capacity (600 kilowatt) and the towers and foundations supporting the nacelle and rotor do not have the necessary height or design strength to accommodate the installation of modern, larger nacelles and rotors capable of generating a much greater amount of electricity per WTG. Thus, for the Foote Creek I facility, as with older facilities of its type, repowering involves the removal of all of the old wind turbine equipment, including towers, foundations, and energy collection system, and replacement with new equipment and energy collector circuits appropriately sized for the new equipment. Repowering at the Foote Creek I facility will result in the replacement of 68 existing small-capacity wind turbines currently at the site with just 13 modern wind turbines.

Q. When did PacifiCorp initiate its wind repowering project?

A. PacifiCorp began the wind repowering project in the fall of 2016, and authorized the acquisition of safe harbor equipment to facilitate repowering of its fleet of General Electric turbines in early December 2016.

Q. Did PacifiCorp's 2017 Integrated Resource Plan (IRP) evaluate repowering all of the facilities described above?

A. Yes, except for Goodnoe Hills and Foote Creek I. When the 2017 IRP was developed, PacifiCorp had not assessed repowering either Goodnoe Hills or Foote Creek I. After finalization of the 2017 IRP, however, PacifiCorp evaluated repowering both facilities and determined that they could be repowered and provide economic benefits to customers, similar to the other facilities evaluated in the 2017

IRP. Mr. Link describes the Company's analysis of the wind repowering project in the 2017 IRP.

Q. As you note above, the scope of repowering at Foote Creek I is different than repowering at the Company's other wind facilities. Can you provide additional background on the Company's decision to repower Foote Creek I?

A. Foote Creek I was the Company's first wind energy facility. Commercial operation began in April 1999 as a demonstration project to evaluate the feasibility of utility-scale wind energy. The facility was developed in partnership with the Eugene Water & Electric Board (EWEB) and the Bonneville Power Administration (BPA). As developed, Foote Creek I was co-owned by EWEB (21.21 percent ownership) and PacifiCorp (78.79 percent ownership), with BPA taking 37 percent of the facility's output through a 25-year cost-based power purchase agreement (PPA). As the first utility-scale wind energy project in Wyoming, Foote Creek I was sited at one of the most favorable wind sites in the United States and enjoys the highest wind speeds of any of the Company's wind projects. Unlike the remainder of the facilities the Company is repowering, the Foote Creek I project is unique in that it was co-owned and also had a third-party PPA associated with the resource.

The Foote Creek I facility currently consists of 68 turbines with a 600-kilowatt generating capacity, a rotor diameter of 42 meters, and towers that support a 40 meter hub height. Although employing the latest technology when originally installed, the existing turbines are costly to operate and maintain relative to the Company's more modern turbines that have a much higher nameplate capacity, larger rotor diameters, and taller towers. Accordingly, the operations and maintenance costs of the Foote Creek I facility are the highest of all of the Company-owned wind resources on a per-MW basis since the maintenance requirements for these smaller turbines are similar to those of larger turbines, but the capacity of the Foote Creek I turbines is much less.

The costs associated with continued operation of the existing turbines at Foote Creek I for both the Company and EWEB will increase after the expiration of the BPA PPA in April 2024 since 37 percent of these costs would no longer be covered through the cost-based PPA. Similarly, BPA was required to take higher cost energy from the project until the PPA expired. For these reasons, PacifiCorp, EWEB, and BPA were all motivated to explore whether the existing Foote Creek I project could be unwound in order to achieve an outcome more favorable to customers as compared to continuing to operate the facility through its planned 30-year asset life. Repowering the facility presented the opportunity to realize this outcome for customers.

Q. What was necessary for the Company to repower the project?

A. Because of the very favorable wind conditions at the site, the Company was interested in repowering the facility so that customers could benefit from the low-cost energy that could be generated at the site with modern wind turbine equipment qualified at 100 percent of the value of the PTCs. To achieve that, however, it was necessary for the Company to acquire EWEB's ownership share of the facility and to terminate the existing PPA with BPA. The Company negotiated a PPA termination agreement with EWEB and BPA, and a purchase and sale agreement with EWEB for its interests in the facility. The termination of the PPA was negotiated to be effective upon

PacifiCorp's acquisition of EWEB's interest in the project. Closing of the purchase and sale agreement with EWEB was contingent upon the Company obtaining necessary regulatory and permitting approvals related to repowering, as well as satisfactory commercial arrangements for turbine supply and construction that ensured repowering could occur.

Q. How much did the Company pay EWEB for its interests in the facility?

A. PacifiCorp paid EWEB approximately [redacted] for its interests in the facility.

Q. Did the Company incur costs to terminate the Foote Creek I PPA with BPA?

A. No. Under the termination agreement, BPA paid an early termination payment for the facility in the amount of [redacted]—the Company's 78.79 percent ownership share of the facility—was paid to the Company. This payment to the Company and EWEB reflected the fact that BPA realizes savings by terminating the PPA early and replacing the power with lower cost energy resources.

Q. Were these amounts consistent with the Company's expectations?

A. Yes. These payments were consistent with the Company's economic analysis of the Foote Creek I repowering project, which is described by Mr. Link.

Q. Did the Company enter other commercial arrangements related to repowering at Foote Creek I?

A. Yes. The Company executed a turbine supply agreement with Vestas American Wind Technology, Inc. (Vestas) and executed a balance of plant construction contract with Thorstad Companies, Inc. Both contracts were awarded following competitive solicitation processes. When these contracts were finalized, the Company proceeded to close on the purchase of EWEB's interest in the project and terminate the PPA.

The Company also purchased the wind energy lease rights for the Foote Creek I facility.

Q. Why did the Company purchase the wind energy lease rights for Foote Creek I?

A. The Company was operating the Foote Creek I facility under land rights that were subleased from Chandar Energy Land Associates, Inc. (CELA), which held the master wind energy lease rights with the ultimate property owners upon whose land the Foote Creek I turbines are located. The wind energy lease payments due to CELA under the sublease were production-based and were costly as compared to what the Company pays for similar production-based wind energy leases, even given the high-value wind energy resource at the site. The Company was able to negotiate the purchase of the master wind energy leases from CELA at a cost that improved the economics of the Foote Creek I repowering project relative to continuing to operate under the existing sublease. Additionally, the master wind energy lease rights can be renewed for a total term of up to 99 years, providing potential future customer benefits even beyond the asset life of the repowered Foote Creek I facility.

Q. Were there unique permitting requirements related to Foote Creek I as compared to the other repowering projects?

A. Yes. It was necessary for the Company to obtain a new Certificate of Public Convenience and Necessity from the Wyoming Public Service Commission related to repowering the facility, and a new Conditional Use Permit from Carbon County, Wyoming. The Company also had to obtain concurrence from the Bureau of Land Management (BLM) that repowering was consistent with the existing right of way grant from BLM for the facility, and the Company worked with the U.S. Fish and

Wildlife Service to review the locations of the new turbines on the existing project footprint to evaluate and minimize potential avian impacts associated with the new turbine layout.

Q. When did the Company finally approve repowering the Foote Creek I facility?

A. The Company approved repowering the facility on June 25, 2019. The Company then closed on the purchase of EWEB's interest in the facility on July 24, 2019, after commercial arrangements to repower the facility were finalized. Following approval of the repowering project, the Company was able to negotiate the purchase of the master wind leases and incorporated this change in the project scope. The Company subsequently closed on the purchase of the master wind energy lease rights from CELA on August 8, 2019.

Q. What repowering costs is the Company seeking to recover in this filing?

A. Given the Company's previous filings related to repowering its wind fleet,[5] in this proceeding, the Company is seeking cost recovery of and a determination of prudence for acquiring the wind energy lease rights and repowering the Foote Creek I wind facility.

Q. What benefits will customers realize from repowering Foote Creek I?

A. Repowering Foote Creek I re-qualifies the facility for PTCs, which are benefits that are passed through to customers in the Company's annual Transition Adjustment Mechanism filing. Additionally, repowering increases the amount of emissions-free energy produced from the repowered facility, as shown in Confidential Exhibit PAC/903. Further, by replacing older WTG equipment, which is subject to

[5] *See* Docket Nos. UE 352 and UE 369.

more failure and maintenance issues than newer equipment, repowering will reduce PacifiCorp's ongoing operating costs. Finally, repowering the wind facility with new WTG equipment will extend the useful life by 21 years, creating substantial energy and capacity benefits for customers in the future when this wind facility would otherwise have been retired from service.

V. REQUALIFICATION FOR PTCS

Q. How do wind facilities qualify for the PTC extension enacted in 2015?

A. On December 18, 2015, Congress enacted changes to the federal Internal Revenue Code extending the full value of the PTC for wind facilities that began construction in 2015 and 2016. The legislation also provided for a phase-out of the PTC over three years, reducing the PTC value by 20 percent for wind facilities beginning construction in 2017, 40 percent for wind facilities beginning construction in 2018, and 60 percent for wind facilities beginning construction in 2019. The Internal Revenue Service (IRS) has issued guidance that establishes a "safe harbor" for taxpayers to demonstrate the year a facility will be deemed to "begin construction," thereby setting the value of the PTC. If at least five percent of the total project costs were incurred in 2016, then the facility qualifies under the IRS safe harbor for the full value of the PTC, provided the taxpayer can demonstrate "continuous efforts" to complete construction. The IRS has issued additional guidance that establishes a safe harbor for satisfying this continuous-efforts standard. Under the continuous-efforts safe harbor, the wind facilities must be in service by the end of the fourth calendar year following the calendar year in which construction began. Thus, wind facilities that began construction in 2016 must be in service no later than December 31, 2020, to satisfy the continuous-efforts safe-harbor provisions. If the facilities are not placed in service by December 31, 2020, the projects must satisfy IRS requirements that continuous-efforts were expended to repower the facilities, which may be a more challenging standard to meet.

Q. What is the full value of the PTC for wind facilities?

A. For 2019, wind facilities that are qualified for the PTC will receive 2.5 cents per kilowatt-hour, or $25 per megawatt-hour. This PTC value is adjusted annually based upon an inflation index, and the PTC is available for energy produced during the 10-year period after the wind facility begins commercial operation.

Q. Does the Foote Creek I repowering project qualify for the full value of the PTC under these rules?

A. Yes. Consistent with IRS guidance, a facility owner can demonstrate that construction of a facility has begun in the year in which at least five percent of the applicable project costs are incurred. If wind turbine equipment is purchased and delivered in 2016, and the equipment comprises at least five percent of the applicable project costs, a PTC "safe harbor" is created for the wind facilities subsequently constructed. To meet this requirement, PacifiCorp executed safe harbor equipment purchases with General Electric International, Inc. (GE) and Vestas in December 2016, and took delivery of equipment with a value sufficient to give the Company the ability to repower its entire wind fleet and qualify the repowered wind facilities for 100 percent of the PTC value. For the Foote Creek I facility, PacifiCorp will use safe harbor equipment obtained from Berkshire Hathaway Energy Renewables, a Berkshire Hathaway Energy affiliate, which similarly made safe harbor equipment purchases from Vestas in December 2016 that can be used to qualify the Foote Creek I project for 100 percent of the PTC value.

Q. What other requirements must repowered projects satisfy to qualify for the PTCs?

A. On May 5, 2016, the IRS issued Notice 2016-31 (Notice), which provides guidance on various aspects of qualifying for the PTCs and whether new tax credits can be claimed when wind turbines are repowered or retrofitted. The Notice generally provides that the repowering costs must equal at least four times the fair market value of the equipment that the owner retains from the original facility for the repowered turbines to qualify for new PTCs. Thus, 80 percent of the fair market value of the repowered WTG must result from repowering project costs while the value of the retained components cannot exceed 20 percent of the fair market value of the new facility. This “80/20” test is applied on a turbine-by-turbine basis. Each wind turbine—composed of a foundation, tower, and machine head (including nacelle, hub and rotor)—is considered a separate facility.

Q. Is the Foote Creek I facility subject to this 80/20 test?

A. No. Because the Foote Creek I facility will be repowered without using any retained components—meaning the tower and foundations of the existing turbines at the site will not be reused—the 80/20 test does not apply to this repowered facility. Thought of another way, the applicable repowering costs at Foote Creek I, on a per-turbine basis, will equal 100 percent of the repowering costs at this facility since there are no retained components, satisfying the 80/20 test.

Q. Have recent changes to federal tax laws impacted the ability to qualify the repowered Foote Creek I facility for PTCs?

A. No. Neither the Tax Cuts and Jobs Act enacted into law in December 2017 nor the Tax Extender and Disaster Relief Act of 2019 change the qualification requirements that allow Foote Creek I to receive the full value of PTCs.

VI. INCREASED ENERGY BENEFITS FOLLOWING REPOWERING

Q. Once repowered, how do the energy benefits of the Foote Creek I wind facility increase?

A. Repowering the Foote Creek I facility will employ entirely new wind turbines with new foundations and taller towers. The new nacelles have generators that have a much greater nameplate generating capacity than the equipment that is removed. The new turbines installed at the site will have generator nameplate ratings of 2.0 MW and 4.2 MW, replacing existing turbines with a 0.6 MW nameplate rating. Details regarding the proposed wind turbine upgrades, capital project costs, in-service date, and resulting energy benefits are shown in Confidential Exhibit PAC/903.

In addition to the larger generators in the repowered turbines, the new turbines also include larger blades, which will increase the rotor-swept area of the wind turbines. A larger rotor-swept area allows more of the wind energy flowing past the wind turbine to be captured and converted by the wind turbine into electricity. Because the size of the rotors will increase, the repowered turbines will also include more robust hubs, main shafts, bearings and couplings, and gearboxes suitable to handle the greater torque exerted by the larger rotors.

Finally, the Foote Creek I repowering project will result in all of the facility's output serving the Company's customers as compared to only approximately 47 percent under the earlier co-ownership and PPA structure. With the entire output of Foote Creek I directed to the Company's customers, and with the increased generation from the more efficient turbines, the amount of emissions-free energy provided to customers by the facility will increase by more than [redacted] percent.

Q. Will the larger blades installed with repowering increase the potential for avian impacts at the wind facilities?

A. Not necessarily. Although the larger blades will increase the overall risk zone (rotor-swept area) of the repowered wind turbines, this does not necessarily correlate with an increased risk of avian impacts at existing turbine sites. PacifiCorp performs monthly monitoring at all of its wind facilities and reports all findings to state wildlife agencies and the U.S. Fish and Wildlife Service. PacifiCorp will continue this monthly monitoring to determine if the new turbine blades cause additional impacts to avian species and will engage with the appropriate agency to discuss and, if prudent and practicable, implement additional avoidance, minimization, or mitigation measures.

Q. Are there other ways that the Company has worked to minimize avian impacts?

A. Yes. At the Foote Creek I facility, the significant reduction in the number of turbines required with site repowering means that less of the overall project site area will be covered by wind turbines. This has allowed the Company to adjust the layout of the wind turbines at the project site to avoid areas of higher avian use such as the edges of Foote Creek Rim.

Q. How did PacifiCorp determine the amount of additional generation that will be produced from the repowered Foote Creek I facility?

A. PacifiCorp's consultant, Black & Veatch (B&V) evaluated historical project generation and availability data from the existing Foote Creek I turbines, local and project-specific meteorological information, and the new proposed turbine layout to model the anticipated energy output of the repowered wind project, similar to the approach used by the Company to estimate the energy output from its new wind projects now under construction.

Q. Why was this approach most suitable for Foote Creek I?

A. This approach was most suitable because the turbine locations are changing at Foote Creek I, as discussed above, and also because the turbine hub heights are increasing from 40 meters to 80 meters. Thus, the wind conditions—wind speeds, turbulence intensity, and inflow angle to the wind turbines—experienced by the existing turbines may not be representative of what the new turbines will experience and therefore wind modeling was relied upon to develop the energy estimate for Foote Creek I.

Based on B&V's analysis, PacifiCorp estimates that energy production following repowering will increase at Foote Creek I as shown in Confidential Exhibit PAC/903.

Q. What are the major power production advantages of the new equipment?

A. The larger rotor size and improvements in blade design of the new equipment generate more power at all ranges of wind speeds. Additionally, the new turbines begin producing power at a lower wind speed than the existing equipment; thus, the turbines can produce energy during lower wind conditions in which the current equipment may sit idle. Additionally, the new 4.2 MW capacity wind turbines have a higher cut-out wind speed than the existing turbines, meaning they can continue producing power at higher wind speeds in which the existing equipment at the site would shut down. Because the new turbines will have an increased generator capacity, the turbines will also produce more energy when wind speeds are high and the turbines are at their maximum output, allowing the facility to produce equivalent capacity with far fewer turbines.

VII. REDUCED ONGOING OPERATIONAL COSTS FOLLOWING REPOWERING

Q. Aside from increased generation and the associated PTC benefits, what other benefits will be realized with the Foote Creek I repowering project?

A. The repowering project will lower the ongoing capital costs of operating the existing wind facility. PacifiCorp's turbine-supply contracts for repowering, consistent with wind industry standards for new equipment, will include a two-year warranty on the new equipment. This will reduce capital costs associated with replacing or refurbishing turbine components currently in service.

The repowering project will also result in more certainty related to ongoing operations and maintenance costs of the facility. PacifiCorp will operate the repowered facility under a full service agreement with the turbine equipment supplier who will be responsible for operating and maintaining the new turbines for a fixed cost while attaining a guaranteed availability of the turbines. Under this agreement, failure to meet the guaranteed availability, if not the result of an excusable event defined in the contract, will result in the payment of liquidated damages to the

Company. Customers will benefit by having operations and maintenance costs fixed for the term of the agreement. Thus, there is greater cost certainty related to the run-rate capital expenditures and operations and maintenance costs.

Q. Will the new equipment address any other operational issues?

A. Yes. Gearboxes at the Foote Creek I facility have experienced high failure rates relative to other gearboxes in the wind fleet. However, the impact to the Company of these failures has been mitigated by an agreement that was set to expire in 2024, at which point the cost of addressing failed gearboxes would be borne entirely by the Company and EWEB. Given the short remaining life of the project in 2024—with just five years of operational life remaining—turbines that experienced a failed gearbox after that time could not be economically returned to service given the limited remaining generation anticipated from the existing turbines and the estimated cost to replace a failed gearbox. Thus, repowering also addresses the likelihood of diminished generation from the Foote Creek I facility after 2024.

Q. What is the current asset life of the Foote Creek I wind facility?

A. All of the Company's existing wind facilities are currently being depreciated assuming a 30-year asset life. Given the 1999 commercial operation date of Foote Creek I, the depreciable life approved by the Commission for Foote Creek I extends to 2029. In anticipation of repowering the facility, the Company has proposed in the 2018 depreciation study in docket UM 1968 a new 30-year depreciable life following repowering that would extend the asset life of Foote Creek I by 21 years to 2050.

VIII. PROJECT PERMITTING, CONTRACTS, AND CONSTRUCTION STATUS

Q. What is the status of permitting related to the Foote Creek I repowering project?

A. PacifiCorp received approval from the Federal Aviation Administration for the new turbine locations in April 2018, indicating the new turbines location and heights would not pose a hazard to air navigation. Carbon County, Wyoming issued a new Conditional Use Permit for the repowered project in April 2019. The BLM, upon whose land approximately half of the turbines at the site are located, accepted the Company's revised plan of development for the project in June 2019, reflecting the repowered project.

Q. What is the status of contracting related to the Foote Creek I repowering project?

A. In July 2019, PacifiCorp executed contracts with Vestas for turbine supply and service and maintenance of the new turbines that will be installed at the site. Shortly thereafter, also in July 2019, PacifiCorp executed a construction contract with Thorstad Companies, Inc. for construction of the project.

Q. Has construction commenced on the Foote Creek I repowering project?

A. Yes. Initial site work began in the fall of 2019 with the installation of construction trailers, foundation excavation, and material deliveries. Site work has been halted for the winter and will resume when weather conditions allow. Turbine component manufacturing is currently underway, with turbine deliveries anticipated to begin in July 2020.

Q. When does the Company anticipate that Foote Creek I will enter commercial operation?

A. Commercial operation of the repowered Foote Creek I facility is anticipated to occur by December 1, 2020.

IX. DISPOSITION OF REPLACED EQUIPMENT

Q. What is PacifiCorp planning to do with the existing equipment that will be removed from Foote Creek I?

A. PacifiCorp issued a request for proposals related to the disposition of the existing equipment in which the Company sought proposals for the purchase or removal of the equipment that will be replaced as part of repowering. In general, proposals received from this solicitation were not favorable as compared to the equipment removal proposals offered by the construction contractor that will be installing the new equipment.

PacifiCorp understands that a significant number of turbines of all makes and models are currently being repowered, and will likely continue to be before the sunset of the PTCs available for wind energy projects in 2024. As a result, there is very little market for used turbines and the salvage value of the equipment is very low given the large number of repowered turbines and associated spare parts that have become available as a result of the significant repowering effort that the wind industry is now undertaking. While some individual turbine sales are likely to result from PacifiCorp's efforts to obtain the highest salvage value from the removed equipment at other repowered projects, the lowest cost alternative for the disposition of the old equipment is to allow the construction contractors to retain the equipment so the scrap value offsets their equipment removal, handling, and transportation costs. That is also the case at Foote Creek I. Given the relative inefficiency of the replaced equipment compared to new equipment, it does not make economic sense to redeploy the replaced equipment at other potential wind sites.

Q. Does the Company's inability to achieve a salvage value for the replaced equipment impact the Company's economic analysis of the Foote Creek I repowering project?

A. No. PacifiCorp did not assume any salvage value for the replaced equipment in its economic analysis. Thus, project economics are not impacted by the fact that none of the old equipment will ultimately be re-sold by the Company when it is removed.

Q. Does PacifiCorp have a proposal for the treatment of the remaining net book value of the replaced equipment at Foote Creek I?

A. Yes. Consistent with the stipulation filed in docket UE 369, PacifiCorp proposes to offset the remaining net book value of the replaced wind equipment with the deferred Open Access Transmission Tariff revenues. This treatment is described more fully in the direct testimony of Ms. Shelley E. McCoy.

X. OVERVIEW OF LEWIS RIVER HYDROELCTRIC PROJECTS MERWIN FISH COLLECTION AND SORTING FACILITY

Q. Please provide a brief description of the Company's Lewis River hydroelectric projects.

A. The Company owns and operates approximately 1,074 MW of hydroelectric power generation facilities in the Pacific Northwest and Rocky Mountains that provide carbon free electricity for the benefit of our customers. The Merwin, Yale, and Swift

No. 1 Hydroelectric Projects (collectively, the Lewis River Projects), are located in Southwest Washington and comprise the Company's largest hydroelectric project with a generating capacity of 510 MW. The Lewis River Projects are multi-value resources that provide low-cost, emissions-free energy for customers, allow for load following to meet dynamic customer and system balancing needs, assist in integrating variable, renewable generation resources, and provide recreation opportunities on project reservoirs and associated lands. These hydroelectric resources also provide spinning reserves and voltage support to the transmission system, and participate in the Energy Imbalance Market, which provides benefits to customers by reducing system balancing costs.

Q. What is the driver for the Merwin Fish Collection and Sorting Facility project at the Lewis River Projects that the Company has included in its filing?

A. On June 26, 2008, FERC issued new 50-year licenses for the Lewis River Projects, which include the Merwin (FERC Project No. 935), Yale (FERC Project No. 2071), and Swift No. 1 (FERC Project No. 2111) Hydroelectric Projects. The licenses incorporate the provisions of the comprehensive multi-party Lewis River Settlement Agreement (Settlement Agreement) entered into by the Company in 2004 with federal and state agencies, local governments, local Tribal governments, non-governmental entities, and conservation groups.

The overall objective of the Settlement Agreement was to outline agreed-upon measures to protect and enhance fish, wildlife, and other ecological resources affected by the Lewis River Projects while providing for the continued operation of the facilities for the benefit of customers and providing other public benefits, including flood control and recreation. To address the fish and wildlife impacts of the Lewis River Projects, key components of the Settlement Agreement include the construction of fish passage facilities and fish hatchery modifications. FERC incorporated these requirements into the licenses for the Lewis River Projects as license articles, or as mandatory conditions under Section 4(e) or Section 18 of the Federal Power Act, or these requirements were included as terms and conditions of the Biological Opinions issued by the National Marine Fisheries Service and the U.S. Fish and Wildlife Service for the relicensing of the Lewis River Projects.

Q. What is the status of the Company's implementation of these fish passage and hatchery requirements?

A. To date, the Company has constructed fish passage facilities that allow fish to access the upper Lewis River basin. This area contains the majority of historic habitat that was made inaccessible to anadromous fish as a result of construction of the Lewis River Projects between 1931 and 1958. The new fish passage facilities, along with completed fish hatchery modifications projects, support the first phase of fish mitigation and enhancement projects contemplated in the Settlement Agreement.

Q. Please describe how fish passage facilities have restored fish access to historic habitat areas on the Lewis River impacted by the hydroelectric projects.

A. The restored access has been achieved by means of a trap-and-haul fish passage program that collects adult salmon and steelhead from the most downstream development—Merwin Dam—and transports those fish upstream of Swift Dam. The collection of the upstream-migrating adults is accomplished at the Merwin Fish Collection and Sorting Facility. The juvenile progeny of adult fish transported upstream of Swift Dam are collected from Swift Reservoir at the Swift Floating Surface Collector, and then transported downstream of Merwin Dam. Before release into the lower Lewis River, fish are placed into the Woodland Release Ponds for a short period to observe the condition of the fish and enumerate any mortalities to track the effectiveness of the program. These facilities are the major components of the Lewis River Fish Passage Program.

Q. Please describe the Merwin Fish Collection and Sorting Facility.

A. The Merwin Fish Collection and Sorting Facility is the key component of the upstream fish passage system of the Lewis River Fish Passage Program and is designed to collect, trap, and transport adult anadromous fish around the three Lewis River dams so they can access and spawn in upstream habitat areas. The facility consists of four major components; a fish attraction water supply system, a fish ladder, a fish crowder and lift, and a fish sorting building with holding tanks. Fish are attracted to the ladder by water provided from the fish attraction water system, ascend the ladder, and are transported to the sorting area via the crowder and fish lift. Once inside the fish sorting building, biologists enumerate and sort the fish by species. Once sorted, fish are sent to holding tanks prior to transport in large capacity fish trucks to their final destination upstream of Swift dam. The facility operates 24 hours per day, 365 days per year. The facility cost approximately $49.6 million and was placed in service in December 2013.

Q. Was construction of the Merwin Fish Collection and Sorting Facility mandated by FERC?

A. Yes. Construction of the facility was mandated by the Settlement Agreement which was incorporated into the FERC licenses for the Lewis River Projects through license articles or mandatory conditioning authority under the Federal Power Act.[6]

Q. Was the project subject to review and approval by resource agencies?

A. Yes. Consistent with the requirements of the FERC licenses, the Company engaged in project siting and design reviews with affected agencies, Tribes, and other stakeholders, including the National Marine Fisheries Service, the U.S. Fish and Wildlife Service, the Washington Department of Fish and Wildlife, and the U.S. Forest Service. All required, federal, state, and local permits and approvals were acquired for physical construction of the project.

XI. CONCLUSION

Q. Please summarize your recommendations.

A. I recommend that the Commission determine that the Foote Creek I repowering project and the Merwin Fish Collection and Sorting Facility project provide benefits to Oregon customers and are therefore prudent and in the public interest.

Q. Does this conclude your direct testimony?

A. Yes.

TABLE OF CONTENTS

ATTACHED EXHIBITS

I. INTRODUCTION AND QUALIFICATIONS

Q. Please state your name, business address, and present position with PacifiCorp.

A. My name is Richard A. Vail. My business address is 825 NE Multnomah Street, Suite 1600, Portland, Oregon 97232. My present position is Vice President of Transmission. I am responsible for transmission system planning, customer generator interconnection requests and transmission service requests, regional transmission initiatives, capital budgeting for transmission, transmission and distribution project delivery, and administration of the Open Access Transmission Tariff (OATT). I am testifying for PacifiCorp d/b/a Pacific Power (PacifiCorp or the Company).

Q. Please describe your education and professional experience.

A. I have a Bachelor of Science degree with Honors in Electrical Engineering with a focus in electric power systems from Portland State University. I have been Vice President of Transmission for PacifiCorp since December 2012. I was Director of Asset Management from 2007 to 2012. Before that position, I had management responsibility for a number of organizations in PacifiCorp's asset management group including capital planning, maintenance policy, maintenance planning, and investment planning since joining PacifiCorp in 2001.

II. PURPOSE OF TESTIMONY

Q. What is the purpose of your testimony in this case?

A. The purpose of my testimony is to describe PacifiCorp's transmission system and the benefits it provides to Oregon customers. PacifiCorp's transmission system is designed to reliably transfer electric energy from a broad array of generation resources to load. PacifiCorp's interconnection to other balancing authority areas

(BAAs) and participation in the Energy Imbalance Market (EIM) provide access to markets and promote affordable and reliable service to PacifiCorp's customers. Further, all transmission system capacity increases provide benefits to customers by increasing reliability and allowing more generation to interconnect to serve customer load, as well as allowing PacifiCorp flexibility in designating generation resources for reserve capacity to comply with mandatory reliability standards.

I also specifically describe PacifiCorp's major capital investment projects for new distribution and transmission systems included in this rate case. These investments include the transmission projects associated with Energy Vision 2020 in addition to other transmission improvements. My testimony demonstrates that the Company has made prudent decisions related to these projects and that these investments result in an immediate benefit to PacifiCorp's customers in Oregon. I recommend that the Public Utility Commission of Oregon (Commission) find these investments prudent and in the public interest.

III. OVERVIEW OF PACIFICORP'S TRANSMISSION SYSTEM AND INVESTMENT DRIVERS

Q. Please briefly describe PacifiCorp's transmission system.

A. PacifiCorp owns and operates approximately 16,500 miles of transmission lines ranging from 46 kilovolts (kV) to 500 kV across multiple western states. PacifiCorp has nearly two million customers with approximately 615,000 customers located in Oregon.

For convenience in load and resource planning, PacifiCorp groups its local area transmission and distribution system into load areas. These load areas are regions in which the PacifiCorp system is generally contiguous within the load area, while a set of transmission constraints and boundaries separate the load area from other portions of the PacifiCorp system. In Oregon, PacifiCorp generally has three primary load areas: Southern Oregon, Central Oregon, and the Willamette Valley. These primary load areas are further divided into 23 sub-areas within Oregon for planning purposes when evaluating the capability of the PacifiCorp system to meet the load and resource requirements of its customers.

Q. Please describe PacifiCorp's responsibility for maintaining reliability on its transmission system.

A. In 1996, the Federal Energy Regulatory Commission (FERC) issued Order No. 888,[1] which required that transmission system owners provide non-discriminatory access to their transmission systems. PacifiCorp is obligated under its OATT to plan its transmission system for the open access of all transmission customers. Through the OATT Attachment K local planning process and the FERC Order 1000 regional and inter-regional planning processes, PacifiCorp participates in open stakeholder planning processes covering its entire transmission footprint. These planning processes result in system plans that incorporate economics, reliability, and public policy inputs and requirements. PacifiCorp must also coordinate with other entities in the region for transmission planning purposes as required under FERC Order No.

[1] *Promoting Wholesale Competition Through Open Access Non-discriminatory Transmission Services by Pub. Util.; Recovery of Stranded Costs by Pub. Util. and Transmitting Utilities*, Order No. 888, 61 FR 21540 (May 10, 1996), FERC Stats. & Regs. ¶ 31,036 (1996), order on reh'g, Order No. 888-A, 62 FR 12274 (Mar. 14, 1997), FERC Stats. & Regs. ¶ 31,048 (1997), order on reh'g, Order No. 888-B, 81 FERC ¶ 61,248 (1997), order on reh'g, Order No. 888-C, 82 FERC ¶ 61,046 (1998).

1000.[2] In addition to these more general requirements, PacifiCorp also must comply with the specific requirements of the mandatory reliability standards approved by FERC.

Q. Who establishes transmission reliability standards?

A. FERC directs the North American Electric Reliability Corporation (NERC) to develop Reliability Standards to ensure the safe and reliable operation of the Bulk Electric System (BES) in the United States in a variety of operating conditions. On April 1, 2005, NERC established a set of transmission operations reliability standards. A subset of the transmission reliability standards are the transmission planning standards (TPL Standards). The purpose of the TPL Standards is to "establish Transmission system planning performance requirements within the planning horizon to develop a BES that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies."[3] The TPL Standards, along with regional planning criteria (*i.e.*, regional planning criteria established by the Western Electricity Coordinating Council (WECC)) and utility-specific planning criteria, define the minimum transmission system requirements to safely and reliably serve customers.

Q. How does PacifiCorp ensure compliance with the TPL Standards?

A. The Company plans, designs, and operates its transmission system to meet or exceed NERC Standards for BES and WECC regional standards and criteria. To ensure compliance with applicable TPL Standards, PacifiCorp conducts an annual system

[2] *Transmission Planning and Cost Allocation by Transmission Owning and Operating Pub. Util.*, Order No. 1000, 76 FR 49842 (Aug. 11, 2011), FERC Stats. & Regs. ¶ 31,323 (2011), order on reh'g, Order No. 1000-A, 139 FERC ¶ 61,132 (2012), order on reh'g, Order No. 1000-B 141 FERC ¶ 61,044 (2012).
[3] *See* http://www.nerc.com/files/tpl-001-4.pdf.

assessment to evaluate the performance of the Company's transmission system and to identify system deficiencies. The annual system assessment is comprised of steady-state, stability, and short circuit analyses[4] to evaluate peak and off-peak load seasons in the near-term (one-, two-, and five-year) and long-term (10-year) planning horizons. The assessment is performed using power flow base cases maintained by WECC and developed in coordination among all transmission planning entities in the Western Interconnection. These base cases include load and resource forecasts along with planned transmission system changes for each of the future year cases and are intended to identify future system deficiencies to be mitigated.

As part of the annual system assessment, corrective action plans are developed to mitigate identified deficiencies, and may prescribe construction of transmission system reinforcement projects or, as applicable, adoption of new operating procedures. In certain instances, operating procedures prescribing action to change the configuration of the transmission system can prevent deficiencies from occurring when there are two back-to-back (N-1-1) (or concurrent) transmission system events. However, the use of operating procedure actions have limitations. In particular, actions taken in connection with operating procedures that are designed to protect the integrity of the larger integrated transmission system in the Western Interconnection of the United States can lead to large numbers of customers being at risk of an outage upon the occurrence of the second of two back-to-back (N-1-1) events. An effective

[4] Analyses consist of taking a normal system (N-0) and applying events (N-1, N-1-1, N-2, etc.) within each category (P0, P1, P2, P3, etc.) listed within the TPL Standards in order to identify system deficiencies. Example: An N-1-1 event describes two transmission system elements being out of service at the same time, but due to independent causes. An example of an N-1-1 event would be a planned outage of one 230 kV transmission line followed by an unplanned outage of any element in the system being used to continue service with the initial element out.

corrective action plan is critical to ensuring system reliability so that large numbers of customers are not subjected to avoidable outage risk.

Q. Is compliance with the reliability standards optional?

A. No. The reliability standards are a federal requirement, subject to oversight and enforcement by WECC, NERC, and FERC. PacifiCorp is subject to compliance audits every three years, and may be required to prove compliance during other NERC or WECC reliability initiatives or investigations. Failure to comply with the reliability standards could expose the Company to penalties of up to $1 million per day, per violation. Accordingly, and as described more fully later in my testimony, compliance with reliability standards is a major driver for the new capital investments in PacifiCorp's system transmission assets identified in and supported by my testimony.

Q. Please identify other drivers that are relevant to the capital investments in PacifiCorp's distribution and transmission systems described in your testimony.

A. There are several other drivers that inform whether PacifiCorp will build new distribution and transmission facilities, including increased demand for transmission capacity, requests for transmission service, increased demand for distribution capacity, and the age and condition of existing distribution and transmission facilities. The specific drivers for the projects addressed in my testimony are described in more detail later in my testimony.

IV. OVERVIEW OF INVESTMENTS DESCRIBED IN TESTIMONY

Q. What specific distribution and transmission system investments are you addressing in your testimony?

A. My testimony addresses PacifiCorp's major new distribution and transmission system projects included in this general rate case filing. Specifically, my testimony addresses the following projects:

1. Aeolus to Bridger/Anticline 500 kV Transmission Project

The Aeolus to Bridger/Anticline 500 kV Transmission Project includes the construction of facilities to integrate approximately 1,150 megawatts (MW) of new wind generation resources located in southeast Wyoming (*i.e.*, TB Flats I and II, Cedar Springs, and Ekola Flats, collectively referred to as the Energy Vision 2020 Wind Projects or individually referred to as an Energy Vision 2020 Wind Project)[5] and deliver energy from those resources across PacifiCorp's system. Those facilities include:

- A 140-mile, 500 kV transmission line (Aeolus to Anticline line), which includes construction of the new Aeolus (500/230 kV) and Anticline (500/345 kV) substations; a map of the proposed line can be found attached in Exhibit PAC/1001;
- A five-mile, 345 kV transmission line that will extend from the proposed Anticline substation to the Jim Bridger substation, along with associated interconnection facilities at the Jim Bridger substation to accommodate the interconnection of the 345 kV line from the proposed Anticline substation; and
- A voltage control device at the existing Latham substation.

Additional network upgrades are also required to accommodate the Aeolus to Bridger/Anticline 500 kV Line Project and the interconnection of the Energy Vision 2020 Wind Projects (230 kV Network Upgrades). These network upgrades include:

[5] The Energy Vision 2020 Wind Projects are more thoroughly discussed in the testimony of Mr. Chad A. Teply.

- A new 16-mile 230 kV transmission line parallel to an existing 230 kV line from the Shirley Basin substation to the proposed Aeolus substation, including modifications to the Shirley Basin substation to accommodate the new line;
- The reconstruction of four miles of an existing 230 kV transmission line between the proposed Aeolus substation and the Freezeout substation, including modifications of the Freezeout substation to accommodate the new line; and
- The reconstruction of 14 miles of an existing 230 kV transmission line between the Freezeout substation and the Standpipe substation, including modifications to the Freezeout and Standpipe substations to accommodate the transmission lines.

The reconstructed sections are proposed to be in a parallel alignment to the existing 230 kV transmission lines. The Aeolus to Bridger/Anticline 500 kV Transmission Project and 230 kV Network Upgrades are needed to support interconnection of the new Energy Vision 2020 Wind Projects, which are described in the testimony of Mr. Chad A. Teply.

2. Wallula to McNary 230 kV New Transmission Line Project

The Wallula to McNary 230 kV new transmission line extending from Wallula substation located in Wallula, Washington, to McNary substation located near Umatilla, Oregon, as shown in the map attached in Exhibit PAC/1002.

3. Snow Goose 500/230 kV New Substation Project

The Snow Goose 500/230 kV substation which is located near Klamath Falls, Oregon, as shown in the map attached in Exhibit PAC/1003.

4. Vantage to Pomona Heights 230 kV Transmission Line Project

The Vantage to Pomona Heights 230 kV new transmission line extending from Vantage substation located northeast of Yakima, Washington, to Pomona Heights substation located in Selah, Washington, as shown in the map attached in Exhibit PAC/1004.

5. Goshen to Sugarmill to Rigby 161 kV Transmission Line Project

The Goshen to Sugarmill to Rigby 161 kV transmission line rebuild of an existing 69 kV line from Goshen substation to Sugarmill substation and then construction of a new 161 kV line from Sugarmill substation to Rigby substation located in the southeast Idaho area, as shown in the map attached in Exhibit PAC/1005.

6. Sigurd to Red Butte 345kV Transmission Line Project

The Sigurd to Red Butte 345 kV transmission line project constructed a new single circuit 345 kV transmission line between Sigurd substation in Sevier County, Utah and Red Butte substation in Washington County, Utah, as shown in the map attached in Exhibit PAC/1006. The project also included substation and control system upgrades and modifications at both Sigurd and Red Butte substations.

7. Northeast (NE) Portland Transmission Upgrade Project

The NE Portland Transmission Upgrade project consisted of five major construction components, which included: converting Parkrose substation from 57 kV to 115 kV; re-insulating sections of transmission lines to 115 kV; converting Columbia substation 57 kV to 69 kV; converting Vernon substation from 69 kV to 115 kV; and installing two substation transformers and voltage regulators at Albina substation. The project is located in Portland, Oregon, and shown in Exhibit PAC/1007.

8. Southwest Wyoming Silver Creek 138kV Transmission Line Project

This project sited, permitted, and rebuilt approximately 70 miles of 46 kV transmission line at 138 kV, built a new 138/46/12.5 kV substation (near Henefer, Utah), removed the Henefer substation, and converted Coalville substation to 138 kV. A project map and subsequent scope change diagram are included in Exhibit PAC/1008.

9. Threemile Canyon Farm Project

This project added a fourth 230-34.5 kV, 25 megavolt-ampere (MVA) transformer and a third 34.5 kV feeder position at the existing Dalreed substation and upgrades to the local 34.5 kV and 4.16 kV distribution system located near Boardman, Oregon, as shown on the map attached in Exhibit PAC/1009.

Q. What are the projected costs associated with these distribution and transmission investments and their associated in-service dates?

A. Table 1 identifies the specific projects and associated costs and in-service dates.

TABLE 1

Project	Total Company Cost ($m)	In-Service Date
Aeolus to Bridger/Anticline 500 kV line[6]		
Sequence Two (In-Service)	$4.1	July 2018
Sequence Three	$11.1	December 2019
Sequence Four	$663.9	December 2020
Q707 TB Flats 1	$30.6	December 2020
Q712 Cedar Springs Wind 1	$61.7	December 2020
Wallula to McNary 230 kV New Transmission Line		
Sequence One (In-Service)	$6.4	December 2017
Sequence Two (In-Service)	$36.2	January 2019
Snow Goose 500-230 kV New Substation Project		
Sequence One (In-Service)	$10.3	May 2017
Sequence Two (In-Service)	$32.5	November 2017
Vantage to Pomona Heights 230 kV New Transmission Line Project	$57.3	May 2020
Goshen-Sugarmill-Rigby 161kV Transmission Line Project		
Sequence One	$21.5	November 2020
Sequence Two (not included in this case)	N/A	November 2022
Sigurd-Red Butte 345kV Line		
Sequence One (In-Service)	$2.2m	May 2013
Sequence Two (In-Service	$349.0m	May 2015
Sequence Four (In-Service)	$3.4m	June 2017
NE Portland Transmission Upgrade	$20.6	December 2018
Sequence One- (In-Service)	$8.4m	December 2016
Sequence Two- (In-Service)	$.8m	December 2016
Sequence Three- (In-Service)	$3.9	December 2018
Sequence Four- (In-Service)	$1.0m	December 2018
Sequence Five- (In-Service)	$4.9m	December 2018
Sequence Six- (In-Service)	$1.6m	May 2019
Southwest WY Silver Creek 138kV Ln- (In-Service)	$41.9m	August 2017
Threemile Canyon Farm 2,500 HP Increase- (In-Service)	$6.2m	April 2015

These amounts include costs associated with engineering, project management, materials and equipment, construction, right-of-way (including rights

[6] As discussed later in my testimony, Sequence One was placed into service in 2011.

acquired by condemnation), and an allowance for funds used during construction. These costs are also shown in the testimony and exhibits of Ms. Shelley E. McCoy. The in-service dates are based on the best available information at the time of preparing this case.

Q. Please briefly describe the benefits associated with these investments.

A. The benefits associated with these investments include increased load serving capability, enhanced reliability, conformance with NERC Reliability Standards, improved transfer capability within the existing system, relief of existing congestion, and interconnection and integration of new wind resources into PacifiCorp's transmission system. These benefits will be described more fully below.

Q. Will PacifiCorp's OATT transmission customers pay for some of these assets?

A. Yes, through OATT transmission charges. The Company's current transmission formula rate (included in PacifiCorp's OATT) was approved by FERC in Docket No. ER11-3643.[7] The Company's transmission formula rate is updated annually with the annual transmission revenue requirement (ATRR) that represents the annual total cost of providing firm transmission service over the test year. The ATRR calculation incorporates all transmission system investments by the Company, a return on rate base, income taxes, expenses, and certain revenue credits, among other specific elements and adjustments. Transmission assets, including new transmission capital, are included in the ATRR, weighted by months in service. The ATRR is converted into a rate by dividing the ATRR by firm transmission demand. All third-party revenues for transmission service (along with third-party revenues for ancillary

[7] *In re PacifiCorp*, 143 FERC ¶ 61,162 (May 23, 2013) (letter order approving settlement agreement establishing formula rate).

services) are included as revenue credits in the calculation of rates in each of the Company's state retail jurisdictions.

Q. Please explain how network upgrade cost allocation works under the OATT.

A. In accordance with its OATT, when PacifiCorp receives a request for generation interconnection or transmission service, the Company completes studies to determine what new facilities or upgrades to existing facilities are required to accommodate the request. The studies identify the facilities and upgrades required and classify the asset additions required to support the service into two categories: direct assigned or network upgrade. Direct assigned assets are those assets that only benefit or are used solely by the customer requesting generator interconnection or transmission service. Those costs are directly assigned and paid for by that customer and will not be included in either the Company's ATRR or retail rate base. Network upgrades, on the other hand, are those assets that benefit all customers using the transmission system. Costs associated with network upgrades are investments by the transmission provider and are included in PacifiCorp's ATRR[8] and retail rate base.

V. AEOLUS TO BRIDGER/ANTICLINE 500 KV TRANSMISSION PROJECT

Q. Please describe the investment for the Aeolus to Bridger/Anticline 500 kV Transmission Project.

A. The Aeolus to Bridger/Anticline 500 kV Transmission Project is planned to be placed in-service in four sequences. The first sequence was the purchase of property used

[8] For generation interconnection customers, those customers may be required to pay the initial cost of network upgrades, subject to refund through credits to invoiced charges for transmission service and full refund of any remaining amounts after 20 years. *See* Section 11.4 of PacifiCorp's Standard Large Generator Interconnection Agreement (OATT Attachment N, Appendix 6 and available at http://www.oasis.oati.com/woa/docs/PPW/PPWdocs/20190601_OATTMASTER.pdf); *see also* Standardization of Generator Interconnection Agreements and Procedures, Order No. 2003-B, 109 FERC ¶ 61,287 (Dec. 20, 2004).

for the new Aeolus and Anticline substations, which were placed in-service in March 2011. The second sequence was to construct a replacement access bridge over the Medicine Bow River and complete associated upgrades to an existing unpaved county road for $4.1 million in July 2018. The third sequence of work started in December 2019, for an estimated $11.1 million, is the installation of a Static Synchronous Compensator (STATCOM) voltage control device. To accommodate this equipment, the Latham Substation will be expanded with a new line termination bay. Finally, the last sequence of plant in-service is the two 500 kV substations and the transmission line for $663.9 million in December 2020.

Q. Please describe the 230 kV Network Upgrades.

A. There are four generation interconnection projects selected as part of a request for proposal to interconnect 1,150 MW of new wind generation to the 230 kV transmission system in eastern Wyoming. The request for proposal process and the resulting resources selected are described in the testimony of Mr. Rick T. Link. A separate generation interconnection agreement was negotiated and signed for each of the four projects.

Q707 TB Flats 1 is planned to be placed in-service in December 2020 and requires $30.6 million of network upgrades. This project includes a new 16-mile 230 kV transmission line parallel to an existing 230 kV line from Shirley Basin substation to the proposed Aeolus substation, including modifications to the existing Shirley Basin substation.

Q712 Cedar Springs Wind 1 is planned to go into service in December 2020 and requires $61.7 million of network upgrades. This project includes the reconstruction of four miles of an existing 230 kV transmission line between the proposed Aeolus substation and the Freezeout substation, including modifications as required at the Freezeout substation; the reconstruction of 14 miles of an existing 230 kV transmission line between the Freezeout substation and the Standpipe substation, including modifications as required at the Freezeout and Standpipe substations; and the reconstruction of 16 miles of an existing 230 kV transmission line from the proposed Aeolus substation to the existing Shirley Basin substation.

Q. Please explain why this investment in the Aeolus to Bridger/Anticline 500kV Transmission Project was needed.

A. As described in more detail in the testimony of Mr. Link, the Aeolus to Bridger/Anticline 500 kV Transmission Project supports the Company's short- and long-term energy demands for serving customers across the entire PacifiCorp system, and will strengthen the overall reliability of the existing Wyoming transmission system and therefore PacifiCorp's entire transmission system.

The Aeolus to Bridger/Anticline 500 kV Transmission Project has long been recognized as an integral component of PacifiCorp's long-term transmission planning, but the construction of the project has not been economic until now. The renewal of the federal wind production tax credits (PTCs) created a unique opportunity for the Company to acquire significant cost-effective, zero emission wind resources, generating PTCs that provide cost savings necessary to economically construct the project. To achieve the full customer benefits of the PTCs, however, the Company must develop the Energy Vision 2020 Wind Projects and the Aeolus to

Bridger/Anticline 500 kV Transmission Project together and bring them into service by December 31, 2020.

Q. Can PacifiCorp develop the Energy Vision 2020 Wind Projects without the Aeolus to Bridger/Anticline 500 kV Transmission Project?

A. No. The Energy Vision 2020 Wind Projects are not economic without the completion of the Aeolus to Bridger/Anticline 500 kV Transmission Project, which is needed to relieve existing congestion and to interconnect and integrate new PTC-eligible wind resources in high-wind areas of Wyoming. Similarly, the Aeolus to Bridger/Anticline 500 kV Transmission Project is not economic to PacifiCorp customers if there are no incremental cost-effective wind resources producing PTCs.

Q. How will the Aeolus to Bridger/Anticline 500 kV Transmission Project benefit customers and improve system performance?

A. The Aeolus to Bridger/Anticline 500 kV Transmission Project will: (1) relieve congestion and increase transmission capacity across Wyoming, allowing interconnection and integration of new generation resources and more efficient dispatch of and greater flexibility managing existing resources; (2) provide critical voltage support to the transmission system; (3) improve system reliability; and (4) reduce energy and capacity losses. Remarkably, customers will be able to receive all of these benefits, while taking advantage of the PTCs from the Energy Vision 2020 Wind Projects to offset the costs of the project.

Q. How will the Aeolus to Bridger/Anticline 500 kV Transmission Project increase transmission capacity in southeastern Wyoming?

A. Currently, the Company's transmission system in southeastern Wyoming is operating at capacity, which limits transfer of existing resources from eastern Wyoming and precludes the ability to interconnect and integrate additional resources east of Bridger/Anticline. This investment will increase the transfer capability from east to west across Wyoming by 951 MW. When the Aeolus to Bridger/Anticline 500 kV Transmission Project is complete, the Company estimates that it will be able to accommodate up to approximately 1,510 MW of additional new wind resources east of the Bridger/Anticline substation.

The increased transmission capacity also provides improved access to existing generation resources, and will provide options to access other resources, including renewable resources. The resulting increase in capacity allows flexibility to use future generation and interconnected transmission facilities.

Q. How will the Aeolus to Bridger/Anticline 500 kV Transmission Project impact the dispatch of the Company's existing generation resources?

A. The Aeolus to Bridger/Anticline 500 kV Transmission Project will increase the ability to dispatch the Company's existing resources. With the project being constructed between eastern Wyoming and Jim Bridger/Anticline, eastern Wyoming transmission congestion will be mitigated and wind resources entering the Jim Bridger energy hub can flow onto the Bridger West transmission path to PacifiCorp load centers. With increased wind generation entering the Jim Bridger energy hub, the Jim Bridger generating plant can be dispatched to maximize wind transfers out of the energy hub.

Q. Will the increased capacity benefit customers in any other ways?

A Yes. To provide low-cost energy, the Company must have the ability to acquire power from numerous generation sources and negotiate the most competitive pricing. By adding transmission capacity, the Company has increased its ability and options to obtain additional generation sources at competitive pricing. The Aeolus to Bridger/Anticline 500 kV Transmission Project will result in a stronger transmission system in southern Wyoming and therefore throughout PacifiCorp's entire service territory.

Q. Is the increased capacity provided by the Aeolus to Bridger/Anticline 500 kV Transmission Project consistent with the Company's obligation to provide transmission service under its OATT?

A. Yes. The Company's OATT, approved by FERC, details the Company's requirements and obligations to provide transmission service. Section 28.2 of the OATT defines the Company's responsibilities, which include the requirement to "plan, construct, operate, and maintain the system in accordance with good utility practice." Section 28.3 states the requirement for the Company to provide "firm service over the system so that designated resources can be delivered to designated loads." The Company is required to provide adequate and non-discriminatory service to all network customers. Although the Aeolus to Bridger/Anticline 500 kV Transmission Project is not specifically mandated by the Company's obligations under its OATT, the project will allow the Company to more efficiently meet current and forecasted customer energy demand by relieving the existing transmission congestion in southeastern Wyoming.

Q. What are the benefits resulting from the critical voltage support that will be provided by the Aeolus to Bridger/Anticline 500 kV Transmission Project?

A. Under certain operating conditions, voltage control issues have limited the ability to add additional resources, particularly wind resources, in southeastern Wyoming. The Aeolus to Bridger/Anticline 500 kV Transmission Project will greatly enhance the ability to control voltage issues and allow additional wind generation to be integrated into the Company's system.

Q. How will the Aeolus to Bridger/Anticline 500 kV Transmission Project improve system reliability?

A. The transmission grid can be affected in its entirety by what happens on an individual transmission line or path. For example, the transmission system between eastern and central Wyoming is comprised of several individual transmission lines or line segments. A single outage on any of the individual lines or line segments due to storm, fire, or other external human interference can and does cause significant reductions in transfer capability, which can negatively impact the Company's ability to serve customers. Line outages require the Company to curtail generation resources to stabilize system voltages and require less efficient re-dispatch of system resources to meet network load requirements. This in turn places a burden across the entire interconnected system as generation resources across PacifiCorp's service territory, using PacifiCorp's transmission system, are used to ensure the continued reliability of energy supply to all PacifiCorp customers.

In the event of a line outage, the redundancy provided by the Aeolus to Bridger/Anticline 500 kV Transmission Project will allow the Company to continue to meet native load obligations and other contractual obligations to third parties. Strengthening this path and increasing system redundancy will benefit all customers by reducing the risk of outages and inefficient dispatch resulting from those outages.

In addition, the Aeolus to Bridger/Anticline 500 kV Transmission Project will improve the Company's ability to perform required maintenance without significant operational impacts to the system, and will reduce impacts to customers during planned and forced system outages. Transmission line and substation maintenance windows are currently limited because the system is highly utilized. By relieving congestion and providing additional transmission paths, this investment will allow greater flexibility to the Company in the operation of its transmission system.

Q. Can you provide an example where the Aeolus to Bridger/Anticline 500 kV Transmission Project would mitigate the impact of an outage on the 230 kV transmission system?

A. Yes. For an outage of the Latham – Point of Rocks 230 kV line, the Aeolus to Bridger/Anticline 500 kV Transmission Project eliminates the overload on the Dave Johnston to Amasa 230 kV line. For an outage of the Mustang to Spence 230 kV line, the Aeolus to Bridger/Anticline 500 kV Transmission Project eliminates the overload on 230 kV lines west of Platte. For an outage of the Riverton to Wyopo 230 kV line, the Aeolus to Bridger/Anticline 500 kV Transmission Project eliminates overloads on 230 kV lines west of Platte. For an outage of the Dave Johnston to Amasa 230 kV line, the Aeolus to Bridger/Anticline 500 kV Transmission Project eliminates the overload on the 230 kV lines west of Platte. For an outage of the Platte to Standpipe

230 kV line, the Aeolus to Bridger/Anticline 500 kV Transmission Project will eliminate the need to trip approximately 130 MW of wind generation at Foote Creek.

Q. Will the Aeolus to Bridger/Anticline 500 kV Transmission Project also enhance the Company's ability to meet the reliability standards applicable to its transmission system?

A. Yes. Although the Company currently meets or exceeds the applicable reliability standards and criteria for its transmission system, the addition of the Aeolus to Bridger/Anticline 500 kV Transmission Project will allow the Company to do this more efficiently.

Q. How do NERC and WECC standards and criteria influence the need for the Aeolus to Bridger/Anticline 500 kV Transmission Project?

A. The mandatory standards, particularly NERC's TPL-001-4 standard, require the Company to have a forward-looking transmission plan of action to reliably serve current and anticipated customer demands under certain planning horizon conditions, including normal system operations (all system elements in service) and during system contingencies (where elements of the transmission system are out of service), both planned or otherwise.

As described earlier in my testimony, the Company performs annual reliability assessments to determine that its transmission system complies with minimum mandatory system performance standards, which require that during loss of any single transmission system element (N-1 single contingencies) that firm service is maintained, no system overloads exist, and there is no loss of customer demand.

The Aeolus to Bridger/Anticline 500 kV Transmission Project is sub-segment D.2 of Gateway West, which, as part of Energy Gateway, has been included in the Company's annual TPL-001-4 assessment as part of its short- and long-term plans to dependably meet NERC and WECC reliability requirements. The Aeolus to Bridger/Anticline 500 kV Transmission Project's new transmission segments are particularly effective in increasing system reliability under the various multiple contingency categories of the TPL-001-4 standard.

The NERC Standard TPL-001-4 has category P6 (N-1-1) that results in outage of multiple transmission elements. This category outage allows adjustment of the transmission system after the first outage following which the second outage is conducted. The Aeolus to Anticline 500 kV line will significantly help under these N-1-1 conditions. For example, the N-1-1 outage of Riverton to Wyopo 230 kV line followed with an outage of Spence to Mustang 230 kV line without the 500 kV line would require curtailment of the TOT 4A path by approximately 500 MW. But with the addition of the 500 kV line this curtailment would not be required. The study was performed with TOT 4A flows at 1,030 MW in the original case. The addition of the 500 kV line prevents thermal overload on the 230 kV transmission system west of Platte.

Q. Has the Aeolus to Bridger/Anticline 500 kV Transmission Project been included in WECC path rating studies?

A. Yes. The Aeolus to Bridger/Anticline 500 kV Transmission Project has undergone WECC's Three Phase Ratings Process, and has been approved by WECC for Phase 3-"Construction Phase" status as part of the overall Energy Gateway project. The

Aeolus West transmission path and three other Gateway West transmission paths (TOT 4A, Bridger/Anticline West and Path C) have completed the Three Phase Rating Process and were granted Phase 3 status on January 5, 2011.

Q. What is WECC's Three Phase Ratings Process?

A. The purpose of the Three Phase Rating Process is to provide a formal process for project sponsors to attain an accepted rating and demonstrate how their project will meet NERC Reliability Standards. The Three Phase Rating Process addresses planned new facility additions and upgrades, or the re-rating of existing transmission facilities. It requires coordination through a review group comprised of the project sponsors and representatives of other systems that may be affected by the project. An accepted rating affords the project sponsor some protection against erosion of established capacity of the rated transmission facility when further expansion of the western interconnected transmission system is proposed or new limitations are discovered.

Q. Why is WECC's Three Phase Ratings Process important to the Aeolus to Bridger/Anticline 500 kV Transmission Project?

A. This WECC approval is necessary because it allows the Company to interconnect the Aeolus to Bridger/Anticline 500 kV Transmission Project to the wider transmission system in the area and to reliably operate the new line at its approved ratings. The Aeolus to Bridger/Anticline 500 kV Transmission Project, especially when complemented with other Energy Gateway projects (specifically Aeolus to Clover, included in the 2019 Integrated Resource Plan (IRP) preferred portfolio, and Anticline to Populus and Oquirrh to Terminal, included in PacifiCorp's IRPs over the last several cycles), will greatly strengthen the Company's transmission capacity and flexibility. The Aeolus to Bridger/Anticline 500 kV Transmission Project is regarded as a necessary interconnection point to support the long-term transmission expansion planning established in the WECC Region plans and in the most recent Northern Tier Transmission Group (NTTG) sub-regional plan.[9]

While the Aeolus to Bridger/Anticline 500 kV Transmission Project provides the next necessary increment of transmission capacity in the area, it also supports and complements other future transmission investments that are currently proposed by the Company as included in the 2019 IRP preferred portfolio, provides recognition for continued permitting and supports the reliability of other utilities in the region as shown in the NTTG regional plans. The construction of this line, as an integral component of the larger Energy Gateway project, positions the Company to be strongly interconnected to other regional projects currently being planned and provides options for access to additional resources.

Q. What are the impacts to the system and the Company if the Aeolus to Bridger/Anticline 500 kV Transmission Project is not completed or delayed?

A. If the Aeolus to Bridger/Anticline 500 kV Transmission Project is not completed, the existing congestion will remain and the Company's ability to deliver resources to load will also remain constrained. As discussed above, the Company currently meets all

[9] PacifiCorp participates in FERC Order 1000 regional planning through membership in the NTTG. Under FERC Order 1000, regional planning groups were established to facilitate coordinated and transparent transmission system planning among the participating member entities to ensure regional transmission stability and efficiency. Currently, there are four sub-regions in the Western Interconnection of the United States, including NTTG, Columbia Grid, West Connect, and California ISO. These four sub-regions each develop independent regional plans and then coordinate on interregional planning across the Western Interconnection. Effective January 2020, NTTG and Columbia Grid will merge into the new Northern Grid regional planning group, of which PacifiCorp will be a participating member. Further information on NTTG is available at: http://nttg.biz/site/index.php?option=com_docman&task=cat_view&gid=308&Itemid=31.

applicable system reliability and performance criteria and therefore the Aeolus to Bridger/Anticline 500 kV Transmission Project is not strictly required to satisfy those standards. Rather, this project has long been identified as an important addition to the Company's transmission system, and the PTCs generated by the incremental wind resources provide a time-limited opportunity to build the Aeolus to Bridger/Anticline 500 kV Transmission Project now with only a moderate rate impact.

Q. How will the Aeolus to Bridger/Anticline 500 kV Transmission Project reduce energy and capacity losses?

A. Reduced energy and capacity losses on the transmission system have the potential to provide monetary savings over time. The addition of a new transmission line operated in parallel with existing lines reduces the electrical impedance of the transmission system, resulting in lower energy line losses (megawatt-hours) over the life of the project. Depending on the amount of power flow, line loss savings can be substantial.

Q. Did the Company consider alternatives to the Aeolus to Bridger/Anticline 500 kV Transmission Project?

A. Yes. While long-term alternatives to constructing a new transmission line are limited, the Company did consider other approaches, but none were cost-effective. As described more fully in the testimony of Mr. Link, the Aeolus to Bridger/Anticline 500 kV Transmission Project and Energy Vision 2020 Wind Projects were included in the Company's 2017 IRP, where they were analyzed in comparison to alternatives. The resource portfolio that included the Aeolus to Bridger/Anticline 500 kV

Transmission Project and Energy Vision 2020 Wind Projects was consistently the risk-adjusted, least-cost option.

The Company also considered the ability to obtain additional transmission capacity by upgrading the existing transmission system or implementing alternative transmission technologies. Indeed, since 2013 the Company has completed several important projects to enhance the transmission system in southeast Wyoming, including the dynamic line rating of the Miners (Standpipe) to Platte 230 kV line in 2013, Southern Wyoming Voltage Control Scheme, which coordinated wind generation reactive output to stabilize local area voltages, in 2015, and construction of the Standpipe substation and 60 megavolt-ampere-reactive (MVAr) synchronous condenser for voltage control in 2016. These projects allowed the Company to delay the Aeolus to Bridger/Anticline 500 kV Transmission Project until 2020, but were not a long-term substitute for the project.

Q. Is the Company confident that it can manage the construction schedule risk and deliver the Aeolus to Bridger/Anticline 500 kV Transmission Project by 2020?

A. Yes. To manage construction schedule risk, the Company is structuring and managing the project on a firm, date-certain, fixed-price, turnkey contract basis. Construction contractors and equipment suppliers will be held to key construction and delivery milestones and development of compressed schedule mitigation plans, if required. The Company also established construction contract completion dates and backstopped them with guarantees.

Q. Has the Company obtained all of the necessary permits and rights of way for the Aeolus to Bridger/Anticline 500 kV Transmission Project?

A. Yes.

Q. Has the Company made substantial progress on construction of the Aeolus to Bridger/Anticline 500 kV Transmission Project?

A. Yes. The Company has in place all contracts for construction of the Aeolus to Bridger/Anticline 500 kV Transmission Project, including contracts for construction of supporting 230 kV network upgrades. Construction work commenced in April 2019. As of early December 2019, the 500 kV transmission line had 98 percent of all foundations installed, 86 percent of structures erected and 41 percent of wire stringing completed. The Aeolus, Anticline, and Jim Bridger substations are under construction with grading complete and foundations, as well as underground construction, is ongoing. Steel erection and bus installation has commenced at Aelous, Anticline, and Jim Bridger substations. Major substation equipment is being manufactured and tested; first deliveries of circuit breakers have been received at all three substations, capacitor banks and reactive devices were delivered in December 2019, and the transformers will begin arriving in spring 2020. The Latham substation expansion is now complete and was placed in-service in December 2019. The voltage control device foundations and building enclosure are under construction with major equipment being manufactured and tested. Work at the Freezeout substation is complete, and the majority of the construction of the Shirley Basin substation to support the future 230 kV transmission has been completed with the remaining work scheduled to be completed in spring of 2020.

Q. What are the major milestones remaining before the December 2020 in-service date for the Aeolus to Bridger/Anticline 500 kV Transmission Project?

A. Major Milestones are identified below:

500 kV Transmission

- Mechanical Completion August 31, 2020
- Substantial Completion October 31, 2020

500 kV Substations

- Mechanical Completion Aeolus 230 kV yard; May 15, 2020
- Substantial Completion Aeolus 230 kV yard; June 15, 2020
- Mechanical Completion (all remaining work); August 31, 2020
- Substantial Completion (all remaining work); October 31, 2020

230 kV Network Upgrades

- Aeolus to Shirley Basin; Substantial Completion May 15, 2020
- Aeolus to Freezeout; Substantial Completion May 30, 2020
- Freezeout to Standpipe; Substantial Completion September 15, 2020
- Aeolus to Shirley Basin (rebuild); Substantial Completion September 30, 2020

Q. Are the transmission projects currently on budget and are they forecasted to be delivered on budget?

A. Yes.

Q. Please describe the estimated total cost of the Transmission Project.

A. The Aeolus to Bridger/Anticline transmission line and associated substations are estimated to cost $679.2 million, as summarized in Table 2 below.

TABLE 2	
Item	**Total Company Value**
Transmission Line	$234.6m
Substations	$214.1m
Engineering	$18.9m
ROW Acquisition	$16.0m
PM/Environmental/Support Works	$92.4m
In-directs	$86.7m
Contingency	$16.5m
TOTAL	**$679.2m**

The entire cost of the Aeolus to Bridger/Anticline project will be paid by the Company without contribution from any transmission customer projects.

The 230 kV transmission line and associated substations are estimated to cost $92.2 million, as summarized in Table 3 below.

TABLE 3	
Item	**Total Company Value**
Transmission Line	$53.15m
Substations	$12.67m
Engineering	$3.7m
ROW Acquisition	$1.06m
PM/Environmental/Support Works	$9.15m
In-directs	9.69m
Contingency	$2.78m
TOTAL	**$92.2m**

The Company expects that transmission customers will contribute to the cost of the 230 kV transmission interconnections. The 230 kV transmission facilities identified to integrate the Aeolus to Bridger/Anticline single-circuit 500 kV line with the existing Wyoming transmission system are considered network upgrades.

Q. If the Aeolus to Bridger/Anticline 500 kV Transmission Project is not fully in-service by December 31, 2020, can the Energy Vision 2020 Wind Projects still qualify for PTCs?

A. Yes. Assuming the Aeolus to Bridger/Anticline 500 kV Transmission Project is not completed by December 31, 2020, but otherwise has facilitated synchronization to the transmission grid and commissioning of individual wind turbines in accordance with Internal Revenue Service guidance, the Company would treat a completed and functional wind turbine as being placed in-service regardless of any transmission constraints affecting a wind project.

Q. How will the costs of the Aeolus to Bridger/Anticline 500 kV Transmission Project flow into the Company's transmission rates, and who will pay these rates?

A. Transmission assets, including new transmission capital like the Aeolus to Bridger/Anticline 500 kV Transmission Project, are included in the ATRR, weighted by months in-service. The ATRR is converted into a rate by dividing ATRR by firm transmission demand. All third-party revenues for transmission service (along with third-party revenues for ancillary services) are included as revenue credits in the calculation of rates in each of the Company's state retail jurisdictions.

VI. WALLULA TO MCNARY 230 KV NEW TRANSMISSION LINE PROJECT

Q. Please describe the investment for the Wallula to McNary 230 kV New Transmission Line Project.

A. The in-service Wallula to McNary 230 kV New Transmission Line Project consisted of two sequences of work, the combined costs of which are included in this general rate case filing. The first work sequence was placed in-service in December 2017 for $6.4 million and included expansion at PacifiCorp's Wallula substation, as well as, relay and communications work at the Nine Mile substation. The second sequence of work was the construction of the new 230 kV transmission line that went into service in January 2019 for $36.2 million. A one-line diagram of the Wallula to McNary 230 kV New Transmission Line project is included in Exhibit PAC/1002.

Q. Please explain why this investment in the Wallula to McNary 230 kV New Transmission Line Project was needed and beneficial.

A. The Wallula to McNary 230 kV New Transmission Line Project was needed to enable PacifiCorp to comply with PacifiCorp's OATT, its transmission service agreements, and FERC's requirements to provide the requested transmission service. Before this line went into service, there were only two MW of available transfer capacity on the existing line between Wallula and McNary, which was insufficient to satisfy the requests for service from providers of generation capacity from renewable resources. The completion of the project now enables PacifiCorp to fulfill such requests in compliance with its OATT requirements, and will also increase the Company's access to generation capacity from renewable resources.

In addition, the project enhances transmission reliability by providing a second connection between the Bonneville Power Administration's (BPA's) McNary substation and PacifiCorp's Wallula substation. With only a single line between Wallula and McNary, line outages, either planned or unplanned, cause disruption of service to customers. This disruption can result in loss of service under existing contracts or reduced reliability for customers served from the Wallula substation.

This new second line will provide service reliability in a single line outage condition, and, because it was constructed with lightning protection, the new line reduces lightning-caused voltage sag events in the area.

Q. Did PacifiCorp consider alternatives to investing in the Wallula to McNary 230 kV New Transmission Line Project?

A. Yes. In lieu of the selected project, PacifiCorp considered re-building the existing Wallula to McNary 230 kV transmission line to a double circuit line, but this project had an estimated cost of $73.6 million. As a second alternative, PacifiCorp considered re-conductoring the existing Wallula to McNary 230 kV transmission line with high temperature conductor. This alternative would have required the addition of phase shifting transformers to produce increased flow on the line and a new substation to place the equipment at an estimated cost of $53.6 million. Both alternatives were rejected due to cost savings associated with investing in the Wallula to McNary 230 kV New Transmission Line Project.

VII. SNOW GOOSE 500/230 KV NEW SUBSTATION PROJECT

Q. Please describe the investment for the Snow Goose 500/230 kV New Substation Project.

A. This in-service project constructed a new 500/230 kV substation located near Klamath Falls, Oregon, as shown on the map attached in Exhibit PAC/1003. The new Snow Goose substation has a 500/230 kV, 650 MVA transformer bank and associated switchgear. In addition, PacifiCorp constructed 0.5 miles of 230 kV transmission line and 1.2 miles of 500 kV transmission line to integrate the substation into the area's 230 kV and 500 kV systems. The 230 kV yard was placed in-service in May 2017, and the 500 kV yard was placed in-service in November 2017, for a total of $42.8 million. A one-line diagram of the Snow Goose 500/230 kV New Substation Project is also included in Exhibit PAC/1003.

Q. Please explain the benefits of this investment in the Snow Goose 500/230 kV New Substation and why it is needed.

A. The need for the Snow Goose 500/230 kV New Substation Project was based on achieving continued compliance with reliability standards mandated by NERC under the TPL Standards. In 2012, PacifiCorp performed TPL Standards screening studies that identified system performance deficiencies following the single contingency loss of PacifiCorp's existing 500/230 kV, 650 MVA transformer bank at Malin substation. Specifically, PacifiCorp determined that during the 2017 projected summer peak load conditions, the loss of the transformer bank would result in the system failing to meet the low voltage limits on the PacifiCorp-owned 230 kV, 115 kV and 69 kV systems and an increase in the load on the Copco to Lone Pine 230 kV line. By 2027, the Copco to Lone Pine 230 kV line would exceed its rated thermal continuous and emergency capacity during this outage. This outage would also cause a reduction of the power flow on the Alturas to Reno WECC Path 76. As a result, firm scheduled transfers on this line could not continue to be supported without a second 230 kV source.

Construction of the Snow Goose substation provided a second 500 kV to 230 kV transmission tie in the area that ensured that PacifiCorp is able to maintain adequate system voltage and power delivery during a single contingency outage condition, thus maintaining service for customers in southern Oregon and northern California.

Q. Did PacifiCorp consider alternatives to investing in the Snow Goose 500/230 kV New Substation Project?

A. Yes. In lieu of the Snow Goose 500/230 kV New Substation Project, PacifiCorp considered resolving the deficiencies under the TPL Standards by installing a second transformer at Malin substation and building a second line from Malin to Klamath Falls. This alternative was rejected as Malin substation could not be readily expanded to accommodate a new 500/230 kV transformer position due to physical site constraints. This alternative was estimated to be $85.0 million.

A second alternative would have involved installing a 500/230 kV, 650 MVA transformer at the BPA-owned Captain Jack substation and building 27 miles of 230 kV line from Captain Jack to Klamath Falls. Adding another transformer at the Captain Jack substation would require increasing the size of the substation property and reaching an agreement with BPA. This alternative was estimated to be $90.0 million and was rejected because of insufficient space at the BPA-owned Captain Jack substation, inadequacy of the site in serving as a new source of 69 kV to the Klamath Falls metropolitan area, and additional reinforcement requirements of the 230 kV path between Captain Jack and Klamath Falls substations.

The last alternative considered would have involved installing a 500/230 kV, 650 MVA transformer at the Klamath Co-Gen substation and building a new 230 kV line to tap the Klamath Falls to Boyle 230 kV line. As with the first alternative, this option was rejected due to space and cost limitations. Estimated costs for this alternative were $85.0 million.

VIII. VANTAGE TO POMONA HEIGHTS 230 KV NEW TRANSMISSION LINE PROJECT

Q. Please describe the investment for the Vantage to Pomona Heights 230 kV New Transmission Line Project.

A. The Vantage to Pomona Heights 230 kV new transmission line consists of a new 41-mile 230 kV transmission line that extends from BPA's Vantage substation near Vantage, Washington, and ends at PacifiCorp's Pomona Heights substation in Yakima, Washington, as shown on the map attached in Exhibit PAC/1004. The project consists of two sequences of work. The first work sequence to expand the Pomona Heights substation 230 kV ring bus to provide adequate breaker separation between lines and transformers for breaker failure and bus fault events was placed in-service in November 2015 for $9.4 million. The second sequence of work is projected to be placed in-service in May 2020 for an estimated $57.3 million and includes the installation of a new 230 kV transmission line connected at BPA's Vantage substation and ending at the Pomona Heights substation. The Company has now received full federal permissions to construct this transmission line. The final segment permission was received from the Bureau of Land Management on September 27, 2019. This portion of the project will include the installation of breakers, protection and control equipment, and communications equipment at each substation as required to monitor and safely operate the new line. The infrastructure additions at Vantage substation will be designed, purchased, installed, and maintained by BPA. A one-line diagram of the Vantage to Pomona 230 kV new transmission line is also included in Exhibit PAC/1004.

Q. Please explain why this investment in the Vantage to Pomona Heights 230 kV New Transmission Line Project is needed and beneficial.

A. The need for the Vantage to Pomona Heights 230 kV project was identified through internal planning studies and a coordinated Northwest Transmission Assessment Committee study in 2007. NERC screening studies conducted in 2009 and subsequent NERC screening studies additionally identified TPL Standards performance deficiencies following breaker failure and bus fault events on the Pomona Heights 230 kV bus and various N-1-1[10] outages associated with the Wanapum to Pomona Heights 230 kV line. Breaker failure and bus fault and N-1-1 events on other portions of the Yakima 230 kV and 115 kV systems resulted in additional TPL Standards performance deficiencies. In total, there are eight contingency combinations that were identified that could give rise to the need to shed Yakima area load. The Yakima area is currently served primarily by two 230 kV transmission sources. The loss of both primary 230 kV sources or loss of one primary 230 kV source and another major element in the underlying system leaves the remaining system unable to provide adequate electric service to all customers in the area.

The addition of a new 230 kV line between Vantage and Pomona Heights substations and providing a third 230 kV source to the area mitigates the identified deficiencies. Specifically, the project eliminates the need to shed Yakima area load

[10] See footnote 2 for a description of N-1-1 events.

for those eight contingency combinations and eliminates overloads in the PacifiCorp and BPA transmission systems with loss of the existing line.

By enabling PacifiCorp to comply with the TPL Standards and increasing the reliability of PacifiCorp's transmission system by eliminating the need to shed Yakima area load under certain outage conditions, this project provides benefits to customers.

Q. Did PacifiCorp consider alternatives to investing in the Vantage to Pomona 230 kV New Substation Project?

A. Yes. In lieu of the selected project, the new 230 kV line from Vantage to Pomona Heights, PacifiCorp considered constructing a new 500/230 kV transformer and bus position at Wautoma substation and a new 230 kV transmission line from Wautoma substation to Pomona Heights substation resulting in an estimated cost of $89.6 million. This alternative was rejected because the costs were higher than the selected project. Another alternative would have involved constructing a second 230 kV transmission line from Midway substation to Union Gap substation. This alternative was rejected, however, because it would have corrected identified deficiencies for only approximately 10 years before additional transmission reinforcement would be required.

IX. GOSHEN TO SUGARMILL TO RIGBY 161 KV TRANSMISSION LINE PROJECT

Q. Please describe the investment for the Goshen to Sugarmill to Rigby 161 kV Transmission Line Project.

A. The Goshen to Sugarmill to Rigby 161 kV Transmission Line Project constructs approximately 44 miles of new transmission lines from the Goshen to Sugarmill and Sugarmill to Rigby substations located in the southeast Idaho area. Substation expansion will be required at Goshen, Sugarmill, and Rigby substations to accommodate the new 161 kV positions and associated structures and equipment, as shown on the map attached in Exhibit PAC/1005. The project consists of two sequences of work. The first work sequence, planned to be placed in-service in November 2020 for $21.5 million, is to construct approximately 24 miles of the new Goshen to Sugarmill #2 161 kV transmission line and perform the required substation construction at Goshen and Sugarmill substations to terminate the new transmission line at both ends. The new 161 kV line consists of approximately 22.2 miles of 69 kV line rebuilt to 161 kV and 1.6 miles of new double circuit construction into Sugarmill substation. Substation work includes yard expansion for adding the new 161 kV line positions and installation of transmission dead-end structures, substation bus and associated disconnect switches, and breakers. The substation work also includes the installation of protection and control equipment, and communications equipment at each substation as required to monitor and safely operate the new line. The second work sequence is planned to be placed in-service in November 2022, which falls outside of the scope of this case. The second sequence will consist of constructing approximately 20 miles of the new Sugarmill to Rigby #2 161 kV line and performing the required substation construction at Goshen and Sugarmill substations to terminate the new transmission line at both ends of the line.

Q. Please explain why this investment in the Goshen to Sugarmill to Rigby 161 kV Transmission Line Project is needed and beneficial.

A. The need for the Goshen to Sugarmill to Rigby 161 kV line was identified in the 2016 Goshen Area Planning Study to address projected overloads on the Goshen to Sugarmill 161 kV line and Goshen to Rigby 161 kV line, in addition to low voltage at Rigby and Sugarmill substations that manifest under heavy loading conditions. Projected peak summer load conditions in 2021 in the Rigby-Sugarmill area indicate that under normal operating conditions (N-0) the Goshen to Sugarmill 161 kV line is expected to load to 100 percent of its continuous rating of 201 MVA and the Rigby and Sugarmill substations 161 kV bus voltage is expected to reach its minimum limit of 0.95 per unit. Additionally, the projected load growth exacerbates several existing N-1 conditions in the area. Based on 2021 load, loss of the Goshen to Sugarmill 161 kV line causes the Goshen to Rigby 161 kV line to overload to 179 percent of its four-hour emergency rating and can result in excessively low voltage down to 0.68 per unit in the Rigby-Sugarmill area. The loss of the Goshen to Rigby 161 kV line can cause the Goshen to Sugarmill 161 kV line to overload to 111 percent of its four-hour emergency rating of 255 MVA, overload to 102 percent of its 30-minute emergency rating of 279 MVA, and can cause low voltage down to 0.88 per unit at Rigby substation. The Goshen to Sugarmill 161 kV line and Goshen to Rigby 161 kV line are operated radially during summer heavy loading periods to mitigate the risk of violating NERC Standard TPL-001-4 category P0 (N-0), P1 (N-1) and P6 (N-1-1) performance requirements due to transmission capacity deficiencies in the area. Operating radially puts approximately 150 MW load at risk for N-1 loss of either the Goshen to Sugarmill 161 kV line or the Goshen to Rigby 161 kV line and 300 MW at risk for N-1-1 loss of any two transmission lines.

The new Goshen to Sugarmill to Rigby 161 kV line will increase load serving capacity in the Rigby to Sugarmill area by 250 MVA that will allow the transmission lines between Goshen, Sugarmill, and Rigby substations to operate in a normal loop configuration and N-1 thermal overload and low voltage issues on the remaining transmission line and substation. Benefits also include elimination of the N-0 overload risk, improved load service reliability under N-1 conditions, and resolution of most N-1-1 issues present in the area.

Q. Did PacifiCorp consider alternatives to investing in the Goshen to Sugarmill to Rigby 161 kV Transmission Line?

A. Yes. The first alternative in lieu of the Goshen to Sugarmill to Rigby 161 kV line that PacifiCorp considered was a project to construct a new approximately 35-mile long Goshen to Rigby 345 kV line with 1272 aluminum conductor steel-reinforced (ACSR) cable and add a new 450 MVA capacity or larger 345/161 kV transformer at the Rigby substation. Work involved expanding both the Goshen and Rigby substation yards to accommodate the new facilities consisting of at least two 345 kV breakers at Goshen, one 345 kV breaker at Rigby and at least two 161 kV breakers at the Rigby 161 kV substation. This alternative was rejected since the estimated cost of the project was about $17.0 million higher than the chosen project to construct the new Goshen to Sugarmill to Rigby 161 kV transmission line. The alternative was estimated to be $57.7 million.

A second alternative considered was to construct an approximately 61-mile-long Antelope to Rigby 161 kV transmission line with 1272 ACSR cable or larger. Work involved expanding both the Antelope and Rigby substation yards to accommodate the new facilities consisting of at least two 161 kV breakers at Antelope and at least two 161 kV breakers at Rigby. A new 161 kV line from Antelope would provide a new source into the Rigby to Sugarmill area apart from Goshen substation; however, planning studies indicated that by adding the Antelope to Rigby 161 kV line, the N-1 loss of the Goshen to Sugarmill 161 kV line would still cause thermal overload and low voltage issues in the area and that load shedding and radialization of the Rigby to Sugarmill area would still be required. This alternative was rejected since the estimated cost of the project was about $8.0 million higher than the new Goshen to Sugarmill to Rigby 161 kV transmission line and that a new Antelope to Rigby 161 kV transmission line does not resolve the loading and voltage issues in the Rigby to Sugarmill area. The alternative was estimated to be $48.0 million.

A third alternative considered was to construct approximately 22.8 miles of a 161 kV transmission line from the Meadow Creek wind farm substation to Sugarmill and Rigby substations to create a looped transmission source back to Goshen substation. Work involved constructing approximately 5.9 miles of new single circuit 161 kV transmission line from Meadow Creek to a new tap location, using the existing right of way to construct 4.5 miles of double-circuit line from the new tap location to Sugarmill substation, and construct 12.4 miles of new single-circuit

161 kV line from the new tap location to Rigby substation. Work also included converting Meadow Creek's 161 kV substation yard into a new three breaker ring bus, installation of at least two 161 kV breakers at Sugarmill and Rigby substations, rebuilding the Goshen to Wolverine Creek to Jolly Hills to Meadow Creek 161 kV line with 1557 ACSR cable (approximately 32.4 miles), rebuilding the remaining three miles of 795 all-aluminum conductor (AAC) cable on the Goshen to Sugarmill 161 kV line, and adding a 161 kV bus tie breaker at Rigby to facilitate sectionalizing post N-1. Currently, the Goshen wind farms are radial from the Goshen 161 kV substation. Once looped through the Rigby and Sugarmill substations, a detailed voltage control study would be required to coordinate the wind farms and shunt devices in the area. Since the existing radial wind farm line is owned and operated by third parties, an agreement to use or buy the facilities would need to be negotiated. This alternative was rejected since the estimated cost of the project was about $8.2 million higher than the new Goshen to Sugarmill to Rigby 161 kV transmission line and required significant coordination with third parties to deliver the project. The alternative was estimated to be $48.5 million.

The last alternative considered was to loop the existing Goshen to Jefferson 161 kV transmission line in and out of the Bonneville substation. Work involved converting the Bonneville substation into a 161 kV breaker and one-half configuration, constructing an approximately 27-mile-long 161 kV line from Bonneville to Rigby substation with at least 1557 ACSR cable. Work also involved expanding both the Rigby substation yards to accommodate a new 161 kV line position consisting of at least two 161 kV breakers at the Rigby substation. Adding this new Bonneville to Rigby 161 kV line does not improve N-1 and N-1-1 issues in the area and therefore is not considered as a viable alternative. The estimate for this project was $33.2 million. Additional projects would be required to address the N-1 and N-1-1 issues. These projects include reconductoring 32 miles of Goshen to Rigby 161 kV line, reconductoring 16 miles of Sugarmill to Rigby 161 kV line, and reconductoring 3.5 miles of 795 AAC cable on existing Goshen to Sugarmill 161 kV line. Additionally, a new Goshen to Sugarmill 161 kV line would be required to mitigate the low voltage and voltage swings caused by the loss of the existing Goshen to Sugarmill 161 kV line. The estimate to reconductor these lines was $6.6 million and the estimate to construct a new Goshen to Sugarmill 161 kV line was $13.3 million. This alternative was rejected since the estimate for the new Bonneville to Rigby 161 kV line and supporting projects was about $12.7 million higher than the recommended new Goshen to Sugarmill to Rigby 161 kV transmission line project. The alternative was estimated to be $53.1 million.

X. SIGURD TO RED BUTTE 345 KV TRANSMISSION LINE PROJECT

Q. Please describe the investment for the Sigurd to Red Butte 345 kV Transmission Line Project.

A. This in-service project constructed a new 170-mile single circuit 345 kV line from Sigurd substation in Sevier County, Utah to Red Butte substation in Washington County, Utah, as shown in the map attached in Exhibit PAC/1006. This project was placed in-service in three sequences. The first sequence, placed in-service in May 2013, was the Three Peaks series capacitor upgrade. The second sequence included all segments of the new 345 kV transmission line, as well as the required upgrades and modifications at Red Butte and Sigurd substations. Sequence three was the completion of the final cultural report required as part of the National Environmental Policy Act permitting process.

Q. Please explain the benefits of this investment in the Sigurd to Red Butte 345 kV line and why it is needed.

A. The Sigurd to Red Butte 345 kV line provides a reliable and adequate supply of electricity to meet existing and future electrical loads. Without the increased transmission capacity provided by the Sigurd to Red Butte 345 kV line, the Company would have been faced with an increased and unacceptable risk of not being able to meet its load service obligations during peak periods. The Sigurd to Red Butte 345 kV transmission line enhances the Company's ability to provide safe, reliable, and efficient service to all customers. Further, in order to provide low-cost energy, the Company must have the ability to acquire power from numerous generation sources in order to negotiate the most competitive pricing.

The addition of the Sigurd to Red Butte 345 kV line is an important piece in strengthening the Western Interconnection transmission infrastructure. The Sigurd to Red Butte 345 kV line has resulted in a stronger interconnection with other parts of the Western Interconnection, providing better transmission system access to the other sources of generation. The Sigurd to Red Butte 345 kV line, especially when complemented with other projects, such as the Populus to Terminal transmission project and the Mona to Oquirrh transmission project, greatly strengthens the Company's transmission capacity and flexibility. This is necessary, based upon the near-term and long-term load growth projections of the Company and its transmission customers, as well as the contingencies and restrictions occurring on the system during outage conditions.

Q. Has the investment in the Sigurd to Red Butte 345 kV line enhanced PacifiCorp's access to wholesale markets?

A. Yes. By adding transmission capacity, the Company has increased its ability and options to obtain power from additional generation sources at competitive pricing. In December 2015, Nevada Energy joined the EIM and established an Energy Transfer System Resource (ETSR) at Red Butte. The Red Butte ETSR provides PacifiCorp the ability to facilitate intra-hour transfers between NV Energy and the rest of the EIM footprint. Were it not for the investment in the transmission segment, PacifiCorp's EIM transfer capability would likely be 200 MW lower at this ETSR, providing less benefits to PacifiCorp's customers.

Q. Please explain the benefits of the investment in the Three Peaks series capacitor upgrade and why it is needed.

A. To support the additional load flows brought about by the completion of the new Sigurd to Red Butte 345 kV line, the Three Peaks series capacitor needed to be modified to increase the current (ampere) rating. The Three Peaks series capacitor upgrade had to be placed in-service before placing the new transmission line between Sigurd and Red Butte substations in-service. With the completion of the Three Peaks series capacitor project ahead of the completion of the Sigurd to Red Butte 345 kV line, the southern Utah transfer capability was increased for the 2013 and 2014 summer operating periods, and additionally to provide the same functions for the 2015 summer operating period if the transmission line project was delayed.

Q. Please explain the reason for the final cultural report completed in June 2017.

A. The report was a summary and interpretation of all archeological investigation and treatment that was required during construction. During the federal permitting process for the project, several archeological sites were identified where treatment was required throughout the project. The treatments included such things as photo documentation, barricading, monitoring, and excavation/investigation. The final report summarized what was found on the project, how it was treated, the results of any analyses which were required, and an interpretation of the historical significance of the artifacts. All archeological field work was completed in 2015; however, the report was not complete until 2017 due to the extensive laboratory analysis, research and writing that was necessary in the report preparation.

Q. Did PacifiCorp consider alternatives to investing in Sigurd to Red Butte 345 kV Transmission Line Project?

A. The Company took significant steps to identify and implement alternatives that delayed the need for the Sigurd to Red Butte 345 kV Transmission Line Project. These included: 1) completion of interim projects in 2009 which added major equipment to the existing Three Peaks substation, thus improving the 345 kV system operation and increasing reliability for serving the general area; 2) addition of major equipment and devices in 2011 to the existing Red Butte substation, which increased system capacity, improved voltage support, and maintained the reliability of the system in the general area; and, 3) the addition of a 345/230 kV 375 MVA transformer, also in 2011, to the Harry Allen substation. These projects, along with special operating procedures, allowed the Company to delay the Sigurd to Red Butte line until the summer of 2015.

PacifiCorp also considered advancing construction of a 345 kV transmission line from Sigurd to St. George, Utah. The 2011 Southwest Utah Joint Study Report, conducted in association with Utah Associated Municipal Power Systems, Deseret Power, and PacifiCorp determined that a future transmission line beyond the proposed Sigurd to Red Butte 345 kV Transmission Line Project will be needed between Sigurd and St. George, Utah, when load and reliability requirements reach a critical point, at the time estimated to be beyond 2025.[11] The planned Sigurd to St. George, Utah 345 kV line will be 185 miles in length, compared to 170 miles for the Sigurd to Red Butte 345 kV line, and would have been more costly and provided fewer system benefits than the enhanced interconnection with a neighboring balancing authority area. Additionally, the future line will connect to four substations instead of the two which the Sigurd to Red Butte 345 kV line connects to.

XI. NORTHEAST PORTLAND TRANSMISSION UPGRADE PROJECT

Q. Please describe the investment for the Northeast (NE) Portland Transmission Upgrade Project.

A. The NE Portland Transmission Upgrade was a systematic solution resolving several operational and contingency related network issues in the Portland transmission and substation system, as shown on the map attached in Exhibit PAC/1007. Due to the complexity and duration of the scope, this project was placed in-service in six sequences for a total of $20.6 million. The first sequence of work was the conversion

[11] Updated studies now indicate load and reliability requirements in the area do not require additional action until 2028.

of the Parkrose substation from 57 kV to 115 kV, utilizing existing transformers, replacing open air bus-work with switchgear and replacing the 57 kV structure and equipment to implement substation conversion to 115 kV. This phase was placed in-service in December 2016 for $8.4 million. The second sequence of work, placed in-service in December 2016 for $800,000, was to re-insulate approximately 7 miles of 57 kV and 69 kV transmission line by replacing the existing insulators with 115 kV insulators, along with any necessary structure replacements to accommodate the new insulator configuration, as required for the voltage conversion. The third sequence was to convert the Columbia substation from 57 kV to 69 kV, re-deploying two existing transformers. This sequence was placed in-service in December 2018 for $3.9 million. The fourth sequence was to convert the Vernon substation from 69 kV to 115 kV, retaining the existing transformer and reconfiguring the upgraded transmission lines. This sequence was also placed in-service in December 2018 for $1.0 million. The fifth and sixth sequence replaced the two existing transformers at Albina substation with two standard transformers having voltage regulation. The new Albina transformer 1, along with associated substation upgrades and reconfiguration was placed in-service in December 2018 for $4.9 million, and the second transformer was placed in-service in May 2019 for $1.6 million.

Q. Please explain the benefits of the NE Portland Transmission Upgrade Project and why it was needed.

A. There were four primary issues addressed by this project. The first was the system capacity limitations with the Albina to Troutdale 69 kV Sundial transmission line. Before completion of this project, full outage restoration was not possible for a loss of either the Troutdale to Alderwood or the Albina to Vernon sections of the Sundial transmission line. For a loss of the Troutdale to Alderwood section, this would have resulted in a 0.8 mile section of 350 copper conductor loaded up to 117 percent and a 2 mile section of 795 ACSR loaded up to 108 percent of thermal capability. The load shedding exposure for summer 2015 was 14 MVA over 62 hours over 7 days. For a loss of the of Albina to Vernon section the resulting loading would have been up to 111 percent for 7.3 miles of the 795 ACSR conductor. The load shedding exposure for summer 2015 for the loss of this line segment was 10 MVA over 47 hours over six days based on the load duration curve for the line. Before this project, a single contingency on the Sundial line resulted in loss of service to three distribution substations: Vernon, Killingsworth, and Alderwood. Killingsworth and Alderwood are the primary sources to medical and government services. In May 2015, an outage occurred that, due to this system's capacity limitations, impacted 6,644 customers with an outage lasting up to 44 minutes, resulting in 284,416 customer minutes lost and an increase to SAIDI of 0.36 for PacifiCorp.

The second issue the project addressed was at Albina substation. There were two components to address at Albina. Transformer T-901 at Albina was built in 1949 and was showing signs of internal insulation breakdown based on oil tests. The oil was processed to improve quality and extend the life of the transformer but replacement was needed. The transformer secondary winding provided a source for the Albina to Troutdale 69 kV Sundial Line and the tertiary winding was used as the 11.7 kV source for the distribution network serving the north portion of downtown Portland. Utilizing the tertiary winding of the transformer resulted in higher fault current values on the distribution system. Due to the high fault currents, a standard voltage regulator to maintain proper voltage on the distribution system could not be used. Instead, the voltage on the 11.7 kV bus was regulated manually by dispatch using a system of Supervisory Control & Data Acquisition alarm levels in the energy management system, and was accomplished by switching four 6 MVAr capacitor banks on and off the system. Manual voltage regulation increased the opportunity for system voltages to be outside the range of mandated acceptable limits.

The third issue related to two existing NERC TPL deficiencies for NERC Standard TPL-001-4 that identify system overload conditions that existed, but which the conversion of Parkrose substation and the conversion of the identified line segments to 115 kV solved. The NE Portland Transmission Upgrade retired the 69 kV source and yard at Albina, which positioned the system for the planned future solution involving conversion of an existing 57 kV line to 115 kV to provide a third 115 kV path between the North Portland transmission sources and the PacifiCorp Portland area system.

The fourth issue was system operability on the existing 57 kV transmission system. Parkrose substation was designed with the intent to be able to transfer load to other substations for service; as such, it lacked mobile access and a bus tie breaker. Parkrose substation was the last 57 kV to 12.5 kV distribution substation in PacifiCorp's system. Load transfer options during peak conditions were no longer an option, and no spare or mobile existed to address outage recovery. The remaining 57 kV transmission lines are feed from the Knott 115 kV to 57 kV substation and have inter-ties with Portland General Electric Company's 57 kV system, which will be converted as both companies have plans for eventual elimination of the 57 kV transmission voltage within the Portland network.

Q. Did PacifiCorp consider alternatives to investing in the NE Portland Transmission Upgrade Project?

A. Yes. Options to remedy the capacity issue of the existing Sundial line were explored with the distributed energy resource (DER) development group. The conclusion was there was not a DER solution to address the Sundial capacity issues based on the provided load curve and duration needed. Application of energy storage technology to defer construction was also evaluated as an alternative to the infrastructure improvements on the Sundial line. To provide an equivalent solution for the immediate deficiency, with a small margin for load growth, the energy storage would have needed to be capable of providing 15 MVA from roughly 6:00 a.m. until 10:00 p.m. based on a winter load profile with a charging window of about 5 hours and a peak demand that avoids equipment overload (about 25 MVA). It should be noted that the required energy output greatly exceeded the available energy input, and significant infrastructure upgrade or addition would have needed to be constructed to facilitate the installation of the alternative. The NE Portland Transmission Upgrade Project fully mitigated the issues identified beyond the planning horizon.

An additional alternative was explored that would result in greater long-term system benefit. The solution would require construction of a new transmission line at an estimated cost of $85 million. This alternative was the most expensive, and the ability to permit and construct through the NE Portland urban area was anticipated to be extremely challenging. As a result, the solution was not deemed a viable alternative.

XII. SOUTHWEST WYOMING SILVER CREEK 138 KV TRANSMISSION LINE PROJECT

Q. Please describe the investment for the Southwest Wyoming Silver Creek 138 kV line.

A. This project was placed in-service in August 2017 for $41.9 million and included the siting, permitting, and rebuilding of approximately 70 miles of 46 kV transmission line at 138 kV, the construction of a new 138/46 kV substation (near Henefer, Utah), the removal of the Henefer substation, and the conversion of the Coalville substation to 138 kV. A project map and subsequent scope change diagram are included in Exhibit PAC/1008.

Q. Please explain the benefits of this investment in the Southwest Wyoming Silver Creek 138 kV line and why it is needed.

A. In the winter of 2009 to 2010, Park City, Utah's load peaked at 181 MVA. This is 113 percent of the winter thermal limit of either of the 138 kV lines serving the area. The area load exceeding 160 MVA could result in load loss under multiple outage scenarios due to the loss of either 138 kV source to the area or the Midway 138/46 kV transformer. These scenarios resulted in low voltages at best and cascading outages at worst. The following conditions for N-1 scenarios were expected and mitigated by the project:

- An N-1 fault on the Hale to Midway 138 kV line or a fault on the Midway 138/46 kV transformer could have caused: an outage to the Wallsburg substation (2.5 MVA – 650 customers), the Park City to Judge 46 kV line loads to 108 percent (58 MVA) of the winter rating (relay settings set at 76

MVA), the Park City to Silver Creek 46 kV line loads to 123 percent (66 MVA) of the winter rating (relay settings set at 67 MVA), and all voltages remained above 95 percent.

- An N-1 fault on the Cottonwood-Silver Creek 138 kV line could have caused: an outage to the Snyderville substation (35 megavolt-amps – 4,650 customers), the Midway 138/46 kV transformer loads to 104 percent (93 MVA) of the winter rating, the Brighton 46 kV voltage drop to 90 percent, the Henefer 46 kV voltage drop to 90 percent, and the Silver Creek 138 kV voltage drop to 88 percent (results from back-feeding the Silver Creek 138/46 kV transformer, which is normally set to boost voltage, is now bucking voltage). Silver Creek's 12.5 kV voltage drops to 99 percent with the regulation at full boost, and the Jordanelle 138 kV voltage drops to 88 percent and the 12.5 kV voltage levels drop to 99 percent with the regulation at full boost.

- An N-1 fault on the Park City-Judge 46 kV lines could have caused the Brighton 46 kV voltage levels to drop to 92 percent, but the 12.5 kV and 25 kV voltages remain at 1.02 percent due to the regulators.

Q. Did PacifiCorp consider alternatives to investing in the Southwest Wyoming Silver Creek 138kV line?

A. Yes. The first alternative considered was to rebuild the existing 138 kV and 46 kV lines in the Park City area with 1272 ACSR conductor and convert both Judge and Wasatch substations to 138 kV for a total estimated cost of $79.3 million. This alternative was rejected due to the higher cost and difficulty in permitting in the Park City area. The second alternative was to build a new 138 kV line from the Butlerville substation in Salt Lake City to the Brighton substation, rebuild the existing Brighton-Judge 46 kV line to 138 kV, rebuild the Judge to Silver Creek 46 kV line with single and double circuit 138 kV construction, and convert Brighton and Judge substations to 138 kV. All lines would be built using 1272 ACSR conductor. The total estimated cost for this alternative was $78.2 million. This alternative was rejected due to the higher cost and line routing through wilderness-designated areas. The final alternative considered was to build a 265-mile 230 kV line from the Hayden/Craig generating plant in Colorado through the Vernal area to Park City. This project provided additional benefits because of the ability to deliver generation located in Colorado into the Salt Lake area. There was no firm commitment with this project, but it could have been a third source into the Park City/Salt Lake area. The estimated cost for this alternative was estimated to be greater than $100 million and was rejected due to higher cost and construction timing.

XIII. THREEMILE CANYON FARM PROJECT

Q. Please describe the investment for the Threemile Canyon Farm Project.

A. This in-service project added a fourth 230/34.5 kV, 25 MVA transformer and a third 34.5 kV feeder position at the existing Dalreed substation and upgrades to the local 34.5 kV and 4.16 kV distribution system located near Boardman, Oregon, as shown on the map attached in Exhibit PAC/1009. Before this project, Dalreed substation consisted of three 230/34.5 kV transformers, sized 25 MVA, 20 MVA and 25 MVA, respectively, designed for redundancy such that the area irrigation load could remain served for an outage to any single transformer. The addition of the fourth transformer increased the substation designed capacity from 45 MVA to 70 MVA. The project was placed in-service in April 2015, for a total of $6.2 million. A one-line diagram of the Threemile Canyon Farm Project is also included in Exhibit PAC/1009.

Q. Please explain the benefits of this investment in the Threemile Canyon Farm Project and why it is needed.

A. This project was initiated as a 2,500 horsepower (HP), later increased by the customer to 3,150 HP (approximately 2.68 MW), load addition request from Threemile Canyon

Farm, LLC and evaluated under the Electric Services Study Agreement process. The load interconnection system impact study report identified the following impacts:

- The requested 2.68 MW (3.15 MVA) load addition increased the total Dalreed substation load to 51.76 MVA.
- An outage of either of the two 230/34.5 kV, 25 MVA transformers would result in forced load curtailment down to the remaining 45 MVA capacity.
- An outage of the 230/34.5 kV, 20 MVA transformer would result in forced load curtailment down to the remaining 50 MVA capacity.
- The requested load additions would increase loading on the Simtag feeder to 38.9 MVA, 86 percent of the conductor thermal rating. The PacifiCorp feeder loading guideline at 34.5 kV is 23.9 MVA and replacement of the conductor is recommended when loadings exceed 85 percent of thermal ratings.

The study identified the addition of a fourth 230/34.5 kV, 25 MVA transformer and third 34.5 kV feeder at Dalreed substation, along with the associated distribution upgrades as the recommended solution to ensure the system would have full N-1 capability at the 230/34.5 kV transformer level and each of the three 34.5 kV feeders would remain within guideline ratings.

Q. Did PacifiCorp consider alternatives to investing in the Threemile Canyon Farm Project?

A. Yes. The system impact study performed under an Electric Services Study Agreement evaluated two alternatives. The first alternative considered constructing a new 230/34.5 kV substation on new property near Dalreed substation. This alternative would have met the load customer's request while providing the potential benefits of allowing construction to occur without concern for outages and construction related loading limitations on the Dalreed area 34.5 kV system. The new substation alternative would also allow for easier expansion in the future if customer load continues to grow. However, construction of new facilities on new property was estimated to cost significantly more, at $8.5 million. Additionally, a new 230 kV interconnection would be required with BPA's Jones Canyon to McNary 230 kV line, potentially carrying higher costs and extending the construction timeline by three to five years. Due to the higher cost and longer timeline, this alternative was rejected.

The second alternative considered purchasing the fourth 230/34.5 kV, 25 MVA transformer but keeping it as an on-site spare instead of constructing the remaining substation improvements. Under this alternative, any 230/34.5 kV transformer failure would have resulted in forced curtailment to some portion of the customer load. The forced curtailment would have an expected duration of several days up to three weeks, resulting in potential customer agricultural crop loss due to lack of irrigation. In discussions with the customer, they indicated that they would not willingly accept the ongoing risk of forced curtailments. This alternative was rejected as not meeting the customer's load service requirements.

XIV. CONCLUSION

Q. Please summarize your recommendation to the Commission.

A. I recommend that the Commission determine that the projects stated above will provide benefits to Oregon customers and are therefore prudent and in the public interest.

Q. Does this conclude your direct testimony?

A. Yes.

Aeolus to Bridger/Anticline 500 kV Transmission Project

February 2020

Energy Vision 2020 Wind Network Improvements

D.2 Project Facilities:

D.2 Project Transmission Facilities:

- Addition of the Aeolus 500/230 kV autotransformer
- Addition of the Aeolus – Anticline 500 kV line (~138 miles)
- Addition of the Anticline 500/345 kV autotransformer
- Addition of the Anticline – Bridger 345 kV line (5 miles)

Southeast Wyoming – Network Upgrades

- Loop the Shirley Basin – Freezeout 230 kV line into Aeolus 230 kV
- Add the Aeolus – Shirley Basin 230 kV #2 line (~16 miles) [Q0707]
- Rebuild the Aeolus – Shirley Basin 230 kV #1 line (~16 miles) [Q0712]
- Rebuild the Aeolus – Freezeout - Standpipe 230 kV line (~15 miles) [Q0712]
- Add Latham SVC

A drawing depicting all new D.2 Project network transmission facilities east of Jim Bridger Power Plant is provided below:

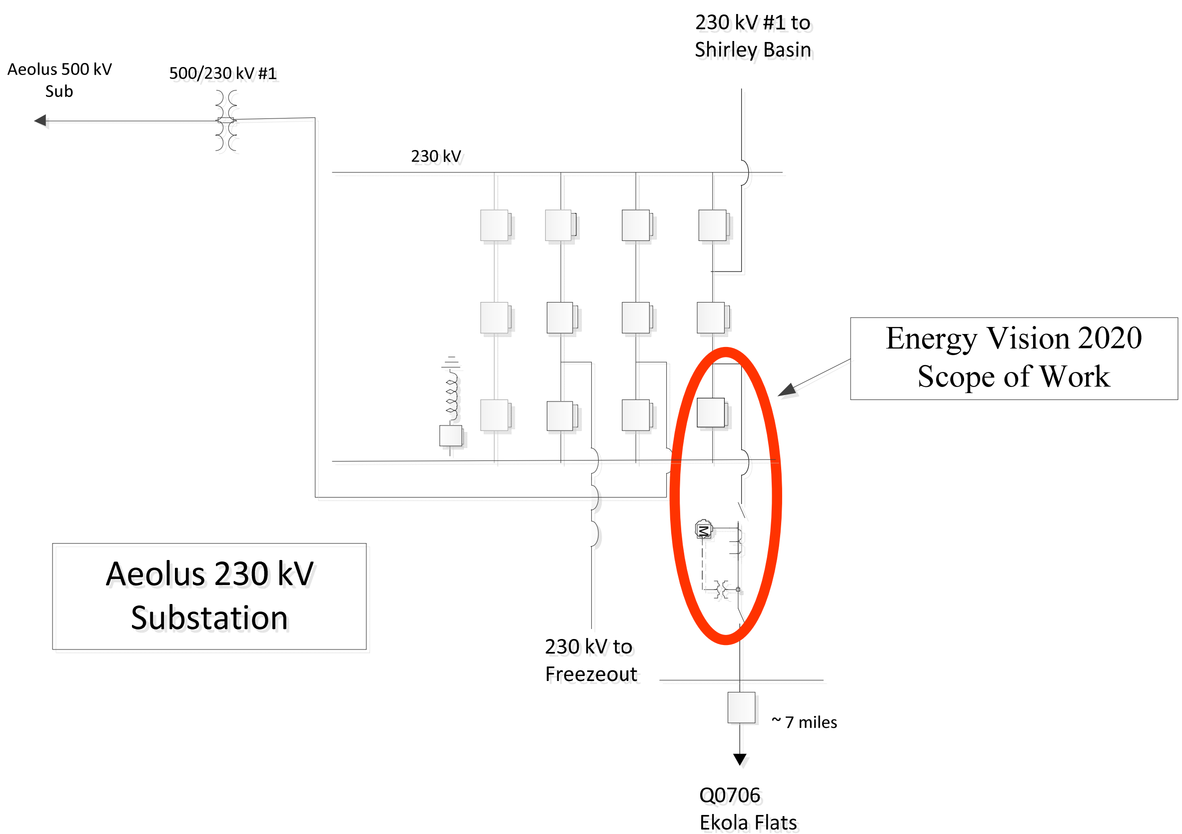
At the Aeolus substation to support the Ekola Flats wind project the following network upgrades are required:

- Add one (1) 230 kV 4000 ampere circuit breaker and one line position with associated switches.
- Include the project in the Aeolus RAS generation dropping scheme.



Updated: November 8, 2019
Contributors: Robyn Kara, Craig Quist, Kris Bremer

At Shirley Basin substation to support the inclusion of TB Flats I wind projects, the following network upgrades are required:

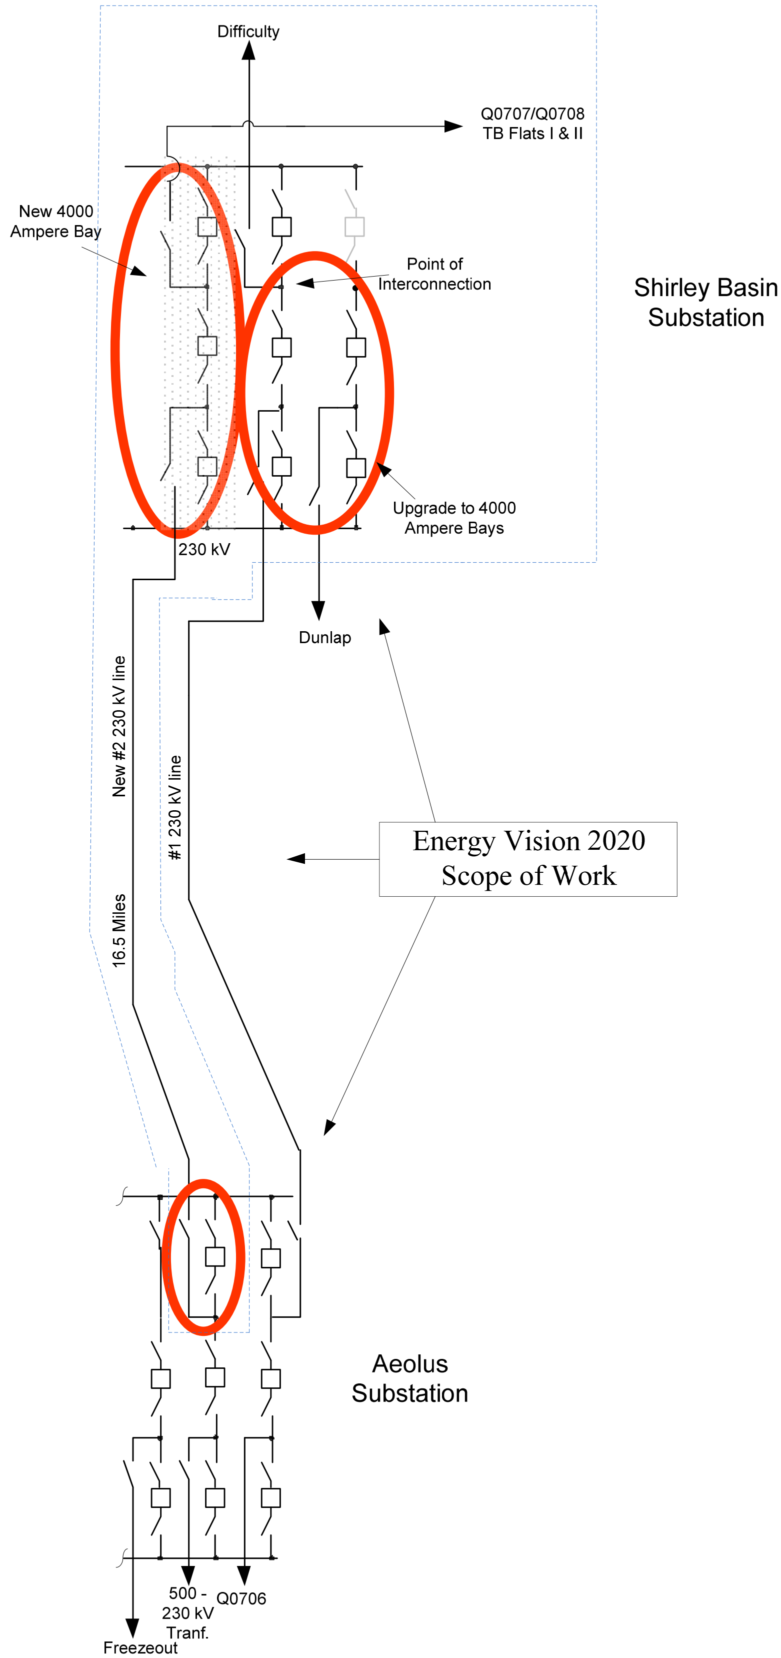
- Add one new bay and rebuild existing bays to 4000 amperes, seven (7) new 4000 ampere 230 kV circuit breakers, two line terminations with associated switches
- Construct a new approximately 16.5-mile Shirley Basin – Aeolus 230 kV #2 line.

At Aeolus substation the following network improvements are required:

- Add one (1) new 4000 ampere 230 kV circuit breaker, one line termination and associated switches
- Include the project in the Aeolus RAS generation dropping scheme.

The TB Flats I and II were combined into a single point of interconnection. As such, to support inclusion of the TB Flats II wind the following network upgrades are required:

- Include the project in the Aeolus RAS generation dropping scheme.



Updated: November 8, 2019
Contributors: Robyn Kara, Craig Quist, Kris Bremer

At Windstar substation to support the inclusion of Cedar Springs I wind project the following network upgrades are required:

- Add one (1) 230 kV 3000 ampere circuit breakers and one line termination

At Freezeout substation to support the inclusion of Cedar Springs I wind project the following network upgrades are required:

- Add three (3) 230 kV 4000 ampere circuit breakers along with associated switches for re-termination of lines associated with the Aeolus-Freezeout-Standpipe 230 kV line rebuild
- Upgrade two bays to 4000 amperes
- Rebuild the Aeolus – Freezeout – Standpipe 230 kV line ~15 miles
- Rebuild the Shirley Basin – Aeolus 230 kV #1 line ~16 miles

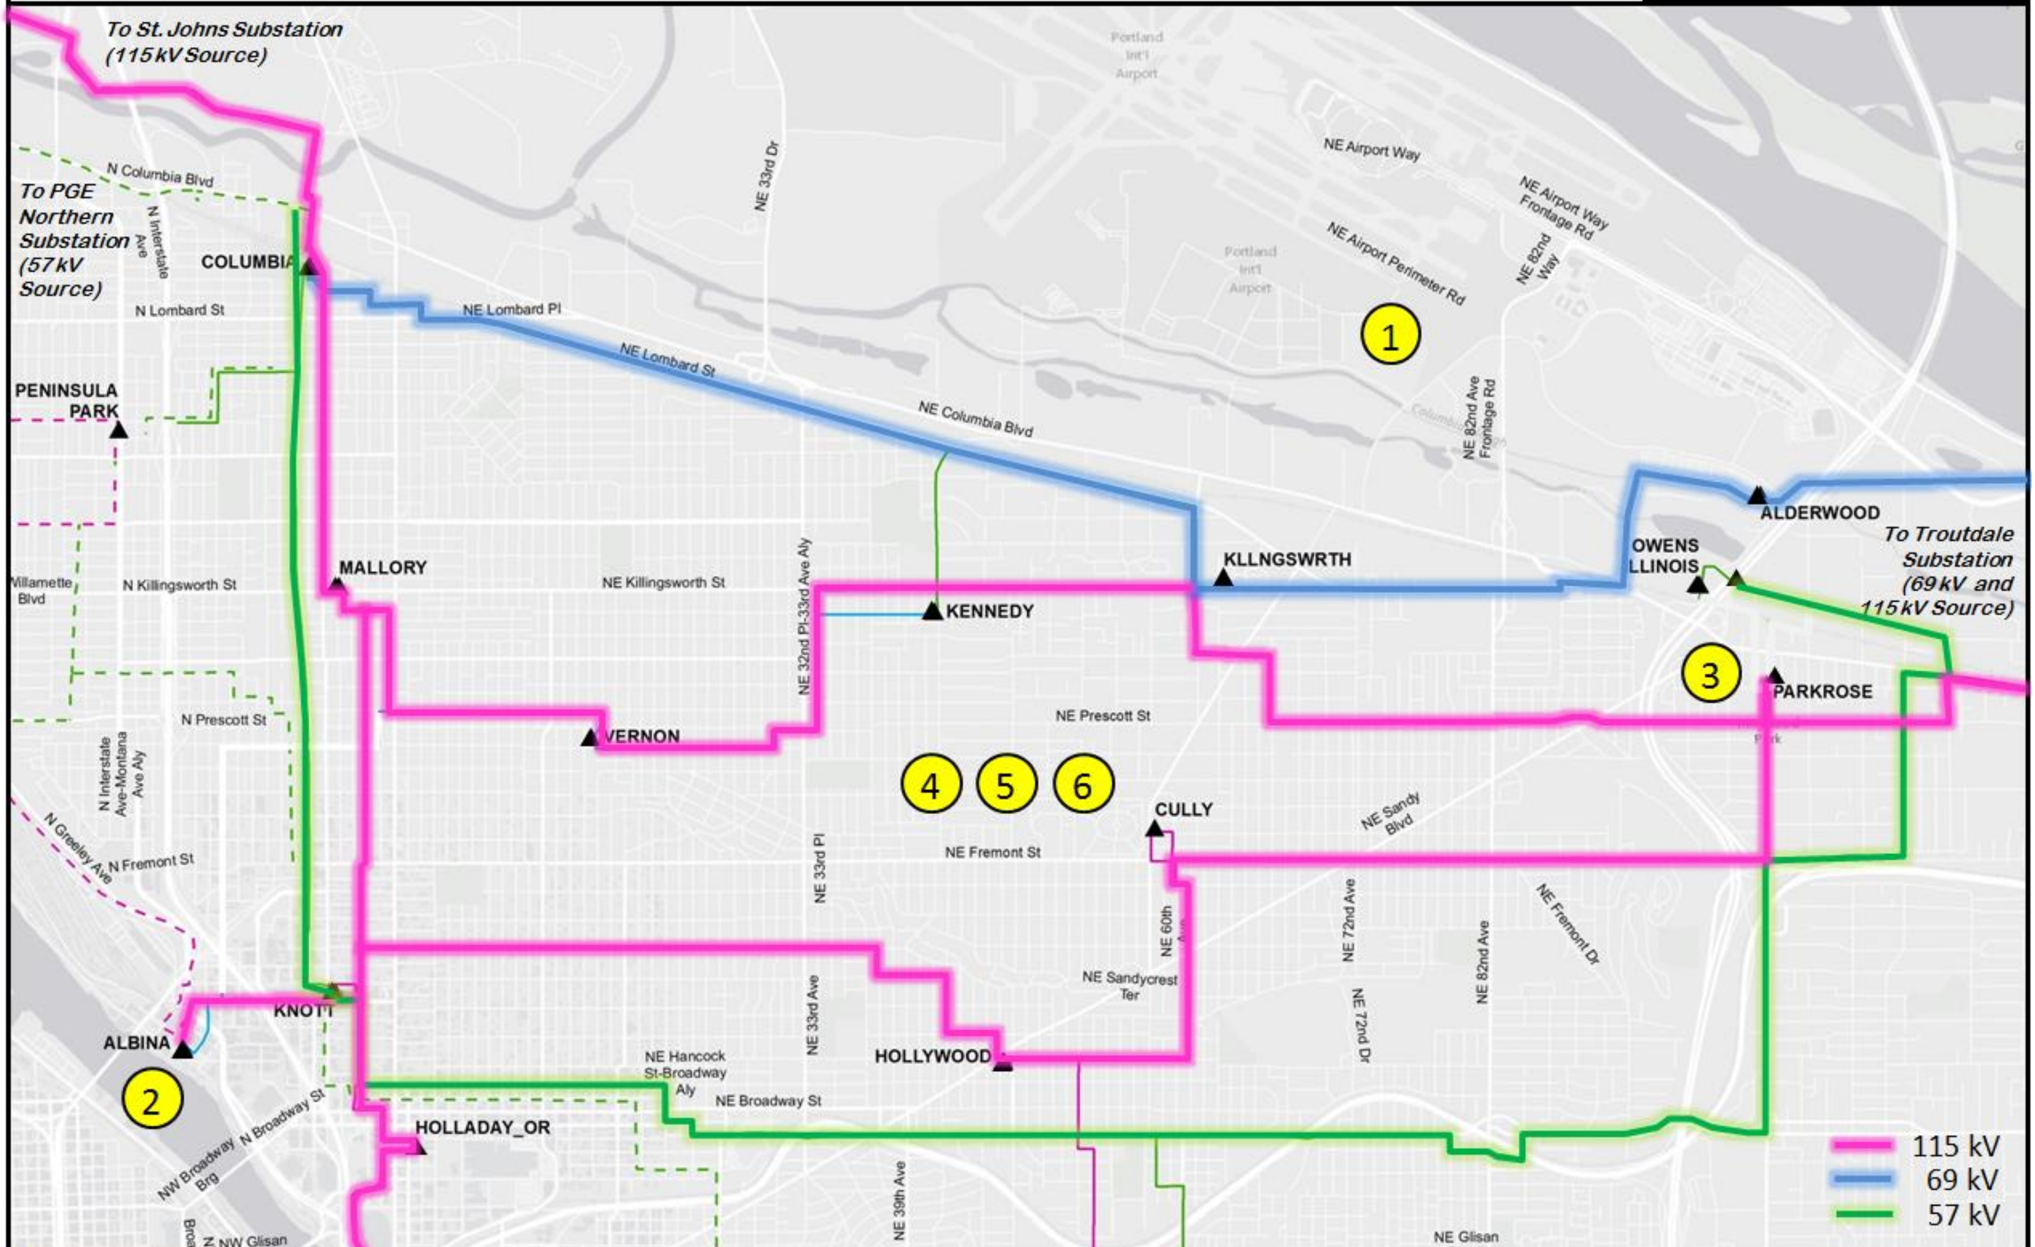
AFTER



BENEFITS

1) Airport now has independent transmission sources
2) Albina aging assets reliability risk mitigated
3) Parkrose: Removal of the last 57kV supplied sub for Pacific Power, mitigating lack of mobile and spare transformer risks.
4) Reliability improvement due to increased transfer capability
5) Remediation of multiple existing and future TPL deficiencies
6) Reduces overall operating risk in the Portland area while increasing the ability to meet known spot load growth additions.

TABLE OF CONTENTS

ATTACHED EXHIBITS

I. INTRODUCTION AND QUALIFICATIONS

Q. Please state your name, business address, and present position with PacifiCorp d/b/a Pacific Power (PacifiCorp or the Company).

A. My name is David M. Lucas. My business address is 825 NE Multnomah Street, Suite 1700, Portland, Oregon 97232. My present position is Vice President of Transmission and Distribution Operations for the Company's Pacific Power division. I am responsible for the operations, maintenance, construction, safety, and support organizations for PacifiCorp's transmission and distribution systems in California, Oregon, and Washington.

Q. Briefly describe your education and professional experience.

A. I joined PacifiCorp in 2010 in the role of Managing Director of Gas and Geothermal Generation with responsibility for the operations, maintenance, and construction of PacifiCorp's natural gas and geothermal generation facilities. I held that position until I was appointed to my present position as Vice President of Transmission and Distribution Operations in November 2017. Before starting my career at PacifiCorp, I held a number of positions of increasing responsibility over a period of 20 years within the generation organization of CalEnergy Generation U.S., including the position of General Manager, U.S. Gas Operations.

II. PURPOSE OF TESTIMONY

Q. What is the purpose of your testimony?

A. The purpose of my testimony is to describe PacifiCorp's investment in certain transmission and distribution assets included in this rate case.

Q. What specific transmission and distribution system investments are you addressing in this case?

A. In addition to addressing PacifiCorp's wildfire mitigation investments, my testimony addresses the following specific projects:

- Delta fire damaged transmission facilities rebuild (Line 14 and Line 2);
- The Portland Low Voltage Secondary Network (LVSN) Project; and
- Oregon Advanced Metering Infrastructure (AMI) installation.

My testimony supports the Company's incremental investments in wildfire mitigation to address the risks posed by the increased frequency, severity and costs of wildfires to customers, employees, and Company facilities. My testimony also supports the Company's investments in the specific projects described above as prudent and in the public interest.

III. WILDFIRE MITIGATION PROJECTS

Q. Have the risks associated with wildfires changed in PacifiCorp's service territories?

A. Yes. There has always been some degree of wildfire risk across PacifiCorp's territories, including in Oregon. This risk is inherent to operating an electric utility, and is elevated for utilities in the Western United States where climates are arid year-long in some areas, or seasonally in others. However, the frequency, severity, and costs of catastrophic wildfires are increasing across the West. California's recent experiences with catastrophic and tragic wildfires, has resulted in an even greater focus on wildfire risk mitigation by public utilities. The widely publicized impact of these fires on California's public utilities has led to an increased focus on wildfire risks in PacifiCorp's service territories in California and other states, including Oregon. Evidence of this increased risk and focus on wildfires has had measurable impacts on the insurance market as "insurers have become concerned about the growing liability risks to utilities, and prices have increased substantially."[1]

Q. How is PacifiCorp addressing this increased risk profile?

A. PacifiCorp is adapting to the changes in wildfire risk through adoption of accelerated and enhanced wildfire mitigation measures that meet new industry best practices, largely derived from the experiences of California, for utility wildfire mitigation. PacifiCorp identified key goals to help inform its wildfire mitigation approach: 1) minimize the risk of wildfires from PacifiCorp equipment; 2) promptly address any problems attributed to PacifiCorp equipment if they do occur; 3) be prepared to address wildfires from other sources; and 4) respond when a wildfire puts utility equipment at risk. PacifiCorp took these goals and engaged in an extensive modeling process to develop a risk-based approach to achieving them. This risk-based approach facilitates smart investments targeted to places on PacifiCorp's system where they will have the most impact, and ensures that PacifiCorp's human capital is also deployed in areas where they will have the greatest impact. These targeted investments are incremental to PacifiCorp's investment in the ordinary course of its business, and will meaningfully reduce the wildfire risk on the Company's system.

[1] Carolyn Kousky, Katherine Greig & Brett Lingle, *Financing Third Party Wildfire Damages: Options for California's Electric Utilities*, Wharton Risk Management and Decision Process Center (Feb. 2019) *available at* https://riskcenter.wharton.upenn.edu/wp-content/uploads/2019/02/Financing-Third-Party-Wildfire-Damages-1.pdf.

Q. Please describe how the risk of wildfire has been modeled in PacifiCorp's service territory.

A. PacifiCorp recognizes that if certain weather and fuel conditions are present, a disruption of normal operations on the electrical network, called a "fault", can result in the ignition of a fire. Under certain weather conditions and in the vicinity of wildland fuels, such an ignition can grow into a harmful wildfire, potentially even growing into a catastrophic wildfire causing great harm to people and property. PacifiCorp's risk analysis reviews fire history, the recorded causes of the fires, the acreage impact of the fires, and when in the year the fires typically occur. Using that information, the risk analysis identifies the logic for a risk-informed method to strategically address utility wildfire risks. PacifiCorp patterned its wildfire risk modeling on the methodology developed after a long and iterative process in California. To take advantage of the experience learned through that process, PacifiCorp engaged REAX Engineering Inc., a fire-science engineering firm, to identify areas of elevated wildfire risk, designated as Fire High Consequence Areas (FHCA).

The data and process used in PacifiCorp's analysis are as follows:

1) Topography of the land, including elevation, slope, and aspect;

2) Fuel data which quantify fuel loading, fuel particle size, and other quantities needed by fire models to calculate the rate of spread;

3) Weather Research and Forecasting, which is a hybrid of weather modeling and surface weather observations (including temperature, relative humidity, wind speed/direction, and precipitation);

4) Historical fire weather days spanning the period from January 1, 1979, through December 31, 2017;

5) Estimated live fuel moisture;

6) Ignition modeling, using Monte Carlo simulated ignition scenarios; and

7) Fire spread modeling.

A final confirmation exercise was completed by evaluating the FHCA against historical fire perimeters (which are the final recorded footprint for any given fire), existing Company facility equipment, and the Company's service territories. The resulting FHCA, with wildfire perimeters, and PacifiCorp's service territories are shown in Exhibit PAC/1101. In general, if population density did not correlate to fuel and fire weather history, it would not be considered a candidate for FHCA designation.

Q. Based on this wildfire risk modeling, what components of PacifiCorp's system have been identified as existing in a FHCA?

A. Based on the wildfire risk modeling conducted in PacifiCorp's service area, a large portion of PacifiCorp's service territory in southern Oregon, northern California and parts of Washington and Utah are identified as having sections inside the FHCA and are candidates for wildfire mitigation project investments.

Q. What are the costs for the wildfire mitigation projects in 2019 and 2020?

A. Table 1 below describes the specific wildfire mitigation costs by breakdown of activity.

Table 1: Wildfire Mitigation Program Capital Costs*

Mitigation Program	Description	Purpose/Risk Being Mitigated	Category	2019 Capital Costs	2020 Capital Costs	2021 Capital Costs	2022 Capital Costs
System Hardening	Distribution line rebuilds including all or parts of the following: installation of covered conductor, pole replacements, wrapping wood poles in fire proof mesh, and conductor replacements	Reduce equipment failure that may ignite a wildfire along with increased resiliency to a wildfire occurrence	Oregon Distribution	$550,000	$13,364,000	$37,991,000	$38,253,000
System Hardening	Transmission line rebuilds including all or parts of the following: installation of covered conductor, pole replacements, wrapping wood poles in fire proof mesh, and conductor replacements	Reduce equipment failure that may ignite a wildfire along with increased resiliency to a wildfire occurrence	Transmission	$35,000	$20,475,000	$34,538,900	$35,420,000
Advanced Protection and Control	Replace electromechanical relays protecting distribution lines in FHCA with modern microprocessor relays that provide more accurate data and faster relaying	Increasing ability to locate where a fault occurred on a line which could result in increased patrol time	Oregon Distribution	$458,000	$2,330,000	$2,465,000	$1,700,000
Advanced Protection and Control	Replace electromechanical relays protecting transmission lines in FHCA with modern microprocessor relays that provide more accurate data and faster relaying	Increased ability to locate where a fault occurs on a line which contributes to improved patrol time	Transmission	$1,308,000	$4,743,000	$3,774,000	$750,000
Condition Corrections	Prioritize corrections to any deficiencies found from inspections in the FHCA	Reduce equipment failure that may ignite a wildfire along with increased resiliency to a wildfire occurrence	Transmission	$200,000	$100,000	0	0
Access Roads and Rights-of-way increases	Addition of new access roads and/or improvements along with increasing rights of way on transmission lines that the forest service wants to use as fire breaks	Reduce likelihood of equipment loss in the case of a wildfire by increasing accessibility for firefighters	Transmission	0	$1,000,000	0	0
Total				**$2,551,000**	**$42,012,000**	**$78,768,000**	**$76,123,000**

*Transmission costs are provided on a total-company basis. Oregon distribution costs are situs assigned to Oregon

I discuss these mitigation programs in more detail below.

System Hardening

Q. Please explain what system hardening is in the context of the Company's wildfire mitigation efforts.

A. System hardening is an engineered response to an identified risk to the electrical system. System hardening includes retrofitting specific devices or components within the system to make it more resilient, and may also include the wholesale replacement of legacy equipment when retrofitting is not a viable solution. I will describe some of the system hardening that PacifiCorp is and will be engaging in to mitigate wildfire risks in more detail below.

Q. How do these system hardening projects reduce the threat of wildfire?

A. PacifiCorp's system hardening projects focus on reducing the potential that the power system is the source of ignition for a catastrophic fire by creating a spark during a fault event. A significant ignition driver on electrical systems is contact from foreign objects (trees, wildlife, mylar balloons, etc.) that can result in high-energy and high-temperature arcing between two conductors or between one conductor and the ground.

Q. What hardening efforts on distribution systems reduce potential ignitions?

A. A key hardening effort for wildfire mitigation is a covered conductor program to mitigate the risk of contact related faults on overhead conductor. Covered conductor, unlike bare conductor, is designed to withstand incidental contact with vegetation, other debris, and even the ground in a wire down event. The program will involve more than replacing existing bare conductor with covered conductor. Poles will be replaced as necessary based on loading assessments of existing poles where covered conductor is to be installed. This is because, covered conductor is heavier than bare conductor, and under the combination of ice and wind has a larger diameter which results in further additional pole loading. A secondary benefit to covered conductor is an improvement in reliability. In certain applications standard overhead fuses will be replaced within the FHCA with non-expulsion fuses that eliminate any melted fuse material from falling to the ground when operated. In addition, distribution poles will be evaluated based on location within the FHCA and, if required, replaced with composite material poles to diversify the vintages (remaining strength), and reduce wildfire risk due to pole failures as wildfires burn through an area.

Q. Is it standard practice for PacifiCorp to install covered conductor, non-expulsion fuses, or composite material distribution poles?

A. No. Standard overhead circuit construction uses bare conductor and wood poles that balance safety, reliability, and costs. The installation of covered conductor, non-expulsion fuses, and composite material poles are in direct response to increased wildfire risk and are specifically designed to accelerate and improve mitigation of catastrophic wildfires associated with PacifiCorp's system.

Q. What were the Company's capital expenditures with respect to its system hardening efforts in 2019?

A. As shown in Table 1, in 2019, PacifiCorp made approximately $585,000 ($559,000 Oregon-allocated) in distribution and transmission capital expenditures for its system hardening wildfire mitigation measures.

Q. What capital expenditures will the Company make in 2020 and what does the Company forecast for 2021 and 2022 with respect to system hardening?

A. As shown in Table 1, in 2020, PacifiCorp will make capital expenditures of approximately $13,364,000 in its Oregon distribution system and $20,475,000 ($5,328,000 Oregon-allocated) in its transmission system on system hardening. PacifiCorp expenditures will further accelerate into 2021, when approximately $37,991,000 will be spent on system hardening the Oregon distribution system and $34,539,000 ($8,988,000 Oregon-allocated) on hardening the transmission system. In 2022, the Company anticipates additional expenditures of $38,253,000 to harden the Oregon distribution system and $35,420,000 ($9,217,000 Oregon-allocated) to harden the transmission system.

Q. How do transmission line rebuilds help mitigate and protect against wildfire risk?

A. Rebuilding transmission lines helps to reduce equipment failures and incidental contacts that pose a risk of wildfire ignition. Such equipment failures, while infrequent occurrences, could result in substantial arc energy that can result in wildfire ignition. Due to the cross-country nature of many portions of PacifiCorp's system (particularly on the local transmission network) the risk of ignition sources is heightened. For example, in Oregon, trees outside of the vegetation managed corridors that are particularly tall, or located on slopes, result in increased risk of fall-in contacts. Rebuilding transmission lines in areas where this risk is heightened allows PacifiCorp to install covered conductor and improve structures. Respectively, such measures will reduce the probability of a fault event and improve resiliency to the extent rebuilt structures can better withstand localized wildfire events.

Q. What criteria did the Company use to select areas in the FHCA to replace existing conductor with covered conductor?

A. PacifiCorp targeted areas within the FHCA to determine what areas in its system were at elevated risk based on proximity to population centers, historic weather patterns, and vegetation. Covered conductor was selected for use where there is risk of incidental contacts, such as large branches or trees striking the phase conductors.

Q. Are there reliable measurements or metrics the Company can use to determine how successful the use of covered conductor is in mitigating wildfire risks over time?

A. Yes, though such measurements will not be immediately informative. Over time, the Company anticipates that comparisons of fault rates resulting from incidental tree contacts for the areas where covered conductor is employed versus the same areas before replacement with the covered conductor will demonstrate the effectiveness of this measure.

Q. What kind of monitoring does the Company plan to use to ensure that the use of covered conductor is meeting expectations in the absence of such metrics?

A. As noted in my response to the preceding question, the Company will track fault rates resulting from incidental tree contacts on rebuilt sections. This information will enable the Company to compare faults both before and after installation of covered conductor to better understand how successful it has been in mitigating wildfire risks over time. Unfortunately, the data needed to quantitatively provide useful metrics for such a comparison will not be available for several years.

Q. How do pole replacements help mitigate and protect against wildfire risk?

A. Replacing wood pole structures with composite materials increases the structure's ability to withstand wildfires caused by non-utility sources, and therefore enhances the resiliency of the system. The reduced risk of a composite pole burning also reduces the risk posed by a pole failure, which could exacerbate an existing wildfire caused by another source.

Q. What criteria is the Company using to identify the poles that should be replaced?

A. The Company has developed several criteria to determine which poles to replace, including condition based information, the quantity of attachments (e.g., joint use with cable or communication providers) that could result in higher use of the available pole strength, age of the pole, its location, right of way clearances, and the existence of wildfire fuel (i.e., vegetation) in the area.

Q. Are there reliable measurements or metrics that the Company can use to determine how successful its pole replacements are in mitigating wildfire risks over time?

A. No, however, PacifiCorp expects to observe a small reduction in its pole intrusive reject rates over time as a result of these replacements.

Q. Please describe fireproof mesh wrapping for wooden poles and how it works.

A. The fireproof mesh wrapping is intumescent, meaning that it swells in the event of a fire. That swelling protects the underlying wood. The companies that manufacture the wrapping have tested the material at testing labs to demonstrate the material's effectiveness at protecting wooden poles from fire damage.

Q. Why not wrap all wooden poles with fireproof mesh?

A. Not every pole on PacifiCorp's system is expected to be at high risk of wildfire. Installing the mesh on all poles would increase costs without an expected corresponding benefit. PacifiCorp's Oregon system uses more than half a million poles, at approximately $100 per pole, the costs of such an effort would be over $50 million. Aside from the costs, it would take years for the Company to complete such an extensive program. Finally, there are maintenance trade-offs to encircling a pole with fireproof mesh, such as impeding intrusive testing, that weigh in favor of targeted use of fireproof mesh over a system-wide application.

Q. How will the Company determine where fireproof mesh wrapping wooden poles will have the biggest wildfire mitigation impact?

A. PacifiCorp will focus on FHCAs to determine which poles to fully replace and which to employ fireproof mesh. The poles that will be covered with the mesh are those that are relatively young, structurally sound, have no outstanding observed maintenance needs, and have limited joint use attachments affecting the strength of the pole.

Q. What criteria will the Company use to measure the success of its pole wrapping and pole replacement efforts?

A. When and if fires occur near facilities that have received the pole wrapping, PacifiCorp will be able to observe the success of its efforts. To monitor this, the Company will record locations where the fire mesh is installed, and areas where wooden poles are replaced with composite poles, to assess the relative performance of each during any wildfires that occur.

Advanced Protection and Control

Q. Please explain what advanced protection and control measures are in the context of wildfire mitigation.

A. Advanced protection involves the deployment of sophisticated protection control strategies, particularly advanced relay technologies on distribution and transmission lines. In the context of wildfire risk mitigation, these protection control strategies involve the device operations that take place when fault events occur. In contrast to the wildfire mitigation strategies discussed above, which relate to limiting the occurrence of fault events, advanced protection and control strategies relate to limiting the length and magnitude of a fault event. Specifically, the window of time after fault events represents the time when electrical system facilities pose the highest risk of igniting adjacent fuel, which could result in a wildfire. Reducing the time between when a fault occurs and that fault condition is cleared, reduces the risk of igniting adjacent fuel, and therefore also reduces wildfire risk.

Q. Please describe the differences between legacy electro-mechanical relays and modern microprocessor relays.

A. Unlike an electro-mechanical relay, microprocessor relays are able to exercise programmed functions nearly immediately (near the speed of light), which results in much faster device response during fault conditions. Microprocessor relays also allow for greater customization to address environmental conditions through multiple settings groups; they are also better able to incorporate complex logic to execute specific operations. Also, in contrast to electro-mechanical relays, microprocessor relays retain event logs that provide data for fault location and later analysis.

Q. Will these modern microprocessor relays provide the Company more data regarding line contacts and other faults on the system than the electro-mechanical relays currently used on PacifiCorp's system?

A. Yes. These new relays will capture a variety of event logs, including waveforms during fault events.

Q. How will the additional data provided by these new relays help the Company in its wildfire mitigation efforts?

A. In addition to faster fault clearing schemes, these relays improve response times since they can identify locations where disturbances emanate from, which will be used by field and office teams to assess these situations. PacifiCorp will also use this data during investigations of events to ensure that the devices performed consistent with the programmed settings and to evaluate other wildfire mitigation technologies.

Q. What were the Company's capital expenditures with respect to its advanced protection and control wildfire mitigation efforts in 2019?

A. As shown in Table 1, in 2019, PacifiCorp made capital expenditures of approximately $458,000 in its Oregon distribution system and $1,308,000 ($358,000 Oregon-allocated) in its transmission system to implement advanced protection and control wildfire mitigation measures.

Q. What capital expenditures will the Company make in 2020 and what does the Company forecast for 2021 and 2022 with respect to its advanced protection and control wildfire mitigation efforts?

A. As shown in Table 1, in 2020, PacifiCorp will make capital expenditures of approximately $2,330,000 in the Oregon distribution system and $4,743,000 ($1,234,000 Oregon-allocated) in the transmission system to further implement advanced protection and control measures, as its wildfire mitigation efforts accelerate. PacifiCorp anticipates that level of expenditure to continue into 2021, when approximately $2,465,000 will be spent on advanced protection and control in its Oregon distribution system, and $3,774,000 ($982,000 Oregon-allocated) in its transmission system. In 2022, the company anticipates a slightly lower expenditure of $1,700,000 in its Oregon distribution system and $750,000 ($195,000 Oregon-allocated) in its transmission system.

Condition Corrections

Q. Please describe the Company's condition correction process as it relates to wildfire mitigation efforts.

A. When the Company inspects its system infrastructure, it documents "conditions" which reflect observed characteristics, including wear or damage, of a given element of PacifiCorp's system. These conditions are reported in PacifiCorp's Facility Point Inspection (or FPI) system, and ranked for priority. Based on that priority, work is assigned to personnel to correct and repair conditions requiring attention.

Q. Has the Company modified its inspection process to address increased wildfire risks in FHCAs?

A. Yes. A subset of conditions observed during inspections pose a potential source of wildfire ignition. To better track these, PacifiCorp created a classification in FPI called "fire threat conditions." This designation allows the Company to assign personnel to accelerate correction of these conditions, and to address them in advance of high wildfire risk periods to help reduce the risk that fire threat conditions will lead to a wildfire.

Q. What were the Company's capital expenditures with respect to condition correction to mitigate wildfire risk in 2019?

A. As shown in Table 1, in 2019, PacifiCorp made capital expenditures of approximately $200,000 ($52,000 Oregon-allocated) on condition corrections in its transmission system as part of its wildfire mitigation efforts.

Q. What capital expenditures will the Company make in 2020 with respect to condition correction to mitigate wildfire risk?

A. As shown in Table 1, in 2020, PacifiCorp will make capital expenditures of approximately $100,000 ($26,000 Oregon-allocated) on condition corrections in its transmission system as part of its wildfire mitigation efforts. PacifiCorp does not anticipate expenditures in 2021 and 2022.

Q. How does the Company plan to measure the success of this modified inspection process?

A. As with many of these wildfire mitigation efforts, the best indication of effectiveness will be reduced incidents of wildfire ignitions over time. While comparisons between periods prior to implementing these efforts to the periods following may provide some useful information, those comparisons will not be immediately informative due to a lack of sufficient data.

Q. How will that information allow the Company to improve and refine its inspection process overtime to better address wildfire risks in FHCAs?

A. PacifiCorp will be able to better identify "conditions" that cause higher fault rates. By focusing on these "conditions" the Company will continue to improve and refine its inspection process in FHCAs.

Access Roads and Rights-of-Way

Q. Please explain how the addition of new access roads and other improvements, and increasing rights-of-way on transmission lines support the Company's wildfire mitigation efforts?

A. Increasing access roads help to reduce the likelihood of equipment loss when wildfires occur by increasing accessibility for firefighters. While increasing transmission line rights-of-way benefit firefighter access (and also creates potential fire breaks for fire defense positions), it also affords better access for utility response personnel and can be valuable in improving the utility corridor.

Q. What capital expenditures will the Company make in 2020 with respect to access roads and increased rights-of-way?

A. As shown in Table 1, in 2020, PacifiCorp will make capital expenditures of approximately $1,000,000 ($260,000 Oregon-allocated) to expand access roads and rights-of-way across its transmission system. PacifiCorp does not anticipate expenditures in 2021 or 2022.

Q. How does the Company plan to evaluate and improve upon its access roads and rights-of-way efforts over time?

A. PacifiCorp will continue to take feedback from firefighters and patrol personnel regarding access roads and rights-of-way to monitor its efforts over time.

Q. Please describe the benefits of PacifiCorp's wildfire mitigation investments.

A. Proactively investing in wildfire mitigation projects in identified FHCAs reduces the risk of catastrophic fire caused by PacifiCorp's facilities, directly benefiting PacifiCorp customers. In addition, reducing the risk of catastrophic fire benefits fire response agencies, preserves customer property and Company facilities, and minimizes the cost of rebuilding.

Q. How do PacifiCorp's wildfire mitigation efforts relate to the Company's standard safety and compliance activities?

A. Many of the wildfire mitigation strategies I discuss above go beyond standard utility practice. For example, PacifiCorp does not, in the normal course, install covered conductor or wrap poles in fireproof mesh. These measures are in direct response to changing best practices for mitigating wildfire and are incremental to work PacifiCorp would do in the ordinary course of its business. Similarly, activities such as replacement of existing equipment (replacing distribution poles with composite material poles, replacing electro mechanical relays, etc.) are now informed by the potential for the replacement to mitigate wildfire risk, location of the existing equipment within FHCA, and may involve accelerated replacements. Certain activities such as conditions corrections, are a standard part of PacifiCorp's safety operations. Prioritizing and accelerating conditions corrections that are identified as potentially increasing wildfire risk, however, is a new feature of PacifiCorp's conditions corrections protocols.

Wildfire Mitigation Program Costs for 2021 - 2022

Q. Will the Company's wildfire mitigation projects continue after 2020?

A. Yes. As discussed in docket UM 2013, PacifiCorp's Application for Deferred Accounting Related to Wildfire Risk Mitigation Measures, PacifiCorp's wildfire mitigation efforts will span multiple years.[2]

Q. Does PacifiCorp have a proposal for cost recovery of costs associated with wildfire mitigation projects in 2021 and 2022?

A. Yes. As described in the testimony of Ms. Etta Lockey, the Company is proposing a Wildfire Cost Recovery Mechanism to recover the costs of continued wildfire mitigation activities in 2021 and 2022.

IV. DELTA FIRE DAMAGED FACILITIES REBUILD

Q. Please provide an overview of the Delta fire and how it impacted PacifiCorp facilities.

A. The Delta fire ignited on September 5, 2018, two miles north of Lakehead in Shasta County, California. The fire rapidly grew in size and burned along the Interstate 5 corridor near Slate Creek and Dog Creek. The fire burned for weeks and consumed approximately 60,000 acres. The PacifiCorp facilities damaged by the Delta fire included a six-mile section of the 115 kilovolts (kV) transmission line (Line 14) and a five-mile section of the 69 kV transmission line (Line 2). Both sections required a

[2] *See In the matter of PacifiCorp dba Pacific Power's Application for Deferred Accounting Related to Wildfire Risk Mitigation Measures*, Docket No. UM 2013, Application for Deferred Accounting (May 14, 2019).

complete rebuild. Please refer to Exhibit PAC/1102 for a map of the Delta Fire transmission rebuild.

Q. Please describe the investment for the rebuild of the facilities damaged by the Delta fire.

A. The rebuild project consisted of replacing 78 transmission structures on Line 14 and 110 transmission structures on Line 2 that were impacted by the Delta fire. Also included in this project were associated vegetation management (clearing the rights-of-way of hazard trees), access road repairs, environmental and archaeological studies, inspections and surveys, material hauling charges, and other project oversight requirements. The total-company cost for the rebuild project was approximately $36.1 million, or $9.4 million on an Oregon-allocated basis.

Q. Please describe the benefits of rebuilding the transmission lines damaged by the Delta fire.

A. The Delta fire damaged both Line 14 and Line 2 to the point where both lines were inoperable and not available as part of the integrated PacifiCorp transmission system. While there are alternative sources and paths available while transmission lines are out, this reduces the overall capability and flexibility of the transmission system as a whole. For example, Line 14 is an interconnection with Pacific Gas and Electric Company from the south that is normally open, but serves as an alternate source if PacifiCorp loses the source from Weed Junction. Leaving Line 14 out of service for any duration leaves the system on a radial feed from the north and increases reliability risk to PacifiCorp customers. For these reasons, rebuilding the sections of Line 14 and Line 2 that were damaged provides benefits to PacifiCorp's Oregon customers.

V. PORTLAND UNDERGOUND NETWORK MONITORING

Q. Please briefly describe the Portland underground network.

A. The LVSN is a network of equipment and technologies that provides enhanced reliability to specific sections of PacifiCorp's Portland service territory. It is designed to ensure reliable provision of electric service to customers and businesses with high-reliability needs. The LVSN is a complex system due to the mesh configuration. A mesh network configuration provides maximum reliability and is used by utilities in congested areas, such as metropolitan and suburban business districts. The system is composed of many aging components, including switches, transformers, cable, and network protectors, and visibility into the network's operational status is limited to manual inspections of equipment in vaults and man-holes. The lack of visibility and situational awareness associated with the LVSN exposes the Company and customers to major outages if equipment or the system fails or does not operate correctly. If those issues go unnoticed, the result can cascade into large outage events with long recovery timelines.

Q. How is PacifiCorp responding to this potential risk?

A. PacifiCorp is responding to this potential risk through the installation of the VaultGard network monitoring system for the LVSN that covers approximately 70 blocks in the downtown Portland area, with additional vaults extending towards the Albina Substation.

Q. What are the specific benefits of the VaultGard system?

A. The installation of the VaultGard network monitoring system for the LVSN provides status information to facilitate control of field devices remotely allowing for notifications and alarms to be sent to a central control center to alert operators of equipment abnormality. These monitoring capabilities allow the Company to identify potential system conditions/deficiencies before major outages occur.

Q. Please describe the components included in the network monitoring system.

A. The scope of the project includes 73 VaultGard systems for the downtown Portland network, and eight VaultGard systems for the Lloyd network. The project also includes installation of a fiber communications system and connection of all network protectors across all vaults in the downtown and Lloyd networks.

Q. Please describe the costs associated with this project.

A. The current costs are $7.2 million. This includes the network monitors put in service in 2019. The projected additional costs through the end of the project are $496,000, with approximately $130,000 carrying over into 2020. This remaining spending is related to the delay of the VaultGard commissioning in a few locations described below.

Q. What is the status of this project?

A. All VaultGard assemblies are installed and commissioned with the exception of a few locations. The VaultGard assemblies for two locations are installed, but not yet commissioned because they are direct metered and PacifiCorp does not yet have an agreement in place with the building owners. The VaultGard commissioning in a third location is delayed due to recent remodeling activities at the location limiting access to one of PacifiCorp's vault. PacifiCorp and the owners of the building have an agreement in place that allows PacifiCorp unencumbered access to its vaults.

PacifiCorp is currently in negotiations with the tenant at the impacted location to resolve the access issue.

Q. How is the inclusion of the LVSN in rates beneficial to customers and otherwise in the public interest?

A. As a result of the LVSN, PacifiCorp will be able to improve customer service levels and introduce a greater level of system monitoring to avoid end-user equipment damage and identify potential system conditions so they may be addressed before outages occur on the LVSN. In addition, the implementation the VaultGard monitoring system creates a platform allowing PacifiCorp increased visibility and control of the electrical network resulting in improved response times to system conditions.

VI. OREGON AMI PROJECT

Q. Please briefly describe the Oregon AMI Project.

A. The Oregon AMI Project began in 2017 and was completed in early 2020. The Project consisted of the on-site replacement of approximately 627,000 existing customer meters with AMI meters and installation of AMI-related technology and telecommunications infrastructure, including construction of a field area network across the 21,292 square miles of PacifiCorp's Oregon service territory.

The Oregon AMI Project leveraged existing information technology infrastructure, which was developed in connection with PacifiCorp's California AMI project. This infrastructure was modified and expanded to support Oregon-specific functionality. With implementation of the Oregon AMI project complete, customer usage data is now sent wirelessly to PacifiCorp's meter data management system and is available to customers via the Company's website. In addition, PacifiCorp is able to remotely connect and disconnect electric service.

Q. Please describe the specific components of the AMI system that PacifiCorp invested in as part of the Oregon AMI Project.

A. The Oregon AMI Project consists of the following four primary components and work streams:

1. Installation of AMI

AMI contains a network interface card that enables two-way communication to and from the Company. It is also capable of capturing analytic data, such as temperature, voltage, and power quality. AMI captures meter readings at pre-set intervals and transmits read data wirelessly to the Company. Residential and small commercial meters contain a disconnect switch that enables remote connect and disconnect functionality.

2. Installation of Field Area Network

A field area network consists of communication devices, referred to as access points and relays, which communicate wirelessly to and from a number of meters in a given geographic area. Using the relays, data is transmitted from the access points to the utility's information technology infrastructure, often referred to as the "head-end," via cellular service. To create a field area network, the Company installed access points and relays on PacifiCorp's utility poles throughout its service territory.

3. Development, Installation, and Configuration of Head-End; Software Integration

The head-end is the Company's information technology infrastructure to which data is transmitted via the field area network. The head-end enables the Company to use the data captured by the AMI meter, which includes interval meter reads and temperature, voltage, outage, and power quality data. Such data is used by the Company via third-party AMI software that is integrated with the Company's legacy computer systems and the head-end, and enables the utility to send commands, such as connect or disconnect to the meter.

4. Development of Energy Usage Website

PacifiCorp has enhanced its existing energy usage website to include customer access to historic, hourly consumption based on data captured by the Company's AMI. This access provides customers with hourly energy consumption data from the previous calendar day. Another enhancement to the energy usage website is a bill projection for the current billing cycle. After seven days of usage in a billing month, a customer is able to log into their secure on-line account and see a projected bill amount for that particular billing month. PacifiCorp has also incorporated existing customer communication preferences with the bill projection data. Customers with AMI are able to set up a preference to receive an alert from PacifiCorp when the customer's projected bill will exceed a pre-determined dollar threshold designated by the customer. The customer may choose to receive the alert via text or email.

Benefits of AMI Deployment

Q. Why did PacifiCorp deploy AMI in Oregon?

A. PacifiCorp deployed AMI to provide customer benefits ranging from lowering operating costs (i.e., by reducing manual metering reading operations) and improving reliability, to providing customers with information and tools to better understand and derive greater value from their energy service. PacifiCorp identified AMI as a key technology to enable the Company to achieve long-term customer service objectives. Specifically, AMI functionality allows the Company to:

- Provide customers access to data regarding their hourly energy consumption, which will enable them to make more informed energy decisions;
- Reduce the number of estimated bills by providing the Company with actual meter data regardless of physical access barriers, bad weather delays, or other factors that can impede physical meter reading and give rise to estimated billing;
- Perform remote connect and disconnect which will enable service to be turned on and off on a near real-time basis without deploying employees to customers' premises;
- Detect and trouble-shoot power outage situations and react to customer outages in a more timely manner, without waiting for an outage notification from the customer;
- Obtain analytic information, such as temperature, voltage, and power quality data which can be used to assess system performance and improve service to customers;
- Provide better customer service by giving PacifiCorp's customer service representatives information necessary to provide accurate responses to customer inquiries and facilitate customer complaint resolution;
- Introduce efficiencies related to automation that reduce the cost to obtain meter reads and perform service connects and disconnects; and
- Minimize carbon dioxide emissions through reduced use of vehicles for meter reading operations.

Financial Analysis of Oregon AMI Project

Q. Please describe the costs associated with the Oregon AMI Project.

A. The total project cost of the Oregon AMI Project is $112.1 million in capital costs and $2.5 million in operation and maintenance (O&M) costs. Capital costs are broken down into the following components in support of the Oregon AMI Project: meters ($79.4 million), information technology and telecommunications ($25.5 million), and customer service and project management ($7.2 million). O&M costs are brokedown as follows: information technology and telecommunications ($0.5 million) and customer service and project management ($2.0 million). Going forward, new O&M costs will be incurred in order to run and support the AMI system, with annual operating costs estimated at $2.5 million following the first full year of implementation (year 2019). These costs include new call handling costs, field network hardware maintenance, and information technology maintenance and support.

Q. Please describe the potential O&M savings associated with the Oregon AMI Project.

A. The installation of AMI meters in Oregon will reduce costs related to manually reading meters. Subject to continued costs relative to opt-out customers, use of AMI meters also eliminates the need for employees to drive to customer locations to perform manual connect functions after normal business hours, reducing the amount of overtime required. Further, except with respect to manual meter reading services that will continue to be provided to opt-out customers, PacifiCorp will eliminate use of handheld devices and the cost of maintenance fees required to support those devices.

Q. Is PacifiCorp's investment in Oregon AMI Project prudent and cost effective?

A. Yes. PacifiCorp's investment in Oregon AMI Project is prudent and cost effective because of the advantages it affords PacifiCorp's customers. It may also result in reductions to PacifiCorp's annual operating costs as discussed above.

Q. Is the inclusion of the Oregon AMI Project in rates beneficial to customers and otherwise in the public interest?

A. Yes. As a result of the Oregon AMI Project, PacifiCorp will be able to improve customer service levels and introduce a greater level of transparency into the costs associated with energy usage decisions. In addition, the implementation of AMI creates a platform for smart grid modernization allowing PacifiCorp increased visibility into the electrical network and customer interface to assist in future programs and investments. The Oregon AMI Project also results in incidental benefits to the public generally, including the reduction of vehicle emissions due to the decrease in manual meter readings.

VII. CONCLUSION

Q. Please summarize your testimony.

A. My testimony demonstrates that there can be significant costs and impacts to the Company and its customers associated with wildfires. Therefore, it is prudent for PacifiCorp to make incremental investments in wildfire mitigation projects to reduce the risk of wildfires caused by its facilities in its service territories, especially as wildfires have grown in frequency and severity in the West. My testimony outlines the methodology that PacifiCorp has used to identify locations and specific projects to help mitigate the risk of catastrophic wildfires in the FHCA. I also explain the need to rebuild critical facilities that have been damaged by wildfires.

My testimony also demonstrates the Company's commitment to improve customer service levels through the introduction of technology that allows PacifiCorp increased visibility into the electrical network and customer interface in order to provide increased reliability and response to outages and equipment issues.

Q. Does this conclude your direct testimony?

A. Yes.

PacifiCorp Service Territory with FHCA and Wildfire Perimeters

February 2020

RISK-BASED APPROACH: Fire High Consequence Areas (FHCA)

- Utilizing the same modeling concepts used in California, areas were identified in Oregon and Washington where there is an elevated risk of utility-associated wildfires to ***occur*** and ***spread rapidly***, and where communities face an elevated risk of damage or harm from wildfires

- Per state requirement in California, Tier 3 and Tier 2 are shown regardless if facilities exist in the area; making the impact of Tier 2 seem larger than it is

- In Oregon and Washington, a similar methodology was used to identify FHCAs

- FHCAs are used to prioritize wildfire mitigation initiatives, such as, increased inspections, system hardening and proactive de-energization

Direct Testimony of Melissa S. Nottingham

February 2020

TABLE OF CONTENTS

ATTACHED EXHIBITS

I. INTRODUCTION AND QUALIFICATIONS

Q. Please state your name, business address, and present position with PacifiCorp.

A. My name is Melissa S. Nottingham and my business address is 825 NE Multnomah Street, Suite 2000, Portland, Oregon 97232. I am currently employed as Manager, Customer Advocacy and Tariff Policy. I am testifying for PacifiCorp d/b/a Pacific Power (PacifiCorp or the Company).

Q. Please describe your education and professional experience.

A. I have a Bachelor of Arts in English from Arizona State University and continue to pursue continuing education courses relevant to the utility industry. I began working for PacifiCorp in 1996, and worked in various positions with progressive responsibility for the past 20 years. For the past 10 years, I have been the Manager of Customer Advocacy and Tariff Policy in the Company's Regulation department.

Q. Please describe your current duties.

A. My current duties include overseeing a team of five regulatory analysts who respond to consumer commission complaints, sponsoring tariff changes, ensuring compliance with the Company's tariff rules, and participating in general rate cases and other regulatory proceedings for PacifiCorp's six state service territories. In addition, I oversee a team of three business analysts responsible for the administration of the contracts for new electrical load and the implementation and operation of the Company's customer guarantee program. As my team supports the Company's tariff rules in each state, we also support changes to Schedule 300, which are the charges associated with the implementation of the rules.

Q. Have you appeared as a witness in other regulatory proceedings?

A. Yes. I have testified in proceedings before the California Public Utilities Commission and the Washington Utilities and Transportation Commission.

II. PURPOSE OF TESTIMONY

Q. What is the purpose of your testimony in this case?

A. My testimony supports proposed changes to Schedule 300 of the Company's Oregon tariff schedules, Rule 10, Rule 11D, and a proposal for customers to receive a credit for paperless billing.

The proposed changes to Rule 10, Rule 11D, and Schedule 300, Charges as Defined by the Rules and Regulations, are provided in Mr. Robert M. Meredith's Exhibit PAC/1401.

Finally, I propose housekeeping changes to Schedule 300 regarding the referenced rules.

Q. Why are you proposing these changes?

A. The proposed changes reflect the Company's continued commitment to lower costs for our customers, and to empower customers to control their monthly bills.

Q. Please provide a summary of your testimony and the proposed changes.

A. My testimony proposes an update to several customer charges in Schedule 300. The Company reviewed the costs associated with Schedule 300 charges and identified areas where costs have changed. A variety of factors, including automation of returned checks and fluctuations in financial models for determining Facilities Charges, have contributed to lower costs and different values. Accordingly, the

Company is proposing to sync customer charges to more accurately reflect current costs.

My testimony proposes to update the applicability of the Service Connection Charge to certain applicants requesting service connection at a location with remote connection capability to reflect the Company's ability to now perform remote connections and avoid sending an employee to the premises to connect.

My testimony also proposes to implement a bill credit for customers who choose paperless billing (Paperless Bill Credit). The proposed Paperless Bill Credit will send a price signal to customers to incentivize behavior that results in actual cost savings for the Company. The Paperless Bill Credit will provide a monthly benefit to customers who participate as well as create an incentive for customers to adopt more sustainable practices.

All of the proposed changes are a continuation of PacifiCorp's ongoing commitment to provide fair and reasonable charges by closely managing expenses while still meeting customers' increasing expectations.

III. SCHEDULE 300 – CHARGES AS DEFINED BY THE RULES AND REGULATIONS

Q. Please describe the changes PacifiCorp is proposing to the Schedule 300 charges.

A. Table 1 shows the rule, a description of the charge, the current charge, and the proposed charge.

TABLE 1

Rule	Description of Charge	Current	Proposed
R. 10-2	Returned Payment Charge	$20	$12
R. 13-2	Facilities Charges, at Less than 57,000 volts, installed at Consumer's Expense	0.5% per month	0.4% per month
R. 13-2	Facilities Charges, at Less than 57,000 volts, installed at Company's Expense	1.4% per month	1.2% per month
R. 13-2	Facilities Charges, at and above 57,000 volts, installed at Consumer's Expense	0.3% per month	0.2% per month
R. 13-2	Facilities Charges, at and above 57,000 volts, installed at Company's Expense	0.9% per month	0.85% per month
R. 13-9[1]	Temp Service Charge – Single Phase	$85	$164
R. 13-9	Temp Service Charge – Three Phase[2]	$115	$164

Returned Payment Charge

Q. Please describe the Returned Payment Charge.

A. If a customer presents a payment that is returned by the customer's bank, the Company incurs a cost to process the returned payment. Payments can be returned for a variety of reasons, including, but not limited to, insufficient funds, incorrect account numbers, or closed accounts.

Q. What is the current Returned Payment Charge?

A. The current Returned Payment Charge is $20.

Q. What is the proposed change to the Returned Payment Charge?

A. PacifiCorp proposes to reduce the Returned Payment Charge from $20 to $12.

[1] PacifiCorp Rate Schedule 300 currently notes the Temporary Service Charge comes from R. 13-9. The reference should read R. 13-11 and is corrected in housekeeping changes later in the testimony.
[2] PacifiCorp is proposing to consolidate the single phase and three phase into one Temporary Service Charge, with the same charge amount.

Q. Why is PacifiCorp proposing this change?

A. Banks are now able to electronically transfer money from one bank to another bank with less human interaction. This automation of a portion of the return payment process has led to reduced costs to the Company when a payment is returned. Each time the Company's bank receives a returned item, the bank assesses a fee to the Company. These fees account for the majority of the cost to the Company when a customer's payment is not acknowledged as valid. The fee can vary from $11 to $16 based on the bank presenting the returned payment, the amount of the payment, and the number of times the payment is presented for payment.

While processing these payments has become more automated, labor costs are not completely eliminated. Each returned item requires a PacifiCorp employee to update the account information and reverse the payment if the billing system has already posted the payment to the account. The labor costs range from $1 to $6 per transaction. The Company is proposing $12 as it closely represents the low-end of the average costs of both the labor and the bank fees associated with these returned payments. See Exhibit PAC/1201 for the calculation of the proposed charge.

Facilities Charges

Q. What changes are you proposing for Facilities Charges?

A. PacifiCorp is proposing to lower the Facilities Charges for new distribution and transmission service. Table 2 includes both the current Oregon Facilities Charge and proposed Facilities Charge by voltage.

TABLE 2

Oregon Facilities Charge		
	OR Current	**OR Proposed**
Distribution-Voltage Equipment (<57,000 volts)		
On Customer $	0.5%	**0.4%**
On Company $	1.4%	**1.2%**
Transmission-Voltage Equipment (≥57,000 volts)		
On Customer $	0.3%	**0.2%**
On Company $	0.9%	**.85%**

Facilities Charges are calculated using the financial models provided as Exhibit PAC/1202.

Q. What are Facilities Charges?

A. Facilities Charges are the fixed costs of ownership of facilities necessary to connect new load to PacifiCorp's system, including but not limited to, the return and recovery of any capital investment, operations and maintenance costs, and ongoing taxes. Since these costs vary based on the type of service installed and are funded by both PacifiCorp and the customer, there are four different Facilities Charges percentages, as reflected in Table 2. The percentages in Table 2 are applied to both the customer's up-front payment for new service and PacifiCorp's capital investment. The product of these calculations is the Facilities Charges.

Q. Why is the Company proposing to lower the Facilities Charges?

A. Over time, PacifiCorp has reduced costs and increased operational efficiencies, reducing the minimum amount required to own and operate the required facilities. By lowering the percentages used to calculate the Facilities Charges, the savings will be passed onto the customer. PacifiCorp is passing these savings on to customers through the proposal to lower the Facilities Charges. Please see Exhibit PAC/1202 for more detail.

Q. Please describe when Facilities Charges are billed to a customer.

A. When a customer requests to connect new or additional electric load on the Company's system, the request can trigger both capital investments and additional maintenance costs. To ensure the new revenue generated will cover the costs associated with the new electric load request, the Company contracts with the new customers to recover the costs with a Contract Minimum Billing.

The Contract Minimum Billing is the greater of two items: the customer's bill or 80 percent of the customer's bill plus the Facilities Charge. If the revenue from the electrical usage covers the additional costs to own and operate the facilities, the Contract Minimum Billing is fulfilled or the costs to own and operate are recovered through the energy usage. If the revenue does not cover the additional costs to own and operate the new electrical load, the Facilities Charge is added to the billing.

Temporary Service Charge

Q. Please describe the Temporary Service Charge.

A. A Temporary Service Charge applies when a customer requests the energization of a temporary pedestal for temporary electric service. Temporary pedestals are typically needed for periods when a premise is under construction. The Temporary Service Charge covers the labor cost to bring either a single-phase or three-phase service line to the temporary pedestal and energize the service. Once the service is energized, the requesting customer is billed for the energy used. After the structure is completed, the temporary service is de-energized and the meter is relocated to the permanent meter base.

Q. What is the current Temporary Service Charge?

A. The current charge is $85 for single-phase service and $115 for three-phase service.

Q. What are the proposed changes to the Temporary Service Charge?

A. PacifiCorp is proposing to increase the charge to $164 for all temporary service installations and combine all phases into one charge. The $164 charge is based on the current loaded rate for one hour of journeyman time, which is similar to the methodology used when the Temporary Service Charge was initially calculated in 1987.

Q. Why is PacifiCorp proposing a change to the Temporary Service Charge?

A. The Temporary Service Charge has not been updated since 1987 and does not reflect the Company's current cost to provide this service. See Exhibit PAC/1201 for a summary of the cost calculation.

Paperless Bill Credit

Q. Please describe the Paperless Bill Credit.

A. PacifiCorp is proposing to add a credit to Schedule 300 and Rule 10 to provide customers a monthly credit if they have enrolled in paperless billing.

Q. What is the proposed amount of the Paperless Bill Credit?

A. The proposed monthly credit is $0.50.

Q. Why is PacifiCorp proposing a monthly credit for paperless billing?

A. PacifiCorp is proposing a Paperless Bill Credit that is correlated to the savings and benefits of not sending a paper bill to a customer when that customer voluntarily enrolls in paperless billing. Electronic delivery of the customer's monthly bill eliminates the cost of the bill paper, the envelope, printing and stuffing of the envelope, and the postage to mail the bill. Eliminating these costs results in savings of approximately $0.49 per metered service. By passing this savings to the customer in a $0.50 monthly credit, the Company is encouraging customers to utilize a lower cost billing option and a more environmentally friendly option. All customers, whether they are currently participating in or are new to paperless billing, are eligible to receive a credit as long as they are enrolled in paperless billing. Please see Exhibit PAC/1203 for more detail on the calculation of the credit and Mr. Meredith's Exhibit PAC/1401 for the proposed tariff changes to Schedule 300 and Rule 10.

Work Performed at Consumer's Request–Service Connection Charge

Q. Please describe the changes PacifiCorp is proposing to Schedule 300 and Rule 11D?

A. PacifiCorp proposes to add language to Rule 11D to indicate there is no Service Connection Charge for customers requesting new service at a location with remote connection capability during after-hours or on weekends/holidays. For locations with remote connection capability, PacifiCorp will no longer be required to send an employee to the site to manually turn the power on for a new service connection. However, since not all meters in Oregon have been upgraded with a remote connection meter, the Company still anticipates employees traveling to and from non-remote connection meter locations to turn on electric service. Customers requesting service connection at locations without a remote connection capable meter will continue to be charged the Service Connection Charge.

In addition to the change to Rule 11D, PacifiCorp proposes to change the description of the Service Connection Charge in Schedule 300 to specify there is a charge for non-remote service connections after hours and on weekends, and no charge for remote service connection. Please refer to Mr. Meredith's Exhibit PAC/1401 for the proposed tariff change.

IV. HOUSEKEEPING

Q. What housekeeping changes are you proposing?

A. I am proposing housekeeping changes to Sheet No. 300.3 in Schedule 300 to correct inaccurate sheet references. The Temporary Service Charge is changed from Sheet R13-9 to R13-11 and the Contract Administration Credit is changed from Sheet R13-11 to R13-13. Please see Mr. Meredith's Exhibit PAC/1401.

V. CONCLUSION

Q. Please summarize your testimony.

A. The proposed changes to PacifiCorp's Schedule 300, Charges as Defined by the Rules and Regulations, represent both the ongoing commitment by PacifiCorp to keep operational costs low for customers and align customer charges with cost. With one exception, all of the proposed charges are lower than current charges, and will benefit a comprehensive and diverse group of customers. The proposed change to Rule 11D will allow applicants connecting at a location with remote connection capability to connect after hours, weekends, and holidays while avoiding connection fees. The proposed bill Paperless Bill Credit creates an opportunity for customers to manage costs and directly receive the benefits of their choices.

Q. What is your recommendation regarding changes to Schedule 300, Rule 10, Rule 11D, and the proposed paperless bill credit?

A. I recommend that the Commission approve the changes to Schedule 300, Rule 10, Rule 11D, and the proposed Paperless Bill Credit (included in Rule 10).

Q. Does this conclude your direct testimony?

A. Yes.

Schedule 300 Charge Review

February 2020

Schedule 300 Fee Summary

Rule	Charge	Times Charged 7/1/18-6/30/19	Current Charge	Actual Cost	Proposed Charge	Comments
R.10-2	Returned Payment Charge	14,364	$20.00	$11.25 to $16.25	**$12**	The fees charged by the company's banks when a payment is returned and the labor to process returned payments on customer accounts. The fees vary based on the bank and how many times the same payment is processed.
R.13-2	Facilities Charges On Facilities at Less than 69,000 Volts Installed at Customer's Expense	Data Not Obtained	0.5% per month	N/A	**0.4 % per month**	Current data supports a reduction. The data is from the corporate Use of Facilities Charges found online in the corporate Financial Analysis Tools/Models. The facilities charges are based on the information reported in the company's Federal Energy Regulatory Commission Form No. 1 (FERC form 1), and supporting working papers.
R.13-2	Facilities Charges On Facilities at Less than 69,000 Volts Installed at Company's Expense		1.4% per month		**1.2% per month**	
R.13-2	Facilities Charges For Facilities at and above 69,000 Volts Installed at Customer's Expense		0.3% per month		**0.2% per month**	
R.13-2	Facilities Charges For Facilities at and above 69,000 Volts Installed at Company's Expense		0.9% per month		**0.85% per month**	
R.13-11	Temp Service Charge - Single Phase	1,838	$85.00	$164.18	**$164**	Increase in labor costs, calculated at one hour of the loaded labor cost for the type of employee performing the work.
R.13-11	Temp Service Charge - Three Phase	11	$115.00	$164.18	**Remove**	Three-phase temporary service is rarely used by our customers as the type of service lends itself to permanent installations. Recommend removing this cost and merging the two temporary service charges into one.
NEW	Paperless Bill Credit	0	0		**$.50 Bill Credit**	Each month, customers participating in paperless billing will receive a credit directly correlated to the savings and benefits of this option.

I. INTRODUCTION AND QUALIFICATIONS

Q. Please state your name, business address, and present position with PacifiCorp d/b/a Pacific Power (PacifiCorp or the Company).

A. My name is Shelley E. McCoy, and my business address is 825 NE Multnomah Street, Suite 2000, Portland, OR 97232. I am currently employed as the Revenue Requirement Manager for PacifiCorp.

Q. Briefly describe your educational and professional background.

A. I earned my Bachelor of Science degree in Accounting from Portland State University. In addition to my formal education, I have attended several utility accounting, ratemaking, and leadership seminars and courses. I have been employed by PacifiCorp since November of 1996. My past responsibilities have included general and regulatory accounting, budgeting, forecasting, and reporting.

Q. What are your responsibilities as Revenue Requirement Manager?

A. My primary responsibilities include overseeing the calculation of PacifiCorp's revenue requirement and the preparation of various regulatory filings in Washington, Oregon, and California. I am also responsible for the calculation and reporting of PacifiCorp's regulated earnings and the application of the inter-jurisdictional cost allocation methodologies.

Q. Have you testified in previous regulatory proceedings?

A. Yes. I have previously provided testimony in California and Washington.

II. PURPOSE AND SUMMARY OF TESTIMONY

Q. What is the purpose of your testimony in this case?

A. My direct testimony addresses the calculation of the Company's Oregon-allocated revenue requirement, excluding net power costs (NPC), and the revenue increase requested in the Company's filing. Specifically, I provide testimony on the following:

- The calculation of the $78.0 million revenue increase requested in this general rate case representing the increase over current rates required for the Company to recover its Oregon non-NPC revenue requirement of $1,045.7 million. The Company currently recovers its NPC through the Transition Adjustment Mechanism (TAM).
- The selection of the historical period of the 12 months ended June 2019 (Base Period) as the basis for the test period in this proceeding.
- The development of the forecast test year in this case, which is the 12 month period ending December 31, 2021 (Test Period).
- The treatment of forecasted capital additions included in the revenue requirement calculations, which have been limited to projects placed in service before January 1, 2021, the beginning of the Test Period.
- The presentation of the normalized results of operations for the Test Period demonstrating that under current rates the Company will earn an overall return on equity (ROE) in Oregon of 9.3 percent, which is below the Company's currently authorized ROE of 9.8 percent and the 10.2 percent requested by the Company and supported by Ms. Ann E. Bulkley in this proceeding.

Q. How have you organized your testimony?

A. I have divided my testimony into three sections. I discuss the development of the Company's revenue requirement, including the base and test periods, in Section III, Revenue Requirement. In Section IV, Inter-jurisdictional Allocations, I address the allocation methodology used in this filing. In Section V, Oregon Results of Operations, I provide a description of the Oregon Results of Operations, including a review of the information contained in Exhibit PAC/1302.

III. REVENUE REQUIREMENT

Q. What is the revenue requirement to achieve the requested ROE in this case?

A. At current rate levels, the Company will earn an overall ROE in Oregon of 9.3 percent during the Test Period. This return is less than the 9.8 percent ROE authorized in the Company's 2013 general rate case, docket UE 263 (2013 Rate Case).[1] The Company is proposing to change the authorized ROE in this case to 10.2 percent. A 10.2 percent ROE produces a non-NPC revenue requirement of $1,045.7 million based on the 2020 PacifiCorp Inter-Jurisdictional Allocation Protocol (2020 Protocol). Exhibit PAC/1301 provides a summary of the Company's Oregon-allocated results of operations for the Test Period. Exhibit PAC/1302 provides the supporting details and calculations and is discussed in greater detail later in my testimony.

[1] *In the matter of PacifiCorp dba Pacific Power Request for a General Rate Revision*, Docket No. UE 263, Order No. 13-474 (Dec. 18, 2013). The settling parties to the stipulation in the 2013 Rate Case agreed to an overall rate of return of 7.621 percent and a 9.8 percent ROE for Oregon regulatory purposes. The stipulation was approved by the Commission in Order No. 13-474 on December 18, 2013.

Q. Please explain how you have treated NPC in this filing.

A. As noted above, the Company recovers its NPC through the TAM, which was concurrently filed with this general rate case[2] on February 14, 2020, for calendar year 2021 NPC. To model the non-NPC revenue requirement for this case, the Company first computed an overall Test Period revenue requirement including the NPC as filed in the TAM and then removed the NPC components from the overall price change. This approach is required to compute certain non-NPC components of the Test Period revenue requirement that are impacted by NPC-related items, such as the embedded cost differential (ECD), and various revenue-sensitive items. Details supporting the overall revenue requirement and the breakout between the TAM and general rate case are provided in Exhibit PAC/1301. Page 1 of Exhibit PAC/1301 also shows the division of revenue requirement between the TAM and general rate case components, and the resulting general-rate-case-related price change requested in this case.

Base Period

Q. Why did the Company use July 2018 through June 2019 as the historical basis, or Base Period, for the Test Period?

A. The Company selected the 12-month period ended June 2019 as the historical basis for this case because it was the most recent total-company data available for inter-jurisdictional allocations to achieve a filing date of February 14, 2020. The Company audits and extracts total-company accounting information with the data components necessary for state allocations on a semi-annual basis for the 12-month period ending June and December each year. This semi-annual data extract and review procedure is

[2] *In re the matter of PacifiCorp d/b/a Pacific Power 2021 Transition Adjustment Mechanism,* Docket No. UE 375 Advice No. 20-001 Initial Filing (Feb. 14, 2020).

a key control measure to ensure the accuracy and reliability of the data, which serves as the basis for each of the Company's results of operations and general rate case filings.

Q. Why was a February 14, 2020, filing date for this general rate case necessary?

A. In Order 09-274, the Public Utility Commission of Oregon (Commission) adopted a stipulation establishing guidelines for future TAM filings, including the following provision:

> In all future filings after UE 207 in a year in which the Company files a general rate case, the TAM will be included in or processed concurrently with the general rate case filing. *In future filings after UE 207, the Company agrees that both filings will be made no later than March 1 to allow for a January 1 rate effective date*.[3]

PacifiCorp is filing multiple rate cases across its six-state retail service territory. To accommodate various filing requirements and to manage internal resources, PacifiCorp is filing this general rate case and the concurrent TAM approximately two weeks earlier than the March 1 requirement set forth in Order 09-274.

Q. When will calendar year 2019 total-company data become available on an inter-jurisdictional allocation basis?

A. Only once total-company data is audited does it become available to begin analysis on an inter-jurisdictional allocation basis. Because of the unique complexities the Company faces as a multi-jurisdictional utility, additional time is necessary once total-company financial data is finalized to ensure state-allocated data is accurate. Due to these complex steps, calendar year 2019 data will not be available for use as the basis of a forecast test period until the end of April 2020, more than two months

[3] *In the matter of PacifiCorp dba Pacific Power 2009 Transition Adjustment Mechanism*, Docket No. UE 199, Order No. 09-274, Appendix A at 13 (July 16, 2009) (emphasis added).

after this general rate case is filed.

Test Period

Q. What Test Period did the Company use to determine revenue requirement in this case?

A. The forecast Test Period used by the Company in this proceeding is the 12 months ending December 31, 2021.

Q. Why did the Company choose the year ending December 31, 2021, as the Test Period?

A. The Test Period in this case was selected to best reflect the conditions during the time the new rates will be in effect. The requested rate effective date in this case is January 1, 2021, which matches the Test Period used by the Company in the calculation of the revenue requirement. The Test Period in this general rate case also matches the test period used in the development of the NPC filed in the concurrent TAM.

Q. Please explain how the Company developed the revenue requirement for the Test Period.

A. Revenue requirement preparation began with historical accounting information; in this case, the Company used the 12 months ended June 30, 2019. Each of the revenue requirement components in the Base Period was analyzed to determine if a normalizing ratemaking adjustment was warranted to reflect normal operating conditions. The historical information was then adjusted to recognize known, measurable, and anticipated events.

Q. What is the significance of beginning with historical information?

A. The Company begins with historical accounting information and makes discrete adjustments to arrive at the Test Period revenue requirement. Beginning with historical information provides a solid foundation that is readily available for audit by all who wish to participate in the case. Individual adjustments are also available for review, and regulators and intervenors may determine each adjustment's relevance and accuracy.

Q. Please summarize the process used to adjust the historical accounting information to reflect Test Period revenues and costs.

A. Revenues are adjusted by applying the current Commission-approved tariff rates to the Test Period load projection. NPC are developed using the Generation & Regulation Initiative Decision Tools (GRID) model. The results of the GRID run for the Test Period are embedded in the results for calculation purposes only; as previously mentioned, recovery of these costs is sought through the TAM filing. Historical operations and maintenance (O&M) expenses, excluding NPC, are split into labor and non-labor components. Non-labor costs are adjusted for inflation using inflation indices developed specifically for electric utilities provided by IHS Global Insight (Global Insight) and for other distinct changes required to reflect conditions expected during the Test Period. Historical labor costs are also adjusted for contractual increases through the end of the Test Period.

Q. Does the Company rely solely on its own projections of future cost increases?

A. No. For example, the adjustment made to account for inflation between the historical period and the Test Period relies on inflation indices published by Global Insight.

Updates to pension and benefits expenses are made in accordance with forecasts from actuarial reports, while labor expenses governed by union contracts are walked-forward to Test Period levels using contractual labor increase percentages.

Q. How has the Company addressed areas where cost increases are different than inflation?

A. The Company's business units were asked to identify areas where budgets were significantly different than historical amounts, adjusted for wage increases and inflation. When differences were identified, the business units were asked to provide support for changes in the number, or frequency, of activities. An example of this type of adjustment is the Incremental O&M adjustment (adjustment page 4.7). Adjustments of this nature are necessary because inflation indices account for cost increases on existing units of production, not changes in volume or processes.

Q. How has federal income tax expense been calculated in this case?

A. Federal income tax expense for ratemaking is calculated using the same methodology that the Company uses in preparing its filed income tax returns. On December 22, 2017, Congress passed and the President signed the Tax Cuts and Jobs Act (TCJA) setting a new corporate income tax rate of 21 percent where the previous rate was 35 percent. Accordingly the federal income tax rate has been updated in the Company's revenue requirement model to 21 percent. Additional impacts to the Company's revenue requirement associated with the TCJA are discussed later in my testimony.

Q. Are changes being proposed to depreciation rates in this case?

A. Yes. This filing includes updated depreciation rates as filed with the Commission in the Company's September 2018 Depreciation Study.[4] Please see the supplemental testimony of Mr. Steven R. McDougal, Mr. John J. Spanos and Mr. Chad A. Teply on the proposed depreciation rates, including the updated decommissioning study for coal-fired resources, and the depreciation study in docket UM 1968.

Q. Has the Company made any proposals on the treatment of the deferred balances from the closure of Deer Creek mine in the Test Period?

A. Yes. In Order 15-161 issued in docket UM 1712, the Commission authorized creation of a deferred account to track the Deer Creek Mine closure costs and costs due to Retiree Medical Obligation Settlement Loss to be addressed in the subsequent ratemaking proceedings.[5] The Company is proposing in the current rate case to include all costs and savings in the Deer Creek mine deferred account in rate base to be amortized over three years.

Q. How is the retirement of Cholla Unit 4 reflected in Test Period revenue requirement?

A. As discussed in the testimonies of Ms. Etta Lockey and Mr. Rick T. Link, Cholla Unit 4 will be retired by December 31, 2020. Accordingly, the Company has removed associated rate base, O&M and depreciation expense in the calculation of revenue requirement for this rate case filing. A proposal to recover the remaining balances

---

[4] *In the matter of PacifiCorp dba Pacific Power Application for Authority to Implement Revised Depreciation Rates*, Docket No. UM 1968, (Sept. 13, 2018).
[5] In the matter of PacifiCorp dba Pacific Power Application for Approval of Deer Creek Mine Transaction, Docket No. UM 1712, Order No. 15-161 at 1-2, 6-7, 10, 13 (May 27, 2015) and Order No. 15-166 at 2-3 (June 1, 2015).

and estimated decommissioning costs under the Generation Plant Closure Adjustment are discussed below in my testimony.

Q. How has the Company treated forecast capital additions to electric plant in service in this filing?

A. The Company has included capital additions to plant in service through December 31, 2020, rather than through December 31, 2021, which is the end of the forecast Test Period and the rate effective period. This treatment is consistent with the Company's 2010[6], 2012[7], and 2013 Rate Cases.[8]

Q. What changes are reflected in this rate case for the Klamath Hydroelectric Facilities?

A. PacifiCorp is a signatory to the Klamath Hydroelectric Settlement Agreement (KHSA), which provides for the transfer of four main-stem Klamath Hydroelectric Project developments, currently licensed to PacifiCorp, to a third-party dam removal entity that will pursue their removal. Consistent with the KHSA, depreciation rates for the Klamath assets were previously approved by the Commission to provide for full depreciation of the Klamath assets by December 31, 2019, in anticipation of the target date for dam removal of 2020 established in the KHSA. The Federal Energy Regulatory Commission (FERC) is currently evaluating the proposal to transfer the license for certain Klamath developments to the Klamath River Renewal Corporation,

[6] *See In the matter of PacifiCorp, dba Pacific Power, Request for a General Rate Revision*, Docket No. UE 217, Order No. 10-473 (Dec. 14, 2010).
[7] *See In the matter of PacifiCorp, dba Pacific Power, Request for a General Rate Revision*, Docket No. UE 246, Order No. 12-493 (Dec. 20, 2012).
[8] *See* Order No. 13-474.

the dam removal entity under the KHSA. The timing of when FERC will transfer the license, and when PacifiCorp's operations would ultimately cease, remains uncertain.

As the current project licensee, PacifiCorp's obligations under the license and FERC regulations continue to require capital investments to support ongoing project operations, ensure compliance with dam safety and other regulatory requirements, and to make other capital expenditures necessary to fulfill obligations under the KHSA to mitigate impacts of ongoing project operations.

Because the timing of license transfer and the cessation of generation from the Klamath assets remains uncertain, PacifiCorp has selected a depreciation rate of 20 percent per year for ongoing capital additions to the Klamath assets. PacifiCorp will seek regulatory approval to update the depreciation rate in the next depreciation study or once FERC rules on the license transfer application and there is more clarity about when operation of the Klamath assets will cease.

IV. INTER-JURISDICTIONAL ALLOCATIONS

Q. What methodology did the Company use to calculate the Oregon-allocated revenue requirement in this case?

A. The Company's Oregon-allocated revenue requirement is calculated using the 2020 Protocol, which was approved by the Commission in docket UM 1050 on January 23, 2020.[9] This is the Company's first Oregon rate case filing using the 2020 Protocol. The transition from the 2017 PacifiCorp Inter-jurisdictional Allocation Protocol to the 2020 Protocol results in limited changes to the allocations of revenue requirement to Oregon. The only changes in this filing are the increase to the cap on

[9] *See In the Matter of PacifiCorp d/b/a Pacific Power, Petition for Approval of the 2020 Inter-Jurisdictional Allocation Protocol, Docket No. UM 1050*, Order No. 20-024 (Jan. 23, 2020).

the ECD calculation and the elimination of the 2017 Protocol equalization adjustment.

V. OREGON RESULTS OF OPERATIONS

Q. Please describe Exhibit PAC/1302.

A. Exhibit PAC/1302, which was prepared under my direction, is the Company's Oregon results of operations report (Report). As previously explained, the Base Period for the Report is the 12 months ended June 30, 2019, which has been normalized and used to calculate the revenue requirement for the Test Period, the 12 months ending December 31, 2021. The Report provides totals for revenue, expenses, depreciation, NPC, taxes, rate base, and loads in the Test Period. The Report presents operating results for the Test Period in terms of both return on rate base and ROE.

Q. Please describe how Exhibit PAC/1302 is organized.

A. The Report is organized into sections marked with tabs as follows:

- Tab 1 Summary contains a summary of Oregon-allocated results according to the 2020 Protocol. Page 1.1 breaks out the non-NPC results and calculates the revenue increase the Company is requesting as part of this general rate case (column 5). Page 1.2 contains a summary of the general rate case request.
- Tab 2 Results of Operations details the Company's overall revenue requirement, showing unadjusted costs for the Base Period and fully normalized results of operations for the Test Period by FERC account and 2020 Protocol allocation factor.
- Tabs 3 through 8 provide supporting documentation for the normalizing adjustments required to reflect on-going costs of the Company.
- Tab 9 provides the derivation of the ECD included in this case.

- Tab 10 contains the calculation of the 2020 Protocol allocation factors. Factors in this case are based on the load forecast through December 2021 and pro forma account balances.
- Tabs B1 through B20 contain the historical data for the Base Period and are organized by major FERC function.

Tab 3 – Revenue Adjustments

Q. Please describe the information contained within Tab 3 Revenue Adjustments.

A. Tab 3 begins with the Revenue Adjustment Index which contains a brief overview of the assumptions used to project Test Period revenues and a list of each normalization adjustment included in this section of the exhibit. The numerical summary (page 3.0.2) identifies each adjustment made to actual revenues and each adjustment's impact on the case. Each column has a numerical reference to a corresponding page in the Report, which contains a lead sheet showing the affected FERC account(s), allocation factor(s), dollar amount, and a description of the adjustment.

Q. Please describe the adjustments made to revenue in Tab 3.

A. **Pro Forma Revenue (page 3.1) –** This adjustment normalizes general business revenues by adjusting to the pro forma revenue level for the Test Period based on forecasted loads. Page 3.1.4 shows a breakout of the TAM and general rate case revenues.

Wheeling Revenue (page 3.2) – This adjustment reflects the level of wheeling revenue for the Test Period by adjusting the actual revenue for normalizing, annualizing, and pro forma changes.

Renewable Energy Certificate (REC) Revenues (page 3.3) – This adjustment removes all REC revenue and REC deferrals booked during the 12 months ended June 2019. Most of Oregon's share of RECs is banked for compliance; however, not all RECs meet the Oregon Renewable Portfolio Standard (RPS) qualifications. Oregon's revenue from RPS ineligible RECs that are sold are passed backed to customers through the Oregon property sales balancing account per Commission Order 10-210 in docket UP 260.[10]

Ancillary Revenue (page 3.4) – This pro forma adjustment reflects ancillary revenue changes that are consistent with the forecast NPC treatment reflected in adjustment 5.1 discussed below. The ancillary revenue booked in the 12 months ended June 2019 is adjusted to reflect the Test Period revenue expected per the terms of contracts in effect during the Test Period. The corresponding impact on NPC is included in adjustment 5.1 and in the TAM.

Tab 4 – O&M Adjustments

Q. Please describe the information contained behind Tab 4 O&M Adjustments.

A. Tab 4 includes an O&M Expense Adjustment Index followed by a numerical summary and the specific adjustments. The O&M Expense Adjustment Index begins on page 4.0.1 with a brief overview of assumptions used to adjust operation, maintenance, administrative, and general expenses. The numerical summary (pages 4.0.2 to 4.0.3) identifies each adjustment made to actual expenses and that adjustment's impact on the case. Each column has a numerical reference to a corresponding page in the Report, which contains a lead sheet showing the affected

[10] *In the matter of PacifiCorp, dba Pacific Power Application Approval of Sale of Renewable Energy Credits*, Docket No. UP 260, Order No. 10-210 (June 9, 2010).

FERC account(s), allocation factor(s), dollar amount and a brief description of the adjustment.

Q. Please describe the adjustments made to O&M expense in Tab 4.

A. **Miscellaneous General Expense and Revenue (page 4.1) –** This adjustment removes certain miscellaneous expenses that should have been charged below the line to non-regulated expenses, and recognizes revenues from the Oregon Direct Access Opt Out amortization.[11] It also reallocates certain gains and losses on property sales and regulatory expenses to reflect the appropriate allocation.

Wage and Employee Benefits (page 4.2) – Labor-related costs for the Test Period are computed by adjusting salaries, incentives, health benefits, and costs associated with pension, post-retirement benefits, and post-employment benefits for changes expected beyond the actual costs experienced in the period ended June 2019.

Collective bargaining agreements are used to escalate union wages where increases are specified, while increases for non-union and exempt employees were based on actual or anticipated increases. Incentive compensation for non-union employees is included using a three-year average of the ratio of annual incentive expense to base wages. Pension expense and other employee benefit costs are adjusted to the planned expense for the Test Period, based on actuarial reports, where available, or by escalating actual costs. Please see the direct testimony of Ms. Nikki L. Kobliha for further discussion of the Company's pension expense.

Page 4.2.1 of the Report provides further description of the procedures used to compute Test Period labor costs. Page 4.2.2 contains a numerical summary of actual

[11] *In the matter of PacifiCorp, dba Pacific Power, Transition Adjustment, Five-Year Cost of Service Opt-Out*, Docket No. UE 267, Order No. 15-060 at 6 (Feb. 24, 2015).

labor costs in the year ended June 2019 and summarizes the adjustments made to project costs through the Test Period. This summary is followed by detailed worksheets on pages 4.2.3 through 4.2.11.

Revenue-Sensitive Items & Uncollectible Accounts (page 4.3) – Uncollectible accounts expense is adjusted to the Test Period level by applying the historical uncollectible rate (Oregon uncollectible accounts expense in FERC Account 904 divided by Oregon general business revenues) to the normalized general business revenues in the Test Period. This adjustment also reflects pro forma changes to Franchise Tax, Resource Supplier Tax, and Public Utility Commission Fees based on the normalized level of general business revenue for the Test Period.

Insurance Expense (page 4.4) – In the 2010 Rate Case, the Commission authorized the Company to establish monthly accruals and associated reserve balances for self-insurance for transmission and distribution property losses, non-transmission and distribution (Non-T&D) property losses, and third-party liability losses.[12] The Commission ordered the accrual to begin on April 1, 2011, as a replacement for the expiration of the Company's captive insurance coverage with Berkshire Hathaway Energy Company (formerly known as MidAmerican Energy Holdings Company). The Oregon-allocated monthly accrual for property related losses was based on a 10-year average of actual property losses, with each year escalated by the Consumer Price Index (CPI) to the Test Period. The Oregon-allocated monthly accrual for third-party liability losses was established based on an annual average of historical insurance claim payments from April 2005 to December 2009.

[12] Order No. 10-473 at 5.

The adjustment in this case uses the Commission-approved methodology for self-insurance accruals from the 2010 Rate Case and every case since, updated for known and measurable changes for both property and liability losses. Premiums for both property and liability insurance have also been adjusted for known and measurable changes in the Test Period.

Consistent with the treatment from the 2010 Rate Case, the Company is using a 10-year average of property damages for the self-insurance reserve accrual, using the most recent 10-year time period. Total-Company Non-T&D property insurance premiums were $5.2 million for the 12 months ended June 2019 and will be reduced to $3.3 million for the Test Period.

Consistent with the treatment in the 2010 Rate Case, the third-party liability accrual in this case is calculated based on a five-year average of historical insurance events. Total-Company liability insurance premiums were $3.0 million for the 12 months ended June 2019 and will increase to $6.6 million for the Test Period.

Generation Overhaul Expense (page 4.5) – This adjustment normalizes generation overhaul expenses in the Base Period using a four-year average methodology. In this adjustment, overhaul expenses for the years ending June 2016 to June 2019 are restated to constant dollars to make them comparable prior to averaging.

Memberships and Subscriptions (page 4.6) – This adjustment removes expenses in excess of Commission policy as outlined by the Commission order in docket UE 94.[13] National and regional trade organizations are recognized at 75 percent.

[13] *In the matter of the Petition of PacifiCorp to Amend Order No. 98-191 Regarding Annual System Benefit Charge Adjustment*, Docket No. UE 94, Order No. 01-502 (June 22, 2001).

Incremental O&M (page 4.7) – This adjustment adds incremental O&M to the Base Period to bring it to the projected O&M level for the 12 months ending December 2021 by adding incremental O&M expenses for known and measurable changes in the Test Period. Specifically, this adjustment adds into results of operations incremental expenses associated with the new Pryor Mountain Wind Project and wildfire mitigation efforts. For details on the Pryor Mountain Wind Project, please refer to the direct testimony of Mr. Chad A. Teply, and for details on the Company's wildfire mitigation efforts, please refer to the direct testimony of Mr. David M. Lucas.

Paperless Bill Credit Adjustment (page 4.8) – This adjustment adds into test period results the pro forma reduction to revenues for the proposed paperless bill credit. For details on this proposal, please refer to the direct testimony of Ms. Melissa S. Nottingham.

Credit Facility Fees Adjustment (page 4.9) – The Company incurs banking fees consisting of upfront and quarterly commitment fees on revolving credit facilities which support the Company's Commercial Paper issuances by providing a secondary source of repayment for the Commercial Paper. This adjustment corrects the accounting for these fees.

Remove Non-Recurring Entries (page 4.10) – This adjustment removes accounting entries made to expense accounts during the Base Period that are non-recurring in nature or relate to a prior period. These transactions are removed in this adjustment from the results of operations to normalize the Test Period results. Details on the specific item in the adjustment can be found on page 4.10.1 of the Report.

O&M Escalation (page 4.11) – This adjustment increases non-labor expenses for projected inflation through the Test Period. Projected increases or decreases in costs are based on Global Insight, which provide a detailed assessment of the electric market both historically and into the future. The indices used are based solely on electric utility costs for materials and services, which exclude labor expense, according to the Uniform System of Accounts defined by FERC for major electric utilities.

The Global Insight indices are prepared at the FERC functional subcategory level and are denoted with their corresponding FERC account number. The individual FERC account level indices are then combined into broader indices representing operation, maintenance, or total O&M expenses. The Global Insight study used to prepare this filing was the third quarter 2019 forecast, released November 4, 2019. The Global Insight data is proprietary and subject to copyright protection, therefore the indices utilized in the Company's case are provided in Confidential Exhibit PAC/1306.

Tab 5 – Net Power Cost Adjustments

Q. Please describe the information contained behind Tab 5 Net Power Cost Adjustments.

A. Tab 5 includes adjustments to items that are generally related to NPC, but are addressed separately in the Company's TAM filing. Specifically, adjustment page 5.1, Net Power Costs relates solely to NPC and recovery of these costs is being sought in the TAM rather than the general rate case. This adjustment is included for modeling and computational purposes only. For example, the Test Period revenue requirement includes revenue sensitive items such as Franchise Tax, Resource Supplier Tax, and Public Utility Commission Fees that are calculated off total general business revenues, including those collected for the purpose of recovering costs included in the TAM.

The Net Power Cost Index on page 5.0.1 is a brief overview of assumptions used to adjust NPC-related items. The numerical summary (page 5.0.2) identifies each adjustment made to actual expenses and that adjustment's impact on overall revenue requirement. Each column has a numerical reference to a corresponding page in the Report, which contains a lead sheet showing the affected FERC account(s), allocation factor(s), dollar amount, and a brief description of the adjustment.

Q. Please describe the adjustments included in Tab 5.

A. **Net Power Cost Adjustment (page 5.1) –** This adjustment normalizes power costs by adjusting sales for resale, purchased power, wheeling, and fuel in a manner consistent with the contractual terms of sales and purchase agreements, as well as normal hydro and temperature conditions for the Test Period. The GRID study for this adjustment is based on forecasted loads for the Test Period. As previously described, this adjustment is included in the calculation of overall revenue requirement for computational purposes only; NPC is not part of the revenue requirement for the general rate case.

Nodal Pricing Model Adjustment (page 5.2)—This adjustment adds in pro forma capital and incremental O&M expenses for the new Nodal Pricing Model as agreed to in PacifiCorp's Nodal Pricing Model Memorandum of Understanding.[14] Please refer to the testimony of Mr. Michael G. Wilding for more information on the Nodal Pricing Model.

Tab 6 – Depreciation and Amortization Expense Adjustments

Q. Please describe the information contained behind Tab 6 Depreciation and Amortization Adjustments.

A. Tab 6 includes the Depreciation and Amortization Adjustment Index followed by a numerical summary and the specific adjustments. The Adjustment Index on page 6.0.1 is a brief overview of assumptions used to adjust overall depreciation and amortization expense and reserve. The numerical summary (page 6.0.2) identifies each adjustment made to actual results and that adjustment's impact on the case. Each column has a numerical reference to a corresponding page in the Report, which contains a lead sheet showing the affected FERC account(s), allocation factor(s), dollar amount, and a brief description of the adjustment.

Q. Please describe the adjustments included in Tab 6.

A. **Depreciation and Amortization Expense (page 6.1) –** This adjustment reflects the incremental depreciation expense associated with the capital additions included in Adjustment 8.5, Pro Forma Plant Additions, and calculates the depreciation expense for the proposed depreciation rates in docket UM 1968 effective January 1, 2021. The annualized level of depreciation and amortization expense for the Test Period is calculated by first applying the current composite depreciation and amortization rates

[14] *In the matter of PacifiCorp, dba Pacific Power, Request to Initiate an Investigation of MultiJurisdictional Issues and Approve an InterJurisdictional Cost Allocation Protocol*, Docket No. UM 1050, Exhibit PAC/101, Appendix D (Dec. 3, 2019).

to the December 2020 pro forma plant balances. The current composite rates used are those approved by the Commission in docket UM 1647, which became effective on January 1, 2014.[15] The depreciation expense is then updated for the proposed depreciation rates filed in docket UM 1968, which the Company has requested become effective on January 1, 2021, the beginning of the Test Period. The proposed depreciation rates include the updated decommissioning study for most of the Company's coal generation fleet as discussed in the supplemental testimonies of Mr. Teply and Mr. McDougal in UM 1968. The proposed rates in UM 1968 increase Oregon's allocated share of depreciation and amortization expense by $63.6 million. The detailed calculation of the depreciation and amortization expense is provided on pages 6.1 through 6.1.17.

Depreciation and Amortization Reserve (page 6.2) – This adjustment steps forward the depreciation and amortization reserve from the Base Period to a December 2020 adjusted level. Accumulated depreciation and amortization balances are calculated by applying pro forma depreciation and amortization expense and plant retirements to Base Period balances. The reserve balances are calculated on a monthly basis to walk the balances forward from June 30, 2019, to December 31, 2020. An incremental reserve amount has been added to the December 31, 2020 balance, to reflect the depreciation expense due to the proposed depreciation study rates being added in through adjustment 6.1. The reserve balance calculations are detailed on pages 6.2 to 6.2.13.

[15] *In the matter of PacifiCorp, dba Pacific Power, Application for Authority to Implement Revised Depreciation Rates*, Docket No. UM 1647, Order No. 13-347 (Sept. 25, 2003).

Depreciation Allocation Correction Adjustment (page 6.3) – The Company established a regulatory asset to track and defer any aggregate net increase in allocated depreciation expense in dockets in Wyoming, Utah, and Idaho, for depreciation rates that became effective January 1, 2014. This deferred amount is reflected in historical data on a system-allocated basis, but should only be situs-assigned to Wyoming, Utah, and Idaho. This adjustment removes the steam related deferred depreciation expense from historical data for Oregon's results of operations. Also being removed in this adjustment is the steam plant give-back reversal in Oregon established as part of the 2012 depreciation study. This give-back amount does not need to be incrementally added back into results, since the current rate case incorporates into rates the new depreciation rates through Adjustments 6.1 (Depreciation and Amortization Expense) and 6.2 (Depreciation and Amortization Reserves) and in doing so, will re-set annual depreciation expense to appropriate levels in the Test Period.

Other Plant Closure Costs Adjustment (page 6.4) – This adjustment reflects the recovery of Other Plant Closure Costs included in the updated decommissioning study discussed in Mr. McDougal's supplemental testimony in UM 1968. The Company proposes collecting the identified costs over the remaining life of each respective generation plant.

Additionally, this adjustment includes accelerated depreciation and reclamation costs for the Bridger Mine incremental to the amounts included in the cost of coal delivered to the Jim Bridger Plant. These costs will be recovered over the remaining depreciable life for Oregon customers of the Jim Bridger Plant.

The above amounts to be collected from Oregon customers will be deferred to a regulatory liability, which will be debited with Oregon's share of Other Plant Closure costs when actual plant retirement occurs and Oregon's share of reclamation costs when the Bridger Mine closes. This treatment will allow the Company to recover closure costs of coal generation plants and the Bridger Mine while meeting the Senate Bill (SB) 1547 requirement of removing coal from Oregon electric utility rates prior to January 1, 2030.

Tab 7 – Tax Adjustments

Q. Please describe the information contained behind Tab 7 Tax Adjustments.

A. Tab 7 includes the Tax Adjustment Index followed by a numerical summary and the specific adjustments. The Adjustment Index (page 7.0.1) contains a brief overview of the tax adjustments included in this case. The numerical summary on pages 7.0.2 and 7.0.3 identifies each adjustment made to the various tax components and that adjustment's impact on the case. Each column has a numerical reference to a corresponding page in the Report, which contains a lead sheet showing the affected FERC account(s), allocation factor(s), dollar amount, and a brief description of the adjustment.

Q. Please describe the adjustments included in Tab 7.

A. **Interest True-Up (page 7.1) –** This adjustment details the adjustment to interest expense required to synchronize the Test Period interest expense with Test Period rate base. This is done by multiplying normalized net rate base by the Company's weighted cost of debt in this case.

Property Tax Expense (page 7.2) – Property tax expense for the Test Period is computed by adjusting accruals from the Base Period for known or anticipated changes in the assessed values of the Company's operating property and the corresponding effect such changes will have on property tax expense for the Test Period. For additional information on the Company's property tax estimation procedures and methodologies, please refer to Confidential Exhibit PAC/1303.

Production Tax Credit (PTC) (page 7.3) – The Company is entitled to recognize federal income tax credits as a result of placing renewable generating plants in service. The tax credit is based on the kilowatt-hours generated by the plants, and the credit can be taken for the first 10 years of generation from qualifying property. The PTC calculation reflects the credit based on the qualifying production as modeled for the Test Period NPC study. Customers receive the benefit of the PTCs in the Company's annual TAM filing. As with NPC in Adjustment 5.1, this adjustment is included for the purposes of calculating an overall revenue requirement only.

PowerTax Accumulated Deferred Income Tax (ADIT) Balance (page 7.4) – This adjustment normalizes ADIT balances to an estimated pro forma level of rate base balance for the Test Period. Additional line item detail is included in the tax model that is provided with the Company's electronic workpapers.

Pro Forma Tax Balances Adjustment (page 7.5) – This adjustment normalizes the Schedule M items, deferred tax expense and related ADIT balances to an estimated pro forma level of expense for the Test Period. Additional line item detail is included in the tax model that is provided with the Company's electronic work papers.

Wyoming Wind Generation Tax (page 7.6) – This adjustment normalizes the Wyoming Wind Generation Tax, which became effective January 1, 2012, into Test Period results. The Wyoming Wind Generation Tax is an excise tax levied upon production of electricity from wind resources in the state of Wyoming. The tax is on the production of any electricity produced from wind resources for sale or trade on or after January 1, 2012, and is to be paid by the entity producing the electricity. New wind facilities are exempt from the tax for three years following the date the facility first produces electricity for sale. The tax is one dollar for each megawatt-hour (MWh) of electricity produced from wind resources at the point of interconnection with an electric transmission line.

Allowance for Funds Used During Construction (AFUDC) Equity (page 7.7) – This adjustment reflects the appropriate level of AFUDC equity into regulated results to align the tax schedule M with regulatory income. Per Commission Order 10-022, AFUDC equity in this case is included using flow-through tax treatment.[16]

Tax Cuts and Jobs Act Adjustment (page 7.8) – This adjustment reflects the removal of the non-protected tax deferral balances as a result of the TCJA that was enacted on December 22, 2017. The corporate income tax rate was reduced from 35 percent to 21 percent effective January 1, 2018. The related non-protected tax deferral balances are being removed from the base period and, as described further below, returned to customers via a separate tariff rider proposed as part of this rate case. This adjustment also reflects the appropriate level of protected Excess Deferred Income Tax (EDIT) amortization using the Reverse South Georgia Method. Please

[16] *In the matter of PacifiCorp, dba Pacific Power Request for a General Rate Revision*, Docket No. UE 210, Order No. 10-022 (Jan. 26, 2010).

refer to the testimony of Ms. Kobliha for further information on the impacts of the TCJA.

Q. Please describe the amortization of the deferred TCJA balances.

A. The Company is proposing a three-year amortization of the remaining deferred TCJA balances, including the balance of deferred current tax benefits due to the reduced tax rate. This amortization will result in a $24.9 million annual rate credit for Oregon customers for three years. Please see Exhibit PAC/1313 for the details of the amortization schedule. For additional information on the Federal Tax Act Adjustment that will be used to return this credit to customers, please see the testimony of Mr. Robert M. Meredith.

Tab 8 – Rate Base Adjustments

Q. Please describe the information contained behind Tab 8 Rate Base Adjustments.

A. Tab 8 includes the Rate Base Adjustment Index followed by a numerical summary and the specific adjustments. The Adjustment Index on page 8.0.1 begins with a brief overview of assumptions used to adjust rate base components. The numerical summary (pages 8.0.2 to 8.0.4) identifies each adjustment made to actual rate base and that adjustment's impact on the case. Each column has a numerical reference to a corresponding page in the Report, which contains a lead sheet showing the affected FERC account(s), allocation factor(s), dollar amount, and a brief description of the adjustment.

Q. Please describe each of the adjustments to the historical rate base balances.

A. **Cash Working Capital (page 8.1) –** This adjustment supports the calculation of cash working capital included in rate base based on the normalized results of operations for the Test Period. Total cash working capital is calculated by multiplying jurisdictional net lag days by the average daily cost of service. Net lag days in this case are based on a lead lag study prepared by PacifiCorp using calendar year 2015 information. An electronic version of the lead lag study is included as part of the Company's workpapers.

Trapper Mine Rate Base (page 8.2) – The Company owns a 21.4 percent interest in the Trapper Mine, which provides coal to the Craig generating plant. The normalized coal cost of Trapper includes all O&M costs but does not include a return on investment. This adjustment adds the Company's portion of the Trapper Mine plant investment to the rate base and reflects net plant to recognize the depreciation of the investment over time. This adjustment also walks the reclamation liability forward to December 2020. This adjustment was stipulated to and approved in docket UE 111[17] and has been included in all Oregon rate case filings since.

Jim Bridger Mine Rate Base (page 8.3) – The Company owns a two-thirds interest in the Bridger Coal Company, which supplies coal to the Jim Bridger generating plant. The Company's investment in Bridger Coal Company is recorded on the books of Pacific Minerals, Inc. Because of this ownership arrangement, the coal mine investment is not included in electric plant in service. This adjustment is necessary to properly reflect the Bridger Coal Company investment in rate base for the Company to earn a return on its investment. The normalized coal costs for Bridger Coal Company in NPC include the O&M costs of the mine but provide no return on investment. This adjustment adds the Company's portion of the pro forma

[17] In the matter of the Revised Tariff Schedules Applicable to Electric Service Filed by PacifiCorp, Docket No. UE 111, Order No. 00-580 (Sept. 25, 2000).

December 31, 2020, net plant balance to rate base. This adjustment was stipulated to and approved in docket UE 111 and has been included in all Oregon rate case filings since.[18]

Customer Advances for Construction (page 8.4) – Customer advances were recorded in the Base Period to a corporate cost center location rather than state-specific locations. This adjustment corrects the allocation factors of customer advances.

Pro Forma Plant Additions and Retirements (page 8.5) – To reasonably represent the cost of system infrastructure required to serve customers, the Company has identified capital projects that will be used and useful by December 31, 2020.

Capital additions by FERC functional category are listed on pages 8.5.18 to 8.5.25, indicating the in-service date and amount by project. This adjustment is based on plant balances as of December 31, 2020. As described earlier in my testimony, the accumulated depreciation reserve was adjusted forward to match the depreciation expense and retirements. Projects over $10 million (total-company basis) are described on pages 8.5.27 through 8.5.30 of the Report. Not included in this adjustment are the wind repowering projects, Adjustment 8.13, and the new wind generation resources and associated transmission included in Energy Vision 2020, Adjustment 8.14.

Miscellaneous Rate Base (page 8.6) – This adjustment reflects the change in the fuel stock balance from the Base Period to the Test Period. This adjustment also reflects the working capital deposits that are offsets to fuel stock costs. In addition, balances

[18] In the matter of the Revised Tariff Schedules Applicable to Electric Service Filed by PacifiCorp, Docket No. UE 111, Order No. 00-580 (Sept. 25, 2000).

for prepaid overhauls at the Lake Side, Chehalis, and Currant Creek natural gas plants are walked forward to reflect payments and transfers of capital to electric plant in service on a 13-month average basis through the Test Period. This adjustment was included in the stipulated settlement and approved in the Company's 2013 Rate Case.[19]

Plant Held for Future Use (PHFU) (page 8.7) – This adjustment removes all PHFU assets from FERC account 105. The Company is making this adjustment in compliance with Order 01-787.[20]

Regulatory Asset and Liability Amortization (page 8.8) – This adjustment normalizes regulatory assets and liabilities from the Base Period to the Test Period. In addition, the Company is proposing to begin amortization of deferred FERC Open Access Transmission Tariff (OATT) revenues from 2017 through 2020, net of the undepreciated equipment balances as a result of the all-party stipulation in docket UE 369 and as proposed for the repowering of Foote Creek in this filing, starting on the rate effective date of this case.[21] The Company is proposing an amortization period of three years.

Remove Rolling Hills (page 8.9) – This adjustment removes the gross plant, accumulated depreciation, and O&M amounts related to the Rolling Hills wind resource from the Base Period. Depreciation expense for Rolling Hills is removed in

---

[19] Order No. 13-474 at 3 and App. A at 18.
[20] *In the matter of PacifiCorp's Proposal to Restructure and Reprice its Services in Accordance with the Provisions of SB 1149*, Docket No. UE 116, Order No. 01-787 (Sept. 7, 2001)
[21] *In the matter of PacifiCorp dba Pacific Power 2020 Renewable Adjustment Clause*, Docket No. 369, Stipulation and Joint Testimony (Jan. 31, 2020).

Adjustment 6.1, Depreciation/Amortization Expense Adjustment. This treatment is consistent with Order 08-548.[22]

Carbon Plant Retirement (page 8.10) – The Company established a regulatory asset to track and defer any aggregate net increase in allocated depreciation expense in dockets in Wyoming, Utah, and Idaho for depreciation rates that became effective January 1, 2014. This deferred amount includes a portion representing the accelerated depreciation expense associated with the early retirement of the Carbon plant. The Carbon plant was retired in April 2015. The deferral and amortization continues to be recorded in the Company's accounting books in the Base Period. However, this deferred expense is being recorded on a system-allocated basis, when it should be situs-assigned to Utah, Idaho, and Wyoming only. This adjustment removes the system-allocated amount from Oregon's historical results of operations.

The Company continues to carry a regulatory liability for Carbon Plant decommissioning that has yet to be returned to Oregon customers. This adjustment includes the Company's proposal in the 2018 Depreciation Study to return this balance for the benefit of Oregon customers over a five-year amortization period. For additional details on the Carbon Plant decommissioning balance, please see the direct testimony of Mr. McDougal in the 2018 Depreciation Study, docket UM 1968.

Pension and Other Post-retirement Plan Balances Removal (page 8.11) – This adjustment removes the Company's net prepaid asset associated with its pension and other post-retirement welfare plans, net of associated accumulated deferred income

[22] *In the matter of PacifiCorp dba Pacific Power 2009 Renewable Adjustment Clause Schedule 202*, Docket No. UE 200, Order No. 08-548, at 19-21 (Nov. 14, 2008), as supplemented and corrected by Order No, 08-554 (Nov. 25, 2008).

taxes in unadjusted results. Per Order 15-226 in docket UM 1633, the net pension and post-retirement prepaid is not to be included in rate base for Oregon.[23]

Deer Creek Mine Adjustment (page 8.12) – Order 15-161 in docket UM 1712 addressed closure of the Deer Creek mine located in Utah and ruled on several issues.[24] This adjustment removes the Deer Creek Unrecovered Plant Regulatory Assets from results because these amounts have been recovered through a separate tariff rider.

Order 15-161 also authorized the creation of a deferred account to track the Deer Creek Mine closure costs and costs due to Retiree Medical Obligation Settlement Loss to be addressed in the subsequent ratemaking proceedings.[25] The Company is proposing in the current rate case to include all costs and savings in the Deer Creek deferral account in rate base to be amortized over three years.

Repowering Projects Capital Additions (page 8.13) – This pro forma adjustment adds the capital additions and depreciation amounts for the wind repowering projects set to occur before December 2020. Included in this adjustment are the repowering projects included in the Company's Renewable Adjustment Clause filings for the 2019 and 2020 repowering projects, dockets UE 352 and UE 369, as well as the repowering of Foote Creek I. Per the approved stipulation in docket UE 352,[26] the net book value of replaced equipment included in that filing has been offset with excess deferred income tax balances as a result of the TCJA. As proposed and agreed

[23] *In the matter of Public Utility Commission of Oregon, Investigation into Treatment of Pension Costs in Utility Rates*, Docket No. UM 1633, Order No. 15-226, 10-11 (Aug. 3, 2015).

[24] Order No. 15-161.

[25] *Id.* at 1, 10.

[25] *In the matter of PacifiCorp dba Pacific Power, 2019 Renewable Adjustment Clause,* Docket No. 352, Order No. 19-304 (Sept. 16, 2019).

to in the all-party stipulation filed on January 31, 2020, in docket UE 369, the net book value of replaced equipment at Glenrock III and Dunlap is being offset by deferred revenues related to the Company's OATT. This same treatment is being proposed for the net book value of replaced equipment in the repowering of Foote Creek I. For additional details on the repowering of Foote Creek I, please refer to Mr. Timothy J. Hemstreet's testimony.

EV 2020 Capital Additions (page 8.14) – This pro forma adjustment adds the capital additions and depreciation amounts for the Energy Vision 2020 new wind generation projects and associated transmission set to occur before December 2020. For additional details on the new wind and transmission, please refer to Mr. Link's, Mr. Teply's, and Mr. Richard A. Vail's testimony.

Cholla Unit 4 Retirement (page 8.15) – This adjustment removes from rate base balances related to Cholla Unit 4, which is to be retired on December 31, 2020. It also removes from expense, depreciation expense and costs related to the O&M of this generation resource.

Remaining unrecovered plant, construction work-in-progress, materials and supplies and other costs related to the closure of Cholla Unit 4 have been recorded in regulatory assets. The Company proposes to recover the Cholla regulatory assets and estimated decommissioning costs not already collected in depreciation rates in a separate tariff adjustment, the Generation Plant Removal Adjustment discussed in Ms. Lockey's testimony, beginning January 2021 through April 2025, the previous end-of-life for this unit. Estimated decommissioning costs have been included using currently available estimates. However, a decommissioning study for the Cholla plant is expected to be completed in Spring 2020, at which time these costs will be updated. The Company proposes a carrying charge on the regulatory assets equal to the pre-tax weighted average cost of capital as approved in this rate case. Please see Exhibit PAC/1312 for the details of the amortization schedule.

Klamath Facilities Capital Additions (page 8.16) – As previously discussed in my testimony, the timing of when the Klamath Facilities will cease operations is uncertain. In order to maintain the facilities and ensure compliance with dam safety requirements, the Company will continue to make capital expenditures on these facilities. This adjustment adds in the capital additions that will be in service through December 31, 2020, associated accumulated depreciation as of year-end 2020 and an annual amount of depreciation expense assuming a 20 percent depreciation rate as discussed above.

Tab 9 – 2020 Protocol ECD

Q. Please describe the information contained behind Tab 9.

A. Tab 9 demonstrates the derivation of the 2020 Protocol ECD amount included in the current rate case.

Q. Please explain the changes to the ECD adjustment in the 2020 Protocol.

A. The Fixed ECD, as used in the 2017 Protocol, will continue for Idaho at $836,000 through the end of 2023. The Dynamic ECD, as used in the 2010 Protocol, will continue for Oregon through the end of 2023, capped at $11,000,000. No ECD adjustment exists for Utah or California. In Wyoming, the ECD will terminate December 31, 2020.

Q. What is the Dynamic ECD?

A. The Dynamic ECD measures the embedded cost differentials between the production costs of pre-2005 resources, as defined in the 2010 Protocol, and the production cost of west hydro-electric resources and certain Mid-Columbia Contracts. The first part is computed by taking PacifiCorp's production costs related to pre-2005 resources, expressed in dollars per MWh, compared to production costs of west-side hydro-electric resources expressed in dollars per MWh with the difference multiplied by the hydro-electric resources' MWhs of production. The second part is computed by taking the differential between the pre-2005 resources' dollars per MWh compared to Mid-Columbia Contracts' costs on a dollars per MWh multiplied by the Mid-Columbia Contracts' MWhs.

Tab 10 – Allocation Factors

Q. Please describe the information contained behind Tab 10 Allocation Factors.

A. Tab 10 Allocation Factors summarizes the derivation of the inter-jurisdictional allocation factors using the 2020 Protocol.

Tabs B1 to B20

Q. Please describe the information contained behind Tabs B1 to B-20.

A. Tabs B1 through B20 contain the historical results for the Base Period and are organized by major FERC function. The data contained in this section of the Report matches the unadjusted data found under Tab 2 – Results of Operations.

VI. CONCLUSION

Q. Please summarize your testimony.

A. I recommend that the Commission approve the requested $78.0 million increase and non-NPC revenue requirement of $1,045.7 million.

Q. Does this conclude your direct testimony?

A. Yes.

REC Revenue

	ACCOUNT	Type	TOTAL COMPANY	FACTOR	FACTOR %	OREGON ALLOCATED	REF#
Adjustment to Revenue:							
Remove:							
June 2019 Booked Revenues (Including Accruals)	456	1	(3,760,979)	SG	26.023%	(978,706)	3.3.1
June 2019 REC Deferrals	456	1	130,053	SG	26.023%	33,843	3.3.1
June 2019 Leaning Juniper Indemnity	456	1	(5,859)	SG	26.023%	(1,525)	3.3.1

Description of Adjustment:

This adjustment removes all REC revenues as booked during the 12 months ended June 2019. Most of Oregon's share of the renewable energy certificates (RECs) are banked for compliance; however, not all RECs meet the Oregon RPS qualifications. Oregon's revenues from RPS ineligible RECs that are sold are passed backed to customers through the Oregon property sales balancing account per Commission Order No. 10-210 in Docket UP 260. This adjustment also removes REC Deferrals from the 12 months ended June 2019.

Oregon General Rate Case – December 2021
Operation & Maintenance Expense Adjustment Index

The Company's June 2019 actual O&M expenses are the basis for the test period O&M expenses. These actual expenses are adjusted for various normalizing items including labor costs, non-labor operation and maintenance, and inflation to reflect the appropriate level of on-going costs that the Company expects to incur during the December 2021 test period. The following adjustments are included:

4.1 Miscellaneous General Expense and Revenues
4.2 Wage & Employee Benefits Adjustment
4.3 Revenue Sensitive Items & Uncollectible Expense
4.4 Insurance Expense
4.5 Generation Overhaul Expense
4.6 Memberships and Subscriptions
4.7 Incremental O&M Expense
4.8 Paperless Bill Credits Adjustment
4.9 Credit Facility Fees Adjustment
4.10 Remove Non-Recurring Entries
4.11 O&M Expense Escalation

Total Miscellaneous General Expense Removal			(245,387)			(191,996)	4.1.1
Total Adjustments			4,728,085			2,454,784	

Description of Adjustment:

This adjustment removes certain miscellaneous expenses that should have been charged below-the-line to non-regulated expenses. It also reallocates certain items such as gains and losses on property sales and regulatory commission expense to reflect the appropriate allocation among the Company’s jurisdictions. In addition, it recognizes revenues from the Oregon Direct Access Opt Out amortization.

Description of Adjustment:

This adjustment recognizes wage and benefit increases that have occurred, or are projected to occur during the twelve month period ending December 2021 for labor charged to operation & maintenance accounts. See page 4.2.1 for more information on how this adjustment was calculated.

PacifiCorp
Oregon General Rate Case - December 2021
Wage and Employee Benefit Adjustment

The unadjusted, annualized (12 months ended June 2019), and pro forma period (12 months ending December 2021) labor expenses are summarized on page 4.2.2. The following is an explanation of the procedures used to develop the labor benefits & expenses used in this adjustment.

1. Actual June 2019 total labor related expenses are identified on page 4.2.2, including bare labor, incentive, other labor, pensions, benefits, and payroll taxes.

2. Actual June 2019 expenses for regular time, overtime, and premium pay were identified by labor group and annualized to reflect wage increases during the base period. These annualizations can be found on page 4.2.3.

3. The annualized June 2019 regular time, overtime, and premium pay expenses were then escalated prospectively by labor group to December 2021 (see page 4.2.5). Union and non-union costs were escalated using the contractual and target rates found on page 4.2.4.

4. Compensation related to the Annual Incentive Plan is included on a three-year average of payout percent-tage level. The Annual Incentive Plan is the second step of a two-stage compensation philosophy that provides employees with market average compensation with a portion at risk and based on achieving annual goals. Union employees do not participate in the Company's Annual Incentive Plan; instead, they receive annual increases to their wages that are reflected in the escalation described above.

5. Pro Forma December 2021 pension and employee benefit expenses are based on either actuarial projections or are calculated by using actual June 2019 data escalated to December 2021. These expenses can be found on page 4.2.7.

6. Payroll tax calculations can be found on page 4.2.8.

Description of Adjustment:

This adjusts the Company's actual June 2019 uncollectible accounts expense to the December 2021 pro forma period by applying the unadjusted uncollectible rate (unadjusted uncollectible accounts expense/unadjusted general business revenues) to the normalized level of general business revenues. This adjustment also reflects an impact to other tax expense and regulatory commission expense based on the normalized level of general business revenues.

Description of Adjustment:

This adjustment removes the accrued level of injuries and damages from the base period and recalculates the Oregon-allocated five-year average, using the most recent five-year time period. The adjustment also recalculates the historical 10-year average Oregon-allocated property damage amount using the most recent 10-year time period. The insurance premiums in the base period have been adjusted to those in the Company's most current renewal.

			(488,171)			(127,035)	

Description of Adjustment:

This adjustment normalizes generation overhaul expenses in the 12 months ended June 2019 using a four-year average methodology. In this adjustment, overhaul expenses from July 2015 - June 2019 are restated in constant dollars to a June 2019 level using industry specific indices and then those constant dollars are averaged. The actual overhaul costs for the 12 months ended June 2019 are subtracted from the four-year average which results in this adjustment.

Description of Adjustment:

This adjustment removes expenses in excess of Commission policy allowances as stated in the Commission order in UE-94. National and regional trade organizations are recognized at 75%. Western Electricity Coordinating Council and Northern Tier Transmission Group fees are included at 100%. These fees are no longer included in FERC account 930 and are not shown in this adjustment. The fees for these two organizations are now being booked to FERC account 561.

Description of Adjustment:

This adjustment calculates the non-labor O&M escalation from June 2019 to December 2021 for accounts 500 to 935 , excluding NPC and property and liability insurance, using industry specific escalation indices. Before escalation indices were applied, June 2019 actual data was separated into labor and non-labor components and costs that should not be included in December 2021 actual data were removed. Detail supporting specific FERC accounts is provided in the electronic work papers along with the Company's filing.

Description of Adjustment:

This adjustment calculates the non-labor O&M escalation from June 2019 to December 2021 for accounts 500 to 935 , excluding NPC and property and liability insurance, using industry specific escalation indices. Before escalation indices were applied, June 2019 actual data was separated into labor and non-labor components and costs that should not be included in December 2021 actual data were removed. Detail supporting specific FERC accounts is provided in the electronic work papers along with the Company's filing.

Oregon General Rate Case – December 2021
Net Power Cost Adjustment Index

The following adjustments were used to develop pro forma net power costs for the test period. The Company's booked power costs for the 12 months ended June 2019 provide the starting point for establishing the adjustment amounts for the December 2021 test period.

5.1 Net Power Costs
5.2 Nodal Pricing Model

Description of Adjustment:

This net power cost adjustment normalizes power costs by adjusting sales for resale, purchased power, wheeling and fuel in a manner consistent with the contractual terms of sales and purchase agreements, and normal hydro and temperature conditions for the 12 month period ending December 2021. The GRID study for this adjustment is based on forecast loads for the test period.

As described in the testimony of Shelley E. McCoy, this adjustment is included in the calculation of overall revenue requirement for computational purposes only; the Company is not requesting recovery of NPC as part of the general rate case.

Depreciation and Amortization Adjustment Index

The following adjustments were used to arrive at the normalized levels of depreciation and amortization expense along with the associated reserve balances reflected in the test period.

6.1 Depreciation & Amortization Expense
6.2 Depreciation & Amortization Reserve
6.3 Depreciation Allocation Correction
6.4 Other Plant Closure Costs

Description of Adjustment:

This adjustment reflects the incremental depreciation expense that is calculated on the plant additions included in this filing in adjustment 8.5. The annualized 2020 depreciation and amortization expense for the test period is calculated by applying the currrent composite depreciation and amortization rates to the December 2020 projected plant balances.

Description of Adjustment:

This adjustment reflects the incremental depreciation expense for the proposed depreciation study rates. The depreciation expense is calculated by applying the proposed composite depreciation rates to the December 2020 projected plant balances. The Company's application to implement revised depreciation rates is in Docket No. UM-1968. This adjustment is subject to change depending on the outcome of that docket.

Description of Adjustment:

This adjustment steps forward the depreciation reserve to a December 2020 adjusted level. Accumulated depreciation and amortization balances are calculated by applying pro forma depreciation and amortization expense and plant retirements to the June 2019 balances. The reserve balances are calculated on a monthly basis to walk the balances forward from June 30, 2019 to December 31, 2020. An incremental amount has been added to the December 31, 2020 balance to reflect the depreciation expense due to the proposed depreciation study rates being added in through adjustment 6.1.

PacifiCorp
Oregon General Rate Case - December 2021
Oregon Coal-Fired Steam Plant Depreciation

Depreciation Reserve Adjustment

	Total Company	Factor
Adjustment to June 2019 Reserve:		
Steam Plant Accumulated Depreciation	(704,628,533)	SG
Steam Plant Accumulated Depreciation	(82,848,146)	SG
	(787,476,679)	

Depreciation Reserve Adjustment By Plant

Plant	Factor	Adjustment to Year Ended Jun 2019
CHOLLA	SG	(82,848,146)
NAUGHTON	SG	(16,604,851)
HUNTINGTON	SG	(68,103,815)
HUNTER	SG	(154,222,805)
CRAIG	SG	(21,807,684)
HAYDEN	SG	(14,298,039)
COLSTRIP	SG	(16,249,610)
DAVE JOHNSTON	SG	(131,873,150)
JIM BRIDGER	SG	(203,015,930)
WYODAK	SG	(78,452,649)
		(787,476,679)

This is the increase in the depreciation reserve June 2019 starting balance in adjustment 6.2. This reflects the increase from January 2008 to June 2019 to reflect the different depreciation rates Oregon is using for the coal-fired generating plants. This was approved in the Depreciation Study, in Docket UM-1329 Order 08-427, with rates effective January 1, 2008.

PacifiCorp
Oregon General Rate Case - December 2021
Depreciation Allocation Correction

	ACCOUNT	Type	TOTAL COMPANY	FACTOR	FACTOR %	OREGON ALLOCATED	REF#
Adjustment to Expense							
Remove system allocated deferral	403SP	1	(496,849)	SG	26.023%	(129,293)	6.3.1
Remove system allocated give-back reversal	403SP	1	(2,248,434)	SG	26.023%	(585,102)	6.3.2
			(2,745,282)			(714,395)	

Description of Adjustment:

The Company established a regulatory asset to track and defer any aggregate net increase in allocated depreciation expense in dockets in Wyoming, Utah, and Idaho. This deferred amount is reflected in historical data on a system-allocated basis. Additionally, the Company reverses the depreciation reserve give-backs in Oregon to bring into compliance with the steam plant depreciation rates agreed to in Docket No. UM-1647.

This adjustment removes the system allocated deferral and the steam plant give-back reversal in Oregon. The give-back amount does not need to be incrementally added back since the current rate case incorporates into rates the new depreciation rates through Adjustments 6.1 (Depreciation & Amortization Expense) and 6.2 (Depreciation & Amortization Reserves).

Description of Adjustment:

This adjustment adds into test period results other plant closure costs detailed in the 2018 depreciation study. The Company proposes inclusion of these costs in rates with the accumulation of a credit balance to a regulatory liability account. An annual level of expense is reflected in this adjustment, while the regulatory liability balance is included on a 13-month-average basis for the year ending December 2021. Please refer to the supplemental testimony of Mr. Steven R. McDougal in Docket No. UM-1968 for additional information about the other plant closure costs.

Oregon General Rate Case – December 2021
Tax Adjustment Index

The following adjustments were used to arrive at the normalized levels of tax expenses. The Company's 12 months ended June 2019 accrued tax data provided the basis for known and measurable adjustments to the December 2021 test period.

The tax impacts of the following adjustments are included within the adjustment itself:

- Nodal Pricing Model, page 5.2
- Depreciation & Amortization Expense, pages 6.1.3 and 6.1.4
- Other Plant Closure Costs, page 6.4
- Trapper Mine Rate Base, page 8.2
- Jim Bridger Mine Rate Base, page 8.3
- Regulatory Assets & Liabilities Amortization, page 8.8
- Remove Rolling Hills, page 8.9
- Carbon Plant Closure, page 8.10
- Pension and Other Postretirement Plan Balances Removal, page 8.11
- Deer Creek Mine Closure, page 8.12
- Repowering Capital Additions, page 8.13
- EV 2020 Capital Additions, pages 8.14 and 8.14.1
- Cholla Unit 4 Retirement, page 8.15
- Klamath Facilities Capital Additions, page 8.16

The tax impacts of the following adjustments are included within adjustments 7.4 through 7.5:

- Pro Forma Plant Additions 8.5

Normalized Interest	363,363,587	92,980,612	2.15
		-	

Description of Adjustment:

This adjustment synchronizes interest expense with the jurisdictional allocated rate base. This is calculated by multiplying net rate base by the Company’s weighted cost of debt. A separate column is not shown for adjustment 7.1 on page 7.0.2 as the interest true-up component is calculated and shown on the adjustment summary pages for each of the adjustments individually.

Adj to Pro Forma PTC	40910	3	14,114,694	SG	26.023%	3,673,015	7.3.1

Description of Adjustment:

The Company is entitled to recognize a federal income tax credit as a result of placing renewable generating plants in service. The tax credit is based on the kilowatt-hours generated by a qualified facility during the facility's first ten years of service. This adjustment is made to reflect the level of wind generation as forecasted by the GRID model for the test period.

As described in the testimony of Ms. Shelley E. McCoy, this adjustment is included in the calculation of overall revenue requirement for computational purposes only; the Company is not requesting recovery of NPC and PTCs as part of the general rate case. NPC and PTCs are reflected in the Company's Transition Adjustment Mechanism filings annually.

Federal Renewable Energy Tax Credit					187,272,741

Repowering In Service dates in **bold** reflect actual in-service dates.

[a] Total available Kwh is reflected net of the generation that is not considered PTC eligible because the facility was not fully repowered. For Glenrock, the disallowed Kwh represents 8.3% of the total. For Glenrock III, the disallowed Kwh represents 17% disallowed.

[b] Oregon does not include Rolling Hills in rate base, therefore, there are no credits for Rolling Hills in 2021.

Description of Adjustment:

This adjustment reflects the accumulated deferred income tax balances for property on a jurisdictional basis as maintained in the PowerTax System for the 12 months ended December 31, 2020. Updates the related tax depreciation and book depreciation schedule m items and associated deferred income tax expense for the 12 months ended December 31, 2020. This adjustment also corrects the allocation of the tax schedule m addition and related deferred income tax expense for post-employment costs to correspond with the ADIT treatment.

Adjustment to Expense:							
Taxes Other Than Income	408	3	33,599	SG	26.023%	8,743	7.6.1

Description of Adjustment:

This adjustment normalizes into the test year results the Wyoming Wind Generation Tax that became effective January 1, 2012. The Wyoming Wind Generation Tax is an excise tax levied upon the priviledge of producing electricity from wind resources in the state of Wyoming. The tax is on the production of any electricity produced from wind resources for sale or trade on or after January 1, 2012, and is to be paid by the person producing the electricity. New wind facilities are exempt from the tax for three years following the date the facility first produces electricity for sale. The tax is one dollar on each megawatt hour of electricity produced from wind resources at the point of interconnection with an electric transmission line.

Adjustment to normalize to CY December 2021			**33,599**	**Ref 7.6.1**

(a) Electricity produced from a wind turbine shall not be subject to the tax imposed under this chapter until the date three (3) years after the turbine first produced electricity for sale. After such date the production shall be subject to the tax, as provided by W.S. 39 22 103, regardless of whether production first commenced prior to or after January 1, 2012.

(b) WY Wind Generation tax is based on total MWh production, not PTC eligible generation. Glenrock I, Rolling Hills and Glenrock III were not fully repowered, which results in a difference between PTC eligible generation and WY Wind tax eligible generation. Rolling Hills is not included in this calculation because Oregon does not include Rolling Hills in rates.

Protected PP&E EDIT Amortization - OR	41110	1	3,093,170	OR	Situs	3,093,170	

Description of Adjustment:

This adjustment reflects the removal of tax deferral balances as a result of the Tax Cuts and Jobs Act that was enacted on December 22, 2017. The tax rate was reduced from 35% to 21% effective January 1, 2018. The related tax deferral balances will be removed from the base period and amortization via a separate tariff or rider will be proposed as part of the GRC.

Current Tax: Pursuant to Docket UM-1985, Order 19-028, the benefit of the new tax rate will be returned using a rolling deferral and amortization process until the the next general rate case. Therefore, the amount deferred in 2018 will be returned over 12 months starting on February 1, 2019 through Schedule 195, and the deferral in 2019 will be returned in 2020. Both the 2018 and 2019 deferrals are to be reduced by $1.5m to offset the 2018 TAM. The return of the deferral for 2020 will need to be decided upon in the current rate case.

Non-protected PP&E EDIT, Non-Property EDIT and Deferred Protected EDIT Amortization: Pursuant to Docket UM-1985, Order No. 19-028, all EDIT will continue to be deferred until the next rate case, with the exception of the balances utilized as part of the 2019 OR RAC Settlement. Pursuant to the Oregon Renewable Adjustment Clause settlement (UE 352, Order 19-034), approximately $159.7m of non-protected EDIT balances will be used to accelerate the depreciation on Oregon's share of certain repowered wind facilities in September 2019, December 2019 and Q1 2020. As of December 2019, $90.5m, or $120.0m including gross up, of non-protected EDIT balances have been amortized pursuant to this settlement. Another $30.9m, or $40.4m including gross up, is expected to be amortized in Q1 2020.

Protected PP&E EDIT: This adjustment also reflects the level of protected property EDIT amortization for the test period and adjusts the rate base to the appropriate levels

PacifiCorp

Oregon General Rate Case – December 2021

Rate Base Adjustment Index

The Company used year-end rate base as of June 2019 as the starting point for establishing the adjustments made to the test period. Test period electric plant in service is reflected using December 2020 ending balances. Other rate base components are reflected using a December 2021 13 month average balance. The following rate base adjustments are included.

8.1 Cash Working Capital
8.2 Trapper Mine Rate Base
8.3 Bridger Mine Rate Base
8.4 Customer Advances for Construction
8.5 Pro Forma Plant Additions
8.6 Miscellaneous Rate Base
8.7 FERC 105 (PHFU) Adjustment
8.8 Regulatory Assets & Liabilities Amortization
8.9 Remove Rolling Hills
8.10 Carbon Plant Closure
8.11 Pension and Other Postretirement Plan Balances Removal
8.12 Deer Creek Mine Adjustment
8.13 Repowering Projects Capital Addition
8.14 EV 2020 Capital Addition
8.15 Cholla Unit 4 Retirement
8.16 Klamath Facilities Capital Additions

Oregon General Rate Case - December 2021
Cash Working Capital

	ACCOUNT	Type	TOTAL COMPANY	FACTOR	FACTOR %	OREGON ALLOCATED	REF#
Adjustment to Expense:							
Cash Working Capital	CWC	3	(883,425)	OR	Situs	(883,425)	Below
Adjustment Detail:							
Cash Working Capital June 2019 - Unadjusted			30,507,590			8,591,673	2.28
Cash Working Capital December 2021 - Normalized			26,692,729			7,708,249	2.28
Adjustment:			(3,814,861)			(883,425)	

Description of Adjustment:

This adjustment is necessary to compute the cash working capital for the normalized results of operations in this filing. Cash working capital is calculated by taking total operation and maintenance expense allocated to the jurisdiction and adding its share of allocated taxes, including state and federal income taxes and taxes other than income. This total is divided by the number of days in the year to determine the Company's average daily cost of service. The daily cost of service is multiplied by net lag days to produce the adjusted cash working capital balance. Net lag days for Oregon are calculated using the Company’s 2015 lead lag study. A separate column is not shown for adjustment 8.1 on page 8.0.2 as the cash working capital component is calculated and shown on the adjustment summary pages for each of the adjustments individually.

Adjust to December 2020 12 Mth. Average	(478,796)	Above

Description of Adjustment:

The Company owns a 21.40% interest in the Trapper Mine, which provides coal to the Craig generating plant. The normalized coal cost of Trapper includes all operating and maintenance costs, but it does not include a return on investment. This adjustment adds the Company's portion of the Trapper Mine plant investment to the rate base. This adjustment reflects net plant to recognize the depreciation of the investment over time. This adjustment also walks forward the Reclamation Liability to December 2020. The adjustment was stipulated to and approved in Oregon UE 111, and it has been included in all filings since.

Adjustment Detail

June 2019 End of Period Balance	99,000,229	8.3.1
December 2020 End of Period Balance	76,848,770	8.3.1
Adjustment to December 2020 Balance	(22,151,459)	

Description of Adjustment:

The Company owns a two-thirds interest in the Bridger Coal Company (BCC), which supplies coal to the Jim Bridger generating plant. The Company's investment in BCC is recorded on the books of Pacific Minerals, INC (PMI), a wholly-owned subsidiary. Because of this ownership arrangement, the coal mine investment is not included in Account 101 - Electric Plant in Service. The normalized costs for BCC provides no return on investment. The return on investment for BCC is removed in the fuels credit which the Company has included as an offset to fuel prices leaving no return in results. The Bridger Mine adjustment was stipulated to and approved in Oregon UE 111, and has been included in all filings since.

Description of Adjustment:

To reasonably represent the cost of system infrastructure required to serve our customers, the Company has identified capital projects that will be used and useful by December 31, 2020. This adjustment includes the year end balance of the plant additions that will be placed into service by December 31, 2020. Capital additions by functional category are summarized on separate sheets, indicating the in-service date and amount by project. Projects over $10 million (total company basis) are described on pages 8.5.27 through 8.5.30. Retirements of plant in service are also walked forward through the test period. This adjustment includes the repowering retirements. This adjustment reflects the net impact of capital additions, and retirements. The related tax impact is included in adjsutments 7.4 and 7.5.

PacifiCorp
Oregon General Rate Case – December 2021
Pro Forma Plant Addition Descriptions
Projects Greater Than $10 Million

OTHER PLANT ADDITIONS:

Pryor Mtn Wind Project 240 MW 2020 (Reference page 8.5.20 (in-service Dec-20)
WPRY/2018/C/001- Pryor Mountain wind project will have a nominal rated capacity of 240 MW. The resource will be located on a site in Carbon County, Montana, approximately sixty miles south of Billings, Montana. The project consists of 57 Vestas Model 110-2.0 MW safe harbor, 24 Vestas Model 110-2.2 MW safe harbor and 29 Vestas model 110-2.2 MW follow-on WTGs. In addition PacifiCorp will utilize four General Electric Model 116-2.3 MW safe harbor wind turbines. In addition to the wind turbines there will be a 34.5 kilovolt ("kV") collector systems; a collector substation with two 34.5 kV to 230 kV step-up transformers, an O&M building and site access roads. Under a separate APR, PacifiCorp, as the transmission provider, will construct a new point of interconnection substation located on the project site in Montana. The planned in-service date for the project is December 2020.

Lake Side: STG20 GENERATOR Stator Replacement and Rotor Rewind (Reference page 8.5.20) (in-service Jan-20) OLSP/2019/C/014 – On August 18, 2019 the Lake Side steam turbine tripped following a generator stator fault. Examination and testing indicated that replacement of the stator and rewind of the rotor are required. The scope of the project includes dismantling the steam turbine generator, rewinding the rotor, replacing the stator, and reassembly.

Lake Side: U11 Combustion Overhaul-CY20 (Reference page 8.5.20) (in-service Apr-20)
Lake Side Unit 11 gas combustion turbine overhaul includes the replacement of combustion turbine parts and associated labor in accordance with the long term maintenance contract. The overhaul includes the replacement of program parts in the combustion and hot gas path sections of the gas turbine. The program parts are defined as transition seals, baskets, pilot nozzles, transitions, ring segments, blades and vanes. The service contract requires that the combustion turbine be maintained to the standards agreed upon per the maintenance contract and should occur after a specified number of factored fired hours or equivalent gas turbine starts.

Lake Side: U12 Combustion Overhaul-CY20 (Reference page 8.5.20) (in-service Apr-20)
Lake Side Unit 12 gas combustion turbine overhaul includes the replacement of combustion turbine parts and associated labor in accordance with the long term maintenance contract. The overhaul includes the replacement of program parts in the combustion and hot gas path sections of the gas turbine. The program parts are defined as transition seals, baskets, pilot nozzles, transitions, ring segments, blades and vanes. The service contract requires that the combustion turbine be maintained to the standards agreed upon per the maintenance contract and should occur after a specified number of factored fired hours or equivalent gas turbine starts.

TRANSMISSION PLANT ADDITIONS:

Vantage Pomona Heights 230kV Line (Reference 8.5.21) (in-service May-20)
The Vantage to Pomona Heights project consists of two sequences of work. The first sequence of work included the expansion of the Pomona Heights substation 230 kilovolt ring bus to provide adequate breaker separation between lines and transformers for breaker failure and bus fault events. This portion of the project was completed and placed in service in November 2015.

The second sequence of work includes installation of a new 230 kilovolt transmission line connected at the Bonneville Power Administration Vantage substation near Vantage, Washington, and ending at the PacifiCorp Pomona Heights substation in Yakima, Washington. The project will include the installation of breakers, protection and control equipment, and communications equipment at each substation as required to monitor and safely operate the new line. The infrastructure additions at the Vantage substation will be designed, purchased, installed, and maintained by Bonneville Power Administration. This sequence of work is estimated to be placed in service in May 2020.

This project corrects several existing North American Electric Reliability Corporation TPL deficiencies, eliminates the need to shed Yakima area load, eliminates overload of PacifiCorp and Bonneville Power Administration system with loss of the existing line, and meets the identified infrastructure needs in the joint area plan.

Goshen-Sugarmill-Rigby 161kV Transmission Line (Reference 8.5.21) (in-service Nov-20)
The Goshen-Sugarmill-Rigby 161 kilovolt Transmission Line project consists of two sequences of work. The first sequence rebuilds approximately 25 miles of existing 69 kilovolt line to 161 kilovolt from Goshen substation to Sugarmill substation located in the southeast Idaho area. Substation expansion and new line positions at Goshen and Sugarmill substation will be required. This sequence of work is estimated to be placed in service in November 2020.

The second sequence of work is to construct a new approximately 24 mile long 161 kilovolt line from Sugarmill to Rigby substation. This sequence of work is estimated to be placed in service in 2022 and is outside of the general rate case test period.

This overall project addresses overloading on the Goshen – Rigby and Goshen – Sugarmill lines in addition to low voltage at Rigby and Sugarmill substations that manifest under heavy loading conditions.

Goshen #3 345/161 kV 700 MVA Trfrmr Inst (Reference 8.5.21) (in-service Nov-20)
The Goshen #3 345/161 kilovolt 700 MVA Transformer Installation project consists of two sequences of work. The project will ultimately interconnect a third 345/161 kilovolt transformer at the Goshen substation located in southeast Idaho estimated to be placed in service in 2021. However, the existing Goshen 161 kilovolt bus is inadequate to reliably serve the peak load in the Goshen area and interconnect the third 700 MVA transformer, so the first sequence of the project is to expand the 161 kilovolt yard and convert the existing Goshen 161 kilovolt dual operate bus into a breaker and one-half scheme. Redundant 161 kilovolt relays will also be installed. This sequence of the project will be placed in service in November 2020.

This project corrects North American Electric Reliability Corporation TPL deficiencies for thermal overloading issues on the existing Goshen transformer beginning in 2021.

Wildfire Mitigation – Trans (Reference 8.5.21) (in-service various)
Projects will include:

- Rebuild transmission lines that are approaching the end of their useful life in Fire High Consequence Areas to new wildfire safe designs
- Modify existing transmission lines to new wildfire safe designs
- Replace outdated electromechanical relays protecting transmission lines in Fire High Consequence Areas with modern microprocessor relays that provide more accurate data that is required in Fire High Consequence Areas
- Add fiber optic communication between substations in the Fire High Consequence Areas to improve protective relaying schemes

These projects will result in decreased risk of transmission equipment failure during the wildfire season, which is increasing in length every year. Modern relaying will enable line patrols to quickly locate and fix any problems, restoring service to customers faster. Fiber optic communications between substations in Fire High Concern Areas will improve the clearing times for protective relaying schemes, which will reduce the time the fault is active. New wildfire safe designs on the transmission system will improve the survivability of the lines in the event that a wildfire does occur.

Jordanelle - Midway Construct 138 kV Line – Trans (Reference 8.5.21) (in-service Nov-20)
This project will:

- Construct 9 miles of 138 kilovolt transmission line between the Midway and Jordanelle substations
- Add a three 138 kilovolt breaker ring bus at the Midway substation
- Add fiber optic communications between the Silver Creek and Midway substations
- Install protection and control upgrades at all affected substations

The line siting will substantively follow Heber Light and Power's (HLP) existing 46 kilovolt line across the Heber Valley. The structures will be owned by PacifiCorp and, for portions, HLP will have circuits and other facilities attached to PacifiCorp structures. After project completion, the Summit and Wasatch County system will be capable of operating in a looped configuration for area load levels up to 245 megawatts.

Oregon New Large Load Network Upgrades (Reference page 8.5.21) (in-service Dec-20)
TZBE/2017/C/002/B
The Oregon New Large Load Network Upgrade is to serve a 60 MW Load Addition project which is to construct 230 kV system improvements necessary to provide service to new load near an existing Prineville Data Center. The customer intends to add an additional 220 MW of load between 2020 and 2022 that the proposed improvements will also be able to service.
The current property is served via the Prineville area 115 kV system out of Houston Lake substation. The current contract capacity is for 120 MW. When combining the contract capacity out of Houston Lake, another customer load of 57 MW of contract capacity out of Baldwin Road and Prineville area load of 44 MW, the current 115 kV system cannot accommodate the new data center load of 60 MW (or the additional 220 MW). Adding additional load to the current 115 kV system results in two N-1 NERC TPL thermal violations with thermal loading in excess of 124% and a number of N-1-1 scenarios resulting in NERC TPL thermal and voltage violations. Maintaining compliance with NERC TPL standards will require system modifications that will add capacity before the new load can be served.
The solution to serve the new 60 MW load, with the ability to also serve the next 220 MW load addition, is to (1) obtain a second 230 kV source from BPA at Ponderosa substation, (2) construct a 230 kV substation to support 230 kV interconnection of the BPA source lines to the new infrastructure, (3) construct two 230 kV transmission lines and (4) construct a 230 kV Point of Interconnect substation.

Q0542 Pryor Mountain – Trans (Reference 8.5.21) (in-service Dec-20)
The Q0542 Pryor Mountain project is to interconnect 240 megawatts of new wind generation to PacifiCorp's Frannie - Yellowtail 230 kilovolt transmission line approximately 14.2 miles north of the Frannie substation located in Carbon County, Montana. The network upgrades included in the scope of this project include: the installation of a new three-breaker ring bus substation; installation of approximately 55 miles of fiber optic cable from the Point of Interconnection substation to Frannie and Yellowtail substations; installation of communications equipment at various Transmission Provider locations; and a new transmission line loop in/out of the 230 kV Frannie-Yellowtail transmission line to the Point of Interconnection substation.

DISTRIBUTION PLANT ADDITIONS:

Wildfire Mitigation Plan - OR D (Reference page 8.5.22) (In-service various)
This project outlines the preventative strategies and programs PacifiCorp will implement to its electric distribution and transmission infrastructure that will minimize the risk that causes wildfires. Due to the growing threat of wildfire in the western United States, PacifiCorp has developed a comprehensive wildfire mitigation plan. This plan will guide PacifiCorp's efforts to minimize the chances of a fire igniting from any of PacifiCorp's facilities. This project details PacifiCorp's planned efforts to construct, maintain, and operate its electrical lines and equipment in a manner that will minimize the risk of catastrophic wildfire.

PacifiCorp
Oregon General Rate Case – December 2021
Pro Forma Plant Addition Descriptions
Projects Greater Than $10 Million

GENERAL PLANT ADDITIONS:

Open Floor Plan - OR - Structure OR (Reference page 8.5.24) (in-service various)
The Open Floor Plan project encompasses the remodel of the Lloyd Center Tower in Portland, Oregon, to an open floor plan. Assets will include architectural services, construction of conference rooms and enclaves at the Lloyd Center Tower. The project will provide and install power/data/phone wiring, flooring, furniture, appliances, and finishes on the floors. Construct and furnish two common breakrooms: one breakroom on floor 6 and another on floor 18. This is a multi-year project that will begin with the 20th floor. The remaining floor remodels will be phased from 2020 through 2022.

PacifiCorp
Oregon General Rate Case - December 2021
Miscellaneous Rate Base

	ACCOUNT	Type	TOTAL COMPANY	FACTOR	FACTOR %	OREGON ALLOCATED	REF#
Adjustment to Rate Base:							
1 - Fuel Stock - Pro Forma	151	3	(13,828,605)	SE	25.101%	(3,471,186)	8.6.1

2 - Prepaid Overhauls	186M	3	3,355,979	SG	26.023%	873,314	8.6.1

Description of Adjustment:

1 - Fuel stock levels for December 2021 are projected to be lower than June 2019 levels due to a decrease in the amount of coal stockpiled, offset slightly by higher stockpile unit costs. The adjustment also reflects the working capital deposits which are an offset to fuel stock costs.

2 - Balances for prepaid overhauls at the Lake Side, Chehalis and Currant Creek gas plants are walked forward to reflect payments and transfers of capital to electric plant in service during the year ending December 2021.

Description of Adjustment:

This adjustment adds into results the proposed amortization of the remainder of the Post-2017 FERC OATT Revenue Deferral balance, net of the net book value of replaced wind equipment, as described in Docket UE-369, direct testimony of Mr. Steven R. McDougal (PAC/400, Page 9). The company proposes in this general rate case to begin amortizing the remainder of this balance over three years, beginning on the proposed effective date of January 1, 2021. This adjustment also walks forward Electric Plant Acquisition in the base period (12 months ended June 2019) to pro forma period levels (12 months ending December 2021).

Description of Adjustment:

The Carbon Plant was retired April, 2015 and will be fully recovered as of December 2020. This adjustment removes the allocation in the base period of accelerated depreciation deferral and amortization. This adjustment also returns excess decommissioning costs of the plant back to ratepayers over a five-year period. per the proposal in the Company's 2018 Deprecation Study, UM 1968.

PacifiCorp
Oregon General Rate Case - December 2021
Carbon Plant Closure

On January 1, 2014 new depreciation rates for the Carbon Plant became effective in Utah, Idaho, and Wyoming. The difference in the depreciation in these rates due to the retirement of the Carbon Plant was deferred in those states, to be amortized to expense after the plant was retired. This deferral and amortization of depreciation expense was booked on a company system factor. It should have been allocated situs to Utah, Idaho, and Wyoming, as appropriate. The accounting detail is provided below.

Deferral of Depreciation Expense - 12 Months Ended June 2019

PacifiCorp
Oregon General Rate Case - December 2021
Carbon Plant Closure
Closing Costs in Pro Forma Period

The Company continues to carry an accumulated depreciation reserve for Carbon Plant decommissioning that has yet to be returned to Oregon customers. The Company is proposing a five-year amortization period, as per the 2018 Depreciation Study, to return the benefit of this rate base credit to ratepayers in Oregon.

Description of Adjustment:

This adjustment removes the Company's net prepaid asset associated with its pension and other postretirement welfare plans, net of associated accumulated deferred income taxes in unadjusted results. Per Order No. 15-226 in Docket UM 1633, the net pension and post retirement prepaid is not to be included in rate base for Oregon.

Description of Adjustment:

Oregon Order No. 15-161 in Docket UM 1712 addressed closure of the Deer Creek mine located in Utah and ruled on several issues. This adjustment removes the Deer Creek Unrecovered Plant Regulatory Assets from results because these amounts have been recovered through a separate tariff riders.

Order No. 15-161 authorized a creation of a deferred account to track the Deer Creek Mine closure costs and costs due to Retiree Medical Obligation Settlement Loss to be addressed in the current ratemaking proceedings. The Company is proposing to include all deferred costs and savings in the rate base to be amortized over three years.

PacifiCorp
Oregon General Rate Case - December 2021
Deer Creek Mine Closure
Treatment of Deer Creek Unrecovered Plant

Deer Creek unrecovered plant was fully amortized over four years in May 2019 as ordered in Docket No. UM 1712, therefore, Deer Creek Unrecovered Plant amortization amounts should be removed from unadjusted results.

	Amort	FERC Account	Allocator	Ref
Amortization of unrecovered plant	**8,319,574**	**501**	**SE**	**8.12**

PacifiCorp
Oregon General Rate Case - December 2021
Deer Creek Mine Closure
Closing Costs in Pro Forma Period

In UM 1712 the commission authorized a creation of a deferred account to track Deer Creek Mine closure costs.
In the current rate case, the Company is proposing a 3-year amortization schedule to recover mine closure costs.
The amounts below have been reduced for the joint owner portion.

Oregon General Rate Case - December 2021
Deer Creek Mine Closure
Savings Resulting from the UMWA PBOP Settlement

The UMWA PBOP settlement resulted in lower PBOP expense for the Company.
The Oregon portion of these savings were ordered to be deferred until the current Oregon General Rate Case.
The Company is proposing to return the savings that resulted from The UMWA PBOP settlement to customers over three year amortization period.

Oregon General Rate Case - December 2021
Deer Creek Mine Closure
Recovery Royalties - Closure Costs

Recovery royalties, which are part of the Deer Creek mine closure costs, have been estimated but not spent. The Company is proposing three year amortization of these costs starting January 2021. The balance of the recovery royalties will not be included as part of the closure cost regulatory asset since the Company will not incur these expenses until the Deer Creek mine closure costs are fully paid.

Estimated Recovery Royalties $ 12,118,236

Description of Adjustment:

This adjustment adds the capital additions and incremental operations and maintenance amounts for the wind repowering projects set to occur before December 2020. This treatment reflects the immediate depreciation of the replaced wind assets as stipulated in UE-352 and UE-369.

The adjustment to wind depreciation expense on wind repowering replaced plant is reflected in Adjustment 6.1 Depreciation and Amortization Expense.

Accumulated Def Inc Tax Balance	282	3	(6,320,970)	SG	26.023%	(1,644,883)	

Description of Adjustment:

Consistent with the IRP, the Company will be closing Cholla Unit 4 in December 2020. Recovery of Cholla plant will be included in a separate tariff rider. This adjustment removes Cholla-related expenses and rate base balances from test period results.

Description of Adjustment:

Consistent with the Klamath Hydroelectric Settlement Agreement (KHSA), depreciation rates for the Klamath assets were previously approved by the Commission to provide for full depreciation of the Klamath assets by 12/31/2019. The timing of when FERC will transfer the license, and when PacifiCorp’s operations will ultimately cease, remains uncertain. As the current project licensee, PacifiCorp's obligations under the license and FERC regulations continue to require capital investments to support ongoing project operations. This adjustments adds into test period results capital additions and depreciation through calendar year 2020.

I. INTRODUCTION AND QUALIFICATIONS

Q. Please state your name, business address, and present position with PacifiCorp d/b/a Pacific Power (PacifiCorp or the Company).

A. My name is Robert M. Meredith. My business address is 825 NE Multnomah Street, Suite 2000, Portland, Oregon 97232. My present position is Director, Pricing and Cost of Service.

Q. Briefly describe your education and professional experience.

A. I have a Bachelor of Science degree in Business Administration and a minor in Economics from Oregon State University. In addition to my formal education, I have attended various industry-related seminars. I have worked for the Company for 15 years in various roles of increasing responsibility in the Customer Service, Regulation, and Integrated Resource Planning departments. I have over nine years of experience preparing cost of service and pricing related analyses for all of the six states that PacifiCorp serves. In March 2016, I became Manager, Pricing and Cost of Service. In June 2019, I was promoted to my current position.

II. PURPOSE AND SUMMARY OF TESTIMONY

Q. What are your responsibilities in these proceedings?

A. I am responsible for the Company's proposed revenue requirement for each of the unbundled service categories, the Company's functionalization procedures, the Oregon Marginal Cost Study and the design of the Company's proposed prices in this proceeding. The proposed tariffs incorporate the Company's proposed price increase and are designed consistent with the Commission's rules under OAR 860-038-0200.

I am sponsoring the Company's Oregon electric tariff schedules submitted for approval in this filing. Exhibit PAC/1401 contains the proposed tariffs.

Q. Please summarize your testimony.

A. The overall rate increase proposed by the Company in this case, including the effect of rebalancing the Rate Mitigation Adjustment (RMA) (discussed later in my testimony), is $70.8 million or 5.4 percent.[1] The Company is proposing a base rate spread that is consistent with the cost of service study in this case. Including the effect of all tariff riders, the Company's proposed net rate spread proposes continued use of the RMA to achieve a rate increase on January 1, 2021, where no customer rate class will see a rate increase more than 10.0 percent.

Taking into consideration the requested price change in this case and in the concurrent Transition Adjustment Mechanism (TAM) filed by the Company, the overall requested rate change is a 1.6 percent increase, or about $21.6 million. Table 1 below shows the proposed net bill impact of both filings to the different classes:

Table 1. Net Combined Bill Impact from General Rate Case and Transition Adjustment Mechanism

	GRC	TAM	**Total**
Residential	5.0%	-3.2%	**1.8%**
Commercial and Industrial	6.0%	-4.2%	**1.8%**
Lighting	-18.9%	-7.5%	**-26.4%**
Overall	5.4%	-3.7%	**1.6%**

Rate design/structure changes that the Company proposes in this case include the following:

[1] The net increase of $70.8 million, or 5.4 percent overall on January 1, 2021 consists of the proposed price change including resetting Schedule 299, the Rate Mitigation Adjustment, and the net impact to customers of separate tariff riders for proposed Schedule 195 – Federal Tax Act Adjustment and Schedule 197 – Generation Plant Removal Adjustment.

- Splitting the monthly basic charge into $12 for single-family and $7 for multi-family customers and reducing the differential for tiered rates in half.
- Modernizing time of use periods and increasing the differential between on- and off-peak energy for large non-residential customers.
- Modifying the underlying structure of Company-owned street and area lighting prices to simplify rates and better align the Company's incentives.
- Introduction of several innovative pricing pilots including a residential time of use pilot, a time of use pilot for smaller non-residential customers, and interruptible service and real-time day-ahead pilots for larger non-residential customers.

III. UNBUNDLED CLASS REVENUE REQUIREMENTS

Q. Please identify Exhibit PAC/1402 and explain what it shows.

A. Exhibit PAC/1402 shows the Company's proposed revenue requirement for each of the unbundled service categories required by OAR 860-038-0200: Generation (also referred to as Production), Transmission, Distribution, Ancillary Services, Consumer Services—Billing, Consumer Services—Metering, Consumer Services—Other, Retail Services, and Investment in Public Purposes.

No revenue requirement is shown for the Retail Services or Investment in Public Purposes categories. The Company separately accounts for the costs associated with unregulated retail activities and is not seeking regulatory cost recovery for these items. Public purpose revenues are collected under a separate tariff.

Q. Does the Company include any additional detail within the unbundling of its revenue requirement?

A. Yes. In this case, the Company proposes unbundling a subfunction within Distribution specifically for the Company's provision of lighting equipment that the Company provides for street and area lights. Owning and maintaining lighting equipment is a cost that is only necessary to serve consumers taking service on a limited number of schedules and is easily isolated by Federal Energy Regulatory Commission (FERC) account. Considering changes that the Company proposes for its Company-owned street and area light prices that I will discuss later in my testimony and the Company's intention to transition to more efficient light-emitting diode (LED) technology, it is important for the embedded costs and benefits of Company-owned lights to be tracked and assigned to those consumers who utilize them. This sub-function is listed on Exhibit PAC/1402 as "Distribution - Lighting".

Q. How was the revenue requirement determined for each of the unbundled categories?

A. Rate base balances, revenues and expenses were either assigned or allocated to unbundled categories in accordance with Oregon regulations.[2] Traditional revenue requirement methodology, (i.e., recovery of costs plus a return on rate base), was then used to determine a revenue requirement for each category. Rate base balances, revenues and expenses are from PacifiCorp's Oregon Results of Operations Report, as prepared under the direction of Ms. Shelley E. McCoy. The application of PacifiCorp's proposed rate increase is shown on page 2 of Exhibit PAC/1402.

Q. Please identify Exhibit PAC/1403 and explain what it shows.

A. Page 1 of Exhibit PAC/1403 is the summary page from PacifiCorp's December 2021 Functionalized Oregon Results of Operations Report (Functionalized Oregon Results of Operations Report) and is the basis for the unbundled revenue requirement in

[1] *See* OAR 860-038-0200.

Exhibit PAC/1402. It separates the results of operations into the unbundled categories identified above.

Q. Please explain how the rate base balances, revenues and expenses in the Functionalized Oregon Results of Operations Report were apportioned among the unbundled categories.

A. The detail of PacifiCorp's Functionalized Results of Operations Report by FERC account is found on page 2 through 22 of Exhibit PAC/1403. The functionalization procedures in this case are consistent with those approved in Order 01-787 and implemented in Advice No. 01-020. Functional factors employed in the development of these results are provided in Exhibit PAC/1404.

Q. How did PacifiCorp determine the revenue requirement for Ancillary Services?

A. The revenue requirement for Ancillary Services was estimated by applying PacifiCorp's prices for Regulation and Frequency Response Service, Spinning Reserve Service, and Supplemental Reserve Service to the relevant billing determinants of PacifiCorp's total Oregon retail load. This is shown in Exhibit PAC/1405. The costs associated with providing these services are included in the Generation function. The estimated revenue for Ancillary Services is treated as an offsetting revenue credit against the Generation revenue requirement.

Q. Please identify Exhibit PAC/1406.

A. Exhibit PAC/1406 contains a summary from PacifiCorp's State of Oregon December 2021 Marginal Cost Study (Marginal Cost Study). The Marginal Cost Study is described in more detail later in my testimony.

Q. Please identify Exhibit PAC/1407 and explain what it shows.

A. Page 1 of Exhibit PAC/1407 is the derivation of functionalized class revenue requirements and a comparison with current revenues. This exhibit is based on the results of both the Functionalized Oregon Results of Operations Report and the Marginal Cost Study. Present class revenues are shown on line 1 and megawatt-hours (MWh) are shown on line 2. Full long-run marginal costs for each customer class, separated by function, are shown on lines 4 through 12. Lines 14 through 25 show each class' share of total marginal costs for each function as well as each class' share of revenue and MWh. Lines 28 through 40 show the assignment of functional revenue requirement. The total revenue requirement for each unbundled category, as determined earlier, is shown in the total column. The total for each function is then allocated to a particular customer class based on that class' share of total marginal cost for that function. For example, the residential class accounts for 43.44 percent of generation marginal costs and is assigned 43.44 percent of the generation revenue requirement. Regulatory and franchise fees are considered part of the distribution function; however, for the purpose of assigning cost responsibility, the fees have been broken out separately. Regulatory and franchise fees have been assigned on the basis of class revenue. Lines 42 through 50 compare the total revenue requirement by class to the present class revenues collected from base rates as shown on line 1.

Q. Please explain what is shown on pages 2 and 3 of Exhibit PAC/1407.

A. Pages 2 and 3 of Exhibit PAC/1407 provides a reconciliation between Operating Revenues and Target Revenue Requirement, as shown on page 1 of this exhibit, with those shown in Exhibits PAC/1402 and PAC/1403. Not all customer classes are included in the Marginal Cost Study. Page 2 of Exhibit PAC/1407 accounts for all

Oregon test period revenue sources. Page 3 accounts for all revenue sources included in the Target Revenue Requirement.

IV. MARGINAL COST STUDY

Q. Please describe PacifiCorp's Marginal Cost Study that accompanies this filing.

A. The Marginal Cost Study is found in Exhibit PAC/1408. This study shows, by customer class, PacifiCorp's marginal cost of resources required to produce one additional unit of electricity, or to add one additional customer. Exhibit PAC/1408 contains a marginal cost and circuit model procedures narrative, various summary tables, and supporting calculations.

Q. Is this Marginal Cost Study similar to studies the Company has previously filed?

A. Yes. This study is similar to the cost of service study the Company presented in docket UE 263 (2013 Rate Case), with some notable updates to the methodology which better reflect marginal costs as they exist today. First, the marginal cost of complying with Oregon's renewable portfolio standard (RPS) in the computation of marginal energy-related generation cost was modified to be based on the forecast incremental cost of compliance included with the Company's bi-annual RPS implementation plans. Second, distribution peaks were weighted by the load of substations peaking in each month. Third, the marginal cost of transmission and distribution substations were modified to align with the transmission and distribution deferral credits used for demand-side management modeling in the Company's 2019 Integrated Resource Plan (IRP). Finally, the marginal cost of meter reading was set to zero as a result of the Company's implementation of advanced metering infrastructure (AMI).

Marginal Cost Study Changes: Marginal Cost of RPS Compliance

Q. How was the marginal cost of complying with Oregon's RPS determined?

A. The marginal cost of Oregon RPS Compliance was determined by multiplying the Company's forecast incremental cost of compliance, as calculated and filed in the Company's RPS implementation plan, by the Oregon RPS target percentage for each year.[3] The Company's 2019 RPS Implementation Plan showed that the Company had a negative incremental cost of compliance for each of the forecast years presented (2019 to 2023).[4] For this rate case, the Company therefore assumes zero as the marginal cost of RPS compliance.

Marginal Cost Study Changes: Changes to Distribution Peaks

Q. Why are distribution peaks weighted by the load of substations peaking in each month?

A. Peak load is the key cost-driver of substation equipment. In making distribution investment decisions, engineers use peak-loading on individual circuits and substation transformers. For many of its distribution substations, the Company knows the month and magnitude in megawatts (MW) of peak load. Weighting the 12 monthly distribution coincident peaks by the load of substations peaking in each month provides a more accurate representation of how costs are incurred to serve load, since it reflects the seasonality of when substations peak.

Marginal Cost Study Changes: Modifications to Marginal Transmission and Distribution Substation Costs

Q. Please describe the changes made to the calculation of marginal transmission and distribution substation costs.

A. The method of calculating the marginal cost of transmission and distribution substation costs was revised in this study to reflect the methodology used in the Company's IRP to estimate a transmission and distribution deferral benefit for demand-side management. For marginal transmission cost, the difference in this calculation is that the cost of projected transmission additions are divided by the capacity that would be added from these builds instead of the peak load growth projected for the investment horizon, as was done in the Company's previous marginal cost studies. Using the actual capacity added from the equipment as the denominator is a more accurate reflection of the marginal cost of adding transmission than load growth, because transmission investment is often lumpy and built to reliably serve existing load and provide capacity for load growth that will be experienced in the future.

For marginal distribution substation cost, the difference in the calculation is that the incremental substation cost is multiplied by a substation utilization factor. The substation utilization factor is calculated by dividing the maximum distribution peak by the installed capacity of existing distribution substations. The distribution peak is expanded by transmission voltage level losses and substation thermal loading. Applying a utilization factor to distribution substation costs reflects the fact that substation capacity additions are typically done in blocks which result in some substations being close to being fully utilized and others operating well below peak capacity.

Marginal Cost Study Changes: Meter Reading Costs

Q. Why were marginal meter reading costs set to zero in this filing?

A. The majority of the Company's meters in Oregon were replaced with AMI meters by the end of 2019. With AMI technology there is no marginal cost associated with reading meters. While a small percentage of meters are read either by phone or manually for customers who opt-out of AMI or where the AMI mesh network is not fully functional, AMI opt-out manual meter reading costs are recovered directly through fees to customers who elect to opt-out and the telephony costs associated with meter reading are negligible.

Q. How are marginal costs calculated?

A. One-year marginal costs include only changes in operating costs while 10-year and 20-year marginal costs also include the cost of expanding facilities. The costs of these added facilities result in long-run costs that are higher than short-run costs. Short-run costs include only one year of generation energy costs and some billing costs. They do not include any demand-related generation, transmission or distribution costs. A detailed description of marginal cost procedures is included in pages 1 through 14 of Exhibit PAC/1408.

Q. Please describe the marginal cost summary tables included in pages 15 through 22 of Exhibit PAC/1408.

A. Tables 1 and 2 of Exhibit PAC/1408 summarize the one-year, 10-year and 20-year marginal costs on a mills-per-kilowatt-hour (kWh) or dollars-per-customer basis.

Table 3 summarizes the unit costs based on the results of the long-run (20-year) marginal cost study. Unit costs are shown for generation, transmission, distribution and various customer service functional categories. Table 3 also includes energy usage, peak demand, and number of customers by customer class for the 12-month period ending December 31, 2021 test period. This information is used to calculate the annual long-run marginal costs by class shown at the bottom of Table 3.

Q. Please explain how generation marginal costs are calculated.

A. Marginal generation costs in this study are based on the Company's currently approved Oregon avoided cost calculations. New resource costs are based on the fixed and variable cost of a combined cycle combustion turbine, which operates as a base load unit. Recognizing that base load generation produces the dual products of capacity and energy, capacity costs are determined using the fixed costs of a simple cycle combustion turbine. Generation energy costs are calculated by combining the remaining fixed and all variable costs of the combined cycle turbine plus the marginal cost of RPS compliance. The marginal cost of RPS compliance is based upon the forecast incremental cost of compliance multiplied by the RPS compliance obligation percentage in each year. The compliance obligation is 20 percent for 2021 to 2024, 27 percent for 2025 to 2029, 35 percent for 2030 to 2034, 45 percent for 2035 to 2039, and 50 percent for 2040 and beyond. Marginal generation capacity and energy costs are summarized on Table 4 of Exhibit PAC/1408.

Q. How are transmission costs calculated?

A. Transmission costs are based on a five-year analysis of forecasted expenditures. Expenditures identified as growth-related are used to develop marginal transmission costs. All of these growth-related transmission investments, except bulk power lines, are classified entirely to demand. Bulk power lines are classified both to demand and energy in the same proportions as the long-run marginal costs of generation resources. Marginal transmission costs are summarized on Table 5 of Exhibit PAC/1408.

Q. Please provide a general overview of how marginal distribution costs are determined.

A. Table 6 of Exhibit PAC/1408 provides a unit cost summary by class and load size of marginal distribution costs. Distribution costs are classified into three components: (1) demand-related, shown in dollars per kilowatt (kW)/year; (2) commitment-related, shown in dollars per customer/year; and (3) billing-related, shown in dollars per customer/year. Commitment-related distribution costs consist of the costs of transformers, poles and conductors that are not determined by the level of demand customers place on the system. Demand-related distribution costs include additional costs of larger transformers, substations, poles and conductors with sufficient capacity to serve the level of demand a customer class places on the system.

Q. Please describe how the marginal costs of distribution line transformers are calculated.

A. Marginal transformer costs are calculated using a least squares regression analysis of the current installed cost versus size of the Company's commonly installed transformers. Commitment and demand costs are separated by the nature of this statistical technique. The regression provides an intercept term, which represents the commitment costs, and a slope, which represents the demand cost per kW. The regression also identifies the additional costs of a three-phase transformer over a single-phase transformer.

Q. Please describe how the marginal costs of distribution circuits are calculated.

A. Marginal costs of distribution poles and wires are calculated using the Company's Distribution Circuit Model. The circuit model focuses on several key characteristics that influence distribution cost of service. Among these are customer density, customer size and usage characteristics, and customer location on the circuit. The hypothetical circuit is constructed with seven branches of equal length using the composite line statistics and current cost estimates for Oregon. Customer locations are based on actual customer distances from the substation. The results are segregated into commitment-related and demand-related costs for each customer class. A detailed description of the updated circuit model is also included in the marginal cost procedures on pages 5 through 14 of Exhibit PAC/1408.

Q. How are substation marginal costs calculated?

A. Marginal substation costs are determined using the per kW cost of substation additions being considered for a five-year period. The cost per kW is determined by dividing the growth-related distribution substation investment in the capital budget horizon by the related increase in substation capacity. Substation marginal costs are classified entirely to demand and are allocated to customer classes based on the distribution peak load for each class weighted by the load of substations peaking in each month.

Q. What is included in the service drop category?

A. The service drop category includes the marginal cost of service drops with associated operation and maintenance (O&M). Current typical installed costs for service drops are determined for each customer load size.

Q. What is included in the metering category?

A. The metering category includes the marginal cost of metering equipment with associated O&M. Current typical installed metering costs are determined for each customer load size by analyzing service requirements, such as single- or three-phase service and voltage level. Meter O&M is based on historical expenditures.

Q. What is included in the billing and customer service/other categories?

A. This category includes the costs of billing, payment processing and debt recovery, meter reading expense, and all the remaining customer accounting and customer service activities. As discussed earlier in my testimony, marginal meter reading expense is assumed to be zero because AMI has been deployed for almost all customers. Customer accounting and customer service expense are based on historical expenditures and are assigned to each customer class based on the various resources required to perform billing, collections, and customer service activities for different types of customers.

V. ALLOCATION OF THE FUNCTIONALIZED REVENUE REQUIREMENT

Q. How is the Company proposing to allocate the functionalized revenue requirement across classes of customers in this proceeding?

A. The Company is allocating the functionalized revenue requirement to classes consistent with the Commission's Direct Access Rules. These rules indicate that "rates for any class of consumer must be based on the unbundled costs to serve that class."[5] In this filing, the Company has allocated the revenue requirement to each rate schedule based on the results of the functionalized class cost of service study. The proposed rates for each rate schedule included in the cost of service study are targeted to collect the cost of service for that rate schedule in the test period. Therefore, the proposed base rates for each class are based on the unbundled costs to serve that class.

Q. Do you have an exhibit that summarizes the functionalized results of the cost of service study?

A. Yes. Pages 1 and 2 of Exhibit PAC/1409 summarize the functionalized results of the cost of service study in column (4). This summary is provided at the level used to design rates. The cost of service for each rate schedule has been summarized into the following components: Transmission & Ancillary Services, System Usage, Distribution, Generation Energy Other Non-net Power Costs (Non-NPC), and Generation Energy NPC.

Q. What is the purpose of including this summary of cost components for the target functionalized revenue requirement?

A. The summary level for revenue requirement shown on pages 1 and 2 of Exhibit PAC/1409 summarize the cost of service results into the target revenue requirement components used in rate design.

The process of unbundling the Company's proposed prices is consistent with the method the Company first implemented in docket UE 116. For each rate

[4] OAR 860-038-0240(3)(b).

schedule, the functionalized costs are applied to rates as follows: distribution, billing, metering, and customer costs are included in each proposed delivery service schedule's Distribution rates; the FERC regulated transmission and ancillary services are included in each proposed delivery service schedule's Transmission & Ancillary Services rates; NPC generation costs are included in Schedule 200, Base Supply Service rates; and NPC are included in Schedule 201, Net Power Costs, Cost-Based Supply Service rates.

Q. Please explain the System Usage costs shown in exhibit PAC/1409 and how those costs are proposed to be recovered in rates.

A. In Order 12-500, the Commission directed the Company to develop a volumetric rate element for franchise fees that could be avoided by customers taking direct access. The amounts shown as System Usage costs in Exhibit PAC/1409 are a portion of the Oregon Franchise Tax and Oregon Energy Supplier Assessment from FERC Account 408 in the results of operations.[6] The System Usage costs have been calculated as the portion of the franchise and energy supplier taxes associated with revenues not paid by direct access customers: NPC and transmission and ancillary services. As discussed later, a separate volumetric rate element has been developed to recover these costs, which will not be paid by direct access customers.

[5] The Oregon Energy Supplier Assessment is a fee paid to the Oregon Department of Energy under ORS 469.421(8). While this treatment for this assessment was not reflected in Order 12-500, the Company has included it in the System Usage Charge because it is assessed in the same manner (a percent of revenue) as franchise taxes in FERC Account 408. The Company is therefore proposing parallel treatment.

Q. Have any adjustments been made to the functionalized revenue requirement by rate schedule resulting from the cost of service study?

A. Yes. The Company has made two adjustments to the functionalized revenue requirement. Consistent with past cases, the functionalized revenue requirement has been adjusted to remove the proposed changes to NPC collected through Schedule 201. Changes to Schedule 201 are implemented through the TAM, which is a separate proceeding from this general rate case, and the Schedule 201 changes will be addressed in that proceeding. The Company also made a balancing adjustment to reflect the difference in the interclass allocation between excess deferred income taxes and the net book value of the undepreciated equipment that has been replaced as a result of repowering. The Company committed to this adjustment in the stipulation to the 2019 Renewable Adjustment Clause (RAC). [7] The modified cost of service results reflecting these adjustments that remove the NPC increase from the functionalized revenue requirement and the balancing adjustment from the 2019 RAC settlement is shown on pages 1 and 2 of Exhibit PAC/1409. This exhibit displays the target functionalized revenue requirement used in the design of rates proposed in this general rate case.

Q. Do the Company's proposed rates collect the target functionalized revenues?

A. Yes. The revenues calculated by multiplying the test period billing determinants by the proposed rates are summarized in column (7) on pages 1 and 2 of Exhibit PAC/1409. A direct comparison to the target functionalized revenues shown in column (6) of this exhibit shows that the calculated revenues equal the target revenues

---

[6] *See In the matter of PacifiCorp dba Pacific Power's 2019 Renewable Adjustment Clause*, Docket No. UE 352, Order No. 19-304 at Appendix A at 4-5 (Sept. 16, 2019).

with the exception of small differences due to the rounding of rates. The detailed calculation of proposed revenues based on billing determinants and proposed rates is shown on pages 3 through 12 of Exhibit PAC/1409. Revenue from Schedule 80 - Generation Investment Adjustment, Schedule 196 - Adjustment to Remove Deer Creek Mine Investment From Rate Base, and Schedule 202 - Renewable Adjustment Clause Supply Service Adjustment were set to zero in proposed rates, since the costs being recovered through these adjustments will be incorporated into base rates. Proposed tariff changes presented in Exhibit PAC/1401 include the cancellation of these schedules.

Q. Have you prepared an exhibit showing the estimated effects of the prices proposed in this general rate case?

A. Yes. Exhibit PAC/1410 shows the estimated effect of the Company's proposed prices. It contains two summary tables. Table 1410-1 shows the effect of the proposed prices by delivery service rate schedule for the proposed net rate increase on January 1, 2021, of $70.8 million which includes the requested revenue requirement change of $78.0 million less the requested Federal Tax Act Adjustment credit of $24.9 million plus the requested Generation Plant Removal Adjustment of $17.3 million plus the impact of the $0.4 million RMA rebalancing (discussed later in my testimony). Table 1410-2 shows the effect of the proposed changes by delivery service rate schedule incorporating the estimated effect of rate changes in 2020 for outstanding RAC filings.[8] The outstanding RAC filings are currently estimated to

[8] *See In the matter of PacifiCorp dba Pacific Power's 2019 Renewable Adjustment Clause*, Docket No. UE 352, Order No. 19-304 (Sept. 16, 2019); *In the matter of PacifiCorp dba Pacific Power's 2020 Renewable Adjustment Clause*, Docket No. UE 369, Stipulation and Joint Testimony (Jan. 31, 2020).

increase revenue by $9.5 million in 2020. The estimated increase for outstanding RAC filings, shown in column (7) of Table 1410-2, reduces the net increase that will go into effect on January 1, 2021, from $70.8 million to $61.3 million. These tables show the effect of the price changes on both base revenues and net revenues. Base revenues show the effect before the impacts of any adjustment tariffs. Net revenues include the effect of adjustment tariffs (discussed directly below) and the RMA.

The adder columns in Tables 1410-1 and 1410-2 show revenues from adjustment tariff schedules (Schedules 95, 104, 203 204, 207, 299, proposed 195 and proposed 197). The adder revenue is added to base revenue to calculate net revenue including adjustment schedules. Table 1410-3 shows the calculation of the adjustment revenue included in the adder columns in Tables 1410-1 and 1410-2. Table 1410-4 shows the present and proposed rates for these adjustment schedules. These tables exclude the effects of pass-through adjustment schedules for Low Income Bill Payment Assistance Charge (Schedule 91), the Adjustment Associated with the Pacific Northwest Electric Power Planning and Conservation Act (Schedule 98), the Public Purpose Charge (Schedule 290), and the Energy Conservation Charge (Schedule 297).

Beginning on page 5 of Exhibit PAC/1410 are the monthly billing comparisons for each of the major delivery service rate schedules showing the customer bill impacts of the proposed prices at various levels of usage. The monthly billing comparisons in Exhibit PAC/1410 show the expected rate increases for January 1, 2021, from proposed rates. The monthly billing comparisons also include the effects of all adjustment schedules, including estimated RAC changes in 2020 and the pass-through adjustment schedules listed above.

Q. What are the Company's rate spread objectives in this case?

A. The Company's rate spread objectives in this case are to minimize price impacts on our customers while fairly reflecting cost of service and sending proper signals about increasing costs.

Q. What is the Company's rate spread proposal in this case?

A. Based on the cost of service results and in order to achieve the Company's rate spread objectives in this case, Table 2 below summarizes the Company's proposed net percentage price changes for the major rate schedule classes.

TABLE 2

Residential Schedule 4	**5.0%**
General Service	
Schedule 23/723 (0-30kW)	**5.8%**
Schedule 28/728 (31-200kW)	**4.0%**
Schedule 30/730 (201-999kW)	**4.1%**
Large General Service Schedules 47/747, 48/748 (≥1,000kW)	**8.6%**
Agricultural Pumping Service Schedule 41/741	**10.0%**
Lighting Schedules	**-18.9%**
Overall	**5.4%**

Under the Company's proposal, the rate change that takes effect January 1, 2021, will result in no customer rate schedule class receiving an increase greater than 10.0 percent. The Company's proposed rate spread strikes a balance between moderating rate impacts on customers, while sending proper price signals about increasing costs and minimizing subsidization across rate schedule classes. As a result, the Company proposes revisions to the RMA to achieve these goals.

Q. Please describe the RMA.

A. The RMA, Schedule 299, is designed to mitigate the impacts of changes in the functionalized revenue requirement on net rates across rate schedules. Net rates are the rates that customers pay once all tariff riders (including the RMA) are taken into account. The RMA is designed to be revenue neutral overall at the time a general rate case price change is implemented, resulting in RMA credits for some rate schedule classes requiring rate mitigation with offsetting RMA charges for others. The RMA was first implemented in docket UE 116 to transition to cost of service rates under Senate Bill (SB) 1149. The Schedule 299 RMA tariff rider is included in customers' rates for delivery services in order to minimize the effect of the price change allocation across customer classes.

Q. Besides mitigation of rate changes across rate schedules, what other factors contribute to the adjustment of the RMA in a general rate case?

A. In each general rate case, the RMA must be rebalanced in order to achieve revenue neutrality so that the revenues from the RMA charges and the RMA credits are in balance. The present Schedule 299 RMA rates were designed to be revenue neutral in the calendar year 2014 test period from the Company's 2013 Rate Case; however, due to changes in rate schedule loads, present Schedule 299 RMA rates are not projected to produce revenue neutrality in the calendar year 2021 test period of this case. The present RMA rates result in RMA credits that exceed RMA charges by $0.4 million for the 2021 test period loads (see Exhibit PAC/1410, Table 1410-3, Column 11, Row 18). Consistent with previous RMA revisions, the proposed RMA rates have been designed to be revenue neutral for the 2021 test period. As a result of this realignment, the proposed net rate increase in this case is $0.4 million higher than the base revenue requirement increase (Exhibit PAC/1410, Table 1410-1 and Table 1410-2).

Q. Has the RMA required rebalancing in previous general rate cases?

A. Yes. For example, in the 2013 Rate Case the RMA required a rebalancing adjustment of $0.2 million.

Q. What are the present and proposed RMA revenues and rates in this case?

A. The present and proposed RMA revenues are shown in Exhibit PAC/1410, Table 1410-3, columns (11) and (12). Present and proposed RMA rates are shown in Exhibit PAC/1410, Table 1410-4, columns (11) through (16).

Q. What is the Company's RMA objective in this case?

A. The Company's RMA objective in this case is to minimize rate schedule subsidization through the RMA while minimizing impacts on customers. As a result, the Company has limited RMA charges and credits as much as possible. The Company proposes decreases to present RMA credit rates. The Company is proposing to reduce the RMA credit to Schedule 41/741. Reducing this credit still allows the Company to cap the increase for Schedule 41/741 at 10 percent which is just under twice the overall proposed net percentage increase of 5.4 percent.

For Large General Service Schedules 47/747 and 48/748, the Company proposes to reduce the present RMA credit rates to half of their current level in order to minimize cross-subsidization. The proposed January 1 net increase for Schedules 47/747 and 48/748 is 8.6 percent. With this proposal, Schedule 47/747 and 48/748 will continue to receive significant RMA credits equal to $5.4 million in annual credits to these rate schedules. Nonetheless, the Company believes the proposed RMA credits for Schedule 47/747 and 48/748 are reasonable in light of the overall percentage increase proposed for these customers.

The Company proposes bringing the RMA to zero for Residential Schedule 4, General Service Schedule 23/723, and for Lighting Schedules 15, 51, 53 and 54. For General Service Schedules 28/728, and 30/730, the Company proposes setting their RMA surcharges to levels that produce a net increase slightly less than the overall average at about 4 percent.

Overall, the Company believes that these proposals result in just and reasonable rates and will minimize rate impacts while reducing subsidization through the RMA.

VI. SCHEDULE 195 - FEDERAL TAX ACT ADJUSTMENT

Q. What rates does the Company propose for Schedule 195 - Federal Tax Act Adjustment?

A. As discussed in Ms. McCoy's testimony, the Company proposes refunding to customers $24.9 million annually for the next three years to pass back the remaining balance at the end of 2020 for the current tax benefit as well as the remaining balance for excess deferred income taxes. Page 5 of Exhibit PAC/1410 shows the calculation of proposed rate spread and prices for Schedule 195 - Federal Tax Act Adjustment. Consistent with how rates were first set in Schedule 195, the Company proposes spreading the credit to classes on the basis of base revenue less NPC. The Proposed Adder columns in Tables 1410-1 and 1410-2 in Exhibit PAC/1410 include the impact of the proposed Federal Tax Act Adjustment.

VII. SCHEDULE 197 - GENERATION PLANT REMOVAL ADJUSTMENT

Q. How does the Company propose recovering costs associated with closure of Cholla Unit 4?

A. The Company proposes that the costs associated with Cholla Unit 4 be recovered through a new adjustment, Schedule 197 - Generation Plant Removal Adjustment. In the draft Schedule 197, the Company proposes collecting $17.3 million annually from customers starting on January 1, 2021, through April 2025. The $17.3 million includes the costs associated with undepreciated plant, materials and supplies, construction work in progress and liquidated damages associated with the closure of Cholla Unit 4 as discussed in Ms. McCoy's testimony. Page 6 of Exhibit PAC/1410 shows the calculation of proposed rate spread and prices for Schedule 197. The Company proposes spreading the surcharge to classes on the basis of base generation revenue requirement. The Proposed Adder columns in Tables 1410-1 and 1410-2 in Exhibit PAC/1410 include the impact of the proposed Generation Plant Removal Adjustment.

VIII. RATE DESIGN

Q. Please generally describe the process for designing rates to collect the proposed revenue requirement.

A. Proposed rates are designed to collect the target functionalized revenue requirement based on customer billing determinants including number of monthly bills, kW, and kWh consumed for the rate case test period. The billing determinants used in this case reflect the forecast test period for the 12 months ending December 2021.

Q. How are the forecast billing determinants developed?

A. Forecast test period billing determinants are developed based on the Company's forecast test period bills and energy forecasts along with the historical test period billing determinants.

A three-step process occurs in developing test period billing determinants. First, the Company forecasts monthly test period bills and energy by class and by rate schedule which is supported in the testimony of Mr. Rick T. Link.

Second, a full set of billing determinants, including all rate elements such as kW demand, load size, reactive power quantities and kWh by rate block, are retrieved at the customer invoice level from the Company's billing system for the base period—in this case, the 12 months ended June 2019. These historical billing determinants are summarized by class, rate schedule, and voltage level.

Finally, a full set of forecast billing determinants is developed using the historical base period data and the test period forecast. The forecast billing determinants are calculated based upon the ratio of historical bills and energy (temperature normalized) in the base period to the forecast bills and energy provided in the sales forecast.

Q. Have you provided an exhibit showing proposed rates and the billing determinants used to design rates?

A. Yes. Pages 3 through 13 of Exhibit PAC/1409 contain historical and forecast billing determinants along with present and proposed base rates.

Q. What underlying themes guide the rate design proposals that you are making in this rate case?

A. There are three major underlying themes to the rate design proposals that I make: making energy more affordable, adapting to a more sustainable future, and giving customers choices.

Q. How do your rate design proposals in this case make energy more affordable?

A. Making energy more affordable means designing rates in ways that make energy consumption less expensive for customers. My testimony proposes several ways to achieve this goal. Improving and expanding time varying rates gives customers more opportunities to save when they consume energy during times when energy is less expensive. Unwinding rate structures with tiered energy charges will make the cost of energy more equitable across different customer usage levels and minimize the impacts of the Company's current tiered rates which for the residential class can be particularly harmful to low-income customers.

Well-designed prices should send a clear price signal to customers about the incremental cost of additional energy consumption and thus promote energy efficiency. However, when rate structures unduly penalize incremental energy usage above its additional cost, it can result in unintended consequences. For example, inverted block tiered energy pricing discourages electric vehicle adoption and encourages the expansion of natural gas service.

Q. What does it mean for rate designs to adapt to a more sustainable future?

A. In the context of rate design, adapting to a more sustainable future means creating opportunities for the Company's rates to encourage customer behavior that mitigates impacts to the environment. Signaling customers to shift energy use to times when renewables are more prevalent on the grid and removing disincentives to electrification are important ways that this can be accomplished.

Q. How do your rate design proposals give customers choices?

A. Giving customers choices means providing more than one option for how a customer will be charged for the services they receive from the utility. When customers have different options, this creates possibilities for bill savings, utility cost reductions, and the ability to use electricity in new and beneficial ways. For this rate case, the Company is proposing two new time of use pilot programs and making one existing time of use pilot more broadly available. The Company is also proposing a real-time pricing pilot and an interruptible tariff pilot for its larger customers.

Q. Please summarize the rate design changes proposed by the Company.

A. The basic structure of the Company's current tariffs, broken out into Delivery Service and Supply Service tariffs as first approved in docket UE 116, is proposed to remain in effect. In this rate case, I will propose rate design changes that will affect the underlying structure for how Schedule 201 rates are set. The prices for Schedule 201 themselves will be proposed in the Company's 2021 TAM, a separate proceeding from this rate case.

In this case the Company is proposing splitting the basic charge for residential customers into different prices based on dwelling type with a proposed increase in the basic charge for customers living in single-family homes and a proposed decrease for customers living in multi-family homes. The Company is also proposing to reduce by half the difference in the first and second tier energy charges.

For large non-residential customers, the Company proposes modernizing its time of use periods and increasing the differential between on- and off-peak energy. Several innovative time varying rate options are proposed for this case including a new residential time of use pilot, a non-residential time of use pilot, a permanent agricultural pumping time of use option, and an interruptible service pilot and real-time day-ahead pricing pilot for larger customers.

Residential Rate Design

Q. Please explain the proposed tariffs for residential customers.

A. Residential customers are served on Delivery Service Schedule 4. The Company proposes splitting the Basic Charge into two separate charges for customers living in single-family and multi-family dwellings. The Company proposes increasing the basic charge from its current level of $9.50 per month to $12 for single-family dwellings and decreasing it to $7 for multi-family dwellings. This change betters reflects the fixed costs of serving residential customers and more accurately recovers costs from customers who live in multi-family dwellings and have a lower cost of service. The Company also proposes to decrease the differential between its two inclining tier block energy charges for residential by 50 percent.

For residential customers, as well as for all classes of customers, Schedule 200, Base Supply Service, is proposed to reflect changes in the non-NPC generation revenue requirement as indicated in pages 1 and 2 of Exhibit PAC/1409. The portfolio options (Schedules 210 through 213) do not require changes since they are adders to customers' Schedule 201 rates.

Q. Why is the Company proposing an increase in its basic charge for most residential customers?

A. The Company's marginal cost of service study which I present as Exhibit PAC/1408 shows on Table 3 that the annual marginal cost of billing- and commitment-related cost is $357.13 or about $29.76 per month. At $9.50, the Company's present basic charge falls far short of cost. Making movement towards a cost-based basic charge is important, because this helps the Company keep energy more affordable for its customers. Given a fixed level of revenue to be collected from all residential customers, an increase in the basic charge will lower energy charges.

Q. Why is the Company proposing a separate basic charge for multi-family customers?

A. The Company is conscious of the effects changing rates can have on its customers. While economically justified and based upon sound cost causation principles, raising the basic charge and decreasing the tiered rate differential increases the cost of electricity for the smallest users. Customers who live in multi-family dwellings like apartments or condos tend to use much less energy than customers living in single-family homes. The Company also recognizes that the fixed costs of serving customers in multi-family configurations can be lower than for single-family homes. To mitigate rate impacts on smaller users while simultaneously better aligning its rates with cost causation, the Company proposes charging different basic charges for residential customers dwelling in multi-family versus single-family dwellings.

Q. What is the basis for a multi-family basic charge that is nearly half of the basic charge for single-family customers?

A. In its Marginal Cost Study, the Company specifically calculates marginal commitment costs for meters, service drops, line transformers, poles and conductors, and also calculates the marginal cost of billing and collections, uncollectibles, and customer service. Marginal commitment-related transformer costs are largely driven by the number of customers on average who utilize a shared transformer. On average for the entire residential class, 3.95 customers are served from a transformer. This value is significantly different for multi-family and single-family customers. On average, 2.92 single-family residential customers are served by a transformer compared to 8.49 multi-family customers per transformer. In general, customers who dwell in multi-family buildings live in more dense habitations and there are economies of scale related to the cost of stepping down voltages to a level they can use relative to single-family where more equipment must be installed to serve a less dense population.

A key driver for the marginal commitment costs of poles and conductor is the distance between customers and the distribution substation that serves them. This marginal cost is higher for customers who are served in more remote outlying areas where longer spans of conductor and more poles must be installed to provide service. A greater proportion of multi-family customers are close by to the substation that serves them than for single-family customers.

The Company prepared an analysis of the marginal commitment and customer costs examining specifically how they differ between single-family and multi-family customers for the costs of transformers and poles and conductor. Exhibit PAC/1411 shows the results of this analysis which calculates that the marginal commitment and customer costs for a multi-family residential customer is $18.62 per month, or about 57 percent of the same value for single-family residential customers of $32.81. Making a 10 percent movement from the current basic charge of $9.50 to the $32.73 marginal cost level calculated for single-family results in a level of $11.83 which the Company rounded to $12 for its proposed single-family basic charge. Applying the 57 percent difference in marginal cost resulted in a value of $6.71 for multi-family that was rounded to $7 for its proposed multi-family basic charge.

Q. How does the Company's current and proposed basic charge compare to other utilities in Oregon?

A. The Company's current and proposed basic charge compare very favorably to the basic charges of other Oregon electric utilities. The Company examined the residential rates of 15 other utilities which includes the other two investor owned utilities (IOUs) in the state and 13 publicly owned electric utilities with service territory in close proximity to the Company's. Table 3 below shows those basic charges as well as an average for all 15 utilities.

Table 3. Comparison of PacifiCorp's Current and Proposed Basic Charge to Other Oregon Electric Utilities

Utility	Residential Basic Charge
Current Pacific Power	$9.50
Proposed Pacific Power	$7 multi-family/$12 single family
Portland General Electric	$11.00
Idaho Power	$8.00
Central Electric Coop	$19.38
Central Lincoln PUD	$24.00
City of Ashland	$14.00
City of Hermiston	$16.00
City of Monmouth	$10.31
Coos-Curry Electric Coop	$26.94
Eugene Water and Electric Board	$20.50
Hood River Electric Coop	$22.50
Lane Electric Coop	$31.50
Salem Electric	$20.00
Springfield Utility Board	$14.00
Tillamook PUD	$23.10
Umatilla Electric Coop	$18.00
Average	$18.62

Note - Prices were those available from each utility's website as of December 17, 2019

The average basic charge of all 15 utilities examined is $18.62 which is well above the Company's proposed basic charge of $7 for multi-family and $12 for single-family.

Q. Distinguishing between residential customers who dwell in single- and multi-family homes is a new feature for the Company's tariffs. How will this difference be defined for different basic charges on Schedule 4 – Residential Service?

A. The Company's proposed definition of a multi-family home will be the same as defined in its Electric Service Requirements Manual (ESR), which is a resource that clarifies electric service requirements for the Company's customers prior to and during construction. The ESR defines a multi-family dwelling as "a building that contains three or more dwelling units".[9] On tariff Rule 4 - Definitions, multi-family home will be defined in this way and a single-family dwelling will be defined as any other building.

Q. How are residential energy charges currently structured?

A. Residential energy charges use what is called an inclining block or tiered rate structure where energy usage up to a specific threshold per month receives a lower price and successive energy consumption is priced at a higher rate. Presently, the first 1,000 kWh[10] in a month are 10.012 cents per kWh and all additional kWh are 11.985 cents per kWh.

Q. Are residential customers of the other IOUs in Oregon subject to inclining block energy charges?

A. Yes. Both Portland General Electric Company (Portland General Electric) and Idaho Power Company's (Idaho Power) residential customers are subject to inclining block energy charges. The percentage differentials between tiers, however, for the other two IOUs are smaller, both in absolute cents per kWh and percentage, than for the Company. Table 4 below shows current residential energy prices for all three utilities:

---

[8] *See* PacifiCorp's Electric Service Requirements Manual (4th Ed) at vi, *available at* https://www.pacificpower.net/working-with-us/builders-contractors/electric-service-requirements.html.

[9] The tier block threshold is prorated so that it is higher for billing periods longer than the average month and lower for billing periods that are shorter. For example, a 28 day cycle has a tier block threshold of 920 kWh and a 34 day cycle has a tier block threshold of 1,117 kWh.

Table 4. Comparison of Tiered Residential Rates for IOUs in Oregon[11]

Utility	1st block price (¢/kWh)	2nd block price (¢/kWh)	Different between 1st and 2nd block	% Difference
PacifiCorp	10.012	11.985	1.973	20%
Portland General Electric	11.234	11.956	0.722	6%
Idaho Power	8.4823	10.0018	1.5195	18%

At a 20 percent difference between tiers, the Company's tiered structure is more steeply inclined than its peers with a six percent difference in the first and second tier for Portland General Electric and an 18 percent difference for Idaho Power.

Q. What are the potential benefits of an inclining block structure?

A. The inclining block rate structure is often referred to as an effective tool for encouraging customers to save energy. The theory is that the first block covers some basic level of usage at a lower rate to help keep the overall bill affordable for customers and a second and possibly third block with a higher rate makes incremental energy usage more expensive. For a customer with usage in the higher tiers, making energy efficient choices like installing a heat pump water heater will yield greater savings than would have been achieved under a flat energy charge rate design. Inclining blocks are also sometimes considered more progressive with low income users, who theoretically have lower usage, paying a lower average price.

[10] Prices for Portland General Electric and Idaho Power were those that were available online on December 12, 2019, from their residential schedule's tariff.

Q. Is the inclining block structure still an appropriate rate design for residential customers?

A. No, not in light of changes in the electric industry and the likelihood of further evolution in the energy landscape of the future. While well intentioned, tiered rates can result in unintended consequences, particularly as the electric industry evolves. Tiered rates are unfair, are not economically justified, and create perverse incentives. In addition, tiered rate structures can be a source of confusion for residential customers.

Q. How are tiered rates unfair?

A. Charging higher prices for greater usage in a given month arbitrarily creates winners and losers. Customers who heat their home with natural gas or a woodstove are winners and those who choose to heat their home with electricity or otherwise do not have access to gas are losers. A bustling, multi-generational household with a large number of people living under one roof is a loser and the person living alone in an apartment is a winner. A customer who chooses to buy an electric vehicle and charge it from home is a loser and another customer who keeps their internal combustion engine vehicle is a winner. Effectively, inclining block rates unfairly reward some customers and punish others, often for reasons outside the customer's control or in ways that incentivize behaviors that are at odds with changes in energy policy.

Q. Please describe why tiered rates are not economically justified.

A. There is no reason why after using 1,000 kWh in a given month that the next kWh consumed by a customer should cost more. The timing of energy consumption, both seasonally and during different hours, can affect the utility's cost of providing kWh to the customer. The load factor, or the effective utilization of kWh consumption relative to peak kW demand, can also change the average cost of providing energy. However, there is nothing special about additional overall usage in a monthly billing period that makes it more expensive for the utility to produce that next kWh of electricity.

Q. How do tiered rates create perverse incentives?

A. Relative to a flat energy charge rate structure, inclining block prices encourage customers to switch fuels to natural gas. Avista Corporation, Cascade Natural Gas Corporation, and Northwest Natural, Oregon's three natural gas providers, do not use an inclining block rate structure for residential customers for volumetric gas consumption. In other words, the price for each therm that a natural gas customer in Oregon purchases is flat and does not become more expensive with greater usage within a monthly billing period. As the result of its rate structure, PacifiCorp has a competitive disadvantage to serving residential customers with electricity to heat their homes relative to natural gas.

Another unfavorable result of tiered rates is that they make residential transportation electrification less attractive. While a customer can at this time still experience "fuel" savings with charging their electric vehicle at the higher second tier price relative to purchasing gasoline, as more costs get pushed into the customer's incremental cost of energy on the second tier the economic rationale to choose an electric car is weakened.

Q. Do tiered rates help low income customers by making a modest level of usage tied to a customer's basic needs more affordable?

A. Not necessarily. It is true that overall average monthly usage tends to increase with income, but it is also true that a significantly smaller percentage of PacifiCorp's lower income customers use less than 1,000 kWh a month on average. In 2017, the Company conducted an email survey of its customers and collected end use and demographic information from participants. Table 5 below highlights some of the Company's findings regarding energy usage and income:

Table 5. Usage Characteristics and Household Income from PacifiCorp's 2017 Residential Customer Survey

	Income Level		
Average Monthly Usage Level	**Below $50,000**	**$50,000 to $74,999[1]**	**$75,000 and greater**
0 - 1,000 kWh	41%	61%	62%
1001 - 1,500 kWh	46%	25%	27%
1,501 kWh and over	13%	14%	11%
Average Monthly Usage (kWh)	941	966	990
	Income Level		
	Below $50,000	**$50,000 to $74,999[1]**	**$75,000 and greater**
Natural Gas Used as Main Fuel for Heating	30%	44%	56%
Sample Size	6,889	3,723	6,316

[1] Note - $60,212 was the median household income in Oregon in 2017 per https://www.deptofnumbers.com/income/oregon/

According to the Company's survey results, about 41 percent of customers with household incomes less than $50,000 per year have average monthly usage less than 1,000 kWh a month. In contrast, 62 percent of higher income households making more than $75,000 per year have monthly usage less than 1,000 kWh. The survey results also notably show that lower income households are much less likely to use natural gas as their main fuel for heating. Customers who heat their homes with electricity will have a much harder time staying warm and keeping kWh consumption in the winter below the 1,000 kWh monthly threshold compared to customers who use gas. Table 5 shows that only 30 percent of PacifiCorp households making less than $50,000 per year use natural gas as their main fuel for heating. In contrast, customers making $75,000 and greater are nearly twice as likely to use gas with 56 percent reporting that they use natural gas as their main fuel to heat their homes. The tiered rate structure makes energy bills less affordable for many lower income customers, particularly when they use electricity to heat their home. The average monthly usage for survey respondents making less than $50,000 per year who do not use natural gas as their primary heating fuel during the peak heating season in the billing months of December, January and February, was 1,563 kWh—well above the 1,000 kWh first tier threshold.

Q. Is the tiered rate structure universally understood by customers?

A. No. According to the Company's 2017 survey, only 48 percent of customers were aware of the tiered rate structure. Of those 48 percent who were aware of the structure, 44 percent said that it did not impact their electricity usage decisions.

Q. What prices does the Company propose for residential energy charges?

A. The Company's proposal for residential energy charges in this case balances the need to effect change gradually while also striving to modernize the Company's rate design to be consistent with policy-driven[12] changing demands on the electricity sector, including increased electrification through electric vehicle charging and a desire to decrease energy sector emissions. Thus, while the inclining block rate structure is

[11] For example, SB 1547, which among other things made a finding that "(w)idespread transportation electrification requires that electric companies increase access to the use of electricity as a transportation fuel in low and moderate income communities."

problematic, I propose reducing the differential between the price on the first tier and the second tier as a reasonable and gradual change that is in the interest of PacifiCorp's customers.

To mitigate customer impacts, the Company recommends energy prices that reduce the differential between tiers by 50 percent. The Company therefore proposes a price of 10.210 cents for the first 1,000 kWh in a month and 11.210 cents per kWh for all additional kWh.[13] The Company recommends that this change would occur for all base tiered rate components that make-up residential energy charges which include rates set in the TAM (Schedule 201).

Q. Why are more affordable energy costs desirable?

A. The energy charge sends an important and powerful price signal to customers about the cost of their consumption. Motivated by bill savings, customers may modify their behavior, adopt conservation measures, and choose to live in more efficient homes. Along with demand-side management incentives and rebates, the price of energy that all customers face is an important tool for limiting overall customer usage.

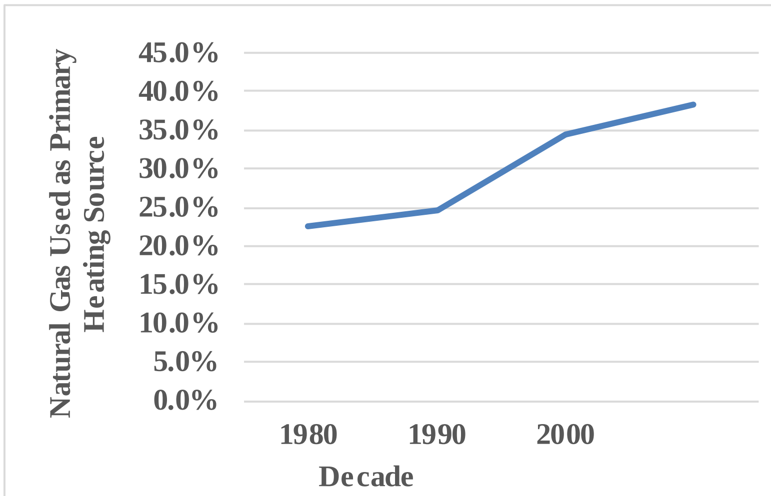
Conservation, however, is not the only behavior that is motivated by the price signal that energy charges present. Customers can often save on their monthly energy costs by connecting to natural gas service and switching the fuel of end uses like space heating, water heating, and cooking from electricity to natural gas. All else equal, higher incremental energy charges provide a greater motivation for fuel switching. Over the past recent decades, the proportion of households that use natural gas as their primary heating source has steadily risen in Oregon. Figure 1 below

---

[12] Proposed prices include changes proposed in this case and the concurrent TAM proceeding.

shows how the share of households in Oregon that heat their home with natural gas has grown since 1980:

Figure 1 – Natural Gas Penetration in Oregon from U.S. Census Bureau Information



Source: United States Census Bureau website https://www.census.gov/hhes/www/housing/census/historic/fuels.html and https://factfinder.census.gov/faces/tableservices/jsf/pages/productview.xhtml?src=CF

The overall magnitude of energy charges are also a very important consideration for transportation electrification. In general, a customer's economic decision to adopt an electric vehicle will be influenced by the price of energy. Lower energy prices provide a greater incentive to switch from an internal combustion engine car to an electric vehicle.

The current pricing regime of steeply tiered energy charges penalizes incremental consumption in a month, while the Company's proposal provides greater balance of the interests of conservation with the need for a more modern rate design that accommodates current and future energy policy. At the Company's proposed energy charges of about 10.2 cents per kWh for the first tier and 11.2 cents for the second tier, that balance will be supported and customers will continue to have good reason to minimize their energy usage while also not dis-incentivizing transportation electrification or unfairly encouraging fuel switching to natural gas.

Residential Time of Use Pilot

Q. Please describe the Company's proposed residential time of use pilot.

A. The Company proposes creating a new time of use residential rate pilot, Schedule 6. Under Schedule 6, residential customers would pay 17.917 cents per kWh during the on-peak period of 3:00 p.m. to 9:00 p.m. during the summer months of July through September, and 6:00 a.m. to 8:00 a.m. and 5:00 p.m. to 11:00 p.m. in the non-summer months of October through June. During all other times considered off-peak, they would pay 6.633 cents per kWh. Schedule 6 would be available for up to 5,000 customers on a first-come, first-served basis.

Q. Why is the Company proposing a residential time of use pilot at this time?

A. Providing residential customers with a time of use rate option that can provide them with a meaningful savings opportunity is consistent with the goals of making energy more affordable, adapting to a more sustainable future, and giving customers choices. The Company already offers a time of use rate option for small customers (Schedule 210) that was implemented as part of SB 1149. Participation in this option has been very limited, however, with only 1,039 customers participating. The potential for residential customers to save on Schedule 210 is relatively small with the average residential customer saving only $1.22 per month. Presently, the relative differential between on- and off-peak prices is 1.6. Limiting participation to a modestly sized pilot allows the Company to gain experience with a more potentially beneficial time of use option without significant risk or cost for its customers. Time varying rates can be an important way to manage load on the grid, shift load to times when renewables are more abundant, and responsibly encourage transportation electrification. This pilot would provide an opportunity for customers to lower their bills based on their own energy usage habits while providing the Company with useful data on customer behavior.

Q. Why isn't the Company simply proposing to adapt its existing time of use offering?

A. The pilot time of use option that the Company is proposing has significant differences with the existing residential option on Schedule 210 including a higher on-/off-peak differential, different time of use periods and a flat rate structure. Before modifying the existing time of use offering, the Company wants to test Schedule 6 and gain a better understanding of customer experience and behavior. As the Company gathers data, the Company can evaluate the design merits of Schedule 6 and understand any potential customer impacts from transitioning Schedule 210 customers.

Q. How did the Company select on- and off-peak time periods for proposed Schedule 6?

A. To develop its proposed time of use periods, the Company used a three year[14] average of Energy Imbalance Market (EIM) data consistent with the Commission's direction in the Resource Value of Solar (RVOS) proceeding.[15]

---

[13] Specifically, the Company used the three-year period ending on October 31, 2019.
[14] *See In the matter of PacifiCorp dba Pacific Power Resource Value of Solar,* Docket No. UM 1910, Order No. 19-021 at 9 (Jan. 1, 2019).

Prices were examined during two seasons – summer, which includes July through September, the three months where the average energy cost is at its highest, and non-summer, which includes October through June. Examining a matrix of average real-time EIM prices shown on Page 1 of Exhibit PAC/1412, the Company ranked the hours in both the summer and non-summer months. The highest six hours were selected as on-peak for the summer months and the highest eight hours were selected for the non-summer months yielding the Company's proposed periods. Six hours were chosen for summer to balance the need of capturing a sufficient level of high cost hours to have a meaningful difference in value with the potential impacts to participants who will likely need to adapt their behavior to save money on the rate option. Eight hours were used for the non-summer months to capture the higher value periods in both the morning and the evening. Holidays and weekends were not considered as off-peak because the average value was not substantially different than non-holidays or weekdays. Page 2 of Exhibit PAC/1412 shows the ranking of prices by season and hour.

Q. What on-/off-peak differential in energy price does the Company propose for Schedule 6?

A. The savings that customers have been able to achieve on the Company's existing residential time of use offering has not yielded high levels of adoption. The Company's proposed pilot will test whether achieving stronger participation requires a greater differential in the on- to off-peak prices which will give customers a greater opportunity to save from shifting load. In the Company's Idaho service territory, the Company has a very successful time of use option that has an 18 percent participation rate. The energy charges on Idaho Schedule 36 – Optional Time of Day Residential Service do not have tiers and have a 2.7 ratio on average between on- and off-peak pricing. For the purposes of developing a robust pilot offering, the Company proposes that a 2.7 differential be applied to proposed rates for Schedule 6.

Q. Please describe how the Company calculated rates for proposed Schedule 6.

A. Exhibit PAC/1413 shows the calculation of proposed Schedule 6 prices. Energy prices were calculated by first determining the average proposed energy price for residential Schedule 4. The estimated units of on- and off-peak energy were taken from energy usage in both periods from the Company's load research study for the residential class. The average energy price was then adjusted so that the on- and off-peak prices would be revenue neutral and produce the same level of revenue as energy charges for the whole class, but still have a relative differential of 2.7 as previously discussed. To incorporate the prices for Schedule 6 into the Company's unbundled rate structure, the Company recommends that base delivery and supply charges be set to the average price proposed for Schedule 4 with the entire time varying differential included in Schedule 201 as an on-peak charge of 7.050 and an off-peak credit of 4.234. Both of these prices applied to the average residential profile yield the average Schedule 201 price. Final prices for Schedule 201 will be set in the TAM proceeding.

Q. Why is the Company proposing that the entire time varying differential be included in Schedule 201?

A. Schedule 201 recovers the Company's NPC, which are the variable short-run costs associated with supplying its customers with energy. When a customer adopts a time varying rate option and shifts its load away from high cost times to low cost times, the most immediate benefit is realized in the Company's NPC. While customer behavior may have additional capacity benefits in the long run, those benefits are not immediately achieved and it is therefore sensible to include the full magnitude of time variance in the price in Schedule 201.

The Company also proposed using Schedule 201 to reflect on- and off-peak energy, because Schedule 201 is updated annually through the TAM whereas other base prices are typically only updated in general rate cases which the Company does not file as regularly, because it prudently manages its costs. Using Schedule 201 therefore ensures that the Company's fixed cost recovery is put less at risk and potential disincentives for the Company to promote Schedule 6 and see that customers are successful at shifting their energy to off-periods is removed. In the future, if the Company is able to scale up a larger, more mature time of use option that reaches a steady state, it would recommend spreading the on- and off-peak energy components to other rate categories.

Q. Why does proposed Schedule 6 not have tiered energy charges?

A. As discussed earlier in my testimony, the tiered rate structure, while used as a tool to promote conservation, can create a number of unintended consequences. Combining tiered pricing with time of use rates may also be more confusing for customers and harder for them to understand. Including a component that makes energy more costly as a customer uses more during a monthly billing period may confuse customers and distract from the message to them to manage their loads to avoid the on-peak period. Including both a time of use element and an inverted tier block element within the proposed pilot may also make it harder for a customers to evaluate whether to enroll. Additionally, the Company has concerns that combining tiers with time varying rates may make it more challenging to study the pilot rate option.

The primary message given through a time of use rate is for participants to use energy at times when energy costs are lower. This gives customers a price signal that appropriately mirrors the actual costs incurred to serve customers. Energy costs are affected by the time of the day, but are not affected by how much usage a customer has in a particular month. As discussed earlier in my testimony, the 1,001st kWh does not cost the Company more to serve. However, high usage during peak hours can impact the Company's costs, and eventually, the costs to customers.

Q. What other feature does the Company propose for Schedule 6?

A. Like Schedule 210, the Company proposes an annual guarantee payment for Schedule 6. If over the course of the customer's first year on time of use rates, the customer's total energy costs are greater than 10 percent over what costs would have been for the same period under standard Schedule 4 residential rates, the Company will make a guarantee payment to refund the difference in excess of 10 percent. The purpose of the guarantee payment is to limit participant risk and provide some assurance and protection that participants will not face a severely adverse annual billing impact from their decision to participate. Offering this guarantee payment under which customers will face no greater than a 10 percent increase in their annual energy cost for the first year will help the Company sign up customers for the pilot while still providing an incentive to participating customers to change their behavior.

Schedule 23/723 – Small General Service (less than 31 kW)

Q. Does the Company propose any changes for the structure of Schedule 23/723 - Small General Service rates?

A. No. For larger general service customers, the Company recommends eliminating or flattening declining block tiered rates, but it is not recommending the same thing for Schedule 23 at this time. Schedule 23 has a basic charge, two energy charges, and a load size charge and a demand charge that only applies to monthly usage in excess of 15 kW. Schedule 23 has two declining block energy charges where for secondary service the first 3,000 kWh is 10.047 cents and all additional kWh are 8.473 cents. The much higher first tier is helpful for recovering fixed costs because there is no demand charge for Schedule 23 customers who use less than 15 kW of demand. This higher volumetric rate ensures an appropriate level of cost recovery from smaller Schedule 23 customers who, before the Company deployed AMI, did not have meters capable of recording a demand register. The Company does not yet have a full 12 months of profile data from Schedule 23 customers from AMI and therefore does not have the data necessary to develop billing determinants for demand and load size charges for monthly kW usage less than 15. In a future case, when this data is available, the Company will consider a transition to a structure with demand and load size charges at all levels and flat energy charges. In this case, Schedule 23/723 rates have been modified to collect the target revenue requirement and to track functionalized costs.

Schedule 28/728 –General Service (between 31 and 200 kW)

Q. What does the Company propose for Schedule 28/728?

A. Schedule 28/728 rates have been modified to collect the target revenue requirement and to track functionalized costs. Presently, Schedule 28 has a declining block rate structure where for secondary service, the first 20,000 kWh are 6.941 cents and all additional kWh are 6.777 cents. Like inclining block tiered rates to which residential customers are subject, declining block tiered rates create additional complexity and send confusing price signals. The Company recommends eliminating tiers for this rate schedule and charging customers a flat price for energy.

Schedule 30/730 –General Service (between 201 and 1,000 kW)

Q. What does the Company propose for Schedule 30/730?

A. Schedule 30/730 rates have been modified to collect the target revenue requirement and to track functionalized costs. Presently, Schedule 30 has a declining block rate structure where for secondary service, the first 20,000 kWh are 6.118 cents and all additional kWh are 5.358 cents. Like Schedule 28, the Company recommends eliminating tiers for this rate schedule.

Schedule 41/741 – Agricultural Pumping Service

Q. What does the Company propose for Schedule 41/741?

A. Schedule 41/741 rates have been modified to collect the target revenue requirement and to track functionalized costs. Schedule 41 has a flat energy price in the summer and a declining kWh per kW structure during the winter months of December through March. For secondary service, summer energy usage is 9.587 cents per kWh and winter usage is 12.275 cents for the first 100 kWh per kW of demand and 9.587 cents for all additional kWh. To improve the transparency and simplicity of agricultural pumping service rates, the Company proposes eliminating the winter declining block kWh per kW block structure and having a flat year round energy price.

Q. Does the Company propose any other changes for Schedule 41/741?

A. Yes. Currently, the Company has a limited time of use pilot (Schedule 215) available for irrigators in the Klamath Basin that it has operated for several years. In this case, the Company proposes building off of the lessons learned from this pilot and establishing a permanent[16] time of use rate option that is available for all agricultural pumping customers.

Q. What lessons has PacifiCorp learned from its Schedule 215 pilot?

A. The Company learned that pumpers can be very successful at shifting their load from on-peak to off-peak times. During the historic test period of the year of the 12 months ending June 30, 2019, 96 percent of load for Schedule 215 pilot participants during the prime summer season was used during the off-peak period. This compares to 88 percent for the entire class of Schedule 41 agricultural pumping customers.

The average Schedule 215 customer saves about $747 per year, or about $21.01 per MWh, relative to what they would have on standard non-time varying Schedule 41 rates. The Company examined the difference in the value of energy between the on-peak period of 3:00 p.m. to 6:00 p.m., Monday through Friday, June through August, excluding Independence Day, and the off-peak period of all other

[15] Permanent here means that it is not a pilot with a cap on participation or a time limit over which it is available. All aspects of regulated utility prices and tariffs may change at any time subject to Commission approval. The Company anticipates that the on- to off-peak price differential as well as the time of use hours may need to evolve over time.

hours and determined that the estimated benefit of this shift in load is about $7.93 per MWh.

Finally, the Company learned that using a single on-peak window for time varying rates for agricultural pumping customers is not a scalable solution. Many of the Company's agricultural pumping customers are part of water projects where they draw water from a canal that is shared with other irrigators. If all of the irrigators on a given canal were to stop pumping during the same window of time, the water made available from the project would not be fully used.

Q. What does the Company propose for a permanent time of use option for agricultural pumping customers?

A. Taking the lessons learned from the Schedule 215 pilot, the Company proposes different design features for its permanent agricultural pumping service time of use option. Instead of having a separate tariff for this option, the Company proposes the time of use option be included in the Schedule 41 tariff with the time varying on-peak charge and off-peak credit being included in Schedule 201 prices. As discussed in my testimony concerning the proposed residential time of use pilot (Schedule 6), it is appropriate at this time to recover time varying energy charge differences through Schedule 201, because it is updated more regularly with the TAM than base rates are through general rate cases and its benefits, at least in the short-term, are primarily related to power cost expense. In the long run, if a significant level of irrigators adopt the time of use option and shift their load to off-peak, the Company anticipates potential system capacity benefits for which the agricultural pumping class will receive a further benefit in the form of lower allocations in cost of service through the years.

Also, like the proposed Schedule 6 residential time of use pilot, the Company selected on-peak hours based upon high value prices using the Company's current forecast view of energy value consistent with RVOS. [17] Time-varying energy charges will only apply during the highest cost months of July, August, and September, which are referred to in the proposed tariff as Summer. To allow this time of use option to be scalable in consideration of customers who pump from water projects, participants would have the option of selecting one of two four hour blocks of time to be on-peak based upon the highest eight hours in the summer season. The on-peak periods for the two proposed options are as follows:

- Option A – 2:00 p.m. to 6:00 p.m., all days in Summer.
- Option B – 6:00 p.m. to 10:00 p.m., all days in Summer.

Q. How were rates for the Schedule 41 time of use pilot calculated?

A. Page 3 of Exhibit PAC/1412 shows the ranking of prices by for the summer months of July through September. Option A comprises the first four-hour block of time in the highest eight hours and Option B comprises the second block of hours. Page 3 of Exhibit PAC/1412 shows that the difference in the average price for the on-peak Option A time and all other hours in the summer season is about $8.16 per MWh. The difference in the average price for the on-peak Option B time and all other hours in the summer season is about $11.69 per MWh. Averaging both periods yields a difference of about $9.92 per MWh. For Schedule 41 time of use option, the total off-

[16] *See* Order No. 19-021 in Docket No. UM 1910 at 9.

peak Summer price was set at the proposed total energy price for Schedule 41 less 0.992 cents per kWh. Designing the time of use option to be revenue neutral, the on-peak price was set at an amount where the same level of revenue would be recovered from Schedule 41 if the entire class were to be on the option with its current forecast load profile. Exhibit PAC/1414 shows the calculation of proposed Schedule 41 time of use option prices.

Schedule 48/748 – Large General Service (greater than 1,000 kW)

Q. Please explain the proposed tariffs for large general service customers.

A. For Schedules 48/748, Large General Service, the Company has proposed to modify base prices, at different voltage levels, to collect the target functionalized revenue requirement. For partial requirements customers served on Schedule 47/747, most prices are linked to changes in Schedule 48/748 prices. Changes to Schedule 48/748 continue to flow through to Schedule 47/747. The Company proposes a couple of notable changes to the current Schedule 48/748 rate structure—modernization of the time of use periods and a larger on- to off-peak energy charge differential.

Q. Why is the Company seeking to update its time of use periods for Schedule 48?

A. Schedule 48 customers are subject to mandatory time varying energy and demand charges. Current Schedule 48 specifies the on-peak period as 6:00 a.m. to 10:00 p.m., Monday through Friday excluding North American Electric Reliability Corporation holidays. This wide 16 hour block of on-peak sends a price signal for customers to shift their usage to the nighttime hours. Observing page 1 of Exhibit PAC/1412, nighttime is not the only low cost period. The middle of the day is also a very low cost period. The greater prevalence of solar on the western grid has increasingly lowered wholesale power prices in the middle of the day.[18] Modernizing the time periods for large non-residential customers to prioritize a shorter on-peak window has many benefits for the Company and its customers. With a shorter on-peak period, conservation and load shifting can be more targeted to the most stressful times for the grid. Moving load from the late afternoon to the middle of the day may also help to better align consumption with renewable output.

Q. What on-peak period does the Company propose for Schedule 48?

A. The Company proposes that the on-peak period for Schedule 48 be from 1:00 p.m. to 11:00 p.m. during all days in the summer months of July through September, and from 5:00 a.m. to 9:00 a.m. and 4:00 p.m. to 12:00 a.m. (midnight) during all days in the non-summer months of October through June. Page 4 of Exhibit PAC/1412 shows that this captures the highest 10 hours in the summer months and the highest 12 hours in the winter months. This reflects more on-peak hours than were proposed for the residential time of use pilot which considers the top six hours in the summer and the top eight hours in the winter. The Company proposes more on-peak hours for Schedule 48 to maintain revenue stability, because time varying rates are mandatory for Schedule 48 and the demand charge, which recovers a significant proportion of fixed costs, is based upon maximum kW usage during on-peak.

Q. What price does the Company propose for on- and off-peak energy for Schedule 48?

A. Presently, the difference in the on- and off-peak energy charges for Schedule 48 is $1 per MWh. Page 4 of Exhibit PAC/1412 shows that difference in value between the proposed on- and off-peak periods is $7.39 per MWh. The Company proposes applying this differential to on- and off-peak energy charges in Schedule 201. The total proposed energy charge for a secondary voltage Schedule 48 customer would be 5.339 cents per kWh for on-peak energy and 4.600 cents per kWh for off-peak energy.

Q. What price does the Company propose for the on-peak kW demand charge for Schedule 48?

A. To set the correct price for on-peak kW demand, the Company adjusted the billing units to reflect the proposed on-peak time periods. The Company proposes a demand charge of $9.38 per on-peak kW for secondary voltage customers.

Proposed Schedule 29 – Non-Residential Time of Use Pilot

Q. Please describe the Company's proposed Schedule 29 Non-Residential Time of Use Pilot.

A. The Company proposes a new optional time of use pilot program for non-residential customers whose loads are less than one MW and who would otherwise qualify for Schedule 23, Schedule 28 or Schedule 30. Schedule 29 would be available for up to

100 customers and would both charge customers different prices for energy based on time of use and recover demand-related costs through a different pricing structure.

Q. Please describe how energy prices would be time differentiated under proposed Schedule 29.

A. Schedule 29 would use the same on-peak period of 1:00 p.m. to 11:00 p.m. during all days in the summer months of July through September, and 5:00 a.m. to 9:00 a.m. and 4:00 p.m. to 12:00 a.m. (midnight) during all days in the non-summer months of October through June that the Company proposes for Schedule 48. To keep the pricing structure as simple as possible, a sur-credit would apply to off-peak energy.

Q. Please describe how demand-related costs would be recovered on proposed Schedule 29.

A. Unlike conventional demand charges to which general service customers are subject, Schedule 29 customers would pay declining kWh-per-kW energy charges. The first 50 kWh for each kW of demand will be charged a higher rate and all additional kWh-per-kW will be charged a lower rate. In effect this structure allows the Company to charge customers an average energy price that declines as load factor increases, much like demand charges do, but puts a cap on how high that average cost can be for low load factor customers.

Q. What are the benefits of this structure?

A. As the Company began investigating the roadblocks to transportation electrification, it realized that a significant impediment to the buildout of fast-charging infrastructure was the very high cost of energy that stations with low utilization face because of the demand charge. In response to this roadblock, the Company implemented Schedule

45, an optional rate for publicly available direct current (DC) fast-charging stations that substitutes time of use energy charges for demand charges for a transitional period of time. While Schedule 45 provides a limited opportunity to give publicly available DC fast-charging stations a reprieve from demand charges, the Company would like to explore a more broadly available time of use option that also minimizes the adverse bill impacts for very low load factor customers.

Other forms of transportation electrification could take advantage of proposed Schedule 29 such as bus charging or fleet charging where time of use rates could lower the incremental cost of off-peak charging and help the Company better manage around its peak periods. There may also be other beneficial applications for this rate option. For example, a fruit grower may want to install frost protection fans, but may only need to use those fans for a limited number of days in a year. Since this type of load's utilization is very low and demand charges would be very acutely felt, this fruit grower might instead turn to propane or diesel powered equipment. Limiting the impact of demand charges, while sending time-based price signals under this option, helps to make energy more affordable and opens up new opportunities for the Company's customers.

Q. Why is it reasonable for very low load factor customers to pay less on this option?

A. Demand or capacity is an important and significant cost driver. Customers' use of power at the same time that generation, transmission, and upstream distribution are peaking can drive the need for the Company to upgrade and expand its facilities over time. The demand charge, which measures the highest kW reading in any 15 minute interval during the monthly billing period, is an effective way to recover these costs, producing stability over time and charging customers based on the overall size of their loads. However, when the load factor, a measurement of a customer's energy utilization relative to peak demand, is very low, it becomes less likely that the customer's peak demand will coincide with the same time that the Company's system peaks. An examination of the profiles of all of the Schedule 23, 28 and 30 customers on the Company's load research sample shows this relationship. Figure 2 below shows how coincidence with the Company's 12 system peaks compares to load factor for its Schedule 23, 28 and 30 load research participants:

Figure 2. Schedule 23, 28 and 30 Coincidence with Monthly System Peaks as Compared to Individual Customer Load Factor

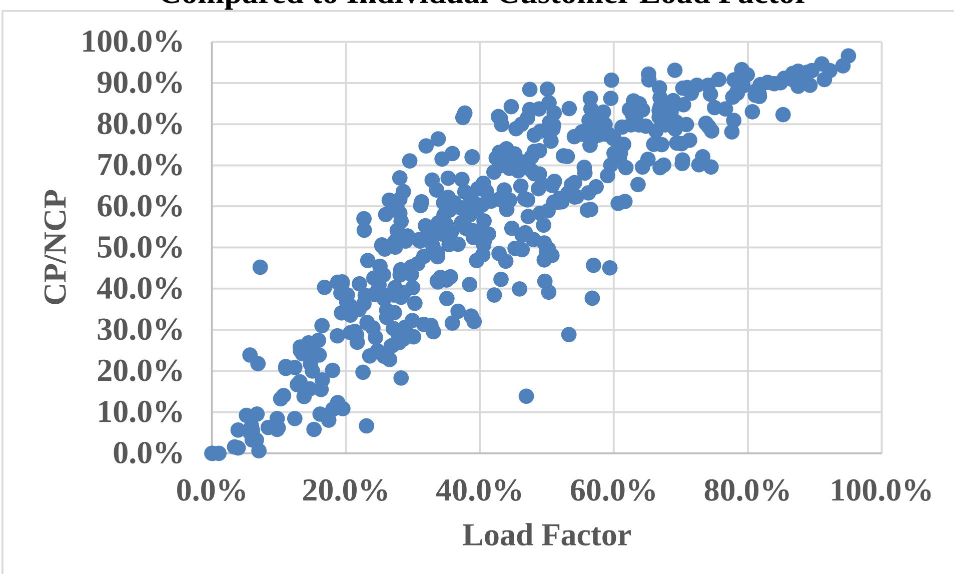

Figure 2 shows that as load factor decreases, the relationship between coincident peak (which is a key driver of costs) and non-coincident peak (which is how non-residential customers are billed for demand) gets weaker. Intuitively, this makes sense, because a 100 percent load factor customer would always hit the Company's peaks and conversely, using an extreme example, a customer who only used power for one hour in the year would be quite unlikely to use power during the Company's peak.

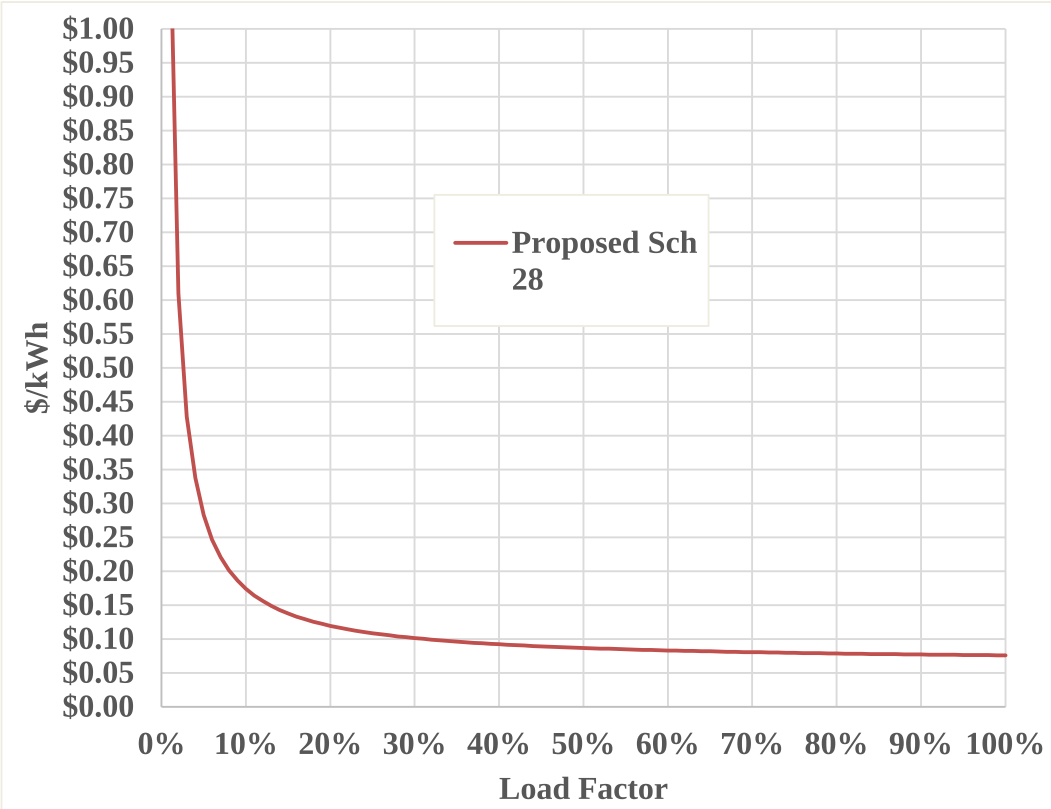
Customers on proposed Schedule 29 will be subject to time-differentiated energy prices and will still pay a higher average price if their load factor is low, but will effectively have the combined effect of their average demand and energy charges capped. Limiting the very high average price paid by low load factor customers is in recognition that coincidence with peak declines with load factor.

Q. How were proposed Schedule 29 prices calculated?

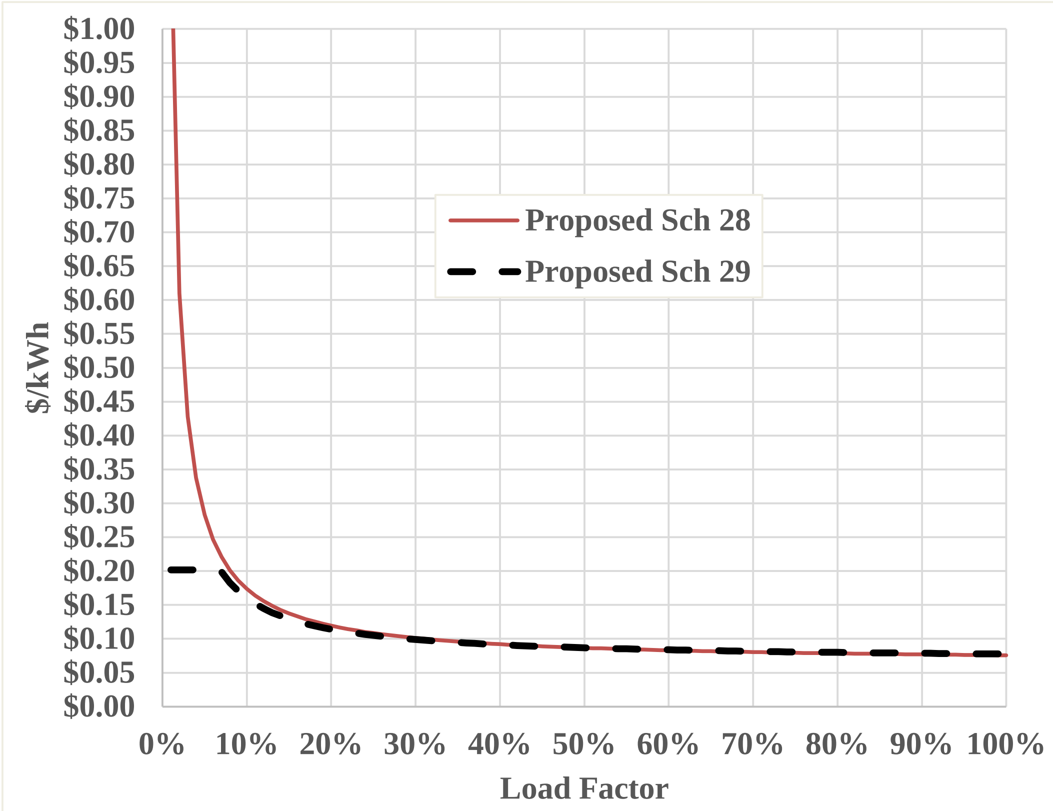
A. The prices proposed for Schedule 29 were based on Schedule 28 proposed rates. The off-peak credit was set to the 0.739 cent differential in value between the proposed on- and off-peak periods. It was then determined that 7.274 cents per kWh would be the average rate that would produce a value that, in concert with the off-peak credit, would be revenue neutral for Schedules 28. The Company then plotted the average energy cost for a 50 kW Schedule 28 customer using both the proposed $7.96 per kW cost for demand and facilities charges and the 6.808 cents per kWh average energy charge against load factor to better understand the relationship between average energy cost and load factor. Figure 3 shows this average demand and energy cost relative to load factor.

Figure 3. Average Demand and Energy Cost Relative to Load Factor for Combined Schedule 28 Prices



Through an iterative process of modifying the two different kWh-per-kW blocks, the Company developed a rate design that closely resembles the same average cost as shown on Figure 3. At 20.614 cents for the first 50 kWh-per-kW and 7.274 cents for all additional kWh, a very similar average cost can be achieved for all customers with load factors greater than about 29 percent. For customers with lower load factors, their average demand and energy cost would be effectively capped at 20.614 cents per kWh. Figure 4 shows how the proposed prices closely match the average demand and energy cost at different load factors.

Figure 4. Comparison of Proposed Schedule 29 Price to Average Energy and Demand Cost.



The Company proposes that the basic charge for Schedule 29 be set at $41.00 which is the weighted average price for the basic charge on Schedule 28. The calculation of proposed Schedule 29 prices is shown on Exhibit PAC/1415.

Q. Please describe any other features that are included in proposed Schedule 29.

A. The Company proposes that Schedule 29 participation be capped at 100 meters. After the Company has some experience and data on these customers, the Company can evaluate whether an expansion to the cap or any modifications to the tariff would be appropriate. Finally, the Company proposes that customers on Schedule 29 not be eligible for net metering service on Schedule 135. Since customers receiving service under Schedule 29 would only pay volumetric energy charges, it would not be reasonable for them to be able to entirely offset their bill with on-site generation whose exported energy is compensated for through energy credits valued at full retail energy rates. Demand charges send an important price signal to help balance the economics of customer generation. An eligible customer can always be served under the Company's standard general service and participate in net metering.

Large Customer Pilot Options

Q. What new pilot options does the Company propose for large non-residential customers?

A. The Company proposes Schedule 218, an optional interruptible service pilot where customers would receive bill credits in exchange for agreeing to interrupt their load when events are called. The Company also proposes Schedule 219, an optional real-time day-ahead pricing pilot where customers would have their energy charges shaped to hourly locational marginal prices that are available on a day-ahead basis.

Q. Why does the Company want to implement these two pilot programs?

A. As discussed earlier in my testimony, making energy more affordable, adapting to a more sustainable future, and giving customers options are important goals for the Company. Both of these options help the Company meet these goals by giving large customers different ways to provide the Company with more flexible loads in return for reductions to their bills. Large customers represent the greatest per meter opportunity for the Company to develop load flexibility. Large customers can also be very sophisticated energy users who may have the capability to respond to more complex pricing structures.

Q. Please describe how the interruptible service pilot would work?

A. Customers would enroll in the program and would nominate their non-interruptible load level, and any load in excess of that level would be interruptible. The Company would call interruption events when market prices are very high or when the Company's grid is under a lot of stress. Notice would be provided to customers at least 30 minutes in advance of each event. In response to each event, participants would need to reduce their load during the event down to the baseline non-interruptible load level they nominated. For example, a customer who typically uses 10 MW could choose to be interruptible down to three MW and would need to shed seven MW when the Company calls each event. In return for interrupting their load, participants would receive a $1 Interruptible Demand Credit applied to their Demand Charges for each of their on-peak kW during the monthly billing period and a 20 cent Interruptible Energy Credit for each kWh interrupted. The Company would call up to 100 hours of events each calendar year and would be able to call an event for up to three consecutive hours each day. Participation in the interruptible service pilot would require the Company to manually bill participants. To fully recover this cost, the Company proposes that participants would pay a $90 per month administrative fee. If necessary, customers would be responsible for any cost necessary to update the customer's metering to record settlement-quality five-minute interval data. Prior to updating the metering of a prospective participant, the Company will provide an estimate of the necessary cost. Proposed Schedule 218, which lays out all of the terms and conditions surrounding the program can be found in Exhibit PAC/1401.

Q. How did the Company determine the proposed prices for the Interruptible Demand Credit and the Interruptible Energy Credit?

A. Page 1 of Exhibit PAC/1416 shows the rationale behind the proposed prices for the Interruptible Demand Credit and the Interruptible Energy Credit. Real-time prices from EIM are a reasonable way to measure the value of energy at different times throughout the year. From specifically examining the Malin node which represents conditions at a point in between the Oregon and California border in the Company's service territory, the Company found that in the past three years of available data, there were less than 100 events each year where the real-time EIM price exceeded $200 per MWh. In the 12 months ended October 2017, there were 51 events where the real-time price exceeded $200 per MWh. During the 12 months ended October 2018, there were 74 events, and for 12 months ended October 2019, there were 46 events. For a program with up to 100 event hours per year, a 20 cent per kWh (which is the same as $200 per MWh) Interruptible Energy Credit is therefore reasonable. The Company will only be motivated to call events when the value of interruptions exceeds $200 per MWh and will likely have less than 100 hours each year when this occurs.

Page 1 of Exhibit PAC/1416 also shows that the value in excess of $200 per MWh during events when EIM prices exceeded $200 equates to about $0.63 per kW-month. For the purposes of the proposed interruptible pilot program, the Company recommends rounding this amount up to $1 for the Interruptible Demand Credit Price. The Company proposes to round this price up for two reasons. First, the Company believes that having at least a $1 per kW credit will be necessary to make the program sufficiently attractive for any large non-residential customers to participate. Second, the Company believes that in addition to energy benefits, there may be capacity value associated with an interruptible program, but experience operating the proposed pilot program can help determine an appropriate capacity value. Rounding the value up is in recognition of capacity and other potential benefits that the Company hopes to better understand with the operation of the pilot. One example of a potential capacity benefit would be avoiding long 16-hour block purchases of power to ensure that the Company has sufficient supply to meet loads.

Q. What accounting does the Company propose for the Interruptible Demand Credits and the Interruptible Energy Credits?

A. The Company proposes that both credits be treated as a NPC and be classified as purchased power expense. The Company also proposes that it be allocated on a System Generation interjurisdictional allocation factor. This treatment comports with the accounting and interjurisdictional allocations for other interruptible customer credits that exist on the east side of the Company's system (specifically in Utah and Idaho).

Q. What will happen if participants fail to perform and interrupt their load down to the nominated level?

A. The Company proposes a three strike system for when participants do not perform and interrupt their load down to their nominated level. The first time a participant does not fully interrupt their load, any interruptible credits will be forfeited for that particular billing month. The second time a participant fails to interrupt, all interruptible credits in the past six months will be forfeited. If a participant fails to interrupt for the third time in a rolling 12-month period, the customer will be removed from the program and will not be able to return for a year. The Company anticipates that these penalties will help to ensure that interruptible load which the Company relies on to serve its customers is available and participants perform the obligations that come with the benefits provided.

Q. Please provide an illustrative example of how a customer could save money on this program.

A. Page 2 of Exhibit PAC/1416 shows how the Interruptible Demand Credit and the Interruptible Energy Credit would work for a hypothetical five MW, 92 percent load factor customer who participates in the program. Without participating, this customer would pay about $2.413 million per year. Assuming 50 event hours get called during a year, this customer could save about 4.3 percent or about $109,000 for being interrupted in 0.6 percent of the hours in the year. This customer would receive $60,000 from the Interruptible Demand Credit and $50,000 from the Interruptible Energy Credit. This benefit would be offset by about $1,000 in administrative fees that recover the cost of billing for the program.

Q. Please describe how the real-time day-ahead pricing pilot would work?

A. Customers would sign up for the real-time day-ahead pricing pilot and would have the price that they pay for energy shaped by information provided by 1:00 p.m. the day before on the California Independent System Operator's (CAISO) Open Access Same-time Information System (OASIS) website. Specifically, the shape of energy prices would be based on the day-ahead market locational marginal price at the "ELAP_PACW-APND" node on the CAISO OASIS website (real-time day-ahead index) which is a rough representation of the general magnitude of hourly marginal energy cost on the PacifiCorp Control West balancing area. A participant could look at these prices the day before, scale back usage for hours and days when prices are elevated, and increase energy consumption when prices are low.

Q. How would energy be shaped on the hourly day-ahead prices provided?

A. Energy prices on Schedule 201 would be lower or higher depending upon how customer usage lines up with the real-time day-ahead index. At the end of each monthly billing period, the average price for the period on the real-time day-ahead index would be compared to the class average Schedule 201 price for the particular customer participating which is proposed in the concurrent TAM filing to be 2.136, 2.017, and 1.896 cents per kWh for secondary, primary and transmission voltage service, respectively. This average real-time day-ahead-index price for the period would be divided by the average Schedule 201 price to calculate an adjustment factor. If the average real-time day-ahead-index price was 4.800 cents per kWh for a particular month, the adjustment factor for a secondary voltage customer would be 0.500 (2.136/4.272). For that month, the customer would pay the hourly real-time price multiplied by the 0.500 adjustment factor. If the average real-time day-ahead-index price were 2.000 cents per kWh for the month, the adjustment factor for a secondary voltage customer would be 1.333 (2.136/1.602). For that month, the customer would pay the hourly real-time price multiplied by the 1.333 adjustment factor. In both cases, the adjusted hourly prices from the real-time day-ahead index for the month would be multiplied by the participant's energy usage in each hour to calculate overall Schedule 201 charges. In some hours, the prices from the real-time day-ahead index can be negative. Participants would see the benefit from usage during those hours, but total Schedule 201 charges for the full month would have a floor set at zero.

Q. Why does the Company propose this calculation be used to shape energy charges for participants?

A. Presently, all large over-one-MW general service customers are subject to mandatory time varying energy charges. In this rate case, the Company is proposing that the on- and off-peak differential be increased and the time of use periods be modernized. This provides a pretty good opportunity for large customers to save by shifting their usage to off-peak times that are clearly established and unchanging outside of rate cases. The on- and off-peak periods do a pretty good job of capturing high and low cost periods throughout the year. The real-time day-ahead pricing pilot, however, opens up an opportunity for customers to have their energy prices shaped in a far more detailed way to capture the different times when costs slump and spike. This pilot program is not intended to provide consumers with access to wholesale power markets. Direct access programs provide customers with that ability through energy service suppliers. Under the proposed program, the real-time day-ahead index prices would be adjusted to bring the magnitude of pricing in line with the levels paid by other non-participating customers. If the index's pricing is particularly high in a certain month, participants are only exposed to the variation of hourly prices within the month, not to the overall magnitude of any given month's pricing. Conversely, months with very low prices on the real-time day-ahead index would not create a windfall for participants, but would give them an opportunity to respond to the hourly variation in pricing within the month.

Q. How will demand charges be determined under the real-time day-ahead pricing pilot?

A. Schedule 48 customers pay demand charges that are based upon the highest kW reading during any 15-minute intervals that fall with the on-peak period defined on the Schedule 48 tariff. For a customer participating in the pilot, the on-peak period may not totally align with periods of lower pricing on the real-time day-ahead index. This could be problematic for a lower load factor customer who avoids demand charges by using energy outside the on-peak windows, but who has a high degree of flexibility and would otherwise be an excellent candidate for the pilot program. The Company therefore proposes that demand charges for the pilot program would be based upon the highest kW reading during any 15-minute interval that occurs during the highest priced 100 hours on the real-time day-ahead index during each monthly billing period. This allows the timing of demand charges to align with the higher cost periods on the pilot.

Q. Are there any other proposed features for the real-time day-ahead pricing pilot?

A. Yes. Like the interruptible service pilot, the Company proposes that a $90 per month administrative fee be charged to recover the cost of manually billing participants on the program. The Company also proposes that participants would be able to nominate a baseline quantity of load that could be exempted from participation. For example, a participant that has a 10 MW load could nominate three MW of baseline non-participating load. For this customer, in any given hour the first three MW would pay standard retail rates and all additional MW would be subject to the pricing and rules of the real-time day-ahead pricing pilot described on Schedule 219. Proposed Schedule 219, which lays out how the pilot would work, can be found in Exhibit PAC/1401.

Q. Does the Company anticipate using the "ELAP_PACW-APND" node on the CAISO OASIS website indefinitely for this program?

A. No. As discussed earlier, prices on CAISO's "ELAP_PACW-APND" node are generally capable of approximating the magnitude of hourly energy costs for the Company and that information is reasonable for shaping energy for the purposes of this pilot, but it is not perfect. One of the chief advantages of these data is that they are publicly available and updated daily by a third party and therefore can be used right away for this pilot. As discussed in Mr. Wilding's testimony, the Company is under contract with CAISO to develop nodal prices for PacifiCorp's system which will more accurately capture costs and better represent different points on the Company's system. Longer term, the Company would like to use this more detailed nodal pricing for any real-time pricing option(s). When it is available and set up in a format to deliver to customers, the Company anticipates it would make a filing with the Commission to update the real-time day-ahead index.

Q. Please provide illustrative examples of how a customer could save money on this program.

A. Page 1 of Exhibit PAC/1417 shows at a high level how the billing would work for an illustrative five MW, 92 percent load factor customer who participates in the pilot and chooses to avoid the two highest cost hours each day. The real-time day-ahead index for the 12 months ended June 2019 was used. In January, the average real-time day-ahead index is 4.025 cents per kWh which, when compared to the average 2.017 cents per kWh Schedule 201 price for Schedule 48 primary customers, produces an adjustment factor of 0.50. This gets applied to the participant's average price on the index of 3.843 cents per kWh to produce an average Schedule 201 price for the participant of 1.926 cents per kWh. The adjustment factors for each of the months ranges from a high of 1.10 in May to 0.26 in February. In each month, the customer achieves a lower average Schedule 201 energy price by cutting back load during the two highest hours each day. For the full year, this hypothetical customer would be able to save about 2.8 percent or about $70,000.

Page 2 of Exhibit PAC/1417 shows the billing for another illustrative participant with a five MW load, but who has a 25 percent load factor. This customer only chooses to use energy when the price is 73 percent less than a rolling average of the prior 15-day period. This customer avoids demand charges during all months and pays a lower rate by avoiding costlier hours. For the full year, this hypothetical customer would be able to save about 13 percent, or about $70,000.

Q. Does the Company propose caps on participation for the interruptible service and real-time day-ahead pricing pilots?

A. Yes. For each program, the Company proposes a cap of 25 MW of participation. Twenty-five MW is the minimum size for which the Company may trade energy on wholesale markets and is a reasonable sized cap that the Company believes will give it some experience with these programs while also limiting any potential risk to non-participating customers. To ensure that a single large customer does not take up the entire cap, the Company proposes that for both pilots a customer may only enroll up to 10 MW of load. Depending upon how well the pilots perform at providing both the Company and customers with meaningful value, the Company may request further expansion of the proposed programs.

Q. Is there value in offering these programs, if ultimately no customers participate in the proposed interruptible service pilot or real-time day-ahead pricing pilot?

A. Yes. Even if no customers ultimately enroll in either program, the Company will learn that the pilots are not sufficiently attractive to entice participation.

Street Lighting Price Re-Design

Q. What does the Company propose for lighting customers?

A. For Company-owned street and area lights, the Company proposes re-designing the prices to be based on the level of lighting service that the Company is providing, rather than on technology (*i.e.*, bulb) type. The Company also proposes creating a new "Customer-Funded LED Conversion" option for Company-owned street lights.

Q. Please provide a brief overview of the Company's current pricing structure for Company-owned lighting?

A. The Company currently offers service to Company-owned lights under the following schedules:

- Schedule 15 – Outdoor Area Lighting – No New Service
- Schedule 50 – Mercury Vapor Street Lighting Service – No New Service
- Schedule 51 – Street Lighting Service Company-Owned System
- Schedule 52 – Street Lighting Service Company-Owned System – No New Service

Street lights are provided for governmental entities to illuminate public streets, highways, and thoroughfares. Area lights, which are currently closed to new service, are provided to residential and non-residential customers to light spaces outside such as driveways or alleys. Prices for Company-owned street and area lights are based on the particular technology and type of lamp that the Company is providing. For example, a 7,000 lumen mercury vapor area light is $9.40 per month and a 4,000 lumen LED street light is $6.47. Schedule 52, which is closed to new service, charges a price per kWh plus a flat fee for the estimated operations and maintenance cost that is unique to different installations and has been in place for many years. Schedule 50 is for legacy mercury vapor lamps that the Company no longer offers. Schedule 50 charges different prices based on the type of pole and whether a lamp is served from overhead or underground facilities. For example, a 55,000 lumen mercury vapor, served from overhead facilities and installed on a wood pole is $34.79 per month. In summary, pricing for Company-owned lights is complicated.

Q. What does it mean to base prices for Company owned street and area lighting on level of service?

A. Presently, prices for Company-owned street and area lights are based on the particular technology and type of lamp that the Company is providing. The time is right to move away from this model for pricing lights that the Company owns and maintains. Ultimately, what the Company provides street and area lighting customers is a level of light to a specific area. The Company therefore proposes that Company-owned street and area light prices be based on the level of lighting service that the Company provides irrespective of technology or lamp type. The level of lighting service would be based on ranges of LED equivalent lumens. Under this new paradigm, an LED, a mercury vapor, and a high pressure sodium vapor lamp that provide the same level of light would have the same price. For area lights, the Company proposes the following levels:

- Level 1 (0-5,500 LED Equivalent Lumens)
- Level 2 (5,501-12,000 LED Equivalent Lumens)
- Level 3 (12,001 and Greater LED Equivalent Lumens)

For street lights, the Company proposes the following levels:

- Level 1 (0-3,500 LED Equivalent Lumens)
- Level 2 (3,501-5,500 LED Equivalent Lumens)
- Level 3 (5,501-8,000 LED Equivalent Lumens)
- Level 4 (8,001-12,000 LED Equivalent Lumens)
- Level 5 (12,001-15,500 LED Equivalent Lumens)
- Level 6 (15,501 and Greater LED Equivalent Lumens)

Q. Why is the Company proposing this change to the way it prices Company-owned street and area lights?

A. There are two reasons why the Company proposes this change. First, basing prices on service level better aligns the Company's incentives towards providing the provision of lighting at the lowest possible cost. LED has emerged as the dominant lighting technology and is the most efficient way to light a space, but the present structure of its rates disincentivizes the Company from converting lights to LED. If the Company replaces an older light with LED, its revenue decreases to reflect the lower-priced LED lamp. Basing the price for Company-owned lights on level of service will provide the Company with an incentive to transition its fleet of lights to the most efficient technology available.

Second, the Company's present prices for Company-owned lighting service are hard to understand. Simplifying them to specific ranges of light levels makes it easier for customers to understand.

Q. What is the "Customer-Funded LED Conversion" option?

A. Presently, street lighting customers can save by requesting that the Company-owned lights they pay for get converted to LED. Because this lowers the Company's revenue, the customer does not get a line extension allowance and pays for the full cost of the conversion. This provides customers with an opportunity to invest in more efficient technology and save on their monthly electric bill. While the proposed new level of service pricing paradigm for Company-owned lights removes a disincentive for the Company to convert to LED, the Company does not want to eliminate the incentive for customers to fund conversion of street lights to LED. The Company also wants to ensure fairness for early adopters who have paid to have the street lights serving them converted to LED. The Company proposes lower street light prices would be available in the tariff for "Customer-Funded Conversion" reflecting the lower marginal cost of lamps whose luminaires have been paid for by customers. While the Company plans to convert the lights to LED when it makes sense to do so,[19] that may be too slow for some customers who want the most energy efficient street lights in their community now.

Q. Did you prepare an exhibit that shows which existing street and area lighting prices change to the different proposed price based upon level of service?

A. Yes. Pages 1 and 2 of Exhibit PAC/1418 shows the different existing prices for Company-owned street and area lighting as well as the prices and levels of service that each type would change to under the Company proposed tariff revisions. With the Company's proposed level of service approach to pricing Company-owned lights,

[18] For example, the Company would convert a light to LED instead of fixing legacy equipment when it fails.

legacy Schedules 50 and 52 that are closed to new service would be canceled and customers on those schedules would go onto Schedule 51. Page 3 of Exhibit PAC/1418 shows a consolidated list of proposed prices for Company-owned street and area lighting for reference. With the Company's proposed pricing, the count of unique street and area lighting charges goes from 90 prices to 29 prices.

Q. How were prices set for the street and area lighting schedules?

A. In the Company's marginal cost of service study, marginal costs are developed for the street and area lighting class in the following way:

- Schedule 53 - Customer-Owned Street Lights – Marginal energy costs as well as commitment-related distribution costs are developed for this schedule. Service on Schedule 53 is un-metered, so metering costs are not included.
- Schedule 54 – Recreational Field Lighting – Marginal costs are developed in the same way as for Schedule 51, except the marginal cost of metering is included.
- Schedules 15, 50, 51 and 52 – Company-Owned Street and Area Lights - Marginal costs are developed in the same way as for Schedule 53, except the marginal cost of light ownership is included. This comprises the marginal cost of light installation as well as the marginal cost of light maintenance. For the newly created "Customer-Funded LED Conversion" option, the marginal cost of light installation is excluded.

In the Company's last marginal cost of service study, marginal costs for Company-owned lights which were closed to new service were not calculated. Additionally, since LED was a relatively new technology for the Company, the marginal cost for LED lamps was not developed. Marginal costs were therefore calculated for only four different high pressure sodium vapor street lights.

The energy output and maintenance costs for LED technology far exceeds other formats like high pressure sodium vapor and metal halide. Moving forward, the Company plans to only offer new service for Company-owned street and area lights that are LED and to transition its existing lights to LED over time. Consequently, the marginal cost of providing a level of lighting to a specific space outside is the cost of owning and maintaining LED lamps. For the cost of service study in this case, the Company developed the marginal cost of LED light ownership for the three levels of service proposed for area lights, the six levels of service proposed for street lights where the customer did not fund conversion, and the same six levels of service proposed for street lights where the customer did fund conversion (excludes the cost of light installation). In developing full marginal costs, the number of lamps that would fall under different service levels with Company's proposed pricing structure were applied to the marginal cost for each lamp type. Since the marginal cost of providing Company-owned lighting service is based on LED technology, the energy usage for each lamp type was assumed to be at what the Company's current standard LED lights use. For lighting (Schedules 15, 50, 51/751, 52/752, 53/753, and 54/754), the proposed revisions are designed to collect the overall functionalized target revenue requirement. Prices within each schedule and for each level of service for Company-owned lights are set at levels where prices reflect the relative differences in marginal cost.

Area Lights

Q. In addition to re-designing the Company-owned lamp prices, what other change does the Company propose for Schedule 15 – Outdoor Area Lighting Service?

A. The Company proposes that Schedule 15 be open to new service again on existing distribution poles only.

Q. Why has the Company closed its area light tariffs to new service?

A. My understanding is that the Company closed area lights for new service for two reasons. First, the Company was concerned about the costs associated with maintaining lights at homes and businesses throughout its service area. Second, the Company reasoned that a customer could always install an area light on its own side of the meter.

Q. Why is the Company requesting that Schedule 15 be opened up for new service again?

A. With LED technology, maintenance of area lights is far less than for other legacy lighting technologies. Whereas a high pressure sodium vapor lamp needs to have its bulb changed out every six years on average, an LED area light head is designed to last for 25 years. With the falling cost of LED lights, the Company can provide an efficient, low cost solution for its customers' outdoor lighting needs.

While customers can install area lights on their side of the meter, this is not always a good option for them. Sometimes the area that a customer wants to illuminate is much closer to distribution lines than to the customer's meter. In these circumstances, particularly in the Company's more rural service areas, running wire underground to a light a long distance away is not always cost effective or practical. Offering to own and maintain area lights can be a valuable service for customers.

Q. Why is the Company restricting new lamps to being on existing distribution poles only?

A. Installing new poles on customers' premises to provide area lighting service can increase maintenance costs for the Company and can also create access issues for service personnel who need to visit a lamp. Restricting new service to existing distribution poles mitigates these concerns.

IX. CONCLUSION

Q. Does this conclude your direct testimony?

A. Yes.

Docket No. UE 374
Exhibit PAC/1401
Witness: Robert M. Meredith

BEFORE THE PUBLIC UTILITY COMMISSION

OF OREGON

PACIFICORP

Exhibit Accompanying Direct Testimony of Robert M. Meredith

Proposed Tariffs

February 2020

Index No.

Schedule No.

Schedule No.

PACIFIC POWER
A DIVISION OF PACIFICORP

RESIDENTIAL SERVICE
DELIVERY SERVICE

Available

In all territory served by the Company in the State of Oregon.

Applicable

To single-family Residential Consumers only for all single-phase and three-phase electric requirements when all service is supplied at one point of delivery. Three-phase service will be supplied only when service is available from Company's presently existing facilities, or where such facilities can be installed under Company's Line Extension Rules, and, in any event, only when deliveries can be made by using one service for Consumer's single-phase and three-phase requirements.

Monthly Billing

The Monthly Billing shall be the sum of the Distribution Charge, Transmission & Ancillary Services Charge, and the System Usage Charge plus the applicable adjustments as specified in Schedule 90. (C)

Distribution Charge		
Single-Family Home Basic Charge, per month	$12.00	
Multi-Family Home Basic Charge, per month	$7.00	(C)
Three Phase Demand Charge, per kW demand	$2.20	
Three Phase Minimum Demand Charge, per month	$3.80	
Distribution Energy Charge, per kWh	3.822¢	(I)
Transmission & Ancillary Services Charge		
Per kWh	0.820¢	(I)
System Usage Charge		
Schedule 200 Related, per kWh	0.084¢	(I)
T&A and Schedule 201 Related, per kWh	0.077¢	(I)

Supply Service Options

All Consumers shall pay the applicable rates under Schedule 200, Base Supply Service. Additionally, each Consumer shall specify Supply Service Schedule 201, Schedule 210, Schedule 211, Schedule 212 or Schedule 213, as appropriate and in accordance with the Applicable section of the specified rate schedule.

Franchise Fees

Franchise fees related to Schedule 200, Base Supply Service, are collected through the System Usage Charge - Schedule 200 Related rate. Franchise fees related to Transmission & Ancillary Services and franchise fees related to Schedule 201, Net Power Costs, are collected through the System Usage Charge - T&A and Schedule 201 Related rate. Franchise fees related to distribution charges are collected through distribution charges.

Special Conditions

Consumer shall so arrange his wiring as to make possible the separate metering of the three-phase demand at a location adjacent to the kWh meter. If, on November 25, 1975, any present Consumer's wiring was arranged only for combined single and three-phase demand measurement, and continues to be so arranged, such demands will be metered and billed hereunder except that the first 10 kW of such combined demand will be deducted before applying demand charges for three phase service. No new combined demand installations will be allowed such a demand deduction

(continued)

Issued February 14, 2020 **Effective for service on and after January 1, 2021**
Etta Lockey, Vice President, Regulation *Docket No. UE 374*

PACIFIC POWER
A DIVISION OF PACIFICORP

OREGON
SCHEDULE 5

SEPARATELY METERED ELECTRIC VEHICLE SERVICE FOR RESIDENTIAL CONSUMERS
DELIVERY SERVICE

Available

In all territory served by the Company in the State of Oregon.

Applicable

To single-family Residential Consumers only for all single-phase and three-phase electric requirements supplied to electric vehicle charging installations where such service is supplied at a point of delivery separately metered from other residential service. Three-phase service will be supplied only when service is available from Company's presently existing facilities.

Monthly Billing

The Monthly Billing shall be the sum of the Distribution Charge, Transmission & Ancillary Services Charge, and the System Usage Charge plus the applicable adjustments as specified in Schedule 90. (C) (C)

Distribution Charge		
Single-Family Home Basic Charge, per month	$12.00	(C)
Multi-Family Home Basic Charge, per month	$7.00	
Three Phase Demand Charge, per kW demand	$2.20	
Three Phase Minimum Demand Charge, per month	$3.80	
Distribution Energy Charge, per kWh	3.822¢	(I)
Transmission & Ancillary Services Charge		
Per kWh	0.820¢	(I)
System Usage Charge		
Schedule 200 Related, per kWh	0.084¢	(I)
T&A and Schedule 201 Related, per kWh	0.077¢	(I)

Supply Service Options

All Consumers shall pay the applicable rates under Schedule 200, Base Supply Service. Additionally, each Consumer shall specify Supply Service Schedule 201, Schedule 210, Schedule 211, Schedule 212 or Schedule 213, as appropriate and in accordance with the Applicable section of the specified rate schedule.

Franchise Fees

Franchise fees related to Schedule 200, Base Supply Service, are collected through the System Usage Charge - Schedule 200 Related rate. Franchise fees related to Transmission & Ancillary Services and franchise fees related to Schedule 201, Net Power Costs, are collected through the System Usage Charge - T&A and Schedule 201 Related rate. Franchise fees related to distribution charges are collected through distribution charges.

Continuing Service

This Schedule is based on continuing service at each service location. Disconnect and reconnect transactions shall not operate to relieve a Consumer from minimum monthly charges.

Rules and Regulations

Service under this Schedule is subject to the General Rules and Regulations contained in the tariff of which this Schedule is a part and to those prescribed by regulatory authorities.

(N)

Available

In all territory served by the Company in the State of Oregon.

Applicable

To Residential Consumers otherwise receiving Delivery Service under Schedule 4, in conjunction with Supply Service Schedule 201. Service under this pilot will be limited to approximately five thousand (5,000) metered points of delivery.

Monthly Billing

The Monthly Billing shall be the sum of the Distribution Charge, Transmission & Ancillary Services Charge and System Usage Charge plus the applicable adjustments as specified in Schedule 90 for Schedule 4.

Distribution Charge	
Single Family Home Basic Charge, per month	$12.00
Multi-Family Home Basic Charge, per month	$7.00
Three Phase Demand Charge, per kW demand	$2.20
Three Phase Minimum Demand Charge, per month	$3.80
Distribution Energy Charge, per kWh	3.822¢
Transmission & Ancillary Services Charge	
Per kWh	0.820¢
System Usage Charge	
Schedule 200 Related, per kWh	0.084¢
T&A and Schedule 201 Related, per kWh	0.077¢

Supply Service Options

All Consumers shall pay the applicable rates under Schedule 200, Base Supply Service. Additionally, each Consumer shall pay the applicable rates under Supply Service Schedule 201.

Franchise Fees

Franchise fees related to Schedule 200, Base Supply Service, are collected through the System Usage Charge - Schedule 200 Related rate. Franchise fees related to Transmission & Ancillary Services and franchise fees related to Schedule 201, Net Power Costs, are collected through the System Usage Charge - T&A and Schedule 201 Related rate. Franchise fees related to distribution charges are collected through distribution charges.

On- and Off-Peak Definitions

Seasonal Definitions	Summer:	July through September
	Non-Summer:	October through June
On-Peak Period	Summer:	All days 3 p.m. to 9 p.m.
	Non-Summer:	All days 6 a.m. to 8 a.m. and 5 p.m. to 11 p.m.
Off-Peak Period	All other hours.	

(N)

(continued)

(N)

Guarantee Payment
The Company shall guarantee against excessive increase of consumer costs for the first year of enrollment in the program. If the total energy costs incurred on this Schedule for the first year exceed 10% over what costs would have been for the same period under Cost-Based Supply Service, the net difference, Guarantee Payment, will be credited on the customer's bill following the end of the first year of serviced under the program. No Guarantee Payment shall be given if Consumer terminates service on the program before the end of the first year on the program.

Special Conditions

1. Consumers taking service under this schedule shall be subject to all conditions applicable to Schedule 4 of this tariff.

2. Participants for this program will be chosen on a first-come, first-served basis. Participation will be limited to approximately five thousand (5,000) metered points.

3. The Consumer must have a time-of-use capable meter installed to participate in this option. The appropriate meter will be installed or the existing meter reprogrammed on the Consumer premises at no extra charge to the Consumer. Billing under this schedule shall begin for the Consumer following the meter update and the initial meter reading.

4. Consumers requesting service under this pilot program agree to remain on the pilot for one year. Consumers will have the option to opt out of the pilot after this date by notifying the Company. Service will continue under this schedule until Consumer notifies the Company to discontinue service or this schedule terminates.

5. All Consumers participating in this pilot program may be asked to complete a survey regarding participation. Survey responses will be used to further evaluate the potential of future time-of-use rates. Data gathered will be used for pilot evaluation only.

6. Consumers on this tariff schedule shall have a term of not less than one year. Service will continue under this schedule until Consumer notifies the Company to discontinue service.

Continuing Service
This Schedule is based on continuing service at each service location. Disconnect and reconnect transactions shall not operate to relieve a Consumer from minimum monthly charges.

Rules and Regulations
Service under this Schedule is subject to the General Rules and Regulations contained in the tariff of which this Schedule is a part and to those prescribed by regulatory authorities.

(N)

PACIFIC POWER
A DIVISION OF PACIFICORP

OREGON
SCHEDULE 15

OUTDOOR AREA LIGHTING SERVICE -
DELIVERY SERVICE

Available

In all territory served by the Company in the State of Oregon.

Applicable

To all Consumers for outdoor area lighting service furnished from dusk to dawn by means of Company-owned lamps which may be served by secondary voltage circuits from the Company's existing overhead distribution system. Luminaires shall be mounted on Company-owned wood poles and served in accordance with the Company's specifications as to equipment and installation. Lamp installations on any pole except an existing distribution pole are closed to new service. (C) (C)

Monthly Billing

The Monthly Billing shall be the Rate Per Luminaire plus the applicable adjustments as specified in Schedule 90. (C)

Type of Lamp	LED Equivalent Lumens	Monthly kWh	Rate Per Lamp	
				(D)
Level 1	0-5,000	19	$8.76	(N)
Level 2	5,001-12,000	34	$10.08	(C)
Level 3	12,001+	57	$11.97	(C)
				(C)
				(D)

Supply Service Option

All Consumers shall pay the applicable rates under Schedule 200, Base Supply Service. Supply Service shall be provided by Supply Service Schedule 201.

Franchise Fees

Franchise fees related to Schedule 200, Base Supply Service, Transmission & Ancillary Services, Schedule 201, Net Power Costs, and distribution charges are collected through rates in this schedule.

Special Conditions

1. Inoperable lights will be repaired as soon as reasonably possible, during regular business hours or as allowed by Company's operating schedule and requirements, provided the Company receives notification of inoperable lights from Consumer or a member of the public by either notifying Pacific Power's customer service (1-888-221-7070) or www.pacificpower.net/streetlights. Pacific Power's obligation to repair street lights is limited to this tariff.

2. The Company reserves the right to contract for the maintenance of lighting service provided hereunder.

(continued)

Available

In all territory served by the Company in the State of Oregon.

Applicable

To Small Nonresidential Consumers whose entire electric service requirements are supplied hereunder and as specified in the Company's Rules & Regulations, Rule 7.J. Deliveries at more than one point, or more than one voltage and phase classification, will be separately metered and billed, except as provided below for Communication Devices. Service for intermittent, partial requirements, or highly fluctuating loads, or where service is seasonally disconnected during any one-year period will be provided only by special contract for such service.

Monthly Billing

The Monthly Billing shall be the sum of the Distribution Charge, Transmission & Ancillary Services Charge, and the System Usage Charge plus the applicable adjustments as specified in Schedule 90. (C)

Distribution Charge	**Delivery Voltage** Secondary	Primary	
Basic Charge			
Single Phase, per month	$17.35	$17.35	
Three Phase, per month	$25.90	$25.90	
Load Size Charge			
≤ 15 kW	No Charge	No Charge	
> 15 kW, per kW for all kW in excess of 15 kW Load Size	$1.50	$1.50	(I)
Demand Charge, the first 15 kW of demand	No Charge	No Charge	
Demand Charge, for all kW in excess of 15 kW, per kW	$5.08	$4.94	(I)
Distribution Energy Charge, per kWh	3.640¢	3.537¢	(I)
Reactive Power Charge, per kvar	$0.65	$0.60	
Transmission & Ancillary Services Charge			
Per kWh	0.725¢	0.705¢	(I)
System Usage Charge			
Schedule 200 Related, per kWh	0.078¢	0.076¢	(I)
T&A and Schedule 201 Related, per kWh	0.070¢	0.068¢	(I)

kW Load Size

For determination of the Basic Charge and Load Size Charge, the kW load size shall be the average of the two greatest non-zero monthly demands established during the 12-month period which includes and ends with the current billing month.

(continued)

PACIFIC POWER
A DIVISION OF PACIFICORP

OREGON
SCHEDULE 28

GENERAL SERVICE
LARGE NONRESIDENTIAL 31 KW to 200 KW
DELIVERY SERVICE

Available

In all territory served by the Company in the State of Oregon.

Applicable

To Large Nonresidential Consumers whose entire electric service requirements are supplied hereunder and whose loads have not registered more than 200 kW, more than six times in the preceding 12-month period and as specified in the Company's Rules & Regulations, Rule 7.J. Deliveries at more than one point, or more than one voltage and phase classification, will be separately metered and billed. Service for intermittent, partial requirements, or highly fluctuating loads, or where service is seasonally disconnected during any one-year period will be provided only by special contract for such service.

Monthly Billing

The Monthly Billing shall be the sum of the Distribution Charge, Transmission & Ancillary Services Charge, and the System Usage Charge plus the applicable adjustments as specified in Schedule 90. (C)

	Delivery Voltage		
	Secondary	**Primary**	
Distribution Charge			
Basic Charge			
Load Size ≤50 kW, per month	$ 21.00	$ 29.00	(I)
Load Size 51-100 kW, per month	$ 39.00	$ 49.00	
Load Size 101 - 300 kW, per month	$ 93.00	$ 115.00	
Load Size > 300 kW, per month	$ 132.00	$ 164.00	
Load Size Charge			
≤50 kW, per kW Load Size	$ 1.30	$ 1.60	
51 - 100 kW, per kW Load Size	$ 1.05	$ 1.30	
101 – 300 kW, per kW Load Size	$ 0.65	$ 0.80	
> 300 kW, per kW Load Size	$ 0.40	$ 0.40	
Demand Charge, per kW	$ 4.45	$ 5.62	
Distribution Energy Charge, per kWh	0.450¢	0.089¢	
Reactive Power Charge, per kvar	$ 0.65	$ 0.60	
Transmission & Ancillary Services Charge			
Per kW	$ 2.21	$ 2.11	
System Usage Charge			
Schedule 200 Related, per kWh	0.086¢	0.080¢	
T&A and Schedule 201 Related, per kWh	0.077¢	0.072¢	(I)

kW Load Size:

For determination of the Basic Charge and the Load Size Charge, the kW load size shall be the average of the two greatest non-zero monthly demands established during the 12-month period which includes and ends with the current billing month.

Minimum Charge

The minimum monthly charge shall be the Basic Charge and the Load Size Charge plus the demand charge. A higher minimum may be required under contract to cover special conditions.

DELIVERY SERVICE

Available (N)

In all territory served by the Company in the State of Oregon.

Applicable

To Nonresidential Consumers whose entire electric service requirements are supplied hereunder and whose loads have not registered more than 1,000 kW, more than once in the preceding 18-month period and who are not otherwise subject to service on Schedules 47 or 48.. Deliveries at more than one point, or more than one voltage and phase classification, will be separately metered and billed. Participation in this schedule will be limited to 100 metered points of delivery on a first-come, first served basis.

Monthly Billing

The Monthly Billing shall be the sum of the Distribution Charge, Transmission & Ancillary Services Charge and System Usage Charge plus the applicable adjustments as specified in Schedule 90 for Schedule 28.

Distribution Charge	
Basic Charge, per month	$41.00
Distribution Energy Charge	
First 50 kWh per kW demand, per kWh	13.419¢
All Additional kWh, per kWh	0.078¢
Transmission & Ancillary Services Charge	
Per kWh	0.739¢
System Usage Charge	
Schedule 200 Related, per kWh	0.086¢
T&A and Schedule 201 Related, per kWh	0.077¢

Minimum Charge

The minimum monthly charge shall be the Basic Charge. A higher minimum may be required under contract to cover special conditions.

Demand

The kW shown by or computed from the readings of the Company's demand meter for the 15-minute period of the Consumer's greatest use during the month, determined to the nearest kW, but not less than 15 kW.

Supply Service Options

All Consumers taking Delivery Service under this schedule shall pay the applicable rates in Schedule 200, Base Supply Service. Additionally, each Consumer shall pay the applicable rates in Supply Service Schedule 201.

Franchise Fees

Franchise fees related to Schedule 200, Base Supply Service, are collected through the System Usage Charge - Schedule 200 Related rate. Franchise fees related to Transmission & Ancillary Services and franchise fees related to Schedule 201, Net Power Costs, are collected through the System Usage Charge - T&A and Schedule 201 Related rate. Franchise fees related to distribution charges are collected through distribution charges. (N)

(N)

On- and Off-Peak Definitions

Seasonal Definitions	Summer:	July through September
	Non-Summer:	October through June
On-Peak Period	Summer:	All days 1 p.m. to 11 p.m.
	Non-Summer:	All days 5 a.m. to 9 a.m. and 4 p.m. to 12 a.m. (midnight)
Off-Peak Period	All other hours.	

Special Conditions

1. Consumers taking service under this schedule shall be subject to all conditions applicable to Schedule 28 of this tariff.

2. Participants for this program will be chosen on a first-come, first-served basis. Participation will be limited to approximately one hundred (100) metered points.

3. The Consumer must have a time-of-use capable meter installed to participate in this option. The appropriate meter will be installed or the existing meter reprogrammed on the Consumer premises at no extra charge to the Consumer. Billing under this schedule shall begin for the Consumer following the meter update and the initial meter reading.

4. Consumers requesting service under this pilot program agree to remain on the pilot for one year. Consumers will have the option to opt out of the pilot after this date by notifying the Company. Service will continue under this schedule until Consumer notifies the Company to discontinue service or this schedule terminates.

5. All Consumers participating in this pilot program may be asked to complete a survey regarding participation. Survey responses will be used to further evaluate the potential of future rates. Data gathered will be used for pilot evaluation only.

6. Meters enrolled in this pilot will not be eligible to participate concurrently in net metering or any other generation related program offered by the Company.

Continuing Service

Except as specifically provided otherwise, the rates of this tariff are based on continuing service at each service location. Disconnect and reconnect transactions shall not operate to relieve a seasonal Consumer from minimum monthly charges.

Term of Contract

The Company may require the Consumer to sign a written contract which shall have a term of not less than one year.

Rules and Regulations

Service under this Schedule is subject to the General Rules and Regulations contained in the tariff of which this Schedule is a part and to those prescribed by regulatory authorities.

(N)

PACIFIC POWER
A DIVISION OF PACIFICORP

OREGON
SCHEDULE 30

GENERAL SERVICE
LARGE NONRESIDENTIAL 201 KW to 999 KW
DELIVERY SERVICE

Available

In all territory served by the Company in the State of Oregon.

Applicable

To Large Nonresidential Consumers whose entire electric service requirements are supplied hereunder and whose loads have registered more than 200 kW, more than six times in the preceding 12-month period but have not registered 1,000 kW or more, more than once in the preceding 18-month period and who are not otherwise subject to service on Schedules 47 or 48. Deliveries at more than one point, or more than one voltage and phase classification, will be separately metered and billed. Service for intermittent, partial requirements, or highly fluctuating loads, or where service is seasonally disconnected during any one-year period will be provided only by special contract for such service.

Monthly Billing

The Monthly Billing shall be the sum of the Distribution Charge, Transmission & Ancillary Services Charge, and the System Usage Charge plus the applicable adjustments as specified in Schedule 90. (C)

Distribution Charge	**Delivery Voltage**		
	Secondary	**Primary**	
Basic Charge			
Load Size ≤200 kW, per month	$541.00	$538.00	(I)
Load Size 201 - 300 kW, per month	$161.00	$168.00	
Load Size > 300 kW, per month	$423.00	$437.00	
Load Size Charge			
≤200 kW, per kW Load Size	No Charge	No Charge	
201 – 300 kW, per kW Load Size	$1.90	$1.85	
> 300 kW, per kW Load Size	$0.95	$0.90	
Demand Charge, per kW	$4.64	$4.64	
Reactive Power Charge, per kvar	$0.65	$0.60	
Transmission & Ancillary Services Charge			
Per kW	$2.52	$2.47	
System Usage Charge			
Schedule 200 Related, per kWh	0.082¢	0.081¢	
T&A and Schedule 201 Related, per kWh	0.074¢	0.073¢	(I)

kW Load Size:

For determination of the Basic Charge and the Load Size Charge, the kW load size shall be the average of the two greatest non-zero monthly demands established during the 12-month period which includes and ends with the current billing month.

Minimum Charge

The minimum monthly charge shall be the Basic Charge and the Load Size Charge plus the demand charge. A higher minimum may be required under contract to cover special conditions.

Reactive Power Charge

The maximum 15-minute reactive demand for the month in kilovolt-amperes in excess of 40% of the measured kilowatt demand for the same month.

(continued)

Available

In all territory served by the Company in the State of Oregon.

Applicable

To Consumers desiring service for agricultural irrigation or agricultural soil drainage pumping installations only and whose loads have not registered 1,000 kW or more, more than once in the preceding 18-month period and who are not otherwise subject to service on Schedule 47 or 48. Service furnished under this Schedule will be metered and billed separately at each point of delivery.

Monthly Billing

Except for November, the monthly billing shall be the sum of the Distribution Energy Charge, Reactive Power Charge, Transmission & Ancillary Services Charge, and the System Usage Charge plus the applicable adjustments as specified in Schedule 90. For November, the billing shall be the sum of the Basic Charge, Load Size Charge, Distribution Energy Charge, Reactive Power Charge, Transmission & Ancillary Services Charge, and the System Usage Charge plus the applicable adjustments as specified in Schedule 90. (C) (C)

Distribution Charge	**Delivery Voltage** Secondary	Primary	
Basic Charge (November billing only)			
Load Size ≤ 50 kW, or Single Phase Any Size	No Charge	No Charge	
Three Phase Load Size 51 - 300 kW	$390.00	$380.00	(I)
Three Phase Load Size > 300 kW	$1,530.00	$1,490.00	
Load Size Charge (November billing only)			
Single Phase Any Size, Three Phase ≤ 50 kW, per kW Load Size	$19.00	$18.00	
Three Phase 51 - 300 kW, per kW Load Size	$13.00	$13.00	
Three Phase > 300 kW, per kW Load Size	$8.00	$8.00	
Single Phase, Minimum Charge	$70.00	$70.00	
Three Phase, Minimum Charge	$115.00	$110.00	
Distribution Energy Charge, per kWh	4.464¢	4.338¢	(I)
Reactive Power Charge, per kVar	$0.65	$0.60	
Transmission & Ancillary Services Charge			
Per kWh	0.645¢	0.627¢	(I)
System Usage Charge			
Schedule 200 Related, per kWh	0.074¢	0.072¢	
T&A and Schedule 201 Related, per kWh	0.096¢	0.093¢	(I)

kW Load Size

For determination of the Basic Charge and the Load Size Charge, the kW load size shall be the average of the two greatest non-zero monthly demands established during the 12-month period which includes and ends with the current billing month.

Monthly kW is the measured kW shown by or computed from the readings of the Company's meter, or by appropriate test, for the 15-minute period of the Consumer's greatest takings during the billing month; provided, however, that for motors 10 hp or less, the Monthly kW may, subject to confirmation by test, be determined from the nameplate hp rating and the following table:

(continued)

kW Load Size *(continued)*

If Motor Size Is:	**Monthly kW is:**
2 hp or less	2 kW
Over 2 through 3 hp	3 kW
Over 3 through 5 hp	5 kW
Over 5 through 7.5 hp	7 kW
Over 7.5 through 10 hp	9 kW

In no case shall the Monthly kW be less than the average kW determined as:

$$\text{Average kW} = \frac{\text{kWh for billing month}}{\text{hours in billing month}}$$

Reactive Power Charge

The maximum 15-minute reactive takings for the billing month in kilovolt-amperes in excess of 40% of the Monthly kW.

Metering Adjustment

For a Consumer receiving service at secondary delivery voltage where metering is at primary delivery shall have all billing quantities multiplied by an adjustment factor of 0.9718.

For a Consumer receiving service at primary delivery voltage where metering is at secondary delivery voltage shall have all billing quantities multiplied by an adjustment factor of 1.0290.

Supply Service Options

All Consumers taking Delivery Service under this schedule shall pay the applicable rates in Schedule 200, Base Supply Service. A Small Nonresidential Consumer taking Delivery Service under this schedule shall additionally specify Supply Service Schedule 201, Schedule 210, Schedule 211, Schedule 212, Schedule 213, or Schedule 220, as appropriate and in accordance with the Applicable section of the specified rate schedule. A Large Nonresidential Consumer taking Delivery Service under this Schedule shall additionally specify Supply Service Schedule 201 or Schedule 220, as appropriate and in accordance with the Applicable section of the specified rate schedule. If Consumer elects to receive Supply Service from an ESS, Delivery Service shall be provided under Schedule 741, Direct Access Delivery Service.

Time-of-Use Options

Consumers taking service under this schedule who choose Supply Service Schedule 201 may also choose to participate in one of two time-of-use options, Option A and Option B, which provide time-varying rates during the Summer months of July, August and September. Rates and hours for these options are shown in Schedule 201. (N)

Franchise Fees

Franchise fees related to Schedule 200, Base Supply Service, are collected through the System Usage Charge - Schedule 200 Related rate. Franchise fees related to Transmission & Ancillary Services and franchise fees related to Schedule 201, Net Power Costs, are collected through the System Usage Charge - T&A and Schedule 201 Related rate. Franchise fees related to distribution charges are collected through distribution charges.

(M) 41.3

(continued)

Special Conditions *(continued)*

1) For new or terminating service, the Basic Charge and the Load Size Charge shall be prorated based upon the length of time the account is active during the 12-month period December through November; provided, however, that proration of the Basic Charge and the Load Size Charge will be available on termination only if a full Basic Charge and Load Size Charge was paid for the delivery point for the preceding year. M (41.2)
2) For new service or for reestablishment of service, the Company will require a written contract. M (41.2)
3) In the absence of a Consumer or Applicant willing to contract for service, the Company may remove its facilities.
4) Energy use may be carried forward and be billed in a subsequent billing month; provided, however, that energy will not be carried forward and be charged for at a higher rate than was applicable for the billing months during which the energy was used.
5) A Consumer may not at the same time participate in one of the time-of-use options and Schedule 105 or any other demand response program. (N)

Term of Contract

Not less than three years.

Rules and Regulations

Service under this Schedule is subject to the General Rules and Regulations contained in the tariff of which this Schedule is a part and to those prescribed by regulatory authorities.

Issued February 14, 2020
Etta Lockey, Vice President, Regulation

Effective for service on and after January 1, 2021
Docket No. UE 374

On-Peak Period

The kWh shown by or computed from the readings of the Company's energy meter during on-peak hours. The on-peak period is
Winter: Monday through Friday 6:00 a.m. to 10:00 a.m. and 5:00 p.m. to 8:00 p.m.
Summer: Monday through Friday 4:00 p.m. to 8:00 p.m.

Off-Peak Period (D)

All non On-Peak Period plus the following holidays: New Year's Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day and Christmas Day.

Seasonal Definition

Winter months are defined as November 1 through March 31. Summer months are defined as April 1 through October 31.

Special Conditions

1. At the option of the Consumer, service may be provided under the otherwise applicable General Service Schedule.
2. The Consumer shall not resell electric service received from the Company under provisions of this Schedule to any person, except by permission of the Company or as otherwise expressly provided in Company tariffs. The sale of electricity for fuel to a motor vehicle is expressly allowed as described in Rule 2.E of this tariff.
3. A DC Fast Charger is defined for the purposes of eligibility on this rate schedule as a charging station with a Direct Current (DC) connection that has been designed to recharge the battery of an electric vehicle.
4. An electric vehicle charging site is considered to be broadly available to the general public for the purposes of eligibility on this rate schedule if it is available for use by any driver and is capable of charging more than one make of automobile. Eligibility and acceptance of a customer for service under this rate schedule is subject to review and approval by the Company.
5. Prior to receiving service under this rate schedule, the Consumer must disclose to the Company the number of chargers to be installed at the station, the type and capacity of each charger installed, and the maximum number of vehicles that can simultaneously use the station to recharge batteries.
6. The company reserves the right to terminate service under this schedule if it finds that excessive fees imposed by the charging station owner result in the charging station not being broadly available, per the requirements of this schedule.

PACIFIC POWER
A DIVISION OF PACIFICORP

OREGON
SCHEDULE 47

LARGE GENERAL SERVICE
PARTIAL REQUIREMENTS 1,000 KW AND OVER
DELIVERY SERVICE

Available

In all territory served by the Company in the State of Oregon.

Applicable

To Large Nonresidential Consumers supplying all or some portion of their load by self-generation operating on a regular basis, requiring standby electric service from the Company where the Consumer's self-generation has both a total nameplate rating of 1,000 kW or greater and where standby electric service is required for 1,000 kW or greater. Consumers requiring standby electric service from the Company for less than 1,000 kW shall be served under the applicable general service schedule.

If Consumer elects to receive Supply Service from an ESS, Delivery Service shall be provided under Schedule 747, Direct Access Delivery Service.

Monthly Billing

The Monthly Billing shall be the sum of the Distribution Charge, Reserves Charge, Transmission & Ancillary Services Charge, and System Usage Charge plus the applicable adjustments as specified in Schedule 90. (C)

	Delivery Voltage			
Distribution Charge	**Secondary**	**Primary**	**Transmission**

PACIFIC POWER
A DIVISION OF PACIFICORP

On-Peak Demand

The kW shown by or computed from the readings of the Company's demand meter for the On-Peak 15-minute period of the Consumer's greatest use during the month, determined to the nearest kW. Summer On-Peak hours are from 1 p.m. to 11 p.m. all days in the Summer months of July, August and September. Non-Summer On-Peak hours are from 5 a.m. to 9 a.m. and 4 p.m. to 12 a.m. (midnight) in the Non-Summer months of October through June. All remaining hours are Off-Peak. (C) (C) (C)

(D)

Metering Adjustment

A Consumer receiving service at secondary delivery voltage where metering is at primary delivery shall have all billing quantities multiplied by an adjustment factor of 0.9718.
A Consumer receiving service at primary delivery voltage where metering is at secondary delivery voltage shall have all billing quantities multiplied by an adjustment factor of 1.0290.

Baseline Demand

The kW of Demand supplied by the Company to the Large Nonresidential Consumer when the Consumer’s generator is regularly operating as planned by the Consumer. For new Partial Requirements Consumers, the Consumer’s peak Demand for the most recent 12 months prior to installing the generator, adjusted for planned generator operations, shall be used to calculate the Baseline Demand. Existing Partial Requirements Consumers shall select their Baseline Demand for each contract term based upon the Consumer’s peak demand for the most recent 12 months during the times the generator was operating as planned, adjusted for changes in load and planned generator operations. Planned generator operations includes changes in the electricity produced by the generator as well as the Consumer’s plans to sell any electricity produced by the generator to the Company or third parties. Any modification to the Baseline Demand must be consistent with Special Conditions in this schedule.

Facility Capacity

Facility Capacity shall be the average of the two greatest non-zero monthly Demands established during the 12 month period which includes and ends with the current Billing Month, but shall not be less than the Consumer’s Baseline Demand. For new customers during the first three months of service under this schedule, the Facility Capacity will be equal to the Consumer’s Baseline Demand.

Reserves Charges

The Company provides Reserves for the Consumer’s Facility Capacity. Reserves consist of the following components:

Spinning Reserves

In addition to the Spinning Reserves provided for the Consumer’s Baseline Demand, Spinning Reserves provide Electricity immediately after a Consumer’s demand rises above Baseline Demand.

(continued)

Available

In all territory served by the Company in the State of Oregon.

Applicable

This Schedule is applicable to electric service loads which have registered 1,000 kW or more, more than once in a preceding 18-month period. This Schedule will remain applicable until the Consumer fails to meet or exceed 1,000 kW for a subsequent period of 36 consecutive months. Deliveries at more than one point, or more than one voltage and phase classification, will be separately metered and billed. Service for intermittent, partial requirements, or highly fluctuating loads, or where service is seasonally disconnected during any one-year period will be provided only by special contract for such service.

Partial requirements service for loads of 1,000 kW and over will be provided only by application of the provisions of Schedule 47.

Monthly Billing

The Monthly Billing shall be the sum of the Distribution Charge, Transmission & Ancillary Services Charge, and the System Usage Charge plus the applicable adjustments as specified in Schedule 90. (C)

Distribution Charge	**Delivery Voltage**			
	Secondary	**Primary**	**Transmission**

Facility Capacity

For determination of the Basic Charge and the Facilities Charge, the Facility Capacity shall be the average of the two greatest non-zero monthly demands established during the 12-month period which includes and ends with the current billing month.

Minimum Charge

The minimum monthly charge shall be the Basic Charge and the Facilities Charge. A higher minimum may be required by contract.

Reactive Power Charge

The maximum 15-minute reactive demand for the month in kilovolt-amperes in excess of 40% of the maximum measured kilowatt demand for the same month.

(continued)

On-Peak Demand

The kW shown by or computed from the readings of the Company's demand meter for the On-Peak 15-minute period of the Consumer's greatest use during the month, determined to the nearest kW. Summer On-Peak hours are from 1 p.m. to 11 p.m. all days in the Summer months of July, August and September. Non-Summer On-Peak hours are from 5 a.m. to 9 a.m. and 4 p.m. to 12 a.m. (midnight) in the Non-Summer months of October through June. All remaining hours are Off-Peak. (C) (C)

(D)

Metering Adjustment

For a Consumer receiving service at secondary delivery voltage where metering is at primary delivery shall have all billing quantities multiplied by an adjustment factor of 0.9718.

For a Consumer receiving service at primary delivery voltage where metering is at secondary delivery voltage shall have all billing quantities multiplied by an adjustment factor of 1.0290.

Supply Service Options

All Consumers taking Delivery Service under this Schedule shall pay the applicable rates in Schedule 200, Base Supply Service. Additionally, each Consumer shall specify Supply Service Schedule 201 or Schedule 220, as appropriate and in accordance with the Applicable section of the specified rate schedule. If Consumer elects to receive Supply Service from an ESS, Delivery Service shall be provided under Schedule 748, Direct Access Delivery Service.

Franchise Fees

Franchise fees related to Schedule 200, Base Supply Service, are collected through the System Usage Charge - Schedule 200 Related rate. Franchise fees related to Transmission & Ancillary Services and franchise fees related to Schedule 201, Net Power Costs, are collected through the System Usage Charge - T&A and Schedule 201 Related rate. Franchise fees related to distribution charges are collected through distribution charges.

Special Conditions

The Consumer shall not resell electric service received from the Company under provisions of this Schedule to any person, except by permission of the Company or as otherwise expressly provided in Company tariffs.

Term of Contract

The Company may require the Consumer to sign a written contract which shall have a term of not less than one year.

Rules and Regulations

Service under this Schedule is subject to the General Rules and Regulations contained in the tariff of which this Schedule is a part and to those prescribed by regulatory authorities.

PACIFIC POWER
A DIVISION OF PACIFICORP

OREGON
SCHEDULE 50

MERCURY VAPOR STREET LIGHTING SERVICE
NO NEW SERVICE
DELIVERY SERVICE

Available

In all territory served by the Company (except Multnomah County) in the State of Oregon.

Applicable

To service furnished from dusk to dawn for the lighting of public streets, highways, alleys and parks by means of presently-installed mercury vapor lights. Street lights will be served by either series or multiple circuits as the Company may determine. The type and kind of fixtures and supports will be in accordance with the Company's specifications. Service includes installation, maintenance, energy, lamp and glassware renewals.

Monthly Billing

The Monthly Billing shall be the Rate Per Luminaire plus the applicable rate in Schedule 80 and applicable adjustments as specified in Schedule 90.

A. Company-owned Overhead System

Street lights supported on distribution type wood poles: Mercury Vapor Lamps.

Nominal Lumen Rating	**7,000** (Monthly 76 kWh)	**21,000** (Monthly 172 kWh)	**55,000** (Monthly 412 kWh)
Horizontal, per lamp	$5.74	$9.99	$19.43
Vertical, per lamp	$5.28	$9.18	

Street lights supported on distribution type metal poles: Mercury Vapor Lamps.

Nominal Lumen Rating	**7,000** (Monthly 76 kWh)	**21,000** (Monthly 172 kWh)	**55,000** (Monthly 412 kWh)
On 26-foot poles, horizontal, per lamp	$7.84		
On 26-foot poles, vertical, per lamp	$7.32		
On 30-foot poles, horizontal , per lamp		$12.46	
On 30-foot poles, vertical, per lamp		$11.66	
On 33-foot poles, horizontal , per lamp			$21.87

B. Company-owned Underground System

Nominal Lumen Rating	**7,000** (Monthly 76 kWh)	**21,000** (Monthly 172 kWh)	**55,000** (Monthly 412 kWh)
On 26-foot poles, horizontal, per lamp	$7.84		
On 26-foot poles, vertical, per lamp	$7.32		
On 30-foot poles, horizontal , per lamp		$11.95	
On 30-foot poles, vertical, per lamp		$11.19	
On 33-foot poles, horizontal , per lamp			$21.35
plus rate per foot of underground cable:			
In paved area	$0.05	$0.05	$0.05
in unpaved area	$0.03	$0.03	$0.03

(continued)

PACIFIC POWER
A DIVISION OF PACIFICORP

Special Provisions

1. Installation, daily operation, repair and maintenance of lights on this rate schedule will be performed by the Company, providing that the facilities furnished remain readily accessible for maintenance purposes.
2. Inoperable lights will be repaired as soon as reasonably possible, during regular business hours or as allowed by Company's operating schedule and requirements, provided the Company receives notification of inoperable lights from Consumer or a member of the public by either notifying Pacific Power's customer service (1-888-221-7070) or www.pacificpower.net/streetlights. Pacific Power's obligation to repair street lights is limited to this tariff.
3. Existing fixtures and facilities that are deemed irreparable will be replaced with comparable high pressure sodium vapor fixtures and facilities from the Company's Construction Standards.
4. The Company will, upon written request of Consumer, convert existing streetlighting facilities to other types of Company approved facilities. In such event, should the revenue increase, the streetlighting extension allowance defined in Rule 13 Section III.F is applicable only to the increase in annual revenue due to the replacement. If there is no increase in revenue there is no allowance, The Consumer shall advance the estimated cost of all materials and labor associated with installation and removal, less the estimated salvage on the removed facilities, in excess of the applicable allowance.
5. Temporary disconnection and subsequent reconnection of electrical service requested by the Consumer shall be at the Consumer's expense. The Consumer may request temporary suspension of power by written notice. During such periods, the monthly rate will be reduced by the company's estimated average energy costs for the luminaire. The facilities may be considered idle and may be removed after 12 months of inactivity.
6. Pole re-painting, when requested by the Consumer and not required for safety reasons, shall be done at Consumer's expense using the original pole color.
7. Glare and vandalism shielding, when requested by the Consumer, shall be installed at the Consumer's expense. In cases of repetitive vandalism, the Company may notify the Consumer of the need to install vandal shields at the Consumer's expense, or otherwise have the lighting removed.

Supply Service Option

All Consumers shall pay the applicable rates in Schedule 200, Base Supply Service. Supply Service shall be provided by Supply Service Schedule 201.

Franchise Fees

Franchise fees related to Schedule 200, Base Supply Service, Transmission & Ancillary Services, Schedule 201, Net Power Costs, and distribution charges are collected through rates in this schedule.

Termination of Service

The Consumer can request removal of lights with a minimum of 2 months written notice. The Consumer will be charged with the costs of removal.

Rules and Regulations

Service under this Schedule is subject to the General Rules and Regulations contained in the tariff of which this Schedule is a part and to those prescribed by regulatory authorities.

Available

In all territory served by the Company in the State of Oregon.

Applicable

To unmetered lighting service provided to municipalities or agencies of municipal, county, state or federal governments for dusk to dawn illumination of public streets, highways and thoroughfares by means of Company owned, operated and maintained street lighting systems controlled by a photoelectric control or time switch.

Monthly Billing

The Monthly Billing shall be the rate per luminaire as specified in the rate tables below plus the applicable adjustments as specified in Schedule 90. (C)

Type of Lamp	Level 1	Level 2	Level 3	Level 4	Level 5	Level 6
LED Equivalent Lumens	0-3,500	3,501-5,500	5,501-8,000	8,001-12,000	12,001-15,500	15,501+
Monthly kWh	8	15	25	34	44	57
Functional Lighting	$ 7.14	$ 7.59	$ 7.76	$ 7.90	$ 8.43	$ 10.29
Functional Lighting - Customer Funded Conversion	$ 3.76	$ 3.99	$ 4.14	$ 4.25	$ 4.57	$ 5.60
Decorative Series	N/A	$ 13.28	$ 13.43	N/A	N/A	N/A

(C)
(C)
(D)
(N)

Functional Lighting: Common less expensive luminaires that may be mounted either on wood, fiberglass or non-decorative metal poles. The Company will maintain a list of functional light fixtures that are available.

Customer-Funded Conversion: Street lights that have been converted to LED from another lighting type and whose conversion was funded by the Customer.

Decorative Series Lighting: More stylish luminaires mounted vertically on decorative metal poles. The Company will maintain a listing of standard decorative street light fixtures that are available under this Schedule.

(N)

Supply Service Options

All Consumers taking Delivery Service under this schedule shall pay the applicable rates in Schedule 200, Base Supply Service. Additionally, each Consumer shall specify Supply Service Schedule 201 or Schedule 220, as appropriate and in accordance with the Applicable section of the specified rate schedule. If Consumer elects to receive Supply Service from an ESS, Delivery Service shall be provided under Schedule 751, Direct Access Delivery Service.

Franchise Fees

Franchise fees related to Schedule 200, Base Supply Service, Transmission & Ancillary Services, Schedule 201, Net Power Costs, and distribution charges are collected through rates in this schedule.

(continued)

PACIFIC POWER
A DIVISION OF PACIFICORP

OREGON
SCHEDULE 52

STREET LIGHTING SERVICE COMPANY-OWNED SYSTEM
NO NEW SERVICE
DELIVERY SERVICE

Available

In all territory served by the Company (except Multnomah County) in the State of Oregon.

Applicable

To service furnished by means of the Company-owned installations, for the lighting of public streets, highways, alleys and parks under conditions and for street lights of sizes and types not specified on other schedules of this Tariff. The Company may not be required to furnish service hereunder to other than municipal Consumers. This schedule is closed to new service beginning November 8, 2006.

Monthly Billing

The Monthly Billing shall be the Rate Per kWh below plus the applicable rate in Schedule 80 and applicable adjustments as specified in Schedule 90.

A flat rate equal to one-twelfth of the Company's estimated annual cost for operation, maintenance, fixed charges and depreciation applicable to the street lighting system, including Distribution Charge as follows:

For dusk to dawn operation, per kWh	1.672¢
For dusk to midnight operation, per kWh	1.970¢

Supply Service Options

All Consumers taking Delivery Service under this schedule shall pay the applicable rates in Schedule 200, Base Supply Service. Additionally, each Consumer shall specify Supply Service Schedule 201 or Schedule 220, as appropriate and in accordance with the Applicable section of the specified rate schedule. If Consumer elects to receive Supply Service from an ESS, Delivery Service shall be provided under Schedule 752, Direct Access Delivery Service.

Franchise Fees

Franchise fees related to Schedule 200, Base Supply Service, Transmission & Ancillary Services, Schedule 201, Net Power Costs, and distribution charges are collected through rates in this schedule.

Term of Contract

Not less than five years for service to an overhead, or ten years to an underground, Company-owned system by written contract when unusual conditions prevail.

Provisions

1. Installation, daily operation, repair and maintenance of lights on this rate schedule will be performed by the Company, providing that the facilities furnished remain readily accessible for maintenance purposes.
2. Inoperable lights will be repaired as soon as reasonably possible, during regular business hours or as allowed by Company's operating schedule and requirements, provided the Company receives notification of inoperable lights from Consumer or a member of the public by either notifying Pacific Power's customer service (1-888-221-7070) or www.pacificpower.net/streetlights. Pacific Power's obligation to repair street lights is limited to this tariff.
3. Existing fixtures and facilities that are deemed irreparable will be replaced with comparable high pressure sodium vapor fixtures and facilities from the Company's Construction Standards.

(continued)

Provisions (continued)

4. The Company will, upon written request of Consumer, convert existing streetlighting facilities to other types of Company approved facilities. In such event, should the revenue increase, the streetlighting extension allowance defined in Rule 13 Section III.F is applicable only to the increase in annual revenue due to the replacement. If there is no increase in revenue, there is no allowance, The Consumer shall advance the estimated cost of all materials and labor associated with installation and removal, less the estimated salvage on the removed facilities, in excess of the applicable allowance.
5. Temporary disconnection and subsequent reconnection of electrical service requested by the Consumer shall be at the Consumer's expense. The Consumer may request temporary suspension of power by written notice. During such periods, the monthly rate will be reduced by the company's estimated average energy costs for the luminaire. The facilities may be considered idle and may be removed after 12 months of inactivity. The Company will not be required to re-establish such service under this rate schedule if service has been permanently discontinued by the Consumer.
6. Pole re-painting, when requested by the Consumer and not required for safety reasons, shall be done at Consumer's expense using the original pole color.
7. Glare and vandalism shielding, when requested by the Consumer, shall be installed at the Consumer's expense. In cases of repetitive vandalism, the Company may notify the Consumer of the need to install vandal shields at the Consumer's expense, or otherwise have the lighting removed.

Termination of Service

The Consumer can request removal of lights with minimum of 2 month's written notice. The Consumer will be charged with the costs of removal.

Rules and Regulations

Service under this Schedule is subject to the General Rules and Regulations contained in the tariff of which this Schedule is a part and to those prescribed by regulatory authorities.

PACIFIC POWER
A DIVISION OF PACIFICORP

STREET LIGHTING SERVICE CONSUMER-OWNED SYSTEM
DELIVERY SERVICE

Available

In all territory served by the Company in the State of Oregon.

Applicable

To lighting service provided to municipalities or agencies of municipal, county, state or federal governments for dusk to dawn illumination of public streets, highways and thoroughfares by means of Consumer owned street lighting systems controlled by a photoelectric control or time switch.

Monthly Billing

Energy Only Service - Rate per Luminaire

Energy Only Service includes energy supplied from Company's overhead or underground circuits and does not include any maintenance to Consumer's facilities. Maintenance service will be provided only as indicated in the Maintenance Service section below.

The Monthly Billing shall be the rate per luminaire specified in the rate tables below plus the applicable adjustments as specified in Schedule 90. (C)

High Pressure Sodium Vapor						
Lumen Rating	5,800	9,500	16,000	22,000	27,500	50,000
Watts	70	100	150	200	250	400
Monthly kWh	31	44	64	85	115	176
Energy Only Service	$ 1.46	$ 2.08	$ 3.02	$ 4.01	$ 5.43	$ 8.31

(I)

Metal Halide					
Lumen Rating	9,000	12,000	19,500	32,000	107,800
Watts	100	175	250	400	1,000
Monthly kWh	39	68	94	149	354
Energy Only Service	$ 1.84	$ 3.21	$ 4.44	$ 7.04	$ 16.72

(I)

For non-listed luminaires the cost will be calculated for 4167 annual hours of operation including applicable loss factors for ballasts and starting aids at the cost per kWh given below.

Non-Listed Luminaire	¢/kWh
Energy Only Service	4.722

(I)

Maintenance Service (No New Service)

Where the utility operates and maintains the system, a flat rate equal to one-twelfth the estimated annual cost for operation and maintenance will be added to the Energy Only Service rates listed above. Monthly Maintenance is only applicable for existing monthly maintenance service agreements in effect prior to May 24, 2006.

(continued)

Available

In all territory served by the Company in the State of Oregon.

Applicable

To schools, governmental agencies and nonprofit organizations for service supplied through one meter at one point of delivery and used exclusively for annually recurring seasonal lighting of outdoor athletic or recreational fields. This Schedule is not applicable to any enterprise which is operated for profit. Service for purposes other than recreational field lighting may not be combined with such field lighting for billing purposes under this Schedule. At the Consumer's option, service for recreational field lighting may be taken under the Company's applicable General Service Schedule.

Monthly Billing

The Monthly Billing shall be the sum of the Distribution Charge, Transmission & Ancillary Services Charge, and the System Usage Charge plus the applicable adjustments as specified in Schedule 90. (C)

Distribution Charge

Basic Charge, Single Phase, per month	$ 6.00	
Basic Charge, Three Phase, per month	$ 9.00	
Distribution Energy Charge, per kWh	5.287¢	(I)

Transmission & Ancillary Services Charge

per kWh	0.039¢	(R)

System Usage Charge

Schedule 200 Related, per kWh	0.020¢	(R)
T&A and Schedule 201 Related, per kWh	0.015¢	(R)

Minimum Charge

The minimum monthly charge shall be the Basic Charge.

Supply Service Options

All Consumers taking Delivery Service under this schedule shall pay the applicable rates in Schedule 200, Base Supply Service. Additionally, each Consumer shall specify Supply Service Schedule 201 or Schedule 220, as appropriate and in accordance with the Applicable section of the specified rate schedule. If Consumer elects to receive Supply Service from an ESS, Delivery Service shall be provided under Schedule 754, Direct Access Delivery Service.

Franchise Fees

Franchise fees related to Schedule 200, Base Supply Service, are collected through the System Usage Charge - Schedule 200 Related rate. Franchise fees related to Transmission & Ancillary Services and franchise fees related to Schedule 201, Net Power Costs, are collected through the System Usage Charge - T&A and Schedule 201 Related rate. Franchise fees related to distribution charges are collected through distribution charges.

Special Conditions

The Consumer shall own all poles, wire and other distribution facilities beyond the Company's point of delivery.

Continuing Service

This Schedule is based on continuing service at each service location. Disconnect and reconnect transactions shall not operate to relieve a Consumer from monthly minimum charges.

(continued)

Purpose

To provide Consumers served on Schedule 47 with the opportunity of purchasing Energy from the Company to replace some or all of the Consumer's on-site generation when the Consumer deems it is more economically beneficial than self generating.

Available

In all territory served by the Company in Oregon. The Company may limit service to a Consumer if system reliability would be affected. The Company has no obligation to provide the Consumer with economic replacement power except as explicitly agreed to between Company and Consumer.

Applicable

To Large Nonresidential Consumers receiving Delivery Service under Schedule 47.

Character of Service

Sixty-hertz alternating current of such phase and voltage as the Company may have available.

Monthly Billing

The following charges are in addition to applicable charges under Schedule 47 plus the applicable adjustments as specified in Schedule 90: (D)

	Delivery Voltage			
	Secondary	**Primary**	**Transmission**	
Transmission & Ancillary Services Charge				
Per kW of Daily Economic Replacement Power (ERP) On-Peak Demand per day	$0.086	$0.093	$0.124	(I) (I) (I)
Daily ERP Demand Charge				
Per kW of Daily ERP On-Peak Demand	$0.182	$0.188	$0.136	(I) (I) (D)

Supply Service

A Consumer taking Delivery Service under this Schedule shall be served under the terms of Supply Service Schedule 276R.

ERP and ENF

Economic Replacement Power (ERP) is Electricity supplied by the Company to meet an Energy Needs Forecast (ENF) pursuant to an Economic Replacement Power Agreement (ERPA). ERP, ENF and ERPA are more fully described in Schedule 276R.

Daily ERP On-Peak Demand

Daily ERP On-Peak Demand shall not be less than the maximum ERP On-Peak Demand scheduled per day and shall not be greater than the difference between the Facility Capacity and the Baseline Demand. Daily ERP On-Peak Demand will be billed for each day in the month that the Company supplies ERP to the Consumer.

(continued)

PACIFIC POWER
A DIVISION OF PACIFICORP

GENERATION INVESTMENT ADJUSTMENT

Purpose

This schedule reflects an adjustment associated with the Lake Side 2 generation investment and interconnection, consistent with Order No. 13-474.

Applicable

To all Residential Consumers and Nonresidential Consumers.

Monthly Billing

All bills calculated in accordance with Schedules contained in presently effective Tariff Or. No.36 shall have applied an amount equal to the product of all kWh, and/or, as appropriate, kW, multiplied by the following applicable rate as listed by Delivery Service schedule.

Delivery Service Schedule	Secondary	Primary	Transmission
Schedule 4, per kWh	0.170¢		
Schedule 5, per kWh	0.170¢		
Schedule 15, per kWh	0.120¢		
Schedule 23, 723, per kWh	0.168¢	0.163¢	
Schedule 28, 728, per kWh	0.058¢	0.055¢	
Schedule 28, 728, per kW	$0.34	$0.29	
Schedule 30, 730, per kWh	0.055¢	0.054¢	
Schedule 30, 730, per kW	$0.40	$0.37	
Schedule 41, 741, per kWh	0.166¢	0.161¢	
Schedule 47, 747, per kWh	0.054¢	0.053¢	0.048¢
Schedule 47, 747, per On-Peak kW	$0.41	$0.45	$0.62
Schedule 48, 748, per kWh	0.054¢	0.053¢	0.048¢
Schedule 48, 748, per On-Peak kW	$0.41	$0.45	$0.62
Schedule 50, per kWh	0.120¢		
Schedule 51, 751, per kWh	0.120¢		
Schedule 52, 752, per kWh	0.120¢		
Schedule 53, 753, per kWh	0.120¢		
Schedule 54, 754, per kWh	0.120¢		

Rates "per kWh" shall apply to all kilowatt-hours of use per month.
Rates "per kW" and "per On-Peak kW" shall be charged based on measured monthly Demand and On-Peak Demand, respectively, as defined in each respective Delivery Service schedule.

CANCELLED

*Not applicable to all consumers. See Schedule for details.

Purpose

The purpose of this Schedule is to collect funds for electric low-income bill payment assistance as specified in ORS 757.612 Section (7)(b).

Applicable

To all bills for electric service calculated under all tariffs and contracts.

Adjustment Rates

The applicable Adjustment Rates are listed below. Retail electricity Consumers shall not be required to pay more than $500 per month per site for low-income electric bill payment assistance.

Schedule	Adjustment Rate	
Residential Rate Schedules (4, 5, 6)	69 cents per month	(C)
Nonresidential Rate Schedules	0.069 cents per kWh for the first 724,638 kWh	(C)

Definition of Site (Order No. 01-073 entered January 3, 2001)

"Site" means:

(a) Buildings and related structures that are interconnected by facilities owned by a single retail electricity consumer and that are served through a single electric meter; or

(b) A single contiguous area of land containing buildings or other structures that are separated by not more than 1,000 feet, such that:

i. Each building or structure included in the site is no more than 1,000 feet from at least one other building or structure in the site;

ii. Buildings and structures in the site, and land containing and connecting buildings and structures in the site, are owned by a single retail electricity consumer who is billed for electricity use at the buildings and structures; and

iii. Land shall be considered to be contiguous even if there is an intervening public or railroad right of way, provided that rights of way land, on which municipal infrastructure facilities exist (such as street lighting, sewerage transmission, and roadway controls), shall not be considered contiguous.

(continued)

PACIFIC POWER
A DIVISION OF PACIFICORP

OREGON
SCHEDULE 98

ADJUSTMENT ASSOCIATED WITH THE PACIFIC NORTHWEST ELECTRIC POWER PLANNING AND CONSERVATION ACT

All bills of qualifying residential customers on Schedule 4 and Schedule 5 shall have deducted an amount equal to the product of kilowatt-hours of use multiplied by the following cents per kilowatt-hour:

0-1000 kWh	0.934¢ per kWh
> 1000 kWh	0.000¢ per kWh

For Schedules 4 and 5, the kilowatt-hour blocks listed above are based on an average month of approximately 30.42 days. Residential kilowatt-hour blocks shall be prorated to the nearest whole kilowatt-hour based upon the number of whole days in the billing period (See Rule 10 for details).

All bills to qualifying nonresidential customers, and residential customers on Schedule 6, shall have deducted an amount equal to the product of all kilowatt-hours of use multiplied by the following cents per kilowatt-hour: (C)

0.691¢ per kWh

Condition of Service

The eligibility of affected Customers for the rate credit specified in this tariff is as provided by the Pacific Northwest electric Power Planning and Conservation Act, Public Law 96-501.

Eligible Customers with usage at or above 100,000 kWh per year must complete and submit to the Company a certificate verifying eligibility in order to receive the rate credit. Certificate forms are available on the Company's website at www.pacificpower.net under Oregon Regulatory Information. Consistent with the requirements of the Bonneville Power Administration, a federal agency, customers using electricity to aid in growing one or more Cannabis plants are not eligible for the rate credit specified in this tariff. If, in the course of doing business, a utility discovers that one of its existing customers is not eligible for the rate credit specified in this tariff, the customer will no longer receive the credit.

Special Conditions

In no instance shall a farm's total qualifying irrigation load for any billing period exceed 222,000 kWh. Under the Northwest Power Act, any farm may receive REP benefits for up to a maximum of 400 horsepower (HP)/month (222,000 kWh/month) of qualified irrigation/pumping load (the "REP Benefits Qualified Irrigation/Pumping Load Cap" or "Irrigation/Pumping Load Cap").

Purpose

Service under this schedule is intended to maximize the efficient utilization of the electricity requirements of new and existing loads in Commercial and Industrial Facilities by promoting energy efficient design and the installation of Energy Efficiency Measures. No New Service after February 28, 2002.

Applicable

To service under the Company's General Service Schedules 23, 28, 30, 41, 47 and 48 in all territory served by the Company in the State of Oregon. This Schedule is not applicable to existing Commercial Buildings under 20,000 square feet. Square footage is the total Building or Facility area served by the Company's meter(s).

Customers using more than "one average megawatt" (8,760,000 kilowatt-hours of electricity per year) at a site may be required to sign a Company reimbursement agreement prior to receiving services or payments under this Schedule.

Description

Service under this program is available to improve the energy efficiency of eligible Commercial Buildings and Industrial Facilities connected to Company's system. The Company may provide Energy Efficiency Incentives which result in the installation of Energy Efficiency Measures, and also may provide for energy analyses inspections, savings verification and evaluation studies related to such Measures.

Definitions

Annual kWh Savings: The annual kilowatt-hour (kWh) savings resulting from installation of the Energy Efficiency Measures, as estimated by Company using engineering analysis.

Average Monthly On Peak kW Savings: The Average Monthly On Peak kilowatt (kW) savings resulting from the installation of Energy Efficiency Measures as estimated by Company using engineering analysis as described below:

Average Monthly On Peak kW Savings = (baseline average monthly On Peak kW - proposed average monthly On Peak kW), where;

⇒ Average monthly On Peak kW = sum of the 12 Monthly Maximum On Peak kW/12, where;
⇒ Monthly Maximum On Peak kW = highest of all 15 minute average kW (as determined below) for On Peak hours (6AM to 10PM, Monday through Saturday during the month), where;
⇒ 15 minute average kW = sum of kWh used over 0.25 hrs/0.25 hrs

Available

In all territory served by the Company in the State of Oregon.

Applicable

To Residential Consumers and Nonresidential Consumers who have elected to take Cost-Based Supply Service under this schedule or under Schedules 210, 211, 212, 213 or 247. This service may be taken only in conjunction with the applicable Delivery Service Schedule. Also applicable to Nonresidential Consumers who, based on the announcement date defined in OAR 860-038-275, do not elect to receive standard offer service under Schedule 220 or direct access service under the applicable tariff. In addition, applicable to some Large Nonresidential Consumers on Schedule 400 whose special contracts require prices under the Company's previously applicable Schedule 48T. For Consumers on Schedule 400 who were served on previously applicable Schedule 48T prices under their special contract, this service, in conjunction with Delivery Service Schedule 48, supersedes previous Schedule 48T.

Nonresidential Consumers who had chosen either service under Schedule 220 or who chose to receive direct access service under the applicable tariff may qualify to return to Cost-Based Supply Service under this Schedule after meeting the Returning Service Requirements and making a Returning Service Payment as specified in this Schedule.

Monthly Billing

The Monthly Billing shall be the Energy Charge, as specified below by Delivery Service Schedule.

Delivery Service Schedule No.			**Delivery Voltage**		
			Secondary	**Primary**	**Transmission**
4	Per kWh	0-1000 kWh	2.444¢		
		> 1000 kWh	3.340¢		
5	Per kWh	0-1000 kWh	2.444¢		
		> 1000 kWh	3.340¢		

For Schedules 4 and 5, the kilowatt-hour blocks listed above are based on an average month of approximately 30.42 days. Residential kilowatt-hour blocks shall be prorated to the nearest whole kilowatt-hour based upon the number of whole days in the billing period (see Rule 10 for details). (N)

6	Per kWh	All kWh	2.663¢		
	plus	per On-Peak kWh	7.050¢		
	plus	per Off-Peak kWh (credit)	-4.234¢		

For Schedule 6, Summer On-Peak hours are from 3 p.m. to 9 p.m. all days in the Summer months of July, August and September. Non-Summer On-Peak hours are from 6 a.m. to 8 a.m. and 5 p.m. to 11 p.m. in the Non-Summer months of October through June. Off-Peak hours are all remaining hours (N)

23	First 3,000 kWh, per kWh	2.708¢	2.623¢	
	All additional kWh, per kWh	2.007¢	1.946¢	
28	First 20,000 kWh, per kWh	2.649¢	2.549¢	
	All additional kWh, per kWh	2.574¢	2.481¢

OREGON
SCHEDULE 202

RENEWABLE ADJUSTMENT CLAUSE
SUPPLY SERVICE ADJUSTMENT

Purpose

This schedule recovers, between rate cases, the costs to construct or otherwise acquire facilities that generate electricity from renewable energy sources and for associated electricity transmission.

This adjustment is to recover the actual and forecasted revenue requirement associated with the prudently incurred costs of resources, including associated transmission, that are eligible under Senate Bill 838 (2007) and in service as of the date of the proposed rate change. The revenue requirement includes the actual return of and grossed up return on capital costs of the renewable energy source and associated transmission at the currently authorized rate of return, forecasted operation and maintenance costs, forecasted property taxes, forecasted energy tax credits, and other forecasted costs not captured in the Transition Adjustment Mechanism (TAM). The revenue requirement for Oregon will be calculated using the forecasted inter-jurisdictional allocation factors based on the same 12-month period used in the TAM.

Applicable

To all Residential consumers and Nonresidential consumers except consumers who began service under the five-year cost of service opt-out program described in Schedule 296 before January 1, 2019.

Energy Charge

The adjustment rate is listed below by Delivery Service Schedule.

Schedule	Charge	
4	0.075 cents per kWh	
5	0.075 cents per kWh	
15	0.124 cents per kWh	
23, 723	0.142 cents per kWh	
28, 728	0.152 cents per kWh	
30, 730	0.149 cents per kWh	
41, 741	0.154 cents per kWh	
47, 747	0.140 cents per kWh	
48, 748	0.140 cents per kWh	
51, 751	0.152 cents per kWh	(D)
53, 753	0.070 cents per kWh	
54, 754	0.099 cents per kWh	(D)

OREGON
SCHEDULE 205

TAM ADJUSTMENT FOR OTHER REVENUES

Purpose

This schedule adjusts rates for Other Revenues as authorized by Order No. 10-363.

Applicable

To all Residential Consumers and Nonresidential Consumers.

Energy Charge

The adjustment rate is listed below by Delivery Service Schedule and Direct Access Delivery Service Schedule.

Delivery Service Schedule No.			Delivery Voltage Secondary	Primary	Transmission	
4	Per kWh	0-1000 kWh	0.000¢			(R)
		> 1000 kWh	0. 000¢			
5	Per kWh	0-1000 kWh	0. 000¢			
		> 1000 kWh	0. 000¢			

For Schedules 4 and 5, the kilowatt-hour blocks listed above are based on an average month of approximately 30.42 days. Residential kilowatt-hour blocks shall be prorated to the nearest whole kilowatt-hour based upon the number of whole days in the billing period (see Rule 10 for details).

Delivery Service Schedule No.		Secondary	Primary	Transmission
23, 723	First 3,000 kWh, per kWh	0. 000¢	0. 000¢	
	All additional kWh, per kWh	0. 000¢	0. 000¢

SCHEDULE 206

POWER COST ADJUSTMENT MECHANISM - ADJUSTMENT

Purpose

This schedule implements the Company's annual Power Cost Adjustment Mechanism adjustment consistent with Order No. 12-493.

Applicable

To all Residential Consumers and Nonresidential Consumers except Nonresidential Consumers who took service under Standard Offer Supply Service Schedule 220 or who were served under a Direct Access Delivery Service Schedule during the accrual period of this Power Cost Adjustment Mechanism adjustment.

Monthly Billing

The adjustment shall be calculated as an amount equal to the product of all kWh multiplied by the following applicable rate as listed by Delivery Service Schedule.

Delivery Service Schedule	Secondary	Primary	Transmission	
Schedule 4, per kWh	0.000¢			
Schedule 15, per kWh	0.000¢			
Schedule 23, 723, per kWh	0.000¢	0.000¢		
Schedule 28, 728, per kWh	0.000¢	0.000¢		
Schedule 30, 730, per kWh	0.000¢	0.000¢

Schedule 53, 753, per kWh	0.000¢			(D)
Schedule 54, 754, per kWh	0.000¢			

PACIFIC POWER
A DIVISION OF PACIFICORP

Purpose

This schedule recovers costs incurred for the start-up of the State of Oregon's Community Solar Program including the costs associated with the State of Oregon's Program Administrator, Low Income Facilitator and the Company's prudently incurred costs associated with implementing the program that are not otherwise recovered in rates. The recovery of these costs is authorized by ORS 757.386 (7)(c) and OAR 860-088-0160. This adjustment schedule is implemented as an automatic adjustment clause as provided under ORS 757.210 to allow recovery of operations and maintenance start-up costs as soon as the cost data is approved by the Commission.

Monthly Billing

All bills calculated in accordance with Schedules contained in presently effective Tariff Or. No.36 will have applied an amount equal to the product of all kWh multiplied by the following applicable rate as listed by Delivery Service schedule.

Delivery Service Schedule	
Schedule 4, per kWh	0.004¢
Schedule 5, per kWh	0.004¢
Schedule 15, per kWh	0.003¢
Schedule 23, 723, per kWh	0.003¢
Schedule 28, 728, per kWh	0.003¢
Schedule 30, 730, per kWh	0.003¢
Schedule 41, 741, per kWh	0.003¢
Schedule 47, 747, per kWh	0.003¢
Schedule 48, 748, per kWh	0.003¢
Schedule 51, 751, per kWh	0.003¢
Schedule 53, 753, per kWh	0.001¢
Schedule 54, 754, per kWh	0.002¢

Remittance of Funds

In accordance with Order No. 19-122 the Company will remit monthly payments for start-up services to the State of Oregon's Program Administrator and Low Income Facilitator within 15 days of notice from the Commission of the required remittance amount(s).

PACIFIC POWER
A DIVISION OF PACIFICORP

PORTFOLIO TIME-OF-USE SUPPLY SERVICE

Available

In all territory served by the Company in the State of Oregon.

Applicable

To Residential and Small Nonresidential Consumers receiving Delivery Service under Schedules 4, 5, 23 or 41, in conjunction with Supply Service Schedule 201, who have elected to take this service.

Monthly Billing

The Monthly Billing shall be the sum of the Portfolio Service Charge and the Energy Charge. The Monthly Billing is in addition to all other charges contained in Consumer's applicable Delivery Service schedule, Base Supply Service Schedule 200 and Supply Service Schedule 201.

Portfolio Service Charge

$1.50 per month

Energy Charge

Delivery Service Schedule No.		Season Winter	Season Summer
4	On-Peak kWh, per kWh	3.316 ¢	6.124 ¢
	Off-Peak kWh, per kWh	(1.125)¢	(1.125)¢
5	On-Peak kWh, per kWh	3.316 ¢	6.124 ¢
	Off-Peak kWh, per kWh	(1.125)¢	(1.125)¢
23	On-Peak kWh, per kWh	4.365 ¢	9.350 ¢
	Off-Peak kWh, per kWh	(1.438)¢	(1.438)¢
41	On-Peak kWh, per kWh	3.737 ¢	8.004 ¢
	Off-Peak kWh, per kWh	(1.231)¢	(1.231)¢

Seasonal Definition

Winter months are defined as November 1 through March 31. Summer months are defined as April 1 through October 31.

Minimum Charge

The minimum monthly charge will be the Portfolio Service Charge.

On-Peak Period

Winter
Monday through Friday 6:00 a.m. to 10:00 a.m. and 5:00 p.m. to 8:00 p.m.
Summer
Monday through Friday 4:00 p.m. to 8:00 p.m.

(D)

(continued)

(D)

Off-Peak Period

All non On-Peak Period plus the following holidays: New Year's Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day and Christmas Day.

Guarantee Payment

The Company shall guarantee against increase of consumer costs for the first 12 months of enrollment in the program. If the total annual energy costs incurred on this Schedule exceed 10% over what costs would have been for the same period under Cost-Based Supply Service, the net difference, Guarantee Payment, will be credited on the customer’s bill following the last month of the one-year commitment. The Portfolio Service Charge shall not be included in the calculation of the Guarantee Payment and shall not be credited. No Guarantee Payment shall be given if Consumer terminates service before the end of the initial one-year period.

Special Conditions

1. The Consumer shall not resell electric service received from the Company under provisions of this Schedule to any person, except by written permission of the Company or as otherwise expressly provided in Company tariffs and where the Consumer meters and bills any of its tenants at the Company's regular tariff rate for the type of service which such tenant may actually receive.

2. The Company will recover any lost revenues and Guarantee Payment amounts incurred under the Portfolio Option through adjustments to Schedule 291 or Schedule 292.

3. Consumers on this tariff schedule shall have a term of not less than one year. Service will continue under this schedule until Consumer notifies the Company to discontinue service.

4. The Consumer must have a time-of-use meter installed to participate in this option. The Company anticipates that a delay may occur from the time a Consumer requests service under this option until the Company can provide the meter installation. In the interim, Consumers will receive service under the applicable Delivery Service schedule on Supply Service Schedule 201.

5. Billing under this schedule shall begin for the Consumer following installation of the time-of-use meter and the initial meter reading.

6. The Company will not accept enrollment for accounts that have:

   - Time-payment agreement in effect
   - Received two or more final disconnect notices
   - Been disconnected for non-payment within the last 12 months.

7. Service under this schedule will be labeled, "Time of Use".

Continuing Service

This Schedule is based on continuing service at each service location. Disconnect and reconnect transactions shall not operate to relieve a Consumer from monthly minimum charges.

Purpose

To implement a pilot program for optional time-of-use rates for irrigation customers.

Available

To areas served by the Company in and around Klamath Falls and Albany, Oregon.

Applicable

To agricultural irrigation or agricultural soil drainage pumping Consumers receiving Delivery Service under Schedule 41, in conjunction with Supply Service Schedule 201, who have been invited to participate in this pilot and who elect to take this service. New participation in 2016 will be limited to approximately twenty-five (25) metered points of delivery. No more than two metered points of delivery belonging to one Consumer will be allowed into the pilot.

Monthly Billing

The Monthly Billing shall be the Energy Charge. The Monthly Billing is in addition to all other charges contained in Delivery Service Schedule 41, Base Supply Service Schedule 200 and Supply Service Schedule 201.

Energy Charge

		Prime Summer Season
41	On-Peak kWh, per kWh	22.313¢
	Off-Peak kWh, per kWh	(3.161)¢

Seasonal Definition

Prime Summer season is defined as June 1 through August 31. Time-of-use adders under this pilot apply for the Prime Summer season only. No adjustments will be applied in other months.

On-Peak Period

Prime Summer
Monday through Friday 2:00 p.m. to 6:00 p.m.

All other months have no time-of-use periods.

Off-Peak Period

Prime Summer
All non On-Peak Period hours and days plus the following holiday: Independence Day.

All other months have no time-of-use periods.

(continued)

Guarantee Payment

The Company shall guarantee against excessive increase of consumer costs for the 2014 and 2015 Prime Summers of enrollment in the program and thereafter for the first Prime Summer of enrollment. If the total energy costs incurred on this Schedule for the Prime Summer season exceed 10% over what costs would have been for the same period under Cost-Based Supply Service, the net difference, Guarantee Payment, will be credited on the customer's bill following the end of the Prime Summer season. No Guarantee Payment shall be given for a Prime Summer period if Consumer terminates service before the end of the Prime Summer period.

Special Conditions

1. In 2016, eligible Consumers in the Klamath Falls area will be invited via mail to participate in this pilot. Participants will be chosen on a first-come, first-served basis. New participation will be limited to approximately twenty-five (25) metered points. No more than two accounts belonging to one Consumer will be allowed into the pilot.

2. The Consumer must have a time-of-use meter installed to participate in this option. The appropriate meter will be installed or the existing meter reprogrammed on the Consumer premises at no extra charge to the Consumer. The replacement of older meters may result in more accurate metering. The Consumer will be responsible for all charges based on accurate meter measurements from new meters. Billing under this schedule shall begin for the Consumer following installation of the time-of-use meter and the initial meter reading. Rates under this schedule prior to the beginning of the Prime Summer time-of-use rate season will be standard cost-based rates.

3. Consumers requesting service under this pilot program beginning in 2015 agree to remain on the pilot through the end of the 2015 Prime Summer season, which ends on August 31, 2015. Consumers will have the option to opt out of the pilot after this date by notifying the Company. Service will continue under this schedule until Consumer notifies the Company to discontinue service or this schedule terminates. In the event that participants are added to the pilot after the 2015 Prime Summer season, such participants agree to remain on the pilot through the end of their first Prime Summer season of participation.

4. All Consumers invited to participate in this pilot program may be asked to complete a survey following the end of the Prime Summer season. Survey responses will be used to further evaluate the potential of future time-of-use irrigation rates. Data gathered will be used for pilot evaluation only.

5. Meters enrolled in this pilot will not be eligible to participate concurrently in any load control pilot which is offered by the Company.

Continuing Service

This Schedule is based on continuing service at each service location. Disconnect and reconnect transactions shall not operate to relieve a Consumer from monthly minimum charges.

PACIFIC POWER
A DIVISION OF PACIFICORP

INTERRUPTIBLE SERVICE PILOT

Available (N)
In all territory served by the Company in the State of Oregon.

Applicable
To Nonresidential Consumers receiving Delivery Service under Schedule 48, in conjunction with Supply Service Schedule 201. Participation will be limited to the first twenty-five (25) megawatts of load on a first come, first served basis.

Monthly Billing

The Monthly Billing shall be the Interruptible Demand Credit, Interruptible Energy Credit, and Administrative Fee. The Monthly Billing is in addition to all other charges contained in Delivery Service Schedule 48, Base Supply Service Schedule 200 and Supply Service Schedule 201.

Interruptible Demand Credit

Per kW of On-Peak Interruptible Demand	-$1.00

Interruptible Energy Credit

Per kWh of Interrupted Energy	-20.000¢

Administrative Fee

Per month	$90.00

Interruption Events
The Company may call up to 100 hours of Interruption Events each calendar year. One Interruption Event may be called each day and may not exceed 3 consecutive hours. Each Interruption Event called by the Company shall be set for a period of at least 15 minutes in duration. Interruption Events may be called on any day or at any time during the year. During Interruption Events, a participant's usage shall not exceed their Baseline Non-Interruptible Load.

Interruption Notification
At least 30 minutes prior to an Interruption Event, the Company shall notify participants.

Interrupted Energy
Interruptible Energy during each Interruption Event shall be measured as the difference between the average load in kW for the 2 hours preceding the Interruption Event and the Baseline Non-Interruptible Load multiplied by the duration of the Interruption Load in hours.

Interruptible Demand
Interruptible Demand shall be measured as the kW shown by or computed from the readings of the Company's demand meter for the highest 15-minute period during On-Peak as defined by Delivery Service Schedule 48 during the month, determined to the nearest kW, less the Baseline Non-Interruptible Load.

Baseline Non-Interruptible Load (N)
Once per calendar year, participants may nominate a Baseline Non-Interruptible Load in kW which shall not be subject to Interruption Events.

(continued)

Interruptible Service Term (N)

Unless otherwise removed from this schedule by the Company, participants shall agree to remain on Interruptible Service for a period of no less than 12 months. After terminating service under this schedule, a Consumer may not re-enroll for a 12 month period.

Special Conditions

1. If a participant does not interrupt its load by reducing its usage down to its Baseline Non-Interruptible Load or less during an Interruption Event, the participant shall be subject to the following penalties:
    a. For the first failure in a rolling 12 month period, the participant shall forfeit its Interruptible Demand Credit and Interruptible Energy Credit for the month in which it failed to interrupt.
    b. For the second failure in a rolling 12 month period, the participant shall forfeit its Interruptible Demand Credit and Interruptible Energy Credit for the month in which it failed to interrupt and for the prior six months.
    c. For the third failure in a rolling 12 month period, the participant shall be removed service on this schedule.
2. Participants removed from the schedule may not return to Interruptible Service for a period of 12 months.
3. Participants on this schedule may not also take service on Schedule 219 – Real-Time Day Ahead Pricing Pilot.
4. As a condition of receiving service on this schedule, the Company may elect to upgrade and/or update the Consumer's metering to record five minute interval data and otherwise be capable of being a participating resource in the Energy Imbalance Market. Any metering upgrade and/or update shall be at the Consumer's expense. The Company shall provide an estimate of the metering upgrade and/or update to the Consumer prior to incurring any expense.
5. Participants must nominate a Baseline Non-Interruptible Load that results in at least 1,000 kW of Interruptible Load.
6. At its sole discretion, the Company may elect to not provide service under this schedule or remove from participation Consumers with seasonal loads that do not correspond to the times of the year when anticipated Interruption Events may occur.
7. A Consumer may not enroll in this schedule for more than 10 MW of service.
8. A Consumer may not at the same time participate in this schedule and Schedule 219 or any other demand response program.

Rules and Regulations

Service under this Schedule is subject to the General Rules and Regulations contained in the tariff of which this Schedule is a part and to those prescribed by regulatory authorities.

(N)

(N)

Available

In all territory served by the Company in the State of Oregon.

Applicable

To Nonresidential Consumers receiving Delivery Service under Schedule 48, in conjunction with Supply Service Schedule 201. Participation will be limited to the first twenty-five (25) megawatts of load on a first come, first served basis.

Real-Time Day Ahead Energy Charges

Energy Charges under Supply Service Schedule 201 shall be calculated as the sum of Energy, in excess of Baseline Non-Real-Time Load, multiplied by the Real-Time Day Ahead Index price in each hour of the month multiplied by the Real-Time Day Ahead Adjustment Factor calculated for the month. Real-Time Day Ahead Energy Charges shall not be less than zero.

Real-Time Day Ahead Index

The Real-Time Day Ahead Index is comprised of the hourly prices for the day ahead market on the "ELAP_PACW-APND" node on the California Independent System Operator's Open Access Same-time Information System website.

Average Supply Service Schedule 201 Price for Schedule 48

Secondary Delivery Voltage, Per kWh	2.136¢
Primary Delivery Voltage, Per kWh	2.017¢
Transmission Delivery Voltage, Per kWh	1.896¢

Real-Time Day Ahead Adjustment Factor

For each monthly billing period, the Real-Time Day Ahead Adjustment Factor shall be calculated as the average price on the Real-Time Day Ahead Index for the month divided by the Average Supply Service Schedule 201 Price.

Administrative Fee

Participants shall pay a monthly administrative fee of $90.00.

Real-Time Day Ahead Demand Charges

The measurement of the On-Peak kW used to calculate Real-Time Day Ahead Demand Charges shall be the kW recorded by the meter during the highest 15-minute period during the 100 hours with the highest price on the Real-Time Day Ahead Index for the monthly billing period, determined to the nearest kW, less the Baseline Non-Real-Time Load. Baseline Non-Real-Time Load shall be subject to Demand Charges and will use the same measurement of On-Peak kW as other non-participating Consumers.

Baseline Non-Real-Time Load

Once per calendar year, participants may nominate a Baseline Non-Real-Time Load in kW which shall not be subject to Real-Time Day Ahead Pricing.

Real-Time Day Ahead Pricing Service Term

Participants shall agree to remain on Real-Time Day Ahead for a period of no less than 12 months. After terminating service under this schedule, a Consumer may not re-enroll for a 12 month period.

(N)

(continued)

Guarantee Payment (N)

The Company shall guarantee against an increase of Energy Charges for the first 12 months of enrollment in the program. If the total annual Energy Charges incurred on this Schedule exceed 10% over what costs would have been for the same period absent participation, the net difference, Guarantee Payment, will be credited on the Consumer's bill following the last month of the participant's one year anniversary of service on this schedule. The Administrative Fee shall not be included in the calculation of the Guarantee Payment and shall not be credited. No Guarantee Payment shall be given if the Consumer terminates service before the end of the initial one-year period.

Special Conditions

1. Participants on this schedule may not also take service on Schedule 218 – Interruptible Service Pilot.
2. Participants must nominate a Baseline Non-Real-Time Load that results in at least 1,000 kW of load subject to Real-Time Day Ahead Pricing.
3. A Consumer may not enroll in this schedule for more than 10 MW of service.
4. A Consumer may not at the same time participate in this schedule and Schedule 218 or any other demand response program.

Rules and Regulations

Service under this Schedule is subject to the General Rules and Regulations contained in the tariff of which this Schedule is a part and to those prescribed by regulatory authorities.

(N)

PACIFIC POWER
A DIVISION OF PACIFICORP

Available

In all territory served by the Company in the State of Oregon.

Applicable

To Nonresidential Consumers who have elected to take this service. This service may be taken only in conjunction with the applicable Delivery Service Schedule.

Energy Charge

The Energy Charge shall be based on the Energy Charge Daily Rate as described below.

The Energy Charge Daily Rate is calculated by applying the same monthly weights produced by the Weighted Market Value calculation in the Transition Adjustment Schedule – Schedule 294 to actual daily market prices reported by the Platts indices at California/Oregon Border (COB), Mid-Columbia (Mid-C) and Desert Southwest (DSW), which includes the Palo Verde and Four Corners markets. The weights and thermal value will remain constant throughout the calendar year.

Standard Offer HLH

Market	Weight	
COB	11.24%	
DSW	16.90%	
Mid C	38.31%	
SP15	0.00%	
Thermal	33.55%	$17.96/MWh
Total	100%	

Standard Offer LLH

Market	Weight	
COB	5.86%	
DSW	8.30%	
Mid C	14.57%	
SP15	0.00%	
Thermal	71.27%	$18.94/MWh
Total	100%	

If prices are not reported for a particular day or days, the average of the immediately preceding and following reported days' on-peak and off-peak prices shall be used to determine the price for the non-reported period. On-peak and off-peak hours shall be defined as reported by Platts for the Mid-Columbia Index. Currently, on-peak hours are between 6:00 a.m. and 10:00 p.m. Monday through Saturday excluding NERC holidays. Off-peak hours are all remaining hours.

(D)

The Consumer shall notify the Company of its choice of this option within the period defined in OAR 860-038-275. The Consumer shall remain on this option until the Company is properly notified of the Consumers' election of Direct Access Service. The Consumer may return to Cost-Based Supply Service consistent with the provisions of Schedule 201.

(continued)

PACIFIC POWER
A DIVISION OF PACIFICORP

OREGON
SCHEDULE 230

EMERGENCY SUPPLY SERVICE

Available

In all territory served by the Company in the State of Oregon

Applicable

To Nonresidential Consumers. Service commences upon the Company becoming aware that the Nonresidential Consumer's ESS is no longer providing service. Delivery Service shall be billed under the Consumer's applicable rate schedule from the following: Schedule 23, 28, 30, (C) 41, 47, 48, 51, 53, 54. The Consumer must move off of this service within five business days of commencing service under this Schedule.

Energy Charge

The Energy Charge shall be based on the Energy Charge Daily Rate as described below.
The Energy Charge Daily Rate is the Platts Mid-Columbia Daily Electricity Firm Price Index (Platts-Mid-C Index) plus the Emergency Default Risk Premium plus the adjustment for losses. If prices are not reported for a particular day or days, the average of the immediately preceding and following reported days' on-peak and off-peak prices shall be used to determine the price for the non-reported period.

On-peak and off-peak hours shall be defined as reported by Platts for the Mid-Columbia Index. Currently, on-peak hours are between 6:00 a.m. and 10:00 p.m. Monday through Saturday excluding NERC holidays. Off-peak hours are all remaining hours. (D)

The Emergency Default Risk Premium shall be 25 percent of the Platts-Mid-C Index.

The loss adjustment shall be included by multiplying the Energy Charge Daily Rate by the following adjustment factors:

Transmission Delivery Voltage	1.04527
Primary Delivery Voltage	1.06904
Secondary Delivery Voltage	1.10006

In addition to this energy charge, all customers purchasing this service are required to pay for ancillary services at the rates determined by the appropriate pro forma transmission tariffs.

Energy Needs Forecast (continued) (D)

Consumer may request both Standard Blocks and Non-Standard Blocks of Energy in an ENF.

Daily ENF
Prior to HE 0615 PPT on the Pre-schedule Day, Consumer shall provide to Company Consumer's ENF specifying daily preschedule quantities by hour in equal volume blocks. By HE 0630 PPT on the Pre-schedule Day, Company shall notify Consumer of its acceptance of Consumer's ENF or modifications to Consumer's ENF. If Company has modified Consumer's ENF, by HE 0645 PPT on the Pre-schedule Day, Consumer shall notify Company of its acceptance of the modified ENF. Acceptance by Company of Consumer's ENF or acceptance by Consumer of Company's modification of Consumer's ENF shall constitute an ERPA (described below).

Unless modified pursuant to the Western Electricity Coordinating Council (WECC) Interchange Scheduling and Accounting Subcommittee (ISAS) Pre-scheduling Calendar, "Pre-schedule Day" means the business day immediately preceding the day of delivery unless the day of delivery is Sunday or Monday, in which case the Pre-schedule Day shall be the immediately preceding Friday, or unless the day of delivery is Saturday, the Pre-schedule Day shall be the immediately preceding Thursday. In the event the Pre-schedule Day falls on a NERC-defined holiday, the pre-schedule requirement shall be adjusted to reflect such holiday.

Monthly or Quarterly ENF
Between 0900 and 1159 PPT during the last day of gas bid week (Annually, Company will provide participating Consumers with a twelve month calendar of gas bid week days), Consumer shall contact the Company at a designated telephone number and receive a Mid Columbia market price quoted by a broker for the ENF. During that telephone call, the Consumer may purchase the HLH, LLH or Flat block of monthly or quarterly energy at a volume agreed to by Company and Consumer and at the price quoted. Unless accepted by Consumer during the telephone call, the price quoted shall expire at the end of the telephone call. Acceptance by Consumer of the price quoted shall constitute an ERPA (described below).

Broker quote. A Broker quote is a price quote from a brokering house or trading platform that the Company is utilizing on a given day.

Economic Replacement Power Agreement

The Economic Replacement Power Agreement (ERPA) specifies Electricity supplied by Company and agreed to by Consumer to meet in whole or in part an Energy Needs Forecast (ENF). An ERPA shall be required for transactions covered by an ENF. The Consumer shall use best efforts to conform actual Energy usage to the ERPA. If Consumer cannot take ERP as agreed to in an ERPA, Consumer shall promptly notify Company of the same. Such notice shall include, where applicable, the time when the shutdown occurred or is expected to occur and the anticipated duration of such shutdown and any other arrangements as represented in the written agreement.

(continued)

Available

In all territory served by the Company in the State of Oregon.

Applicable

To New Large Load for Nonresidential Consumers taking Delivery Service under Schedule 848 who have chosen to opt-out of the Company's Cost-Based Supply Service prior to the inception of electric service to the New Large Load. Consumer must officially notify the Company of its election for this program in accordance with Rule 22 of this tariff. New Large Load must be separately metered or have its usage measured based on a determination that has comparable accuracy and is mutually agreeable between the Company and the Consumer.

Total Eligible Load

A total of 89 aMW will be accepted under this program unless the Commission determines otherwise.

Administration Fee

Consumers taking service under this program will pay the following program Administration Fee:
$400 per month

Fixed Generation Transition Adjustment

A transition adjustment of 20 percent of fixed generation rates will be charged for the first five years of service to the Consumer under this program beginning when the Consumer's electric service is first energized. Fixed generation rates include Schedule 200, Base Supply Service rates along with any other rates which collect non-net power cost generation costs that are in effect during the five year transition period for each Consumer. The adjustment will be applied at 20 percent of the rates included in the Company's effective tariffs applicable to Delivery Service Schedule 48. At the end of the applicable five-year period, Consumers who have elected this option will no longer be subject to the fixed generation transition adjustment.

List of effective schedules with fixed generation rates which will incur a 20 percent Fixed Generation Transition Adjustment:
Schedule 200, Base Supply Service (D)
Schedule 197, Generation Plant Removal Adjustment (N)
Schedule 203, Renewable Resource Deferral Adjustment
Schedule 204, Oregon Solar Incentive Program Deferral
Schedule 205, TAM Adjustment for Other Revenues
Schedule 207, Community Solar Start-Up Cost Recovery Adjustment

Existing Load Shortage Transition Adjustment

The Existing Load Shortage Transition Adjustment will be applied to the Existing Load Shortage of the Consumer and for the Existing Load Shortage for all of the Consumer's affiliated Consumers. An affiliated Consumer is a Consumer for which a controlling interest is held by another Consumer who is engaged in the same line of business as the holder of the controlling interest. Existing Load Shortage means the larger of zero or a Consumer's Average Historical Cost-of-Service Load plus Incremental Demand-Side Management less the average Cost-of-Service Eligible load during the previous 60 months. Average Historical Cost-of-Service Load means the average monthly Cost-of-Service Eligible Load during the 60 month period beginning five years prior to the date the Consumer gives binding notice of participation in this program.

Schedule 51, 751	0.000¢			(C) (D)
Schedule 53, 753	0.000¢			(C)
Schedule 54, 754	0.000¢			(C)

Available

In all territory served by the Company in the State of Oregon.

Applicable

To Small Nonresidential Consumers who have chosen to receive electricity from an ESS, and as specified in the Company's Rules & Regulations, Rule 7.J. Deliveries at more than one point, or more than one voltage and phase classification, will be separately metered and billed, except as provided below for Communication Devices. Service for intermittent, partial requirements, or highly fluctuating loads, or where service is seasonally disconnected during any one year period will be provided only by special contract for such service.

Monthly Billing

The Monthly Billing shall be the sum of the Distribution Charge and the System Usage Charge plus the applicable adjustments as specified in Schedule 90. (C)

Distribution Charge	**Delivery Voltage** Secondary	Primary	
Basic Charge			
Single Phase, per month	$17.35	$17.35	
Three Phase, per month	$25.90	$25.90	
Load Size Charge			
≤ 15 kW	No Charge	No Charge	
> 15 kW, per kW for all kW in excess of 15 kW, Load Size	$ 1.50	$ 1.50	(I)
Demand Charge, the first 15 kW of demand	No Charge	No Charge	
Demand Charge, for all kW in excess of 15 kW, per kW	$ 5.08	$ 4.94	(I)
Distribution Energy Charge, per kWh	3.640¢	3.537¢	(I)
Reactive Power Charge, per kvar	$ 0.65	$ 0.60	
System Usage Charge			
Schedule 200 Related, per kWh	0.078¢	0.076¢	(I)

kW Load Size

For determination of the Basic Charge and the Load Size Charge, the kW load size shall be the average of the two greatest non-zero monthly demands established during the 12-month period which includes and ends with the current billing month.

Minimum Charge

The minimum monthly charge shall be the Basic Charge and the Load Size Charge. A higher minimum may be required under contract to cover special conditions.

Reactive Power Charge

The maximum 15-minute reactive demand for the month in kilovolt-amperes in excess of 40% of the measured kilowatt demand for the same month.

Demand

The kW shown by or computed from the readings of Company's demand meter for the 15-minute period of Consumer's greatest use during the month, determined to the nearest kW.

In all territory served by the Company in the State of Oregon.

Applicable

To Consumers who have chosen to receive electricity from an ESS and desiring service for agricultural irrigation or agricultural soil drainage pumping installations only and whose loads have not registered 1,000 kW or more, more than once in the preceding 18-month period and who are not otherwise subject to service on Schedule 747 or 748. Service furnished under this Schedule will be metered and billed separately at each point of delivery.

Monthly Billing

Except for November, the Monthly Billing shall be the sum of the Distribution Energy Charge, Reactive Power Charge, and the System Usage Charge plus the applicable adjustments as specified in Schedule 90. For November, the billing shall be the sum of the Basic Charge, Load Size Charge, Distribution Energy Charge, Reactive Power Charge, and the System Usage Charge plus the applicable adjustments as specified in Schedule 90. (C) (C)

<u>Distribution Charge</u>	<u>Delivery Voltage</u> Secondary	Primary	
Basic Charge (November billing only)			
Load Size ≤ 50 kW, or Single Phase Any Size	No Charge	No Charge	
Three Phase Load Size 51 - 300 kW	$ 390.00	$ 380.00	(I)
Three Phase Load Size > 300 kW	$1,530.00	$1,490.00	
Load Size Charge (November billing only)			
Single Phase Any Size, Three Phase ≤ 50 kW, per kW Load Size	$ 19.00	$ 18.00	
Three Phase 51 - 300 kW, per kW Load Size	$ 13.00	$ 13.00	
Three Phase > 300 kW, per kW Load Size	$ 8.00	$ 8.00	
Single Phase, Minimum Charge	$ 70.00	$ 70.00	
Three Phase, Minimum Charge	$ 115.00	$ 110.00	
Distribution Energy Charge, per kWh	4.464¢	4.338¢	(I)
Reactive Power Charge, per kVar	$ 0.65	$ 0.60	
<u>System Usage Charge</u>			
Schedule 200 Related, per kWh	0.074¢	0.072¢	

kW Load Size

For determination of the Basic Charge and the Load Size Charge, the kW load size shall be the average of the two greatest non-zero monthly demands established during the 12-month period which includes and ends with the current billing month.

Monthly kW is the measured kW shown by or computed from the readings of Company's meter, or by appropriate test, for the 15-minute period of Consumer's greatest takings during the billing month; provided, however, that for motors 10 hp or less, the Monthly kW may, subject to confirmation by test, be determined from the nameplate hp rating and the following table:

If Motor Size Is:	**Monthly kW is:**
2 hp or less	2 kW
Over 2 through 3 hp	3 kW
Over 3 through 5 hp	5 kW
Over 5 through 7.5 hp	7 kW
Over 7.5 through 10 hp	9 kW

(continued)

On-Peak Period

The kWh shown by or computed from the readings of the Company's energy meter during on-peak hours. The on-peak period is
Winter: Monday through Friday 6:00 a.m. to 10:00 a.m. and 5:00 p.m. to 8:00 p.m.
Summer: Monday through Friday 4:00 p.m. to 8:00 p.m.

Off-Peak Period

All non On-Peak Period plus the following holidays: New Year's Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day and Christmas Day. (D)

Seasonal Definition

Winter months are defined as November 1 through March 31. Summer months are defined as April 1 through October 31.

Special Conditions

1. At the option of the Consumer, service may be provided under the otherwise applicable General Service Schedule.
2. The Consumer shall not resell electric service received from the Company under provisions of this Schedule to any person, except by permission of the Company or as otherwise expressly provided in Company tariffs. The sale of electricity for fuel to a motor vehicle is expressly allowed as described in rule 2.E of this tariff.
3. A DC Fast Charger is defined for the purposes of eligibility on this rate schedule as a charging station with a Direct Current (DC) connection that has been designed to recharge the battery of an electric vehicle.
4. An electric vehicle charging site is considered to be broadly available to the general publicly for the purposes of eligibility on this rate schedule if it is available for use by any driver and is capable of charging more than one make of automobile. Eligibility and acceptance of a customer for service under this rate schedule is subject to review and approval by the Company.
5. Prior to receiving service under this rate schedule, the Consumer must disclose to the Company the number of chargers to be installed at the station, the type and capacity of each charger installed, and the maximum number of vehicles that can simultaneously use the station to recharge batteries.
6. The company reserves the right to terminate service under this schedule if it finds that excessive fees imposed by the charging station owner result in the charging station not being broadly available, per the requirements of this schedule.

PACIFIC POWER
A DIVISION OF PACIFICORP

OREGON
SCHEDULE 747

LARGE GENERAL SERVICE
PARTIAL REQUIREMENTS 1,000 KW AND OVER
DIRECT ACCESS DELIVERY SERVICE

Available

In all territory served by the Company in the State of Oregon.

Applicable

This Schedule is applicable to Consumers who have chosen to receive electricity from an ESS. To Large Nonresidential Consumers supplying all or some portion of their load by self-generation operating on a regular basis, requiring standby electric service from the Company where the Consumer's self-generation has both a total nameplate rating of 1,000 kW or greater and where standby electric service is required for 1,000 kW or greater. Consumers requiring standby electric service from the Company for less than 1,000 kW shall be served under the applicable general service schedule.

Monthly Billing

The Monthly Billing shall be the sum of the Distribution Charge, Reserves Charges, and the System Usage Charge plus the applicable adjustments as specified in Schedule 90. (C)

	Delivery Voltage			
Distribution Charge	**Secondary**	**Primary**	**Transmission**	
Basic Charge				
Facility Capacity ≤ 4,000 kW, per month	$640.00	$610.00	$820.00	(I) (I) (R)
Facility Capacity > 4,000 kW, per month	$1,220.00	$1,100.00	$1,520.00	(I) (I) (R)
Facilities Charge				
≤ 4,000 kW, per kW Facility Capacity	$2.70	$1.20	$1.25	(I) (R) (R)
> 4,000 kW, per kW Facility Capacity	$2.60	$1.10	$1.25	(I) (R) (R)

System Usage Charge				
Schedule 200 Related, per kWh	0.076¢	0.075¢	0.073¢	(I) (I) (I)

(continued)

On-Peak Demand

The kW shown by or computed from the readings of the Company's demand meter for the On-Peak 15-minute period of the Consumer's greatest use during the month, determined to the nearest kW. Summer On-Peak hours are from 1 p.m. to 11 p.m. all days in the Summer months of July, August and September. Non-Summer On-Peak hours are from 5 a.m. to 9 a.m. and 4 p.m. to 12 a.m. (midnight) in the Non-Summer months of October through June. All remaining hours are Off-Peak. (C)

Metering Adjustment (D)

A Consumer receiving service at secondary delivery voltage where metering is at primary delivery shall have all billing quantities multiplied by an adjustment factor of 0.9718.

A Consumer receiving service at primary delivery voltage where metering is at secondary delivery voltage shall have all billing quantities multiplied by an adjustment factor of 1.0290.

Baseline Demand

The kW of Demand supplied by the Company to the Large Nonresidential Consumer when the Consumer's generator is regularly operating as planned by the Consumer. For new Partial Requirements Consumers, the Consumer's peak Demand for the most recent 12 months prior to installing the generator, adjusted for planned generator operations, shall be used to calculate the Baseline Demand. Existing Partial Requirements Consumers shall select their Baseline Demand for each contract term based upon the Consumer's peak demand for the most recent 12 months during the times the generator was operating as planned, adjusted for changes in load and planned generator operations. Planned generator operations includes changes in the electricity produced by the generator as well as the Consumer's plans to sell any electricity produced by the generator to the Company or third parties. Any modification to the Baseline Demand must be consistent with Special Conditions in this schedule.

Facility Capacity

Facility Capacity shall be the average of the two greatest non-zero monthly Demands established during the 12-month period which includes and ends with the current Billing Month, but shall not be less than the Consumer's Baseline Demand. For new customers during the first three months of service under this schedule, the Facility Capacity will be equal to the Consumer's Baseline Demand.

Reserves Charges

The Company provides Reserves for the Consumer's Facility Capacity. Reserves consist of the following components:

Spinning Reserves

In addition to the Spinning Reserves provided for the Consumer's Baseline Demand, Spinning Reserves provide Electricity immediately after a Consumer's demand rises above Baseline Demand.

(continued)

Available

In all territory served by the Company in the State of Oregon.

Applicable

This Schedule is applicable to Consumers who have chosen to receive electricity from an ESS, to electric service loads which have registered 1,000 kW or more, more than once in a preceding 18-month period. This Schedule will remain applicable until Consumer fails to meet or exceed 1,000 kW for a subsequent period of 36 consecutive months. Deliveries at more than one point, or more than one voltage and phase classification, will be separately metered and billed. Service for intermittent, partial requirements, or highly fluctuating loads, or where service is seasonally disconnected during any one-year period will be provided only by special contract for such service.

Partial requirements service for loads of 1,000 kW and over will be provided only by application of the provisions of Schedule 747.

Monthly Billing

The Monthly Billing shall be the sum of the Distribution Charge and the System Usage Charge plus the applicable adjustments as specified in Schedule 90.

Distribution Charge		**Delivery Voltage**		
	Secondary	**Primary**	**Transmission**	
Basic Charge				
Facility Capacity ≤ 4000 kW, per month	$640.00	$610.00	$820.00	(I) (I) (R)
Facility Capacity > 4000 kW, per month	$1,220.00	$1,100.00	$1,520.00	(I) (I) (R)
Facilities Charge				
≤ 4000 kW, per kW Facility Capacity	$2.70	$1.20	$1.25	(I) (R) (R)
> 4000 kW, per kW Facility Capacity	$2.60	$1.10	$1.25	(I) (R) (R)
On-Peak Demand Charge, per kW	$4.68	$4.83	$3.48	(I) (I) (R)
Reactive Power Charge, per kvar	$0.65	$0.60	$0.55	
System Usage Charge				
Schedule 200 Related, per kWh	0.076¢	0.075¢	0.073¢	(I) (I) (I)

Facility Capacity

For determination of the Basic Charge and the Facilities Charge, the Facility Capacity shall be the average of the two greatest non-zero monthly demands established during the 12-month period which includes and ends with the current billing month.

Minimum Charge

The minimum monthly charge shall be the Basic Charge and the Facilities Charge. A higher minimum may be required by contract.

(continued)

Issued February 14, 2020 — **Effective for service on and after January 1, 2021**
Etta Lockey, Vice President, Regulation — *Docket No. UE 374*

Reactive Power Charge

The maximum 15-minute reactive demand for the month in kilovolt-amperes in excess of 40% of the maximum measured kilowatt demand for the same month.

On-Peak Demand

The kW shown by or computed from the readings of the Company's demand meter for the On-Peak 15-minute period of the Consumer's greatest use during the month, determined to the nearest kW. Summer On-Peak hours are from 1 p.m. to 11 p.m. all days in the Summer months of July, August and September. Non-Summer On-Peak hours are from 5 a.m. to 9 a.m. and 4 (C) p.m. to 12 a.m. (midnight) in the Non-Summer months of October through June. All remaining hours are Off-Peak. (D)

Metering Adjustment

For a Consumer receiving service at secondary delivery voltage where metering is at primary delivery shall have all billing quantities multiplied by an adjustment factor of 0.9718.

For a consumer receiving service at primary delivery voltage where metering is at secondary delivery voltage shall have all billing quantities multiplied by an adjustment factor of 1.0290.

Base Supply Service

All Consumers taking Delivery Service under this schedule shall pay the applicable rates in Schedule 200, Base Supply Service.

Transmission & Ancillary Services

Consumers taking service under this schedule must also take service under the Company's FERC Open Access Transmission Tariff (OATT) or be served by an ESS or Scheduling ESS.

Franchise Fees

Franchise fees related to Schedule 200, Base Supply Service, are collected through the System Usage Charge - Schedule 200 Related rate. Franchise fees related to distribution charges are collected through distribution charges.

Special Conditions

Consumer shall not resell electric service received from Company under provisions of this Schedule to any person, except by permission of the Company or as otherwise expressly provided in Company tariffs.

Term of Contract

Company may require the Consumer to sign a written contract which shall have a term of not less than one year.

Rules and Regulations

Service under this Schedule is subject to the General Rules and Regulations contained in the tariff of which this Schedule is a part and to those prescribed by regulatory authorities.

Available

In all territory served by the Company in the State of Oregon.

Applicable

This Schedule is applicable to Consumers who have chosen to receive electricity from an ESS. To unmetered lighting service provided to municipalities or agencies of municipal, county, state or federal governments for dusk to dawn illumination of public streets, highways and thoroughfares by means of Company owned, operated and maintained street lighting systems controlled by a photoelectric control or time switch.

Monthly Billing

The Monthly Billing shall be the rate per luminaire as specified in the rate tables below plus the applicable adjustments as specified in Schedule 90. (C)

(C)

Type of Lamp	Level 1	Level 2	Level 3	Level 4	Level 5	Level 6
LED Equivalent Lumens	0-3,500	3,501-5,500	5,501-8,000	8,001-12,000	12,001-15,500	15,501+
Monthly kWh	8	15	25	34	44	57
Functional Lighting	$ 7.11	$ 7.54	$ 7.67	$ 7.78	$ 8.26	$ 10.08
Functional Lighting - Customer Funded Conversion	$ 3.73	$ 3.93	$ 4.05	$ 4.12	$ 4.41	$ 5.38
Decorative Series	N/A	$ 13.23	$ 13.33	N/A	N/A	N/A

(C)
(D)
(N)

Functional Lighting: Common less expensive luminaires that may be mounted either on wood, fiberglass or non-decorative metal poles. The Company will maintain a list of functional light fixtures that are available.

Customer-Funded Conversion: Street lights that have been converted to LED from another lighting type and whose conversion was funded by the Customer.

Decorative Series Lighting: More stylish luminaires mounted vertically on decorative metal poles. The Company will maintain a listing of standard decorative street light fixtures that are available under this Schedule.

(N)

Base Supply Service

All Consumers taking Delivery Service under this schedule shall pay the applicable rates in Schedule 200, Base Supply Service.

Transmission & Ancillary Services

Consumers taking service under this Schedule must also take service under the Company's FERC Open Access Transmission Tariff (OATT) or be served by an ESS or Scheduling ESS.

Franchise Fees

Franchise fees related to Schedule 200, Base Supply Service, and distribution charges are collected through rates in this schedule.

(continued)

PACIFIC POWER
A DIVISION OF PACIFICORP

STREET LIGHTING SERVICE
COMPANY-OWNED SYSTEM - NO NEW SERVICE
DIRECT ACCESS DELIVERY SERVICE

Available

In all territory served by the Company (except Multnomah County) in the State of Oregon.

Applicable

This Schedule is applicable to Consumers who have chosen to receive electricity from an ESS. To service furnished by means of Company-owned installations, for the lighting of public streets, highways, alleys and parks under conditions and for street lights of sizes and types not specified on other schedules of this Tariff. Company may not be required to furnish service hereunder to other than municipal Consumers. This schedule is closed to new service beginning November 8, 2006.

Monthly Billing

For systems owned, operated and maintained by Company. The Monthly Billing shall be the Rate Per kWh below plus the applicable rate in Schedule 80 and applicable adjustments as specified in Schedule 90.

A flat rate equal to one-twelfth of Company's estimated annual cost for operation, maintenance, fixed charges and depreciation applicable to the street lighting system, including energy costs as follows:

For dusk to dawn operation, per kWh	1.551¢
For dusk to midnight operation, per kWh	1.849¢

Base Supply Service

All Consumers taking Delivery Service under this schedule shall pay the applicable rates in Schedule 200, Base Supply Service.

Transmission & Ancillary Services

Consumers taking service under this schedule must also take service under the Company's FERC Open Access Transmission Tariff (OATT) or be served by an ESS or Scheduling ESS.

Franchise Fees

Franchise fees related to Schedule 200, Base Supply Service, and distribution charges are collected through rates in this schedule.

Term of Contract

Not less than five years for service to an overhead, or ten years to an underground, Company-owned system by written contract when unusual conditions prevail.

Provisions

1. Installation, daily operation, repair and maintenance of lights on this rate schedule will be performed by the Company, providing that the facilities furnished remain readily accessible for maintenance purposes.
2. Inoperable lights will be repaired as soon as reasonably possible, during regular business hours or as allowed by Company's operating schedule and requirements, provided the Company receives notification of inoperable lights from Consumer or a member of the public by either notifying Pacific Power's customer service (1-888-221-7070) or www.pacificpower.net/streetlights. Pacific Power's obligation to repair street lights is limited to this tariff.
3. Existing fixtures and facilities that are deemed irreparable will be replaced with comparable high pressure sodium vapor fixtures and facilities from the Company's Construction Standards.

(continued)

Provisions (continued)

4. The Company will, upon written request of Consumer, convert existing streetlighting facilities to other types of Company approved facilities. In such event, should the revenue increase, the streetlighting extension allowance defined in Rule 13 Section III.F is applicable only to the increase in annual revenue due to the replacement. If there is no increase in revenue, there is no allowance, The Consumer shall advance the estimated cost of all materials and labor associated with installation and removal, less the estimated salvage on the removed facilities, in excess of the applicable allowance.
5. Temporary disconnection and subsequent reconnection of electrical service requested by the Consumer shall be at the Consumer's expense. The Consumer may request temporary suspension of power by written notice. During such periods, the monthly rate will be reduced by the company's estimated average energy costs for the luminaire. The facilities may be considered idle and may be removed after 12 months of inactivity. The Company will not be required to re-establish such service under this rate schedule if service has been permanently discontinued by the Consumer.
6. Pole re-painting, when requested by the Consumer and not required for safety reasons, shall be done at Consumer's expense using the original pole color.
7. Glare and vandalism shielding, when requested by the Consumer, shall be installed at the Consumer's expense. In cases of repetitive vandalism, the Company may notify the Consumer of the need to install vandal shields at the Consumer's expense, or otherwise have the lighting removed.

Termination of Service

The Consumer can request removal of lights with minimum of 2 month's written notice. The Consumer will be charged with the costs of removal.

Rules and Regulations

Service under this Schedule is subject to the General Rules and Regulations contained in the tariff of which this Schedule is a part and to those prescribed by regulatory authorities.

Available

In all territory served by the Company in the State of Oregon.

Applicable

This Schedule is applicable to Consumers who have chosen to receive electricity from an ESS. To lighting service provided to municipalities or agencies of municipal, county, state or federal governments for dusk to dawn illumination of public streets, highways and thoroughfares by means of Consumer owned street lighting systems controlled by a photoelectric control or time switch.

Monthly Billing

Energy Only Service - Rate per Luminaire

Energy Only Service includes energy supplied from Company's overhead or underground circuits and does not include any maintenance to Consumer's facilities. Maintenance service will be provided only as indicated in the Maintenance Service section below.

The Monthly Billing shall be the rate per luminaire specified in the rate tables below plus the applicable adjustments as specified in Schedule 90. (C)

High Pressure Sodium Vapor						
Lumen Rating	5,800	9,500	16,000	22,000	27,500	50,000
Watts	70	100	150	200	250	400
Monthly kWh	31	44	64	85	115	176
Energy Only Service	$ 1.45	$ 2.06	$ 2.99	$ 3.98	$ 5.38	$ 8.24

(I)

Metal Halide					
Lumen Rating	9,000	12,000	19,500	32,000	107,800
Watts	100	175	250	400	1,000
Monthly kWh	39	68	94	149	354
Energy Only Service	$ 1.82	$ 3.18	$ 4.40	$ 6.97	$ 16.56

(I)

For non-listed luminaires the cost will be calculated for 4167 annual hours of operation including applicable loss factors for ballasts and starting aids at the cost per kWh given below.

Non-Listed Luminaire	¢/kWh
Energy Only Service	4.679

(I)

Maintenance Service (No New Service)

Where the utility operates and maintains the system, a flat rate equal to one-twelfth the estimated annual cost for operation and maintenance will be added to the Energy Only Service rates listed above. Monthly Maintenance is only applicable for existing monthly maintenance service agreements in effect prior to May 24, 2006.

(continued)

PACIFIC POWER
A DIVISION OF PACIFICORP

OREGON
SCHEDULE 754

RECREATIONAL FIELD LIGHTING - RESTRICTED
DIRECT ACCESS DELIVERY SERVICE

Available

In all territory served by the Company in the State of Oregon.

Applicable

This Schedule is applicable to Consumers who have chosen to receive electricity from an ESS. To schools, governmental agencies and nonprofit organizations for service supplied through one meter at one point of delivery and used exclusively for annually recurring seasonal lighting of outdoor athletic or recreational fields. This Schedule is not applicable to any enterprise which is operated for profit. Service for purposes other than recreational field lighting may not be combined with such field lighting for billing purposes under this Schedule. At Consumer's option, service for recreational field lighting may be taken under Company's applicable General Service Schedule.

Monthly Billing

The Monthly Billing shall be the Distribution Charge and the System Usage Charge plus the applicable adjustments as specified in Schedule 90. (C)

Distribution Charge

Basic Charge, Single Phase, per month	$ 6.00	
Basic Charge, Three Phase, per month	$ 9.00	
Distribution Energy Charge, per kWh	5.287¢	(I)

System Usage Charge

Schedule 200 Related, per kWh	0.020¢	(R)

Minimum Charge

The minimum monthly charge shall be the Basic Charge.

Base Supply Service

All Consumers taking Delivery Service under this schedule shall pay the applicable rates in Schedule 200, Base Supply Service.

Transmission & Ancillary Services

Consumers taking service under this schedule must also take service under the Company's FERC Open Access Transmission Tariff (OATT) or be served by an ESS or Scheduling ESS.

Franchise Fees

Franchise fees related to Schedule 200, Base Supply Service, are collected through the System Usage Charge - Schedule 200 Related rate. Franchise fees related to distribution charges are collected through distribution charges.

Special Conditions

Consumer shall own all poles, wire and other distribution facilities beyond the Company's point of delivery.

Continuing Service

This Schedule is based on continuing service at each service location. Disconnect and reconnect transactions shall not operate to relieve a Consumer from monthly minimum charges.

Rules and Regulations

Service under this Schedule is subject to the General Rules and Regulations contained in the tariff of which this Schedule is a part and to those prescribed by regulatory authorities.

PACIFIC POWER
A DIVISION OF PACIFICORP

LARGE GENERAL SERVICE - PARTIAL REQUIREMENTS
SERVICE-ECONOMIC REPLACEMENT SERVICE RIDER
DIRECT ACCESS DELIVERY SERVICE

Purpose

To provide Consumers served on Schedule 747 with the opportunity of purchasing Energy from an ESS to replace some or all of the Consumer's on-site generation when the Consumer deems it is more economically beneficial than self generating.

Available

In all territory served by the Company in Oregon. The Company may limit service to a Consumer if system reliability would be affected. The Company has no obligation to provide the Consumer with economic replacement service except as explicitly agreed to between Company and Consumer.

Applicable

This Schedule is applicable to Consumers who have chosen to receive electricity from an ESS. To Large Nonresidential Consumers receiving Delivery Service under Schedule 747.

Character of Service

Sixty-hertz alternating current of such phase and voltage as the Company may have available.

Monthly Billing

The following charges are in addition to applicable charges under Schedule 747 plus the applicable adjustments as specified in Schedule 90: (C)

	Delivery Voltage			
	Secondary	Primary	Transmission	
Daily ERS Demand Charge				
per kW of Daily ERS On-Peak Demand	$0.182	$0.188	$0.136	(I)(I)(R)

Transmission & Ancillary Services

Consumers taking service under this schedule must also take service under the Company's FERC Open Access Transmission Tariff (OATT) or be served by an ESS or Scheduling ESS.

ERS and ENF

Economic Replacement Service (ERS) is Electricity supplied by an ESS to meet an Energy Needs Forecast (ENF) pursuant to an Economic Replacement Service Agreement (ERSA).

(continued)

Available

In all territory served by the Company in the State of Oregon.

Applicable

This Schedule is applicable to Consumers who have chosen to receive electricity from an ESS and are participating in the New Large Load Direct Access Program in Schedule 293 or to existing consumers who have completed the five-year transition period for the Five-Year Cost of Service Opt-Out in Schedule 296. Existing consumers who have completed the five-year transition period for the Five-Year Cost of Service Opt-Out in Schedule 296 must have electric service loads which have registered 1,000 kW or more, more than once in a preceding 18-month period. This Schedule will remain applicable until Consumer fails to meet or exceed 1,000 kW for a subsequent period of 36 consecutive months. Deliveries at more than one point, or more than one voltage and phase classification, will be separately metered and billed. Service for intermittent, partial requirements, or highly fluctuating loads, or where service is seasonally disconnected during any one-year period will be provided only by special contract for such service.

Monthly Billing

The Monthly Billing shall be the Distribution Charge plus the applicable adjustments as specified in Schedule 90.

Distribution Charge		**Delivery Voltage**		
	Secondary	**Primary**	**Transmission**	
Basic Charge				
Facility Capacity ≤ 4000 kW, per month	$640.00	$610.00	$820.00	(I) (I) (R)
Facility Capacity > 4000 kW, per month	$1,220.00	$1,100.00	$1,520.00	(I) (I) (R)
Facilities Charge				
≤ 4000 kW, per kW Facility Capacity	$2.70	$1.20	$1.25	(I) (R) (R)
> 4000 kW, per kW Facility Capacity	$2.60	$1.10	$1.25	(I) (R) (R)
On-Peak Demand Charge, per kW	$4.68	$4.83	$3.48	(I) (R) (R)
Reactive Power Charge, per kvar	$0.65	$0.60	$0.55	

Facility Capacity

For determination of the Basic Charge and the Facilities Charge, the Facility Capacity shall be the average of the two greatest non-zero monthly demands established during the 12-month period which includes and ends with the current billing month.

Minimum Charge

The minimum monthly charge shall be the Basic Charge and the Facilities Charge. A higher minimum may be required by contract.

(continued)

Reactive Power Charge

The maximum 15-minute reactive demand for the month in kilovolt-amperes in excess of 40% of the maximum measured kilowatt demand for the same month.

On-Peak Demand

The kW shown by or computed from the readings of the Company's demand meter for the On-Peak 15-minute period of the Consumer's greatest use during the month, determined to the nearest kW. Summer On-Peak hours are from 1 p.m. to 11 p.m. all days in the Summer (C)
months of July, August and September. Non-Summer On-Peak hours are from 5 a.m. to 9 a.m. and 4 p.m. to 12 a.m. (midnight) in the Non-Summer months of October through June. All remaining hours are Off-Peak. (D)

Metering Adjustment

For a Consumer receiving service at secondary delivery voltage where metering is at primary delivery shall have all billing quantities multiplied by an adjustment factor of 0.9718.

For a consumer receiving service at primary delivery voltage where metering is at secondary delivery voltage shall have all billing quantities multiplied by an adjustment factor of 1.0290.

Transmission & Ancillary Services

Consumers taking service under this schedule must also take service under the Company's FERC Open Access Transmission Tariff (OATT) or be served by an ESS or Scheduling ESS.

Franchise Fees

Franchise fees related to distribution charges are collected through distribution charges.

Special Conditions

Consumer shall not resell electric service received from Company under provisions of this Schedule to any person, except by permission of the Company or as otherwise expressly provided in Company tariffs.

Term of Contract

Company may require the Consumer to sign a written contract which shall have a term of not less than one year.

Rules and Regulations

Service under this Schedule is subject to the General Rules and Regulations contained in the tariff of which this Schedule is a part and to those prescribed by regulatory authorities.

Definitions (continued)

Emergency Default Service: Has the meaning described in Rule 2, "Types of Service."

Emergency Distribution Service: Service in supply to, or made available to, load devices which are operated only in emergency situations or in testing for same. Such service contemplates frequency and intensity of operation reflective of emergency conditions and excludes service to freeze protection devices which operate in the coldest period of the year.

Energy: Electric energy, measured in kilowatt-hours.

Extension: A branch from, continuation of, or an increase in the capacity of an existing Company-owned transmission or distribution line. An extension may be either single-phase or three-phase or a conversion from a single-phase line to a three-phase line. An extension may also be the addition of, or increase in the capacity of other facilities.

Intermittent Service: Continuously available service which the Consumer uses intermittently and in such duration that minimal amounts of electric power or energy are registered by Company meters for such uses.

Kilovar (kvar): A unit of reactive power equal to 1,000 reactive volt-amperes.

Kilovar-hour (Kvarh): The amount of reactive flow in one hour, at a constant rate of one kilovar.

Kilowatt (kW): A unit of power equal to 1,000 watts.

Kilowatt-hour (kWh): The amount of energy delivered in one hour, when delivery is at a constant rate of one kilowatt.

Large Nonresidential Consumer: A Nonresidential Consumer that is not a Small Nonresidential Consumer.

Load: The amount of electricity delivered to or required by a Consumer.

Multi-Family Home: A residential building that contains three or more dwelling units. (N)

NAICS Code: North American Industry Classification System Code.

New Large Load: as defined in OAR 860-038-0710, load associated with a new facility, an existing facility or an expansion of an existing facility, which: has never been contracted for or committed to in writing by a cost-of-service Consumer with an electric company, and is expected to result in a 10 average megawatt (aMW) or more increase in the Consumer's power requirements during the first three years after new operations begin.

Nonresidential Consumer: A retail electricity consumer that is not a Residential Consumer.

Paralleling: Connection by a Consumer of any source of electric power to Company's system or to a Consumer's system which is connected to Company's system.

(continued)

Definitions (continued)

Service Options: Optional services that are part of Direct Access Service. Service Options include Billing Services and the purchase of Ancillary Services. Service Options do not include Service Elections or the choice of ESS.

Service of Questionable Permanency: Service for operations of a speculative character or the permanency of which has not been established. This will include, among others, service to mines, logging or associated woods operations, rock crushers or paving plants.

Single Enterprises: A separate business or other individual activity carried on by a Consumer. The term does not apply to associations or combinations of Consumers.

Single-Family Home: A residential building that contains less than three dwelling units. (N)

Small Nonresidential Consumer: A Nonresidential Consumer whose demand has not exceeded 30 kW more than once within the preceding 13 months or with seven months or less of service whose demand has not exceeded 30 kW.

Standard Offer Service: Has the meaning described in Rule 2, “Types of Service.”

Standby Service: Service in supply to, or made available to, load which is served part or all of the time by another power source for reasons of increased reliability of supply through duplication of source.

Supplementary Service: Service in supply to, or made available to, load which receives some degree of simultaneous supply from another power source for additional supply or greater economy of supply at peak or light load conditions.

Tract or Subdivision: An area for dwellings which may be identified by filed subdivision plans or as an area in which a group of dwellings may be constructed about the same time, either by a large scale builder or by several builders working on a coordinated basis.

Utility: Pacific Power

Ancillary Services Revenue Requirement

February 2020

PACIFICORP
STATE OF OREGON
Combined GRC and TAM
Ancillary Services Revenue
12 Months Ended December 31, 2021 Forecast

Oregon Annual Ancillary Service Revenue $24,876,786

Calculation below per the PacifiCorp Open Access Transmission Tariff (OATT) Load and Generation prices on
Schedule 3 (Regulation and Frequency Response Service), Schedule 3A (Generator Regulation and Frequency Response Service), Schedule 5 (Operating Reserve - Spinning Reserve Service) and Schedule 6 (Operating Reserve - Supplemental Reserve Service)

Load[1]

Line	Description	Calculation	Value
1	Sum of 12 Oregon Monthly Peaks (MW)		27,103
2	Total Oregon Retail Load (MWh)		15,219,850
3			
4	Schedule 3 Load Rate ($/MW-month)		$177
5	Schedule 3 Revenue	1*4	$4,797,165
6			
7	Schedule 5 Rate ($/MWh)		$0.151
8	Schedule 5 Revenue	2*7	$2,298,197
9			
10	Schedule 6 Rate ($/MWh)		$0.151
11	Schedule 6 Revenue	2*10	$2,298,197
12			
13			
14	Total Oregon Load Revenue	5+8+11	$9,393,559

Generation

Line	Description	Calculation	Value
1	Sum of 12 Total System VER Generator Nameplate Capacities (MW)[2]		68,370
2	Sum of 12 Total System Non-VER Generator Nameplate Capacities (MW)		12,534
3	Total System Generation MWh at input		66,502,586
4			
5	Schedule 3A VER Rate ($/MW-month)		$549
6	Schedule 3A VER Revenue	1*5	$37,535,255
7			
8	Schedule 3A Non-VER Rate ($/MW-month)		$150
9	Schedule 3A Non-VER Revenue	2*8	$1,880,042
10			
11	Schedule 5 Rate ($/MWh)		$0.151
12	Schedule 5 Revenue	3*11	$10,041,891
13			
14	Schedule 6 Rate ($/MWh)		$0.151
15	Schedule 6 Revenue	3*14	$10,041,891
16			
17			
18	Total Generation Revenue	6+9+12+15	$59,499,078
19			
20	Oregon JAM SG Factor		26%
21	Oregon-allocated Total Generation Revenue	18*20	$15,483,227

[1]Load is Oregon's Contributions to Monthly Firm System Retail Load at input
[2]All VER Generation is assumed to be Uncommitted (see OATT Schedule 3A requirements for Committed and Uncommitted)

Oregon Marginal Cost of Service Study

February 2020

PacifiCorp
Marginal Cost Study & Circuit Model Procedures

INTRODUCTION
Customer class marginal costs are developed to illustrate the resources required to produce one additional unit of electricity or add one additional customer to the system. One, five, 10 and 20 years marginal costs are calculated because the Company believes the Commission should have information about the Company's marginal costs over different time periods. Twenty-year (or long-run) marginal costs, however, are the primary time frame used in setting retail tariff prices.

The one-year marginal costs include only changes in operating costs, while 10- and 20-year marginal costs also include the cost of expanding facilities. The cost of added facilities results in long-run costs, which are higher than short-run costs. Short-run costs include only one year of generation energy costs and some billing costs. There are no short-run demand-related generation, transmission or distribution costs. Long-run costs include 10 or 20 years of generation costs, transmission and distribution costs.

One-, 10- and 20-year marginal costs are summarized by customer class and load size group and shown in mills/kWh. Marginal commitment costs and billing expenses, which are sometimes referred to as customer costs, are shown in dollars per customer per year. Costs are shown for both the one-year and the long-run time periods.

Unit costs are adjusted to 2021 values and are shown by generation, transmission, and distribution functional categories and by demand, energy, and commitment and billing costing classifications. Also included are energy usage, peak demand, and number of customers by customer class for the 12-month period ending December 2021.

One, 10- and 20-year marginal costs in mills/kWh are shown on "Summary of Marginal Costs Demand & Energy in Mills/kWh" (Sheet 'Table 1'). Marginal commitment costs and billing expenses are shown on "Summary of Marginal Costs Commitment and Billing in $ / Customer / Month" (Sheet 'Table 2'). Billing information, unit costs, and total marginal costs are shown on "20 Year Marginal Cost" (Sheet 'Table 3').

MARGINAL GENERATION COSTS
The development of marginal generation costs for this study is consistent with the analysis done to prepare the Company's avoided costs filings. Marginal generation costs are based on the Company's most recent avoided cost calculations. The analysis recognizes that baseload generation produces the dual products of capacity and energy. The new resource costs are based on the fixed and variable cost of a Combined Cycle Combustion Turbine (CCCT), which operates as a baseload unit. The cost of the CCCT is split into capacity and energy components. The fixed cost of a simple cycle combustion turbine (SCCT) defines the fixed costs of the CCCT that are assigned to capacity. CCCT fixed costs which are in excess of SCCT fixed costs are assigned to energy. Total energy and capacity costs are present valued, summed, and an annual charge is applied to the total. The marginal generation cost calculation is shown in the

cost of service study on sheet "Summary of Marginal Generation Costs in Nominal Dollars" (Sheet 'Table 4').

MARGINAL TRANSMISSION COSTS

The calculation of transmission costs are based on a five-year (2020-2024) analysis of forecasted expenditures to meet increased load on the transmission system. All of these growth-related transmission investments, except bulk power lines, are classified entirely to demand.

Unlike growth-related system support and local transmission investments, the Company's investment in bulk power lines is classified both to demand and energy in the same proportions as 20-year marginal costs of generation resources. Bulk transmission costs are classified this way because they are thought to be an integral part of the generation system. The Company's investments in high voltage bulk transmission lines are being made to move both energy and capacity. It is usually not possible to site a thermal plant close to the customers the plant is intended to serve. Instead, bulk power lines are constructed to transmit the energy being generated, along with the accompanying capacity.

Each year's growth-related transmission investments are adjusted to 2021 dollars and the five years are totaled. The total transmission investment is divided by the capacity added by the investment to determine the marginal investment per kilowatt (kW). An annual charge for including an administration and general (A&G) expense loading factor and a transmission operation and maintenance (O&M) loading factor are added to the per kW investment to arrive at long-run transmission marginal cost.

The marginal transmission calculation including the split between demand and energy can be seen in the marginal cost study on page "Marginal Transmission Investment and O&M Expenses" (Sheet 'Transm1'). A summarized version of this page is "Marginal Cost of Transmission Investment and Associated Expenses" (Sheet 'Table 5').

MARGINAL DISTRIBUTION COSTS

Distribution costs are classified into three components: Demand-related, shown in dollars per kW/year, commitment-related, shown in dollars per customer/year, and billing-related, shown in dollars per customer/year. Commitment costs consist of the costs of transformers, poles, and conductor that are not determined by the level of demand customers place on the system. Demand-related costs are the additional costs of larger transformers, substations, poles, and conductors with sufficient capacity to serve the level of demand a customer class places on the system. Billing costs are the costs of meters, service drops, and customer accounting functions.

A summary of distribution marginal costs showing these three components is on page "Marginal Distribution & Billing Costs" (Sheet 'Table 6').

Marginal line transformer costs are calculated using a least squares regression analysis of the current installed cost versus size of the Company's commonly installed transformers. Commitment and demand costs are separated by the nature of the statistical technique.

The regression provides an intercept term, which represents the commitment costs, and a slope, which represents the demand cost per kW. The regression also identifies the additional costs of a three-phase transformer over a single-phase transformer.

Line transformer regression results are shown on page "Calculation of Escalation Factors for Transformers" (Sheet 'XFMR3'). Transformer demand costs are shown on page "Transformer Demand Costs" (Sheet 'XFMR2') and commitment costs are shown on page "Transformer Commitment Costs" (Sheet 'XFMR1').

Marginal costs of distribution poles and wires are calculated using the Company's Distribution Circuit Model (Sheets 'PC3' through 'PC14'). The circuit model focuses on several key characteristics that influence distribution cost of service. Among these are customer density, customer size and usage characteristics, and customer location on the circuit. The hypothetical circuit is constructed with seven branches of equal length using the composite line statistics for the state of Oregon. The model determines the cost of the circuit by using current cost estimates to construct one mile of distribution facilities using each of the Company's single- and three-phase wire sizes. The results are segregated into commitment related and demand related costs for each customer class. A more detailed description of the circuit model is included as an appendix to this narrative.

Marginal poles and wire costs are shown on page "Hypothetical Circuit Study Results Annual Demand and Commitment Costs" (Sheet 'PC1').

Marginal substation costs are determined using the per kW cost of budgeted and forecasted substation additions for the five-year period 2020 to 2024. As part of the capital budgeting process the company determines which substations are approaching their maximum design loading. When load can no longer be shifted to adjacent substations, an upgrade, either greater capacity at the substation or a new substation, is required. The capital investment in common year dollars is totaled across all projects and across the budget-planning horizon to produce total substation investment.

This substation investment is then multiplied by a substation utilization factor. The substation utilization factor is calculated by dividing the maximum distribution peak by the installed capacity of existing distribution substations. The distribution peak is expanded by transmission voltage level losses and substation thermal loading. Applying a utilization factor to distribution substation costs reflects the fact that substation capacity additions are typically done in blocks which result in some substations being close to being fully utilized and others operating well below peak capacity. This weighted substation investment is, finally, divided by the associated incremental substation capacity to get dollars/kW. The dollars/kW is adjusted to an annual value by applying a real levelized carrying charge. Substation marginal costs are classified entirely to demand, and are allocated to customer classes based on the distribution peak load for each class.

Page "Substation Investment" (Sheet 'DistSub2') shows the detail of the substation calculation. "Distribution Substation Costs / kW 2021 Dollars" (Sheet 'DistSub1') shows the annualized cost in dollars/kW.

The marginal cost of services includes the costs of new service drop investment plus associated O&M expense. Average service drop investments are determined for each customer load size by analyzing service requirements, such as single- or three-phase service and voltage level. Incremental service drop O&M is based on the average of 10 years of historical expenditures.

The metering category includes the marginal cost of metering equipment with associated O&M expense. Average meter investments are determined for each customer load size by analyzing service requirements, such as single- or three-phase service and voltage level. Meter O&M expense is based on historical expenditures.

The billing customer service/other category includes the costs of billing, payment processing, debt recovery, meter reading expenses and all remaining customer accounting and customer service activities. Customer accounting and customer service expense are based on the most recent five years of expenditures and are assigned to each customer class based on the various resources required to perform billing, collections, and customer service activities for different types of customers.

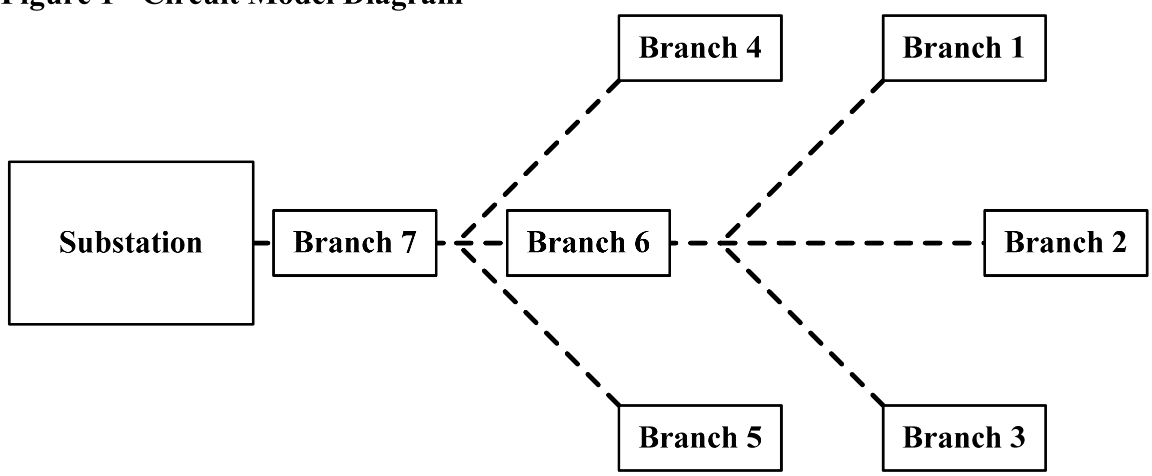
Weighted average installed service drop cost calculations are located on Sheets 'Services 1' through 'Services 3' and the weighted average installed meter cost calculations are included on Sheets 'Meters 1' through 'Meters 5'. The customer accounting and informational expense calculation is on page "Summary of Customer Accounting Expense by Schedule" (Sheet 'Cust Exp Sum'). These calculations are brought together on "Marginal Distribution & Billing Costs" (Sheet 'Table 6') to calculate metering reading, billing, collections and customer service related costs ($/Customer/Yr).

PacifiCorp
Distribution Circuit Model
PacifiCorp Distribution Circuit Model

General Overview

The PacifiCorp Distribution Circuit Model is included in Exhibit PAC/1407, Sheets PC 3 through PC 14 and calculates the cost of building a hypothetical circuit (Figure 1, below) with seven branches of equal length using the composite line statistics for a chosen state or service area. A hypothetical circuit is used rather than a sampling of actual existing circuits. This is because the diverse characteristics of PacifiCorp's six state service area, consisting of over 2,000 distribution circuits, makes the selection of any single, or small number of typical circuits impractical. The fundamental concept of the hypothetical circuit is to create a model that reduces the elements of distribution cost assignment to a workable form.

Figure 1 - Circuit Model Diagram



The circuit model focuses on several key characteristics that influence distribution cost of service. Among these are customer density, customer size and usage characteristics, and perhaps most importantly, customer location on the circuit. Each customer is assigned cost responsibility for all distribution facilities between the customer's location and the substation (upstream facilities), but no facilities beyond the customer's service location (downstream facilities). The model performs three basic functions. First, it estimates the total cost to build the composite circuit using current construction costs and state specific characteristics. Second, it divides the cost of each branch of the circuit between demand and commitment related costs. Third, it assigns the various types of costs to customer classes.

Required Engineering & Statistical Data

Listed below are the basic statistics that we use to calculate the composite circuit for a given state:

1. Current One Mile Line Construction Cost Estimates for Each Conductor Size
2. Economic Conductor Loading for Each Conductor Size

3. Overhead and Underground Line Miles
4. Number of Poles
5. Number of Circuits -- distribution line points of origin radiating from a substation.
6. Actual Customer Distances from Distribution Substations
7. Number of Customers and Loads by Class
8. Percentages of Three-Phase and Single-Phase Customers by Class

One Mile Line Estimate

The model determines the cost of the circuit by using cost estimates to construct one mile of distribution facilities using each of the Company's single- and three-phase wire sizes. These cost estimates are based on typical topography and equipment configuration for an average mile of line construction. Since the number of poles per mile varies between states, we use a factor to adjust the line cost estimate from the system wide average of 26.20 poles per mile to the state average poles per mile. For example, Oregon has an average of 26.13 poles per mile. Figure 2 shows the circuit cost per mile calculation for Oregon.

Figure 2 – Adjusted Oregon Line Costs per Mile

Customer Placement
One of the most significant cost drivers of marginal distribution costs is the distance between the customer and the substation. Costs increase as the distance from the substation increases.

The circuit model takes distance into account by assigning customers to the different branches of the circuit based upon actual customer locations. The actual customer distances are derived from PacifiCorp's outage management system. The system is able to accurately trace the flow of electricity from substation to customer as well as ascertain the exact distance it must travel.
Figure 3 shows the Customer Distribution on the Hypothetical Circuit Branch for Oregon.

LPS - Schedule 48T - > 4 MW (pri)	Large Customers are on dedicated circuits and are not included here							

Customer Density

The next significant driver of distribution costs is customer density. The model uses state specific line and customer statistics to calculate the average number of customers by circuit branch. Total state distribution line miles and state customers, by class, are divided by the number of distribution circuits in the state to determine the average length of the composite circuit (line miles / number of circuits) and the number of customers on the circuit (customers / circuits). Figure 4 shows the average number of customers located on each of the seven circuit branches for Oregon.

Load Accumulation

The kW load that a customer or class places on the system influences the size of the conductor necessary to serve the load. At each point on the circuit, the conductor must be sized to carry the entire downstream load. At the far ends of the outer branches, loads are minimal. As you move upstream closer to the substation, the load on the circuit becomes greater requiring larger conductor sizes. In the model, load can accumulate two ways. The first occurs as customers accumulate on a branch of the circuit. When enough customers, or load, accumulate it is necessary to increment up to the next wire size. Upstream from that point, customer segments increase in cost due to the increase in wire size. The second method of load accumulation is when several branches converge at a central point on the trunk of the circuit. The trunk branches must be of adequate size to carry the load of the customers on that branch plus all downstream branches.

Figure 5 shows the circuit kW loading on each of the circuit branches for Oregon. Loads are for customers located on that branch. Accumulated loads for branch 6 would be the combined loads of branches 1, 2, 3 and 6. Accumulated loads for branch 7 would be the combined loads of all branches.

Circuit Model Cost Assignment

Line statistics for the PacifiCorp service area show that the distribution system is predominately overhead. To calculate the cost of branch construction, miles per branch is calculated by taking the distance per circuit (total line miles / total number of circuits) and dividing it by the number of branches per circuit (7 branches, see figure 1). Next, using an assumption from distribution engineers that the typical outer branches are 25 percent single-phase, the circuit branch length is split between single- and three-phase. The total branch construction cost can then be calculated by taking the single- and three-phase distances per branch and multiplying them by the one mile construction costs for poles and conductors, as shown in figure 6. Costs are split between demand and commitment by assuming that the cost of constructing the branch with the smallest single-phase conductor and smallest pole is the commitment related portion and all costs above this amount are demand related. Trunk branches 6 and 7 are shown as 100% three-phase. Figure 6 shows the circuit costs per mile, costs for each branch and miles per branch broken out by single- and three-phase for Oregon.

Figure 6 – Adjusted Oregon Line Costs per Mile

	Account 364 Pole Cost per Mile			Account 365	Total Line

Miles per Branch	5.28
Single Phase Miles Per Branch	1.85
Three Phase Miles Per Branch	3.43

Customer Circuit Costs

After calculating the cost per mile for single- and three-phase construction for all of the branches, we compile the data and create a hypothetical circuit model branch cost sheet, as shown in figure 7. Figure 7 includes the total cost per circuit branch in columns (A) and (B), and the allocation of total cost between commitment and demand in columns (C) through (F) for Oregon.

Figure 7 – Oregon Hypothetical Circuit Model Branch Costs

Cost Sharing Calculation

As mentioned before, one of the critical factors of cost-responsibility is the location of a customer or class on the circuit branches. Customer classes that locate on all branches share cost responsibility for all branches of the circuit including the trunk. Large industrial customers, who locate on the trunk of the circuit, share cost responsibility for only the trunk. Cost responsibility is determined by calculating the percentage of demand, or percentage of customers, by class that share a particular branch of the circuit. The total branch costs are then multiplied by the share percentage, and the branch costs are totaled by class. To calculate the total branch cost, the applicable cost of branches 6 and 7 are assigned to customers on branches 1, 2, 3, 4 and 5. Demand costs calculated in an earlier step are allocated between customer classes at this point. Figure 8 shows this calculation along with the allocation of branch costs to the individual customer classes for Oregon. Demand costs are totaled for each customer class and divided by circuit kW to get demand cost in dollars/kW.

Commitment costs are calculated using a similar method. Commitment costs calculated in an earlier step are allocated to classes using percent of customers on a given branch. Commitment dollars are totaled by customer class then divided by the number of customers in the class to get commitment costs in dollars per customer. Figure 9 shows these calculations for Oregon.

Large Industrial Customers

Distribution studies have shown that very large industrial customers are not placed on a circuit in the same manner as residential or smaller commercial and industrial customers. Rather the customer is located very close to a substation (the average distance in Oregon is two-thirds of a mile) and has a dedicated circuit for their exclusive use. Since they have a dedicated circuit, they do not share in the costs of other common distribution investments, but they are responsible for the entire cost of the dedicated circuit. Dividing the total cost of a two-thirds of a mile circuit by the customer's kW determines the demand cost in dollars/kW for these customers. Table 10 shows this calculation for Oregon.

Table 10 – Oregon Dedicated Circuit Trunk Costs for Large Customers

	Voltage Delivery				
	Large GS + 4 MW (pri)			Large GS + 4 MW (sec)	
	Poles	Conductor		Poles	Conductor
Construction Cost Per Mile	$ 51,103	$ 110,152		$ 51,103	$ 110,152
Average Trunk Length	0.67	miles		0.67	miles
Total Construction Cost	$ 34,239	$ 73,802		$ 34,239	$ 73,802
Customer Peak Demand	4,637	kW		3,599	kW
Demand Cost $/kW	$7.38	$15.92		$9.51	$20.50

Summary

The final step in the circuit model is to bring the various results together in a single summary page. Table 11 shows the results calculated earlier in the study. Note that the dollars/customer and dollars/circuit kW is the distribution investment to serve that customer and not the price that the customer is expected to pay.

45									

Line	Item	Value
46	System property records & engineering information	
47	Number of pole feet in Oregon	75,328,924
48	Number of pole miles in Oregon	14,267
49	Number of trench feet in Oregon	28,218,782
50	Number of trench miles in Oregon	5,344
51	Total miles in Oregon	19,611
52	Number of circuits in Oregon	531
53	Number of poles in Oregon	372,724
54	Poles per mile	26.13
55	Customers per mile	30.89
56	MWh per customer	20.62
57	MWh per circuit	23,530
58	Branches per circuit	7
59	Miles per circuit	36.93
60	Miles per branch	5.28
61	Single Phase Miles per Branch[1]	1.85

[1]A 12 KV circuit 12 miles long has approx. 3 miles of single phase, which is approx. 25 percent of circuit distance, so applying 25% to the Miles per Circuit and dividing this amount by the 5 outer branches gives the Single Phase Miles per Branch.

36	Annual Econ Carrying + A&G Loading	7.86%	12.52%	22.15%	7.47%	7.58%

Footnotes:
From Financial Analysis -
** PV = Ln(5) x [1/r - (1/r)/(1+r)^a]

18.60*(1/0.0768-(1/0.0768)/(1+0.0768)^62)
16.90*(1/0.0768-(1/0.0768)/(1+0.0768)^52)

Where:
r = Nominal Interest Rate
a = Expected Investment Life

*** The Annual Charge Formula:

AC% = Ln(11) x k x {1/[1 - 1/(1+k)^a]}/(1+k)

Where:
k = real interest rate = (1 + r) / (1 + i) - 1
i = inflation rate = 2.2%
a = expected investment life
r = nominal interest rate
