RE: Advice No. 20-001
Docket UE 374 – PacifiCorp's Request for General Rate Revision

PacifiCorp d/b/a Pacific Power (PacifiCorp or Company) submits for filing an original and 20 copies of the following proposed tariff pages associated with the Company's Tariff P.U.C. OR No. 36, applicable to electric service in the State of Oregon, together with the Executive Summary and supporting direct testimony and exhibits. The tariffs reflect an effective date of January 1, 2021. Electronic versions of the testimony, exhibits, and workpapers is provided on an electronic storage device.

UE 374

In the Matter of PACIFICORP d/b/a PACIFIC POWER Request for a General Rate Revision.	**PACIFICORP'S EXECUTIVE SUMMARY**

I. INTRODUCTION

PacifiCorp d/b/a Pacific Power (PacifiCorp or the Company) is filing this request for a general rate revision under ORS 757.205 and ORS 757.220 to revise its schedules of rates and charges for electric service in Oregon, effective January 1, 2021. In this general rate case filing the Company is requesting an increase in rates of approximately $78.0 million, or 6 percent. The Company is also requesting recovery of costs related to the early closure of Cholla Unit 4, resulting in an increase of $17.3 million. Offsetting these increases, is the Company's proposal to amortize deferred tax benefits associated with the Tax Cuts and Jobs Act (TCJA), which reflects a decrease to rates of approximately $24.9 million. The combined effect of these three components is an increase in rates of approximately $70.8 million or 5.4 percent.[1] The revised rates produce revenues necessary to sustain a stable, reliable, and low-cost power supply, while preserving the Company's ability to attract capital for future investments. The Company files this executive summary and the attached Exhibit A in compliance with OAR 860-022-0019.

PacifiCorp is an electric company and public utility in Oregon within the meaning of ORS 757.005. The Public Utility Commission of Oregon (Commission) has jurisdiction over

[1] The net increase of $70.8 million, or 5.4 percent overall on January 1, 2021, consists of the proposed price change including resetting Schedule 299, the Rate Mitigation Adjustment, and the net impact to customers of separate tariff riders for proposed Schedule 195 – Federal Tax Act Adjustment and Schedule 197 – Generation Plant Removal Adjustment.

the prices and terms of PacifiCorp's electric service to its Oregon retail customers. The Company provides electric service to approximately 615,000 retail customers in Oregon and approximately 1.9 million total retail customers in California, Idaho, Oregon, Utah, Washington, and Wyoming. PacifiCorp's principal place of business is Portland, Oregon.

The Company requests that communications regarding this filing be addressed to:

II. CASE SUMMARY

This case is based upon a historical base period of 12 months ended June 2019, with normalizing and pro forma adjustments to calculate a calendar year 2021 future test period with the exception of capital additions, which are based on calendar year-end 2020 balances. The new rates will become effective no later than January 1, 2021, assuming application of the full nine-month statutory suspension period to the 30-day effective date now contained in the tariffs. Thus, the rate effective period closely aligns with the test period in this case.

A. Return on Equity

PacifiCorp is currently forecast to earn a return on equity (ROE) in Oregon of 9.3 percent on a normalized basis for the test period. The Company is requesting a change to its authorized ROE and capital structure in this case. An increase to 10.2 percent ROE is necessary to maintain the financial integrity of the Company, while ensuring its ability to provide safe, efficient, and reliable service to its Oregon customers with minimal rate impacts.

B. Cost Drivers

1. New System Investments

The Company continues to make new investments in the system required to provide safe, adequate, and reliable service to customers and to comply with regulatory mandates. This case includes investments in all facets of the system—including transmission, generation, and distribution—to bolster reliability and improve power delivery. For example, this filing includes the investments related to the new wind and repowering investments in PacifiCorp's Energy Vision 2020 project, PacifiCorp's Pryor Mountain project, and addition of a fish passage at the Company's Lewis River hydroelectric projects. Additional investments to transmission infrastructure, renewable resources, and pollution controls are included in the Company's revenue requirement.

2. Revised Depreciation Rates

The Company's need for this rate increase is driven, in part, by the impact associated with the revised depreciation rates proposed by the Company in docket UM 1968. The

Company filed its application for authority to implement revised depreciation rates on September 13, 2018. As part of that filing, the Company requested authority to implement the revised depreciation rates in its accounting system on January 1, 2021, which coincides with the beginning of the rate effective period in this proceeding. Additionally, PacifiCorp enlisted a third-party study of demolition and decommissioning costs of seven of its coal-fueled resources, to incorporate more accurate estimates of those costs in the depreciation schedules. Concurrent with this filing, PacifiCorp is filing supplemental testimony in docket UM 1968 to update the depreciable lives to be consistent with the 2019 Integrated Resource Plan and the 2020 PacifiCorp Inter-Jurisdictional Allocation Protocol (2020 Protocol) and to include the revised decommissioning costs consistent with the Decommissioning Study filed on January 16, 2020. The updated depreciable lives and the results of the decommissioning study have been incorporated into this general rate case.

3. Wildfire Mitigation Costs

PacifiCorp is adapting to the changes in wildfire risk through adoption of accelerated and enhanced wildfire mitigation measures as part of its wildfire mitigation program and will incur significant incremental capital costs over the next several years. The Company's revenue requirement includes both operations and maintenance and capital costs associated with wildfire-related issues. PacifiCorp is also proposing a mechanism to recover these costs going forward.

4. Coal-Fueled Plants

PacifiCorp is requesting recovery of investments in emissions control equipment installed at Hunter Unit 1, Jim Bridger Units 3-4, Hayden Units 1-2, and Craig Unit 2. PacifiCorp, and the joint owners of these facilities, installed selective catalytic reduction systems (SCR) at these facilities to reduce the emission of sulfur oxides and nitrous oxides, in compliance with applicable requirements. Also included in the revenue requirement are costs associated with the conversion of the Naughton Unit 3 facility from coal to gas, and a proposed treatment of costs associated with the closure of Cholla Unit 4 in 2020.

Additionally, in PacifiCorp's Multi-State Process, PacifiCorp and stakeholders from across its six-state service territory agreed on a new 2020 Protocol. The signatories to the 2020 Protocol agreed to a process for a state commission to approve discontinuing the use of an existing resource and exclusion of costs and benefits of that resource from customer rates through the issuance of an exit order setting an exit date. PacifiCorp is requesting that the Commission approve the requested exit dates identified for PacifiCorp's coal-fueled plants. PacifiCorp is also proposing a mechanism to remove from rates the costs from the coal plants following the exit dates.

5. Pricing Proposals

PacifiCorp is proposing a number of changes to pricing to modernize its tariffs to align with current usage and technology. For example, PacifiCorp is seeking changes to its street lighting programs to incentivize changes to light-emitting diode technology. PacifiCorp is also seeking to flatten its residential tiered rate structure and modify the basic charge for single- and multi-family service. Additionally, PacifiCorp proposes modernizing the time of use periods for its large non-residential customers and increasing the differential between on- and off-peak energy.

6. Annual Power Cost Adjustment

PacifiCorp is proposing a revision to its net power cost (NPC) forecasting process and true-up mechanism due to changing market conditions and additional resource variability.

D. Mitigating Factors

In light of the current economic climate, PacifiCorp is keenly aware of the financial pressures faced by its customers. The Company has therefore taken several steps to mitigate the rate increase request.

The Company has leveraged economies of scale to invest in non-emitting resources while simultaneously providing system savings to customers. Additionally, participation in the Energy Imbalance Market allows PacifiCorp to obtain the lowest-cost energy available in near real-time, facilitating access to zero-fuel-cost energy to benefit the region and Oregon. The Company's concurrently-filed Transition Adjustment Mechanism also reflects the power cost and production tax credit benefits of new renewables added to PacifiCorp's system. These benefits result in a concurrently-effective proposed rate decrease of $49.2 million, resulting in an overall rate increase of (general rate case and TAM combined) $21.6 million or 1.6 percent.

III. TESTIMONY SUMMARY

The Company's direct case consists of the testimony and exhibits of 14 witnesses:

Stefan A. Bird, President and Chief Executive Officer, Pacific Power, provides an overview of PacifiCorp, its Oregon service area, and the strategies the Company is pursuing to provide its customers with low-cost, reliable, and non-emitting generation.

Etta Lockey, Vice President, Regulation, provides an overview of PacifiCorp's current filing and support of the Company's policy positions throughout this filing.

Nikki L. Kobliha, Chief Financial Officer, addresses the Company's overall cost of capital recommendation for the Company, including a capital structure to maximize value and minimize risk, implementation of the effects of the TCJA consistent with recent Commission decisions, and the Company's projected pension costs.

Ann E. Bulkley, economist and principal at Concentric Energy Advisors, provides a comparison of PacifiCorp's business and financial risk compared to peer utilities, recommends a cost of equity, and provides supporting analyses.

Michael G. Wilding, Director of Net Power Costs and Regulatory Policy, addresses proposed changes to the Company's Transition Adjustment Mechanism and Power Cost Adjustment Mechanism.

Frank C. Graves, principal with the Brattle Group, testifies regarding the shifting landscape for PacifiCorp which requires reexamination of the ratemaking mechanisms that the Company has used to forecast and recover NPC.

Rick T. Link, Vice President, Resource Planning and Acquisition, provides the economic analysis supporting the Energy Vision 2020 project, including wind repowering and the new wind and transmission projects, the Pryor Mountain project, the retirement of Cholla Unit 4, the conversion of Naughton Unit 3 to gas, and the installation of emission control systems at Jim Bridger Units 3-4. Mr. Link also presents the Company's load forecast.

Chad A. Teply, Senior Vice President of Business Policy and Development, provides an overview of the development, implementation, and costs of the Energy Vision 2020 project and the Pryor Mountain project, conversion of Naughton Unit 3 to gas, and the emission control retrofit projects at certain coal fueled power plants.

Timothy J. Hemstreet, Managing Director of Renewable Energy and Business Development, provides an overview of the Foote Creek I repowering project and the Merwin Fish Collection and Sorting System on the Lewis River.

Richard A. Vail, Vice President of Transmission Services, discusses the transmission additions necessary to complement the wind generation portfolio expansion as part of the Energy Vision 2020 projects, including construction of the 500 kilovolt Aeolus-to-Bridger/Anticline transmission line, and addresses other important system upgrades.

David M. Lucas, Vice President of Transmission and Distribution Operations, discusses wildfire risk and the Company's incremental investments in wildfire mitigation, and supports other projects including the Oregon Advanced Metering Infrastructure Project.

Melissa S. Nottingham, Manager of Customer Advocacy, proposes updates to PacifiCorp's miscellaneous services and fees to reflect prices that are reasonable, fair, and cost-based.

Shelley E. McCoy, Revenue Requirement Manager, summarizes the overall test period revenue requirement, pro forma adjustments, and the rate base calculation methodology.

Robert M. Meredith, Director of Pricing and Cost of Service, provides PacifiCorp's allocation and rate design, and discusses how the proposed tariff changes recover the proposed 2021 revenue requirement to achieve fair, just, and reasonable prices for customers.

IV. CONCLUSION

The Company requests that the Commission issue an order approving the proposed rate changes and tariffs described above.

Respectfully submitted February 14, 2020.

Docket No. UE 374
Exhibit PAC/100
Witness: Stefan A. Bird

BEFORE THE PUBLIC UTILITY COMMISSION

OF OREGON

PACIFICORP

Direct Testimony of Stefan A. Bird

February 2020

TABLE OF CONTENTS

ATTACHED EXHIBITS

I. INTRODUCTION AND QUALIFICATIONS

Q. Please state your name, business address, and present position with PacifiCorp.

A. My name is Stefan A. Bird, and my business address is 825 NE Multnomah Street, Suite 2000, Portland, Oregon 97232. I am currently employed as President and Chief Executive Officer of Pacific Power. I am testifying for PacifiCorp d/b/a Pacific Power (PacifiCorp or the Company).

Q. Please describe your education and professional experience.

A. I hold a Bachelor of Science in mechanical engineering from Kansas State University. I joined PacifiCorp in January 2007, where I held the position of Senior Vice President of commercial and trading[1] until I assumed my current position in March 2015. From 2003 to 2006, I served as president of CalEnergy Generation U.S., a developer, owner, and operator of qualifying facilities (QF) and merchant generation assets. From 1999 to 2003, I was vice president of acquisitions and development for Berkshire Hathaway Energy, formerly known as MidAmerican Energy Holdings Company. From 1989 to 1997, I held various positions at Koch Industries, Inc., including energy marketing, financial services, corporate acquisitions, project engineering, and maintenance planning in the Americas and Europe.

II. PURPOSE OF TESTIMONY

Q. What is the purpose of your direct testimony in this case?

A. My testimony provides an overview of PacifiCorp, its Oregon service area, and the strategies the Company is pursuing to provide its Oregon customers with low-cost,

[1] In this capacity, I oversaw PacifiCorp's system dispatch and balancing operations, wholesale power and natural gas risk management, regulatory net power cost recovery, load forecasting, integrated resource planning and resource acquisitions.

reliable, and non-emitting generation to power their homes, businesses, and communities. I also explain the progress PacifiCorp has made since its last full general rate case, docket UE-263 (2013 Rate Case),[2] to deliver these essential customer benefits. Finally, I introduce the Company witnesses that provide direct testimony in support of PacifiCorp's rate request.

III. DESCRIPTION OF PACIFICORP AND OREGON SERVICE AREA

Q. Please provide a brief description of PacifiCorp.

A. As an investor-owned, multi-jurisdictional electric utility, PacifiCorp serves nearly two million customers in six western states: California, Idaho, Oregon, Utah, Washington, and Wyoming. The Company serves its customers with a vast, integrated system of generation and transmission that spans 10 states and connects customers and communities across the West. PacifiCorp's integrated system provides benefits to customers in all six states and includes generation, transmission, and distribution assets. PacifiCorp owns, or has interests in thermal, hydroelectric, wind-powered, solar, and geothermal generating facilities, with a net-owned capacity of 10,894 megawatts (MW). PacifiCorp buys and sells electricity on the wholesale market with other utilities, energy marketing companies, financial institutions, and other market participants to balance and optimize the economic benefits of electricity generation, retail customer loads, and existing wholesale transactions.

PacifiCorp provides wholesale transmission service under its open access transmission tariff approved by the Federal Energy Regulatory Commission and owns or has interests in approximately 16,500 miles of transmission lines. PacifiCorp

[2] *In the matter of PacifiCorp, dba Pac. Power,* Docket No. UE 263, Order No. 13-474 (Dec. 18, 2013).

operates two Balancing Authority Areas (BAAs)—PacifiCorp Balancing Authority Area East (PACE) and PacifiCorp Balancing Authority Area West (PACW) that together comprise the largest privately owned and operated grid in the Western United States.

Q. What are the advantages of PacifiCorp's large regional footprint?

A. PacifiCorp's integrated system allows PacifiCorp to deliver low-cost generation from some of the best renewable generation sites in the country to PacifiCorp's customers, reducing power costs and emissions for customers, and supporting local economies and communities throughout the West. As PacifiCorp looks toward the future, there are even more opportunities for customers to benefit from the connected west that PacifiCorp's integrated system creates. These opportunities may come from participation in a regional resource adequacy program or expansion of markets that allow participants to more efficiently operate their systems. PacifiCorp is and will remain actively engaged in finding additional ways to leverage our vast, integrated system for the benefit of our customers.

Q. Please describe PacifiCorp's Oregon service area.

A. In Oregon, PacifiCorp serves approximately 615,000 customers. Maps of the Company's service territory are provided in Exhibit PAC/101. The Company's Oregon service area is comprised of urban and rural areas. PacifiCorp's sales and revenues are distributed among residential customers, small businesses, and large businesses served under retail tariffs subject to the jurisdiction of the Public Utility Commission of Oregon (Commission). Table 1 below provides the June 2019 number of retail customers and usage for each of the major customer classes that account for the majority of the Company's customer base.

Table 1: Number of Customers and Usage in PacifiCorp's Oregon Service Area

Class	Number of Customers	Usage (megawatt-hours)
Residential	527,003	5,615,069
Commercial	77,267	5,373,138
Industrial	1,775	1,617,437
Irrigation	7,984	351,867
Lighting	1,447	38,375
Total	615,477	12,995,886

Q. What are some of the ways PacifiCorp engages with its communities and customers within its Oregon service area?

A. PacifiCorp is a proud member of its Oregon communities. Over the last several years, the Company deepened its connection to its communities in a variety of ways.

The Company has sponsored a number of community events that focused on the fields of science, technology, engineering, the arts, and mathematics (STEAM). Invent 2018 and Invent 2019, which were held in Grants Pass in October 2018 and October 2019, were interactive community event that showcased local innovation and STEAM. Invent was designed as an interactive events for individuals and families with activities that included drone flying, virtual reality, graphic design, designing and testing wind turbine blades, cooking with solar ovens, art stations, woodworking, and screen printing. Educational opportunities available at the event included an introduction to the Rogue Community College Innovation Hub, a STEAM focused education space; energy education; and information about existing community programs. The Company will also be involved in Invent 2020.

PacifiCorp is also sponsoring the Columbia River Maritime Museum Miniboat Program, which is a global, multidisciplinary STEAM learning experience for 5th, 6th, and 7th graders in Oregon and Southwest Washington and Japan. In the program, students cooperatively design, build, launch, and track seaworthy, GPS-equipped, solar-powered miniboats on a journey across the Pacific Ocean. In addition to financial participation, PacifiCorp has provided mentors from engineering, public relations, and renewable energy operations. The Company is also aiding in publicizing the program to gain additional sponsors in years to come.

PacifiCorp is also engaged in transportation electrification efforts within the state. Recognizing that the electric transportation market is in an emerging market that represents an opportunity for improved air quality, reduced greenhouse gas emissions, and financial benefits for drivers, including low- and moderate-income populations, PacifiCorp is investing over $26 million across its system to support electric vehicle fast chargers along key corridors, including in Oregon. In Oregon that includes $7.6 million approved for current programs through 2020, including over $1 million in awarded grants for charging infrastructure. The first PacifiCorp-operated fast chargers opened in December 2019 in Madras with four more locations anticipated by the end of 2020.

For the ever-increasing engagement with customers who interact with us on our digital platform, the Company overhauled its website to make customer transactions faster, easier, and more secure. To increase customer awareness during service interruptions, PacifiCorp improved its outage map and outage status communications through multiple channels.

These are just some of the recent examples of PacifiCorp's engagement with its Oregon customers and communities.

Q. Please describe PacifiCorp's core principle with respect to providing service to customers.

A. PacifiCorp's core principle is to provide sustainable energy solutions in the form of safe, reliable, and affordable energy to customers in Oregon and throughout the West. The Company has upheld this ideal for close to 110 years and remains steadfast in this commitment even as the electricity sector transforms through public policies, emerging and maturing technologies, and the rise of a regional energy market. The Company is meeting the new demands of this transformation without losing focus on its commitment to delivering safe, reliable, and affordable energy.

PacifiCorp is at a pivotal moment as our system adapts to changing market conditions for generating resources and increasing demand from customers for energy from specific types of generating resources. PacifiCorp is uniquely positioned to respond to these changes as the result of our vast energy system and geographically diverse generation footprint, which is facilitated by our expansive transmission system.

IV. COMPANY INVESTMENTS SINCE THE 2013 RATE CASE

Q. Please describe PacifiCorp's continuous adaptation to the changing energy landscape while keeping electricity affordable.

A. Since the 2013 Rate Case, PacifiCorp has taken many steps to meet the challenges of the changing energy landscape while keeping electricity affordable. These steps include investing in cost-effective sustainable energy solutions to facilitate a transition on PacifiCorp's system including deploying market solutions and technologies that empower our customers and improve service, development of Energy Vision 2020, and pursuing the 2019 Integrated Resource Plan (IRP) action plan.

For example, the Company partnered with the California Independent System Operator (CAISO) to create the Energy Imbalance Market (EIM) and has supported the successful expansion of the EIM across the West. PacifiCorp is currently working with stakeholders to explore the potential for an Extended Day-Ahead Market (EDAM) to further increase customer savings and maximize use of non-emitting resources.

PacifiCorp has taken advantage of the declining cost of renewable energy resources and the availability of federal production tax credits (PTCs) to invest in new renewable resources and transmission in the West including its Energy Vision 2020 projects, which are nearing completion.

Also, to enable its customers to make informed decisions about their energy service, PacifiCorp deployed the Oregon Advanced Metering Infrastructure (AMI)

Project, which provides a number of customer benefits, such as lowering costs and improving reliability while empowering customers to better manage their energy use.

Q. Please explain the EIM and EDAM.

A. The EIM is a real-time bulk power trading market, which uses advanced market systems to automatically find and deliver the lowest-cost energy to serve customer demand on a real-time basis across a wide geographic area. Utilities voluntarily participating in the EIM maintain control over their assets and remain responsible for balancing requirements while sharing in the benefits the market produces. Additional benefits of the EIM include improved situational awareness for increased reliability and more effective integration of renewables and utilization of the transmission system.

Since the CAISO and PacifiCorp, the first participants, launched the market in November 2014, the EIM has produced benefits of $861.8 million, as of December 31, 2019.[3] PacifiCorp customers' share of the EIM benefits are an estimated $235.3 million.[4] In addition to monetary benefits, participation in the EIM has enabled PacifiCorp to operate its thermal generation fleet to more closely follow variable-energy resources such as wind and solar. As a result of this change in operation, in 2016 there was a step-change reduction in PacifiCorp's carbon dioxide (CO_2) emissions of approximately five million tons as compared to the 2011 to 2015 annual average emissions. This step-change reduction has been maintained through 2019—equaling an approximate reduction in CO_2 emissions of 20 million tons over

[3] *See* BENEFITS, WESTERN ENERGY IMBALANCE MARKET, https://www.westerneim.com/Pages/About/QuarterlyBenefits.aspx (last visited Feb. 1, 2020).
[4] *Id.*

four years of EIM operation. Since its inception, nine utilities have joined the EIM, and 11 more have committed to join by 2022. Together, this represents over 70 percent of the West's total electricity demand. PacifiCorp customers and customers of other market participants have benefited as market participation has grown.

More recently, the CAISO launched a stakeholder process to explore the expansion of the EIM to a day-ahead framework, the EDAM. The EDAM initiative is looking to develop an approach to extend participation in a day-ahead market to the EIM entities in a framework similar to the existing EIM approach for the real-time market, rather than requiring full integration into the CAISO BAA. The EDAM is expected to improve market efficiency by integrating renewable resources using day-ahead unit commitment and scheduling across a larger area. With an appropriate market design, PacifiCorp expects that expansion of the EIM to the EDAM will be a critical component to cost-effectively de-carbonize PacifiCorp's system and integrate its aggressive renewable portfolio strategy set forth in the 2019 IRP.

Q. Please explain how the Company is investing in a cleaner energy future.

A. PacifiCorp's Energy Vision 2020 projects increase PacifiCorp's non-emitting generation portfolio with new and repowered wind generation resources and new transmission, while leveraging federal PTCs to provide savings to customers over the life of the projects. These investments support an energy future that decreases greenhouse gas emissions, while providing benefits to customers over the lives of the resources. Please see the direct testimony of Mr. Rick T. Link for further discussion of customer benefits associated with Energy Vision 2020.

Energy Vision 2020 consists of two major components: (1) wind repowering; and (2) investments in new wind and transmission. These new projects deliver more wind generation to PacifiCorp's system along with long-term savings for customers. Please see the direct testimony of Mr. Chad A. Teply, Mr. Timothy J. Hemstreet, and Mr. Richard A. Vail, who address the new wind generation projects, wind repowering, and transmission projects, respectively, associated with Energy Vision 2020.[5]

Q. Will the 2019 IRP further increase the Company's energy diversity in the Western United States?

A. Yes. In the 2019 IRP, PacifiCorp's preferred portfolio indicates a need to further expand its portfolio with new low-cost wind generation, solar generation, storage, and demand-side resources to meet changing customer needs. PacifiCorp's 2019 IRP provides the roadmap by which the Company will reduce greenhouse gas emissions over the next 20 years. As reflected in the 2019 IRP, the Company will be acquiring nearly 14,000 MW of new non-emitting generation and storage by 2038. Further, by 2030, PacifiCorp will have reduced greenhouse gas emissions system-wide by nearly 60 percent from 2005 levels. Figure 1 shows the Emission Reductions, Wind and Solar Capacity, and Energy Cost Savings associated with the 2019 IRP preferred portfolio.

PacifiCorp's 2019 IRP supports the Company's broader three-point strategy (noted below). This strategy recognizes three key, inter-related focus areas that must

[5] All of the Company's repowering projects have been addressed in proceedings before the Commission, with the exception of Foote Creek I, which is addressed in the direct testimony by Mr. Hemstreet in this general rate case. *See In the matter of PacifiCorp, dba Pac. Power, 2019 Renewable Adjustment Clause*, Docket No. UE 352, Order 19-304, pp. 8-9. *See also In the matter of PacifiCorp, dba Pac. Power, 2020 Renewable Adjustment Clause*, Docket No. UE 369, Stipulation and supporting Joint Testimony filed on January 31, 2020. The Commission has not yet ruled on the Stipulation entered into by the parties in Docket No. UE 369.

work in concert to de-carbonize the West, while simultaneously meeting the essential requirements of being a low-cost, reliable and safe energy provider.

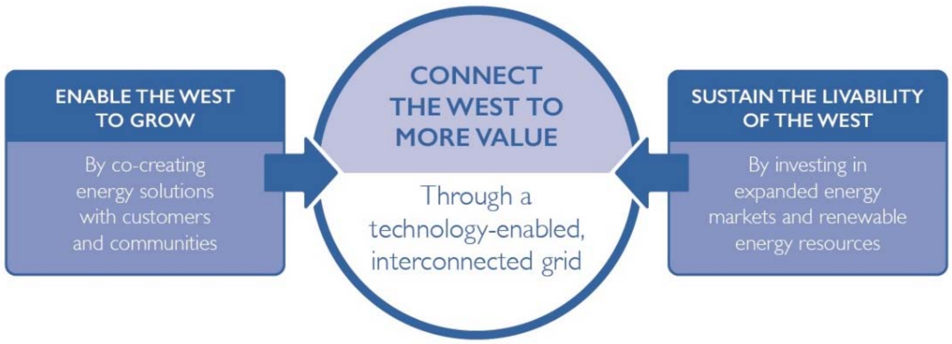

Figure 1: Emission Reductions, Wind and Solar Capacity, and Energy Cost Savings[6]

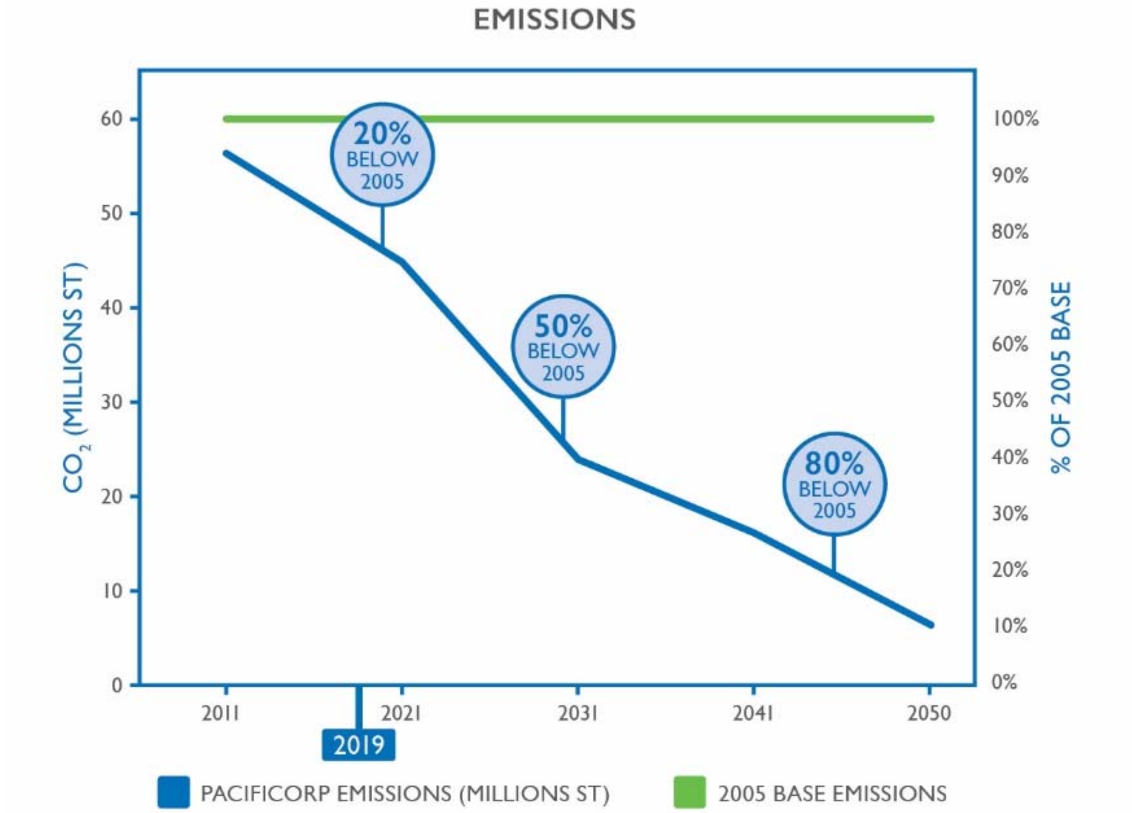

[6] Source: PacifiCorp 2019 IRP filed on October 18, 2019, in Docket No. LC 70. I note that the Energy Cost Savings Chart reflects EIM benefits at the time of the 2019 IRP. The EIM benefits that I discuss are the total benefits updated as of December 31, 2019.

PACIFICORP ENERGY COST SAVINGS DUE TO EIM PARTICIPATION

Q. Has the Company recently taken additional steps to reduce greenhouse gas emissions on its system?

A. Yes. As the Company moves toward increasing reliance on new non-emitting generation, PacifiCorp is continuing to evaluate the economics of the early retirement of its existing coal-fueled power plants. On December 27, 2019, the Company announced it would retire Cholla Unit 4 by December 31, 2020. The Cholla power plant consists of four units located near Joseph City, Arizona, with a combined generating capability of 995 MW. PacifiCorp owns approximately 37 percent of the plant's common facilities and 100 percent of Unit 4 which was commissioned in 1981 with a generating capability of 395 MW.

The Company's 2017 IRP[7] and 2019 IRP[8] both identified the retirement of Cholla Unit 4 as early as 2020. Based on an economic analysis conducted following the 2019 IRP, which is discussed in the direct testimony of Mr. Link, PacifiCorp initiated the process of retiring Unit 4 and anticipates being able to achieve retirement by year-end 2020. The early retirement of Cholla Unit 4 is not only in line with reducing greenhouse gas emissions system-wide, but also the Oregon law that eliminates coal from PacifiCorp's rates by 2030.[9]

---

[7] PacifiCorp, 2017 IRP (Apr. 4, 2017), vol. I, p. 7, 20; PacifiCorp, 2017 IRP Update (May 1, 2018), p. 12 (Docket No. LC 67).
[8] PacifiCorp, 2019 IRP (Oct. 18, 2019), vol. I, p. 98 (Docket No. LC 70).
[9] See Section 1(2) of Senate Bill 1547, effective date Mar. 8, 2016. See https://olis.leg.state.or.us/liz/2016R1/Downloads/MeasureDocument/SB1547/Enrolled.

Q. Please describe how PacifiCorp's investment in these initiatives benefits customers in Oregon.

A. PacifiCorp is uniquely situated to leverage economies of scale to invest in non-emitting resources while simultaneously providing system savings to customers. Participation in the EIM allows PacifiCorp to obtain the lowest-cost energy available in near real-time, facilitating access to zero-fuel-cost energy to benefit the region and Oregon. If there is excess solar energy in California, excess wind in Wyoming, or excess hydropower in the Pacific Northwest, the Company can transport that low-cost energy across the grid and displace higher cost resources.

PacifiCorp's Energy Vision 2020 projects represent an investment not just in decarbonizing PacifiCorp's generation portfolio and increasing the Company's renewable capacity, but also in directly benefiting communities across the West. The Energy Vision 2020 projects have created hundreds of construction jobs, and have added millions of dollars in construction tax revenue and ongoing annual state and local tax revenue in Oregon, Washington, and Wyoming. In the past 13 years, PacifiCorp has become the largest regulated owner of wind generation in the West. From 2018 to 2020, the Company will have increased the percentage of non-emitting resources in our portfolio by 70 percent.

Q. Since the 2013 Rate Case, in addition to sustainable energy solutions described above, has PacifiCorp deployed technologies that empower its customers and improves service?

A. Yes. PacifiCorp's core principle is to provide sustainable energy solutions in the form of safe, reliable, affordable, and increasingly clean energy to customers. The

Company has and continues to take steps to provide sustainable energy solutions in the form of investments as I have explained above. In addition, PacifiCorp has deployed the Oregon AMI Project, which provides a number of benefits including empowering customers to reduce and manage their energy costs.

Q. Please describe the Oregon AMI Project.

A. Completed in 2019, the Company's Oregon AMI Project is comprised of four parts: the installation of over 600,000 AMI meters; the installation of a field area network; the development, installation, and configuration of information technology software; and the development of an energy usage website. The Oregon AMI Project offers a wide range of customer benefits. The Company's operating costs decrease through the reduction or elimination of costs related to meter reading, which directly impact customer rates. Because the Company has greater visibility of its system, the Company is able to react faster to outage information. Armed with hourly energy consumption, customers can make informed decisions about their energy usage. With this granular data, the Oregon AMI Project investment can facilitate residential demand response programs to support the bulk power system. For more details about the Oregon AMI Project and expected benefits, see the direct testimony of Company witness Mr. David M. Lucas.

V. INTRODUCTION OF COMPANY WITNESSES

Q. How is PacifiCorp presenting this case?

A. PacifiCorp is presenting the following direct testimony in support of its rate case filing:

- In Exhibit PAC/200, Etta Lockey, Vice President of Regulation, will describe PacifiCorp's request in this proceeding and summarize the regulatory policy of the Company.

- In Exhibit PAC/300, Nikki L. Kobliha, PacifiCorp's Chief Financial Officer, will provide the Company's overall cost of capital recommendation for the Company, including a capital structure to maximize value and minimize risk. Ms. Kobliha also describes PacifiCorp's implementation of the effects of the Tax Cuts and Jobs Act consistent with recent Commission decisions. Finally, she supports the Company's projected pension costs.

- In Exhibit PAC/400, Ann E. Bulkley, economist and principal at Concentric Energy Advisors, provides a comparison of PacifiCorp's business and financial risk compared to peer utilities, recommends a cost of equity, and provides supporting analyses.

- In Exhibit PAC/500, Michael G. Wilding, the Company's Director of Net Power Costs and Regulatory Policy, addresses proposed changes to the Company's Transition Adjustment Mechanism and Power Cost Adjustment Mechanism.

- In Exhibit PAC/600, Frank C. Graves, principal with the Brattle Group, also testifies regarding the shifting landscape for PacifiCorp which requires reexamination of the ratemaking mechanisms that the Company has used to forecast and recover net power cost.

- In Exhibit PAC/700, Rick T. Link, PacifiCorp's Vice President of Resource Planning and Acquisition, provides the economic analysis supporting the Energy Vision 2020 projects, including wind repowering and the new wind and transmission projects. Mr. Link also provides the economic analyses of the Pryor Mountain Wind Project, the retirement of Cholla Unit 4, the conversion of Naughton Unit 3, and the installation of selective catalytic reduction emission control systems at Jim Bridger Units 3 and 4. Finally, he presents the Company's load forecast.

- In Exhibit PAC/800, Chad A. Teply, PacifiCorp's Senior Vice President of Business Policy and Development, provides an overview of the development, implementation, and costs of the Energy Vision 2020 Wind Projects and the Pryor Mountain Wind Project. Mr. Teply supports the costs to complete the emission control retrofit projects at certain coal fueled power plants. Finally, he discusses the conversion to gas at Naughton Unit 3.

- In Exhibit PAC/900, Timothy J. Hemstreet, the Company's Managing Director of Renewable Energy and Business Development, provides an overview of the Foote Creek I repowering project and the Merwin Fish Collection and Sorting System on the Lewis River.

- In Exhibit PAC/1000, Richard A. Vail, PacifiCorp's Vice President of Transmission Services, discusses the transmission additions necessary to complement the wind generation portfolio expansion as part of the Energy Vision 2020 projects, including construction of the 500 kilovolt Aeolus-to-Bridger/Anticline transmission line, and addresses other important system upgrades.

- In Exhibit PAC/1100, David M. Lucas, the Company's Vice President of Transmission and Distribution Operations, discusses wildfire risk and the Company's wildfire mitigation efforts in Oregon. He also supports other projects including the Oregon AMI Project.

- In Exhibit PAC/1200, Melissa S. Nottingham, Manager of Customer Advocacy, proposes updates to PacifiCorp's miscellaneous services and fees to reflect prices that are reasonable, fair, and cost-based.

- In Exhibit PAC/1300, Shelley E. McCoy, PacifiCorp's Revenue Requirement Manager, summarizes the overall test year revenue requirement, pro forma adjustments, and the rate base calculation methodology.

- In Exhibit PAC/1400, Robert M. Meredith, Director of Pricing and Cost of Service, provides PacifiCorp's allocation and rate design, and discusses how the proposed tariff changes recover the proposed 2021 revenue requirement to achieve fair, just, and reasonable prices for customers.

Q. Does this conclude your direct testimony?

A. Yes, it does.

I. INTRODUCTION AND QUALIFICATIONS

Q. Please state your name, business address, and present position with PacifiCorp.

A. My name is Etta Lockey and my business address is 825 NE Multnomah Street, Suite 2000, Portland, Oregon 97232. I am currently employed as Vice President, Regulation. I am testifying for PacifiCorp d/b/a Pacific Power (PacifiCorp or the Company).

Q. Please describe your education and professional experience.

A. I have a Bachelor of Arts degree in Political Science from the University of Oregon and a Juris Doctorate from the Northwestern School of Law of Lewis and Clark College. I started at PacifiCorp as an attorney in 2013 and assumed my current role as Vice President, Regulation in 2017.

Q. Have you testified in other regulatory proceedings?

A. Yes. I have sponsored testimony on behalf of PacifiCorp in California, Oregon, and Washington.

II. PURPOSE OF TESTIMONY

Q. What is the purpose of your direct testimony in this case?

A. I provide an overview of PacifiCorp's current filing and support the Company's policy positions throughout this filing. Among other things, I give context for this rate filing, which comes at a pivotal time for PacifiCorp. The Company is responding proactively to rapidly changing market conditions, including through implementation of our Energy Vision 2020 plan and implementation of the 2019 Integrated Resource Plan (IRP) action plan, which embodies our commitment to a future that benefits our customers, our communities, and the environment with low-cost renewable generating resources.

The overall impact to customer rates as a result of this general rate case filing and the Company's Transition Adjustment Mechanism (TAM) filing is an increase of $21.6 million, or an average rate increase of 1.6 percent, which consists of four main components. First, in this general rate case filing, the Company is requesting an increase in rates of approximately $78.0 million, or 6 percent. Second, the Company is requesting recovery of costs related to the early closure of Cholla Unit 4, resulting in an increase of $17.3 million. Third, offsetting these increases is the Company's proposal, set forth in the testimony of Ms. Shelley E. McCoy, to amortize deferred tax benefits associated with the Tax Cuts and Jobs Act (TCJA), which reflects a decrease to rates of approximately $24.9 million. Finally, offsetting the rate increase in this general rate case is a $49.2 million decrease in rates proposed in the concurrently filed TAM; the rate effective date in the case and the in the TAM are both January 1, 2021.

The modest request in this case demonstrates PacifiCorp's prudent and efficient management of its costs that has allowed the Company to stay out of general rate cases beyond its commitment made in its last general rate case, docket UE 263 (2013 Rate Case),[1] all while adhering to the core principle of providing sustainable energy solutions in the form of safe, reliable, and affordable service for customers. In addition, the request in this case and the concurrently filed TAM bring to customers

[1] In its 2013 Rate Case, the company committed to not filing a rate case prior to January 1, 2016. *See In the matter of PacifiCorp, dba Pacific Power, Request for a General Rate Revision*, Docket No. UE 263, Order No.13-474, at 6 (Dec. 18, 2013). In a letter to its Oregon customers, PacifiCorp further committed not to file a general rate case prior to January 1, 2018.

the benefits of low-cost new and repowered resources that lower net power costs and pass along the savings of federal production tax credits (PTCs)

Q. How is your testimony structured?

A. Section III of my testimony provides an overview of PacifiCorp's last rate case filing. Section IV provides an overview of this rate case filing, including a discussion of key drivers. Section V discusses certain regulatory mechanisms that the Company is proposing in this proceeding that relate to plant generation transition costs and the retirement of Cholla Unit 4. Section VI discusses the Company' proposed regulatory mechanism to recover costs associated with the Company' wildfire mitigation efforts.

Q. Please summarize the recommendations you make in your direct testimony.

A. I recommend that the Public Utility Commission of Oregon (Commission):

- Authorize an overall increase of $70.8 million[2] or approximately 5.4 percent, which is primarily comprised of (1) an increase in rates of $78.0 million related to a non-net power costs (NPC) revenue requirement of $1,045.7 million; (2) an increase of $17.3 million for the recovery of costs related to the early retirement of Cholla Unit 4; and (3) a decrease of approximately $24.9 million related to the amortization of deferred tax benefits associated with the TCJA results. The support for the overall increase is set forth in my testimony and the testimony of the other Company witnesses;

- Approve as prudent the Company's request to include the incremental additions to the Company's rate base, including Energy Vision 2020 and the Pryor Mountain Wind Project, the installation of emission control retrofits on certain generating plants, the conversion of Naughton Unit 3 to gas, advanced metering infrastructure (AMI), and wildfire mitigation costs for a total rate base of approximately $4.2 billion, as discussed in the testimony of various witnesses in this rate case;

- Approve Exit Dates and issue Exit Orders for coal-fired resources consistent with the dates described in my testimony;

- Approve the proposed Generation Plant Removal Adjustment described in my testimony;

[2] When the impact of the Company's TAM filing is incorporated, the total impact to rates is an increase of $21.6 million.

- Approve the proposed decommissioning balancing account for coal-fired resources that do not operate beyond Oregon's depreciable life;
- Approve the proposed Wildfire Mitigation Cost Recovery Mechanism discussed in my testimony;
- Approve an overall cost of capital of 7.68 percent, which is comprised of a capital structure of 53.52 percent equity, 46.47 percent long-term debt, and 0.01 percent preferred stock as supported by Ms. Nikki L. Kobliha; and a return on equity (ROE) of 10.2 percent as supported by Ms. Ann E. Bulkley;
- Approve as prudent and include in rates costs associated with the Company's wildfire mitigation efforts and costs to repair damaged equipment following the Delta wildfire, as supported in the testimony of Mr. David M. Lucas;
- Approve the changes to Schedule 300, Rule 10, and Rule 11D and the proposals for certain bill credits set forth in the testimony of Ms. Melissa S. Nottingham;
- Approve return of $71.7 million of deferred tax benefits to customers over a three-year period as discussed in the testimony of Ms. McCoy;
- Approve the Company's proposed treatment of costs associated with the closure of Cholla Unit 4 in 2020 as described in the testimony of Ms. McCoy; and
- Approve the innovative and equitable cost of service and rate design proposals set forth in the testimony of Mr. Robert M. Meredith.

Q. Are you also sponsoring exhibits to your testimony?

A. Yes, I am sponsoring Exhibit PAC/201, which is a comparison of PacifiCorp's Oregon rates to national averages.

III. PREVIOUS RATE CASE HISTORY

Q. Please discuss PacifiCorp's most recent general rate case and its outcome.

A. PacifiCorp's efficient management of costs has allowed the Company to file only one general rate case in the last seven years. On March 1, 2013, the Company filed its 2013 Rate Case requesting an increase in revenues from Oregon operations for an overall price change of 4.6 percent or $56.0 million. Based on a stipulation agreed to by the parties and approved by the Commission, PacifiCorp was authorized a $23.7 million rate increase.[3]

Q. What is the Company's overall retail average rate change in Oregon since 2013?

A. Since the conclusion of the Company's 2013 Rate Case with rates effective January 1, 2014, the Company's Oregon customers have seen a modest overall average retail rate increase of only 3.0 percent, from 9.27 cents per kilowatt-hour (kWh) to 9.55 cents per kWh. This is well below inflation over this same time period.[4]

Q. How does the overall retail average rate compare to the national average?

A. PacifiCorp's efficient operations and focus on rate stability for customers have resulted in the Company's average price being approximately 11 percent lower than the national average of 10.83 cents per kWh for the 12 months ending December 31, 2018, as reported by the Edison Electric Institute Winter 2019 Typical Bills and Average Rates Report. Attached to my testimony as Exhibit PAC/201 is a chart comparing PacifiCorp's Oregon rates to national averages.

IV. OVERVIEW OF RATE CASE

Q. Why is PacifiCorp filing a general rate case at this time?

A. There are a number of drivers leading PacifiCorp to filing this rate case at this time. Consistent with Oregon's energy policies, and the 2017 and 2019 IRP action plans, PacifiCorp is transitioning its generation portfolio.[5] As PacifiCorp invests in new renewable resources it is also necessary to address the treatment of costs associated

---

[3] Order No. 13-474, at 1.
[4] *CPI Inflation Calculator*, Bureau of Labor Statistics, https://www.bls.gov/data/inflation_calculator.htm (comparing January 2014 to January 2019).
[5] *See* SB 1547, effective date Mar. 8, 2016 (https://olis.leg.state.or.us/liz/2016R1/Downloads/MeasureDocument/SB1547/Enrolled; Docket No. LC 67, PacifiCorp 2017 Integrated Resource Plan filed April 4, 2017; and Docket No. LC 70, PacifiCorp 2019 Integrated Resource Plan filed October 18, 2019).

with existing legacy resources through updated decommissioning and depreciation rates, as discussed in the testimony of Ms. McCoy, and proposals, discussed later in my testimony, to address the removal of coal-fired resources from Oregon rates.

As part of this transition, the Company has either started or completed a number of major capital projects, such as Energy Vision 2020. The rates set in this proceeding will allow PacifiCorp to recover the prudently incurred investments made since the last rate case and enable PacifiCorp to continue the Company's vision to deliver affordable, reliable energy to customers while reducing greenhouse gas emissions. In addition to capital investments, as the energy landscape has shifted in Oregon, this general rate case represents the first opportunity for PacifiCorp to update and modernize its rate design in seven years.

Q. What test period is the Company proposing in this rate proceeding?

A. The test period the Company is proposing is a fully forecasted test year for the 12 months ended December 31, 2021, with the exception of capital additions, which are based on calendar year-end 2020 balances. The testimony of Ms. McCoy discusses the development of the test year.

Q. What rate of return is PacifiCorp requesting in this case?

A. The Company is requesting approval of an overall rate of return of 7.68 percent. The overall rate of return is comprised of a 10.2 percent ROE as supported by Ms. Bulkley. As explained by Ms. Kobliha, PacifiCorp is requesting approval of a capital structure that is comprised of 53.52 percent equity, 46.47 percent long-term debt, and 0.01 percent of preferred stock. Ms. McCoy applies the overall rate of return to the Company's cost of service.

Q. Is the Company using a new inter-jurisdictional allocation methodology in this rate case?

A. Yes. The Commission approved the 2020 PacifiCorp Inter-Jurisdictional Allocation Protocol (2020 Protocol) on January 23, 2020.[6] The Company used the 2020 Protocol to develop the revenue requirement in this proceeding.

Q. Has the Company incorporated the remaining benefits associated with the TCJA in this general rate case?

A. Yes. PacifiCorp's Oregon customers have already experienced a decrease in rates through PacifiCorp's pass-through of the change in the corporate income tax rate established by the TCJA. This general rate case filing incorporates the remaining impacts of the TCJA that have not already been addressed in docket UM 1985. In Order 19-028, in docket UM 1985, the Commission authorized the Company to return to customers the 2018 TCJA deferral balance to customers over a one-year period ending January 31, 2019, and the 2019 TCJA deferral balance over a one-year period ending December 31, 2020.[7] Per Order 19-028, any remaining 2019 balance at December 31, 2020, and the 2020 deferral balance are to be addressed in this general rate case filing.

Following Order 19-028, in docket UE 352, the Company's 2019 Renewable Adjustment Clause (RAC) proceeding, the Commission approved a stipulation that resolved among other issues, the use of the TCJA deferral balance. Specifically, the

[6] *In the matter of PacifiCorp, dba Pacific Power, Request to Initiate an Investigation of Multi-Jurisdictional Issues and Approve an Inter-Jurisdictional Cost Allocation Protocol*, Docket No. UM 1050, Order No. 20-024 (Jan. 23, 2020).
[7] *See In the matter of PacifiCorp, dba Pacific Power, Application for an Accounting Order and Request for Amortization Related to the Federal Tax Act,* Docket No. UM 1985, Order No. 19-028 (Jan. 29, 2019).

Oregon-allocated net book value of the undepreciated plant that is replaced as a result of wind repowering has been offset with the non-protected Excess Deferred Income Tax benefits resulting from the TCJA.[8] The remaining tax reform benefits are available to customers as discussed in the testimony of Ms. Kobliha. As proposed by the Company in the testimony of Ms. McCoy, the remaining tax reform benefits will decrease customer rates by $24.9 million annually for three years. The all-in effect of the Company's request in this general rate case filing is addressed in the testimony of Mr. Meredith.

Q. Please describe the major drivers of PacifiCorp's rate request.

A. The major drivers of the Company's general rate case filing are: (1) capital additions; (2) updated depreciation rates and decommissioning costs; (3) new regulatory mechanisms to address changing risks and policies; and (4) updated rate design. I discuss each of these drivers in more detail below.

Q. Please describe the capital additions drivers in this rate request.

A. The primary driver is the Company's investment in renewable generation, including Energy Vision 2020 and the Pryor Mountain Wind Project. Other capital additions include emissions control retrofit projects at certain coal-fired resources, wildfire mitigation efforts, and fish passage upgrades at the Lewis River hydroelectric facility. These capital investments are more fully discussed in the testimonies of Mr. Rick T. Link, Mr. Chad A. Teply, Mr. Lucas, and Mr. Timothy J. Hemstreet, respectively.

---

[8] *In the matter of PacifiCorp, dba Pacific Power, Pacific Power's 2019 Renewable Adjustment Clause*, Docket No. UE 352, Order No. 19-304 (Sept. 16, 2019).

Q. What are the major components of Energy Vision 2020?

A. Energy Vision 2020 consists of two major components, both of which are included in this case: (1) wind repowering; and (2) investments in new wind and transmission. PacifiCorp identified and presented its Energy Vision 2020 strategy in its 2017 IRP, which was acknowledged by the Commission.[9]

Q. Please describe PacifiCorp's wind repowering component of Energy Vision 2020.

A. As explained in the testimony of Mr. Hemstreet, the Energy Vision 2020 wind repowering component involves upgrading PacifiCorp's existing wind facilities to increase the amount of zero-fuel-cost energy they produce. By complying with federal tax requirements for wind repowering and completing the work by the end of 2020, PacifiCorp is also able to renew the federal PTCs on all repowered wind facilities for another 10 years. The wind repowering component includes all of PacifiCorp's 13 wind facilities, representing 1,039.9 megawatts (MW) of installed wind capacity. In docket UE 352, the Commission approved nine of the Company's wind repowering projects; in docket UE 369, two of the repowering projects are subject to an all-party stipulation that requests Commission approval.[10] In this general rate case filing, the Company is requesting that the Commission allow the Company to include in rate base the Foote Creek I project, which is addressed in detail by Mr. Hemstreet.

---

[9] *In the matter of PacifiCorp, dba Pacific Power, 2017 Integrated Resource Plan*, Docket No. LC 67, Order No. 18-138, at 12 (Apr. 27, 2018).

[10] Order No. 19-304, at 8-9 (Sept. 16, 2019); *In the matter of PacifiCorp, dba Pacific Power, 2020 Renewable Adjustment Clause*, Docket No. 369, Stipulation filed Jan. 31, 2020 (The Commission has not yet ruled on the Stipulation entered into by the parties in Docket No. UE 369); The Rolling Hills wind project located in Wyoming will also be repowered but it is not included in the proposed Oregon rates in this proceeding and the Company has not requested to bring it into Oregon rates through the RAC in either Docket No. UE 352 or Docket No. UE 369.

Q. Does the Foote Creek I repowering project provide quantifiable benefits to customers?

A. Yes. As described in the testimony of Mr. Hemstreet and Mr. Link, the Foote Creek I project produces net customer benefits across a range of price-policy scenarios.

Q. Please describe Energy Vision 2020's new wind investments.

A. By the end of 2020, PacifiCorp will add 1,150 MW of new wind resources in Wyoming. These resources are three facilities built by the Company, the 500 MW TB Flats I and II facilities and the 250 MW Ekola Flats project, and one facility that is a combined build-own transfer and purchase power agreement, the 400 MW Cedar Springs facility. As Mr. Teply explains, because "safe harbor" wind turbines purchased in 2016 will be used to construct these facilities, each will be eligible for full PTCs if they are in service by the end of 2020. As explained by Mr. Link, these facilities were carefully selected to maximize value to customers in the 2017R Request for Proposals (RFP), which was monitored by independent evaluators from both Oregon and Utah.

Q. Please describe Energy Vision 2020's new transmission investments.

A. PacifiCorp is also building a new, 140-mile Gateway West transmission segment—the 500 kV Aeolus-to-Bridger/Anticline Transmission Project, plus generation interconnection network upgrades—in Wyoming to enable the new Energy Vision 2020 wind generation. As explained by Mr. Richard A. Vail, regional and Company transmission plans called for building the Aeolus-to-Bridger/Anticline Transmission Project by 2024, but by accelerating the construction date, the Company can use PTC benefits from wind facilities to offset costs.

Q. What is the status of the construction of the new wind and transmission facilities?

A. The new wind and transmission facilities are scheduled to be in service in the last quarter of 2020, before the rate effective date in this case. This will ensure that the new wind facilities qualify for PTCs. Mr. Teply and Mr. Vail provide more information on the construction timelines.

Q. Do the combined wind and transmission investments provide quantifiable net benefits to customers?

A. Yes. As Mr. Link explains in his testimony, the investments are a unique opportunity for customers to add needed and valuable renewable generation and transmission resources and reduce overall costs in the process.

Q. Please describe the updated depreciation rates and decommissioning costs driver in this rate request.

A. On September 13, 2018, the Company filed an application and supporting testimony for an accounting order authorizing a change in depreciation rates effective as of January 1, 2021.[11] Concurrent with the filing of this rate case, the Company has supplemented that filing to update the depreciable lives to be consistent with the 2019 IRP and the 2020 Protocol, and to include the revised decommissioning costs consistent with the Decommissioning Study filed in that proceeding. The updated depreciation rates, which include the revised decommissioning costs, are reflected in the rate request in this proceeding. See Ms. McCoy's direct testimony with respect to the calculation of the revenue requirement using the updated depreciation rates.

---

[11] *In the matter of PacifiCorp, dba Pacific Power, Application for Authority to Implement Revised Depreciation Rates,* Docket No. UM 1968, Application filed Sept. 13, 2018.

Q. Please describe the new regulatory mechanisms that address changing risks and policies.

A. The Company has been and will continue to encounter costs associated with the retirement of coal-fired resources on its system and the elimination of coal from Oregon rates by 2030 as required by Senate Bill (SB) 1547.[12] Further, PacifiCorp, like many other western electric utilities, has been mitigating the increased risk of wildfires, which can be devastating to its customers and its facilities. To address these changing dynamics, PacifiCorp is proposing two mechanisms, one related to coal-fired resources, the Generation Plant Removal Adjustment, and one related to the increased wildfire risk, the Wildfire Cost Recovery Mechanism. I address these proposals in Section V and Section VI of my testimony.

Q. Please describe the updated rate design.

A. As I noted earlier, the Company has not filed a rate case since 2013. As a result, the Company is proposing a number of changes to how rates are currently designed, including having a separate basic charge for multi-family customers; and modernizing the time of use periods for its large non-residential customers and increasing the differential between on- and off-peak energy. The Company is also proposing several innovative pricing pilots, including a residential time of use pilot. All of the rate design proposals are discussed in Mr. Meredith's direct testimony.

[12] *See* Section 1(2) of SB 1547.

V. OREGON ENERGY TRANSITION

Q. What is your understanding of the Oregon energy policy regarding coal-fired resources?

A. My understanding is that Section 1 of SB 1547 instructs utilities to eliminate the cost and benefits of coal-fired resources from retail electric rates on or before January 1, 2030.

Q. Has the Company proposed a process to facilitate the removal of the costs and benefits of coal-fired resources from Oregon rates?

A. Yes. The recently approved 2020 Protocol[13] details the process by which Oregon can exit coal-fired resources by a date certain.

Section 4.1 of the 2020 Protocol outlines a process by which state commissions may issue "Exit Orders"[14] that provide for specific "Exit Dates"[15], after which the state will no longer receive any benefits or be subject to any new costs related to the resource for which the Exit Order was issued. The 2020 Protocol states that Exit Orders may be established through the approval of the 2020 Protocol, in depreciation dockets, general rate cases, or other appropriate regulatory proceedings. In requesting approval of the 2020 Protocol, the Company did not seek and the Commission did not approve issuance of Exit Orders or Exit Dates for coal-fired resources;[16] the Company now requests the Commission issues Exit Orders with specific Exit Dates for the majority of PacifiCorp's coal-fired resources.

---

[13] *See* Order No. 20-024.
[14] Exit Order means an order entered by a state commission approving the discontinuation of the use of an existing resource and exclusion of costs and benefits of that resource from customer rates by that state on a date certain. See Appendix A to the 2020 Protocol for the defined term as used in the 2020 Protocol.
[15] Exit Date means the date on which PacifiCorp will discontinue the allocation and assignment of costs and benefits of a coal-fueled Interim Period Resource to the State issuing the Exit Order.
[16] *See* Order No. 20-024, at 7-8.

Q. Did the 2020 Protocol include agreed-upon Exit Dates for Oregon for coal-fired resources?

A. Yes. Where possible, the 2020 Protocol sets forth Oregon Exit Dates for coal-fired resources that comply with SB 1547 (i.e., before December 31, 2029), coincide with the 2019 IRP preferred portfolio (i.e., common closure dates for all states), or allow for potential realignment of the coal-fired resources to other states. PacifiCorp, Commission Staff, the Oregon Citizens' Utility Board, the Alliance of Western Energy Consumers, and Sierra Club, all signatories to the 2020 Protocol, agreed to support the Oregon Exit Dates set forth in the 2020 Protocol for all of PacifiCorp's coal-fired resources, with the exception of Hayden. These Exit Dates are set forth in Table 1 below:

Table 1: Proposed Oregon Exit Dates

Coal-Fired Resource	Recommended Oregon Exit Date
Cholla 4	December 31, 2020
Jim Bridger 1	December 31, 2023
Craig 1	December 31, 2025
Jim Bridger 2	December 31, 2025
Jim Bridger 3	December 31, 2025
Jim Bridger 4	December 31, 2025
Naughton 1	December 31, 2025
Naughton 2	December 31, 2025
Craig 2	December 31, 2026
Colstrip 3	December 31, 2027
Colstrip 4	December 31, 2027
Dave Johnston 1	December 31, 2027
Dave Johnston 2	December 31, 2027
Dave Johnston 3	December 31, 2027
Dave Johnston 4	December 31, 2027
Hunter 1	December 31, 2029
Hunter 2	December 31, 2029
Hunter 3	December 31, 2029
Huntington 1	December 31, 2029
Huntington 2	December 31, 2029
Wyodak	December 31, 2029

Q. Is the Company requesting the Commission issue Exit Orders for the Exit Dates identified in Table 1 above and in the 2020 Protocol?

A. Yes, the Company is requesting the Commission issue Exit Orders with Exit Dates for 23 of PacifiCorp's 24 coal-fired resources.[17] The Company's requested Exit Dates are discussed in greater detail below.

For Hunter Units 1-3, Huntington Units 1-2, and Wyodak, the Company requests the Commission approve Exit Orders with Exit Dates of December 31, 2029,

[17] Hayden is the only unit for which the Company is not currently requesting an Exit Order with an Exit Date. Per the 2020 Protocol, the Company will subsequently bring forth a proposal.

as reflected in Table 1 above. The Exit Orders and Exit Dates for these units are necessary to comply with the mandate contained in SB 1547 to remove coal-fired resources from rates by December 31, 2029.

For Jim Bridger Unit 1, Naughton Units 1-2, Dave Johnston Units 1-4, Craig Units 1-2, Cholla Unit 4, and Colstrip Units 3-4, the Company requests the Commission approve Exit Orders with Exit Dates as set forth in Table 1 above and consistent with the lives identified in the 2019 IRP.[18] Per the 2019 IRP, the Company anticipates that these units will cease operation or the Company will terminate its ownership interest by the requested Exit Dates.

Finally, for Jim Bridger Units 2-4, the Company requests the Commission approve Exit Orders with Exit Dates set forth in Table 1 above and consistent with the Company's requested depreciable lives in the 2018 Depreciation Study.[19] Jim Bridger Units 2-4 are unique in that the requested Exit Dates are in advance of the lives identified in the 2019 IRP[20] and in advance of the compliance deadline for SB 1547.

Q. Please explain the policy basis for issuing an Exit Order with an Exit Date for Jim Bridger Units 2-4 of December 31, 2025.

A. An Exit Date of 2025 for Jim Bridger Units 2-4 aligns with Oregon's policy to transition from coal-fired resources. In addition, the Exit Date for Jim Bridger Units

[18] *In the matter of PacifiCorp, dba Pacific Power, 2019 Integrated Resource Plan*, Docket No. LC 70, PacifiCorp's 2019 Integrated Resource Plan, at 13 (Oct. 18, 2019). Cholla Unit 4 is identified as having a retirement date no later than January 1, 2023. The Company recently committed to closing Cholla Unit 4 by the end of 2020.

[19] *In the matter of PacifiCorp, dba Pacific Power, Application for Authority to Implement Revised Depreciation Rates,* Docket No. UM 1968, Exhibit PAC/202, filed Sep. 13, 2018.

[20] The 2019 IRP identifies an operational life for Jim Bridger 2 of 2028 and operational lives of 2037 for Jim Bridger Units 3-4.

2-4 represents a trade-off between the potential for continued NPC benefits associated with including the units in rates through the operational lives identified in the 2019 IRP, and the certainty of decommissioning and remediation liability of Jim Bridger Units 2-4, commensurate with Oregon's current allocation. Per the 2020 Protocol, if Oregon exits a coal-fired resource in advance of closure, Oregon receives certainty with regard to the level of decommissioning and remediation costs allocated to Oregon; for Jim Bridger Units 2-4, Oregon will only be allocated its estimated share of decommissioning and remediation costs. To the extent that actual decommissioning and remediation costs incurred at the time of closure differ from what was estimated, and Oregon has already exited the units, that cost variance will not be recovered from Oregon customers.

Q. Why are Exit Orders necessary now?

A. Exit Orders for the Hunter, Huntington, and Wyodak units at this time provides certainty with regard to PacifiCorp's compliance with SB 1547. For coal-fired resources anticipated to cease operation or for which the Company is anticipated to terminate its ownership interest before December 31, 2029, issuance of Exit Orders now provides a clear pathway for PacifiCorp to remove the costs of these units from rates consistent with the cessation of operation or PacifiCorp's termination of its ownership interest. In addition, in the event that PacifiCorp continues to operate a coal-fired resource beyond Oregon's Exit Date, an Exit Order will allow time for states other than Oregon (i.e., Idaho, Utah, and Wyoming) to determine whether to take an increased allocation of the costs and benefits of such coal-fired resource, consistent with the 2020 Protocol.

Q. Does the 2020 Protocol specify timelines for receiving Exit Orders from Oregon?

A. Yes. Parties to the 2020 Protocol will endeavor to have Exit Orders issued on or before December 15, 2020, for the resources with 2027 recommended Exit Dates, and Exit Orders issued on or before December 31, 2023, for the coal-fired resources with Exit Dates in 2029.

Q. What actions follow the issuance of an Exit Order for a specific coal-fired resource by one or more states?

A. An Exit Order triggers certain actions identified in the 2020 Protocol, including the establishment of decommissioning cost obligations for exiting states, a potential process for the determination of capital addition responsibility, and a process for the consideration of reassignment of the freed up capacity to other states that have not issued Exit Orders. The 2020 Protocol envisions that sufficient time, at least four years, is provided from the issuance of an Exit Order to the Exit Date to allow for reassignment of the exiting state's share of the coal-fired resource to be considered by other states. The Exit Order alone does not provide for reassignment, or any associated shift in responsibility for future operation and maintenance or capital costs and reassignment of costs and benefits must be approved by states without Exit Orders in order for cost responsibility to shift among states and for benefits of the resource to accrue to a different state.

Q. How does PacifiCorp propose to remove coal-fired resources with an Exit Order from electric rates in a timely manner?

A. PacifiCorp requests that the Exit Order also provide PacifiCorp the ability to effectively remove the coal-fired resource from its rates as of the Exit Date through a separate tariff adjustment until such time that base rates can be adjusted in a general rate case. The Company is proposing a Generation Plant Removal Adjustment in this case to facilitate the removal of coal-fired resources from rates consistent with approved Exit Dates.

Q. Please describe the Generation Plant Removal Adjustment.

A. The Generation Plant Removal Adjustment is a separate tariff that will allow the Company to both recover costs associated with the closure of or termination of ownership interest in (i.e., removal) generation plant (e.g., coal-fired resources), and to credit to customers the revenue requirement associated with generation plant that is removed from rates between general rate cases. This mechanism will allow for the timely recovery of closure or removal costs while also ensuring customers timely receive the benefits of removing generation plant from rates.

Q. How will the Generation Plant Removal Adjustment recover closure or removal costs?

A. In this general rate case, subsequent general rate cases, or stand-alone filings, PacifiCorp will identify specific closure or removal costs for recovery through the Generation Plant Removal Adjustment. PacifiCorp anticipates that the circumstances associated with the closure or removal of generation plant will be unique and, as such, will make specific proposals identifying specific costs for recovery through either general rate case filings or stand-alone filings. In this general rate case, as described later in my testimony and in the testimony of Ms. McCoy, the Company is requesting the recovery of certain closure costs associated with the early closure of Cholla Unit 4.

Q. How will the Generation Plant Removal Adjustment timely reflect to customers the removal of generation plant from rates?

A. In this general rate case and any subsequent general rate that occurs before the Exit Date of a coal-fired resource, the revenue requirement for each coal-fired resource will be clearly identified in the final compliance filing. At least 30 days in advance of the Exit Date, the Company will file an advice letter to credit to customers through a separate tariff adjustment the revenue requirement, approved in the most-recent general rate case, associated with the coal-fired resource that is to come out of rates through operation of the Exit Order and Exit Date. The revenue requirement will include all costs associated with the coal-fired resources including the depreciation expense, ROE, and operations and maintenance expense, as approved in the most-recent general rate case. Coal fuel expense will be removed through the annual power cost forecast mechanism. In the next general rate case following the Exit Date for a coal-fired resource, the coal-fired resource will be removed from base rates and the associated tariff adjustment revenue requirement will be set to zero. This treatment will allow the lower costs associated with the closure or removal of coal-fired resources from rates to immediately flow through to customers without the need for a general rate case, effectively removing the coal-fired resource from rates contemporaneous with the Exit Date.

Q. How does an Exit Order affect decommissioning costs?

A. Per the 2020 Protocol, if a coal-fired resource is included in Oregon rates at the time it is retired, or PacifiCorp terminates its ownership interest in the resource, Oregon is allocated its share of the actual decommissioning cost. If Oregon has issued an Exit Order and PacifiCorp continues operation of the coal-fired resource beyond the Exit Date then Oregon will only pay the estimated decommissioning costs through the time of the Exit Date.

Q. How does the Company propose that decommissioning costs be treated for coal-fired resources that may operate beyond the Exit Date?

A. Consistent with the 2020 Protocol, the Company recently contracted with a third party to conduct a decommissioning study for certain coal-fired resources, namely Hunter, Huntington, Dave Johnston, Jim Bridger, Naughton, Wyodak, and Hayden. The results of this study have been filed in the 2018 Depreciation Study and incorporated into the depreciation rates included in this case. If a coal-fired resource continues operations beyond the Exit Date, the depreciation expense that includes decommissioning costs are simply removed from rates with an advice letter and no further adjustment or treatment is necessary. A decommissioning study is expected to be completed for the Colstrip plant in March 2020 and will be incorporated into the

2018 Depreciation Study at that time. Additionally, an update to the decommissioning study is scheduled to take place in 2024.

Q. What is PacifiCorp's proposal for the treatment of decommissioning costs for coal-fired resources that PacifiCorp does not operate beyond the Exit Date?

A. In this scenario, the Company proposes that Oregon be allocated its share of the actual decommissioning costs per the 2020 Protocol. To ensure Oregon customers only pay actual decommissioning costs, PacifiCorp recommends treatment as follows:

- Creation of a balancing account to track the coal-fired resource decommissioning costs collected through rates, and the actual non-capital decommissioning expenditures incurred contemporaneous with decommissioning and environmental remediation activities;
- Until the end of the remediation process, PacifiCorp will update the decommissioning costs in each subsequent general rate case;
- Decommissioning cost projections ultimately included in rates will be net of insurance proceeds so that the Company will recover only the actual prudently incurred decommissioning costs; and
- At the end of the remediation process, PacifiCorp will amortize the decommissioning balancing account over a one-year period.

Q. Please describe the recovery of Cholla Unit 4.

A. As discussed by Mr. Stefan A. Bird and Mr. Link, PacifiCorp is retiring Cholla Unit 4 by December 31, 2020. PacifiCorp is proposing that the costs associated with the retirement and decommissioning of Cholla Unit 4 be recovered through the Generation Plant Closure Adjustment. Therefore, the proposed revenue requirement in this proceeding does not include Cholla Unit 4 retirement costs, including construction work-in-progress; unused materials and supply inventory; liquidated damages related to the early termination of the related coal supply agreement; and decommissioning costs. The Company proposes to remove Cholla Unit 4 plant balances from rate base as of December 31, 2020. Please see Ms. McCoy's direct testimony for a discussion of the regulatory asset and related amortization, and carrying charges to be recovered through the proposed adjustment.

VI. WILDFIRE MITIGATION COST RECOVERY MECHANISM

Q. What is the purpose of this section of your direct testimony?

A. In this section of my testimony, I discuss the Wildfire Mitigation Cost Recovery Mechanism.

Q. What is the Wildfire Mitigation Cost Recovery Mechanism?

A. PacifiCorp proposes a Wildfire Mitigation Cost Recovery Mechanism to recover its capital expenditures related to wildfire mitigation. As discussed more fully in the testimony of Mr. Lucas, while wildfire risk is inherent in operating an electric utility, particularly in the West, the increasing frequency, severity, and costs of wildfires has heightened the focus on wildfire risk mitigation plans by electric utilities. PacifiCorp has taken this increased risk seriously and developed a capital intensive wildfire mitigation plan that is incremental to its routine safety and maintenance programs to further protect its customers, employees, and facilities from catastrophic wildfires. Please see the direct testimony of Mr. Lucas for a discussion regarding the increased risks of wildfire and the specific actions PacifiCorp is taking to mitigate these risks.

In addition to wildfire risk, the Company is currently unable to receive timely recovery of its capital expenditures for wildfire mitigation activities outside of a general rate case proceeding. It is my understanding that the Commission determined that Oregon Revised Statute 757.259(2)(e), which allows utilities to seek accounting orders to defer costs in between rate cases, does not provide the Commission authority to allow deferrals of any costs related to capital investments.[21] Although the Company does not have a pre-determined level of capital spend that triggers the need for a general rate case, the levels of forecast capital spend for wildfire mitigation, under normal circumstances,[22] would not drive the need for rate case filings. In the absence of the ability to request deferral treatment, however, the Company faces the prospect of taking multi-year regulatory lag on important and significant capital expenditures for wildfire mitigation, or increased general rate case activity. The level of forecast capital spend for wildfire mitigation, discussed in the testimony of Mr. Lucas, should not, on its own, drive annual rate case filings, which would otherwise be necessary for the Company to achieve timely recovery of these costs. PacifiCorp requests the Commission approve the proposed Wildfire Mitigation Cost Recovery Mechanism as a flexible form of ratemaking in response to a rapidly changing environment related to wildfire risk and to ensure a process to minimize regulatory lag for recovery of these important capital investments. Minimizing regulatory lag is particularly important at this time of increased capital expenditures, as discussed more in the testimony of Ms. Kobliha.

[21] *See In the matter of the Public Utility Comm'n of Oregon, Investigation of the Scope of the Commission's Authority to Defer Capital Costs,* Docket No. UM 1909, Order No. 18-423, at 8 (Oct. 29, 2018).
[22] I.e., the ability to defer capital expense.

Q. Have any costs related to wildfire mitigation been included in this general rate case?

A. Yes. PacifiCorp's wildfire mitigation capital expenditures through 2020 have been included in this general rate case. Thus, this proposed mechanism focuses on the Company's recovery of capital expenditures for the years 2021 and beyond, which are discussed in the testimony of Mr. Lucas.

Q. Please describe how the Wildfire Mitigation Cost Recovery Mechanism is structured.

A. If the Commission approves the Company's proposed mechanism in this proceeding, the Company would submit the 2021 forecasted wildfire mitigation expenditures for prudence review in the first quarter of 2021. The Company proposes a six-month time period for review of the expenditures, followed by biannual filings to update the rate to reflect the capital expenditures for each six-month period. These filings would continue until the Company's next filed rate case. As with the RAC, the rate updates would be considered compliance filings and not subject to the 30-day review period required for regular advice filings. Table 2 below provides an example of such filings for 2021 and 2022 should the Commission approve the mechanism.

Table 2: Example of 2021 and 2022 Filings for the Wildfire Mitigation Cost Recovery Mechanism

	Summary of Filing	Proposed Filing Date	Proposed Effective Date
Cost Recovery Filing for 2021	Submit forecasted capital spend for calendar year 2021 for prudence review.	January 15, 2021	Order issued by May 31, 2021
1st Cost Update	Update rate to reflect capital spend for projects placed in service January 1 – June 30.	June 15, 2021	July 1, 2021
2nd Cost Update	Update rate to reflect capital spend for projects placed in service July 1 – December 30.	December 15, 2021	January 1, 2022
Cost Recovery Filing for 2022	Submit forecasted capital spend for calendar year 2022 for prudence review.	January 15, 2022	Order issued by May 31, 2022
1st Cost Update	Update rate to reflect capital spend for projects placed in service January 1 – June 30.	June 15, 2022	July 1, 2022
2nd Cost Update	Update rate to reflect capital spend for projects placed in service July 1 – December 30.	December 15, 2022	January 1, 2023

Q. Are there other examples of similar mechanisms approved by the Commission?

A. Yes. The Company modeled the Wildfire Cost Recovery Mechanism on the RAC, which similarly allows for the Commission to consider new capital additions on a stand-alone basis. Although the RAC is specifically authorized by statute, my understanding is that the Commission has authority to establish automatic adjustment clauses in the absence of specific statutory direction. In this instance, given the policy interest of the state in mitigating wildfires, it is appropriate for the Commission to approve a specific cost-recovery mechanism that allows for timely review and recovery of the capital necessary for PacifiCorp to undertake the incremental activities necessary to effectively mitigate wildfire risk on its system for the benefit of PacifiCorp customers and the state.

Q. Does the proposed Wildfire Cost Recovery Mechanism balance the need for flexible ratemaking treatment with customer protections?

A. Yes. The Wildfire Cost Recovery Mechanism is narrowly tailored to address stand-alone cost recovery of a discrete set of incremental costs associated with a new and emerging risk: wildfire. As discussed in the testimony of Mr. Lucas, not only is the physical risk of wildfire increasing, but insurance markets are also responding to the changing wildfire risk. It is critical that PacifiCorp take immediate steps to mitigate the risk of wildfires and PacifiCorp has done so by implementing wildfire mitigation actions as early as 2018. PacifiCorp anticipates increasing wildfire mitigation activity on its system and in Oregon over at least the next five years as PacifiCorp continues to implement the actions outlined in the testimony of Mr. Lucas. As Mr. Lucas discusses, this timeline is necessary to accommodate resource constraints as utilities throughout the West undertake similar mitigation activities, seasonal access to facilities, and labor constraints due to a national shortage of qualified workers to perform necessary work. For these reasons, it is appropriate for the Commission to exercise its discretion to implement an automatic adjustment clause mechanism to allow for recovery of wildfire mitigation costs.

In addition, the structure of the proposed Wildfire Mitigation Cost Recovery Mechanism provides full opportunity for prudence review by the Commission and stakeholders, similar to the RAC. Cost recovery is not guaranteed, assets will be required to be in-service by the rate effective date, and regulatory lag is not entirely eliminated. This structure appropriately balances customer protections with the need for flexible ratemaking treatment.

VII. CONCLUSION

Q. Please summarize your recommendations to the Commission.

A. I recommend the Commission approve the proposals described in Section II of my testimony, including:

- Authorize an overall increase of $70.4 million or approximately 5.4 percent, which is comprised of (1) an increase in rates of $78.0 million related to a non-NPC revenue requirement of $1,045.7 million; (2) an increase of $17.3 million for the recovery of costs related to the early retirement of Cholla Unit 4; and (3) a decrease of approximately $24.9 million related to the amortization of deferred tax benefits associated with the TCJA results;
- Approve the Company's total rate base of approximately $4.2 billion;
- Approval of Exit Orders with specified Exit Dates for all but one of PacifiCorp's coal-fired resource units;
- Approval of the Generation Plant Closure Adjustment;
- Approval of the Company's proposed decommissioning balancing account;
- Approval of the Company's proposed treatment of Cholla Unit 4 closure costs; and
- Approval of the Wildfire Mitigation Cost Recovery Mechanism.

Q. Does this conclude your direct testimony?

A. Yes.

Docket No. UE 374
Exhibit PAC/300
Witness: Nikki L. Kobliha

BEFORE THE PUBLIC UTILITY COMMISSION

OF OREGON

PACIFICORP

Direct Testimony of Nikki L. Kobliha

February 2020

TABLE OF CONTENTS

ATTACHED EXHIBITS

I. INTRODUCTION AND QUALIFICATIONS

Q. Please state your name, business address, and present position with PacifiCorp.

A. My name is Nikki L. Kobliha and my business address is 825 NE Multnomah Street, Suite 1900, Portland, Oregon 97232. I am currently employed as Vice President, Chief Financial Officer and Treasurer for PacifiCorp. I am testifying for PacifiCorp d/b/a Pacific Power (PacifiCorp or the Company).

Q. Please describe your education and professional experience.

A. I received a Bachelor of Business Administration with a concentration in Accounting from the University of Portland in 1994. I became a Certified Public Accountant in 1996. I joined PacifiCorp in 1997 and have taken on roles of increasing responsibility before being appointed Chief Financial Officer in 2015. I am responsible for all aspects of PacifiCorp's finance, accounting, income tax, internal audit, Securities and Exchange Commission reporting, treasury, credit risk management, pension, and other investment management activities.

II. SUMMARY AND PURPOSE OF TESTIMONY

Q. Please summarize the purpose of your testimony.

A. My testimony supports PacifiCorp's overall cost of capital recommendation, provides information about the way PacifiCorp is implementing the effects of the Tax Cuts and Jobs Act (TCJA) consistent with recent orders issued by the Public Utility Commission of Oregon (Commission), and supports PacifiCorp's projected pension costs.

Q. What is the purpose of each of the items summarized above?

A. Regarding the overall cost of capital recommendation, I sponsor the Company's proposed capital structure with a common equity level of 53.52 percent and provide evidence demonstrating why that level is appropriate and benefits customers. I explain why the recommended equity ratio is required to maintain PacifiCorp's current credit ratings, which provide for a more competitive cost of debt and overall cost of capital and facilitate continued access by the Company to the capital markets over the long term. This capital structure enables the Company's continued investment in infrastructure to provide safe and reliable service from clean energy resources at reasonable costs. I also support PacifiCorp's proposed cost of long-term debt of 4.77 percent and cost of preferred stock of 6.75 percent.

Regarding the implementation of the TCJA, I set forth PacifiCorp's recommendations on how TCJA benefits should be reflected in rates and quantify certain TCJA balances, including Excess Deferred Income Tax (EDIT) balances, and discuss how protected EDIT is being amortized.

Finally, regarding PacifiCorp's projected pension costs, I explain the reasonableness of the costs associated with PacifiCorp's defined pension plans.

Q. What overall cost of capital do you recommend for PacifiCorp?

A. PacifiCorp proposes an overall cost of capital of 7.68 percent. This cost includes the return on equity recommendation of 10.2 percent as supported by the direct testimony of Ms. Ann E. Bulkley and the capital structure and costs set forth in Table 1.

Table 1: Overall Cost of Capital

Component	$m	% of Total	Cost %	Wtd Ave Cost %
Long-Term Debt	$8,433	46.47%	4.77%	2.22%
Preferred Stock	2	0.01%	6.75%	—%
Common Stock Equity	9,713	53.52%	10.20%	5.46%
	$18,148	100.00%		7.68%

Q. What time period does your analyses cover?

A. The capital structure for the Company is measured over the calendar year 2021 test year used in this proceeding using an average of the five quarter-ending balances spanning the 12-month period ending December 31, 2021, based on known and measurable changes through December 31, 2021. Similarly, the costs of the long-term debt and preferred stock are an average of the costs measured for each of the five quarter-ending balances spanning the 12-month calendar 2021 test year, using the Company's actual costs adjusted for known and measurable changes through December 31, 2021.

III. FINANCING OVERVIEW

Q. Please explain PacifiCorp's need for and sources of new capital.

A. PacifiCorp requires capital to meet its customers' needs for new cost-effective, transmission and renewable generation, increased reliability, improved power delivery, and safe operations. PacifiCorp also needs new capital to fund long-term debt maturities.

As described in the testimony of Mr. Stefan A. Bird, through the Energy Vision 2020 project, PacifiCorp is in the process of repowering its wind generation fleet and significantly increasing its wind generation and transmission capacity. PacifiCorp expects to spend approximately $3.5 billion for investments in renewable energy projects and related transmission through calendar year 2021. This capital spending will require PacifiCorp to raise funds by issuing new long-term debt in the capital markets, retaining earnings, and if needed, obtaining new capital contributions from its parent company, Berkshire Hathaway Energy Company (BHE). This increase in wind generation and transmission capacity will support PacifiCorp's progress towards acquiring the new renewable resources identified in PacifiCorp's 2019 Integrated Resource Plan (IRP) action plan.

Q. How does PacifiCorp finance its electric utility operations?

A. Generally, PacifiCorp finances its regulated utility operations using a mix of debt and common equity capital of approximately 48/52 percent, respectively. During periods of significant capital expenditures, as expected to continue now through calendar year end 2023 for the potential new renewable resources identified in PacifiCorp's 2019 IRP action plan, the Company will need to maintain an average common equity component in excess of 52 percent to maintain its credit rating and finance the debt component of the capital structure at the lowest reasonable cost to customers. Maintaining the Company's credit rating will provide more flexibility on the type and timing of debt financing, better access to capital markets, a more competitive cost of debt, and over the long-run, more stable credit ratings. All of these factors assist in financing expenditures like PacifiCorp's Energy Vision 2020 project and potential new renewable resources identified in PacifiCorp's 2019 IRP action plan. In addition, PacifiCorp needs a greater common equity component to offset various adjustments that rating agencies make to the debt component of the Company's published financial statements and to mitigate the impact the TCJA has had on the

Company's credit metrics. I discuss these adjustments in greater detail later in my testimony.

Q. How does PacifiCorp determine the levels of common equity, debt, and preferred stock to include in its capital structure?

A. As a regulated public utility, PacifiCorp has a duty and an obligation to provide safe, adequate, and reliable service to customers in its Oregon service area while prudently balancing cost and risk. Major capital expenditures are required in the near-term for new plant investment to fulfill its service obligation, including capital expenditures for repowering wind projects, new wind, new transmission, and wildfire mitigation. These capital investments also have associated operating and maintenance costs. As part of its annual business plan process, PacifiCorp reviews all of its estimated cash inflows and outflows to determine the amount, timing, and type of new financing required to support these activities and provide for financial results and credit ratings that balance the cost of capital with continued access to the financial markets.

Q. How does PacifiCorp manage its dividends to BHE?

A. PacifiCorp benefits from its affiliation with BHE as there is no dividend requirement. Historically, PacifiCorp has paid dividends to BHE to manage the common equity component of the capital structure and keep the Company's overall cost of capital at a prudent level. In major capital investment periods, PacifiCorp is able to retain earnings to help finance capital investments and forgo paying dividends to BHE. For example, following BHE's acquisition of PacifiCorp in 2006, PacifiCorp managed the capital structure through the timing and amount of long-term debt issuances and capital contributions from BHE, while forgoing any common dividends for nearly five years. At other times, absent the payment of dividends, retention of earnings could cause the percentage of common equity to grow beyond the level necessary to support the current credit ratings. Accordingly, dividend payments can be necessary, in combination with debt issuances, to maintain the appropriate percentage of equity in PacifiCorp's capital structure. With the increased capital investment required for the Energy Vision 2020 project, wildfire mitigation projects and other capital expenditures, however, the proposed capital structure in this case anticipates no additional common dividend payments by PacifiCorp to BHE through calendar year 2020 and $375 million in 2021.

Q. What type of debt does PacifiCorp use in meeting its financing requirements?

A. PacifiCorp has completed the majority of its recent long-term financing using secured first mortgage bonds issued under the Mortgage Indenture dated January 9, 1989. Exhibit PAC/301, Pro forma Cost of Long-Term Debt, shows that, over the test period, PacifiCorp is projected to have an average of approximately $8.2 billion of first mortgage bonds outstanding, with an average cost of 4.85 percent. Presently, all outstanding first mortgage bonds bear interest at fixed rates. Proceeds from the issuance of the first mortgage bonds (and other financing instruments) are used to finance the utility operation.

Another important source of financing in the past has been the tax-exempt financing associated with certain qualifying equipment at power generation plants. Under arrangements with local counties and other tax-exempt entities, these entities issue securities, PacifiCorp borrows the proceeds of these issuances and pledges its credit quality to repay the debt to take advantage of the tax-exempt status of the financing. During the 12 months ending December 31, 2021, PacifiCorp's tax-exempt portfolio is projected to be approximately $218 million, with an average cost of 1.81 percent, including the cost of issuance and remarketing.

Credit Ratings

Q. What are PacifiCorp's current credit ratings?

A. PacifiCorp's current ratings are shown in Table 2.

Table 2: PacifiCorp Credit Ratings

	Moody's	Standard & Poor's
Senior Secured Debt	A1	A+
Senior Unsecured Debt	A3	A
Outlook	Stable	Stable

Q. How does the maintenance of PacifiCorp's current credit rating benefit customers?

A. First, the credit rating of a utility has a direct impact on the price that a utility pays to attract the capital necessary to support its current and future operating needs. Many institutional investors have fiduciary responsibilities to their clients, and are typically not permitted to purchase non-investment grade (*i.e.*, rated below Baa3/BBB-) securities or in some cases even securities rated below a single A. A solid credit rating directly benefits customers by reducing the immediate and future borrowing costs related to the financing needed to support regulatory obligations.

Second, credit ratings are an estimate of the probability of default by the issuer on each rated security. Lower ratings equate to higher risks and higher costs of debt. The Great Recession of 2008-2009 provides a clear and compelling example of the benefits of the Company's credit rating because PacifiCorp was able to issue new long-term debt during the midst of the financial turmoil. Other lower-rated utilities were shut out of the market and could not obtain new capital.

Third, PacifiCorp has a near constant need for short-term liquidity as well as periodic long-term debt issuances. PacifiCorp pays significant amounts daily to suppliers whom we count on to provide necessary goods and services such as fuel, energy, and inventory. Being unable to access funds can risk the successful completion of necessary capital infrastructure projects and would increase the chance of outages and service failures over the long term.

PacifiCorp's creditworthiness, as reflected in its credit ratings, will strongly influence its ability to attract capital in the competitive markets and the resulting costs of that capital.

Q. Please provide examples where poor credit ratings hurt a utility's flexibility in the credit markets.

A. During the Great Recession in 2008, Arizona Public Service Company (rated Baa2/BBB- at that time) filed a letter with the Arizona Corporation Commission in October 2008 stating that the commercial paper market was completely closed to it and it likely could not successfully issue long-term debt.[1]

Further, those issuers who could access the markets paid rates well above the levels that PacifiCorp was able to obtain. For example, PacifiCorp issued new 10-year and 30-year long-term debt in January 2009 with 5.50 percent and 6.00 percent coupon rates, respectively. Subsequently, Puget Sound Energy (rated Baa2/A- at that

[1] *See* Exhibit PAC/302.

time) issued new seven-year debt at a credit spread over Treasuries of 480.3 basis points resulting in a 6.75 percent coupon.

Q. Can regulatory actions or orders affect PacifiCorp's credit rating?

A. Yes. Regulated utilities such as PacifiCorp are unique in that they cannot unilaterally set the price for their services. The financial integrity of a regulated utility is largely a result of the prudence of utility operations and the corresponding prices set by regulators. Rates are established by regulators to permit the utility to recover prudently incurred operating expenses and a reasonable opportunity to earn a fair return on the capital invested.

Rating agencies and investors have a keen understanding of the importance of regulatory outcomes. For example, Standard & Poor's (S&P) has opined on the correlation between regulatory outcomes and credit ratings, concluding:

> Although not common, rate case outcomes can sometimes lead directly to a change in our opinion of creditworthiness. Often it's a case that takes on greater importance because of the issues being litigated. For example, in 2010, we downgraded Florida Power & Light and its affiliates following a Florida Public Service Commission rate ruling that attracted attention due to drastic changes to settled practices on rate case particulars like depreciation rates. More recently, in June 2016, we downgraded Central Hudson Electric & Gas due to our revised opinion of regulatory risk. While that reflected the company's own management of regulatory risk, it was prompted in part by other rate case decisions in New York that highlighted the overall risk in the state.[2]

Similarly, Moody's recently issued a credit opinion for PacifiCorp, concluding:

> The stable outlook incorporates our expectation that PacifiCorp will continue to receive reasonable regulatory treatment, and that funding requirements will be financed in a manner consistent with management's commitment to maintain a healthy financial profile.

[2] S&P Ratings Direct, *Assessing U.S. Investor-Owned Utility Regulatory Environments* (Aug. 10, 2016), at 4.

> ....The ratings could be downgraded if PacifiCorp's capital expenditures are funded in a manner inconsistent with its current financial profile, or if adverse regulatory rulings lower its credit metrics, as demonstrated for example, by a ratio of CFO pre-W/C/Debt sustained below 20%.[3]

As discussed in the testimony of Ms. Bulkley, Section VIII. B., Regulatory Risk, the regulatory environment and the rate decisions by utility commissions have a direct and significant impact on the financial condition of utilities.

Q. How does the maintenance of PacifiCorp's current credit ratings benefit customers?

A. PacifiCorp is in the midst of a period of major capital spending and investing in cost-effective infrastructure to provide electric service that is reliable, clean, and affordable. In addition to being cost-effective resources, PacifiCorp's investments in its existing wind fleet and new wind generation and transmission play a critical role in PacifiCorp's ability to meet the energy policy objectives of the state of Oregon on a least-cost, least-risk basis. If PacifiCorp does not have consistent access to the capital markets at reasonable costs, these borrowings and the resulting costs of building new facilities become more expensive than they otherwise would be. The inability to access financial markets can threaten the completion of necessary projects and can impact system reliability and customer safety. Maintaining the current single A credit rating makes it more likely PacifiCorp will have access to the capital markets at reasonable costs even during periods of financial turmoil.

[3] Moody's Credit Opinion, *PacifiCorp Update to Credit Analysis* (June 27, 2019), at 2.

Q. Can you provide an example of how the current ratings have benefited customers?

A. Yes. One example is PacifiCorp's ability to significantly reduce its cost of long-term debt primarily through obtaining new financings at very attractive interest rates. The lower cost of debt benefits customers through a lower overall rate of return and lower revenue requirement.

To determine the savings realized from maintaining a higher credit rating, in Exhibit PAC/303 New Debt Issue Spreads, I compared the actual effective interest rate on the Company's existing long-term debt forecasted to be outstanding during the calendar year 2021 test period, which was issued since its acquisition by BHE in 2006, comprising 14 series of debt, to what the effective interest rate would have been with a BBB credit rating. The issuance spread of each issuance was changed to match what a BBB rated utility achieved at about the same point in time that PacifiCorp issued the debt. The total result for the 14 series of debt averaging $5.5 billion over the test period, would have been an effective average interest rate of approximately 5.42 percent or 52 basis points higher than the actual effective interest rate. Combined with the existing pre-acquisition debt, the resulting overall cost of long-term debt would increase to 5.11 percent if the Company had a BBB rating. PacifiCorp is currently projecting an overall cost of long-term debt of 4.77 percent, or 34 basis points lower than it might have otherwise been under the scenario I described above.

Table 3 below shows the reduction in the Company's cost of long-term debt since 2010.

Table 3: PacifiCorp's Cost of Long-Term Debt

	Dec 2020	UE 263 Dec 2013	UE 246 Dec 2012	UE 217 Dec 2010	UE 210 Dec 2009
Cost of Long-Term Debt	4.77%	5.32%	5.37%	5.85%	5.96%

PacifiCorp's customers have benefited from a 119 basis points (1.19 percent) reduction in the Company's cost of long-term debt. The Company estimates that this reduction in the average cost of debt since 2010 results in a decrease of approximately $24.0 million in the revenue requirement in the current case. Customers have also benefited from the Company's ability to negotiate lower underwriting fees on long-term debt issuances through BHE's global underwriting fee position.

Q. Are there other identifiable advantages to a favorable rating?

A. Yes. Higher-rated companies have greater access to the long-term markets for power purchases and sales. This access provides these companies with more alternatives to meet the current and future load requirements of their customers. Additionally, a company with strong ratings will often avoid having to meet costly collateral requirements that are typically imposed on lower-rated companies when securing power in these markets.

In my opinion, maintaining the current single A rating provides the best balance between costs and continued access to the capital markets, which is necessary to fund capital projects for the benefit of customers.

Q. Is the proposed capital structure consistent with PacifiCorp's current credit rating?

A. Yes. This capital structure is intended to help the Company deliver its required capital expenditures and achieve financial metrics that will meet rating agency expectations.

Q. Does PacifiCorp's credit rating benefit because of BHE and its parent Berkshire Hathaway Inc.?

A. Yes. Although ring-fenced, PacifiCorp's credit ratios have been weak for the ratings level. PacifiCorp has been able to sustain its ratings in part through the acquisition by BHE and its parent, Berkshire Hathaway Inc. S&P was very clear on this point in its March 2019 assessment of PacifiCorp:

> Under our group rating methodology, we consider PacifiCorp to be a core subsidiary of BHE with a group credit profile of 'a'. The core status reflects our view that PacifiCorp is highly unlikely to be sold, has strong long-term commitment from senior management, is successful at what it does, and contributes meaningfully to the group. At the same time, we consider PacifiCorp as potentially insulated, with existing insulation measures that would support a one-notch separation between PacifiCorp and parent BHE. Given its core subsidiary status and BHE's group credit profile of 'a', the issuer credit rating on PacifiCorp is 'A'.[4]

Moody's states in their June 2019 credit opinion of PacifiCorp:

> PacifiCorp benefits from its affiliation with Berkshire Hathaway Inc., which requires no regular dividends from PacifiCorp or BHE. From a credit perspective, the company's ability to retain its earnings as an entity that is privately held, particularly by a deep-pocketed sponsor like Berkshire Hathaway Inc., is an advantage over most other investor owned utilities that are typically held to a regular dividend to their shareholders. PacifiCorp currently pays dividends that are sized to manage its equity ratio (as measured by unadjusted equity to equity plus long term debt) around its allowed levels of slightly higher than 50% (regulations restrict dividends if this ratio falls below 44%). As of December 2018, PacifiCorp reports its actual equity percentage, as calculated under this test, was 54%.

[4] S&P Ratings Direct, *PacifiCorp* (Mar. 15, 2019), at 9.

> Furthermore, BHE has placed PacifiCorp in a ring-fencing structure that restricts dividends if PacifiCorp's ratings fall to non-investment grade.[5]

These examples are evidence of the credit rating benefit resulting from BHE's ownership of PacifiCorp

Q. How does the TCJA impact PacifiCorp's credit rating?

A. The three main rating agencies have issued reports on the impact of tax reform on U.S. utilities and their holding companies and believe that tax reform will be unfavorable to utilities in the near term but with regulatory support for a stronger capital structure, highly rated utilities may retain positive credit ratings. For example, S&P determined:

> The impact could be sharpened or softened by regulators depending on how much they want to lower utility rates immediately instead of using some of the lower revenue requirement from tax reform to allow the utility to retain the cash for infrastructure investment or other expenses. Regulators must also recognize that tax reform is a strain on utility credit quality, and we expect companies to request stronger capital structures and other means to offset some of the negative impact.[6]

The Company has passed through partial benefits related to tax reform and is planning to pass through all of the remaining benefits in its jurisdictions, thus the negative impact to the Company's key credit metric (Moody's CFO pre-W/C/Debt) has not yet been fully realized. Absent regulatory support for a stronger capital structure, however, the Company's cash from operations will likely fall below levels where it can maintain the minimum 20 percent expectation for this credit metric, which could increase the likelihood of a downgrade.

Moody's states in their January 24, 2018 Sector Comment on Tax Reform:

---

[5] Moody's Credit Opinion, *PacifiCorp Update to Credit Analysis* (June 27, 2019), at 6.
[6] S&P Ratings Direct, *U.S. Tax Reform: For Utilities' Credit Quality, Challenges Abound* (Jan. 24, 2018), at 5.

> Tax reform mainly affects companies that already had limited cushion in their credit profile. The tax reform usually resulted in a further 150-250 bps drop in CFO pre-WC/debt.
>
> Moody's expects that most utilities will attempt to manage any negative financial implications of tax reform through regulatory channels. Corporate financial policies could also change. The actions taken by utilities will be incorporated into our credit analysis on a prospective basis. It is conceivable that some companies will sufficiently defend their credit profiles.
>
> In practice, we believe that most companies will actively manage their cash flow to debt ratios by issuing more equity or obtaining relief by working through regulatory channels.[7]

Q. Has the Commission recognized that the TCJA has had an adverse impact on utility cash flows and credit ratings?

A. Yes. In February 2019, the Commission adopted Staff's memo recommending approval of an application by Avista Corp. (Avista) to issue stock.[8] Staff's memo included the following statements about the TCJA and the importance of maintaining strong credit ratings:

> Staff finds that the Tax Cuts and Jobs Act of 2017 created unanticipated stresses on [Avista's] credit ratings. The requested authorization signals to rating agencies that the Company is committed to the equity portion of its capital structure. However, it is Staff's finding that restoring a notch in credit ratings involves more than just remedying the cause for the downgrade. On December 21, 2018, Moody's stated, "Avista's credit profile reflects its low-risk vertically integrated electric and gas utility business, regulatory uncertainty in WA and the expected negative cash flow impact of tax reform." Authorization herein as recommended by Staff starts the process of addressing rating agency concerns and restoring a positive credit outlook.[9]

[7] Moody's, *Tax Reform is Credit Negative for Sector, But Impact Varies by Company* (Jan. 24, 2018), at 3.
[8] *In the matter of Avista Corp., dba Avista Util., Application for Authorization to Issue 3,500,000 Shares of Common Stock*, Docket No. UF 4308, Order No. 19-067 (Feb. 28, 2019).
[9] *Id.* at Appendix A, p.4.

In July 2019, the Commission approved Avista's application to issue debt securities, adopting Staff's memo stating that, "Raising the Company's credit ratings back up a notch will require hard work and persistence on the part of Avista's finance group as well as a supportive regulatory environment and achieving target metrics."[10]

In January 2019, the Commission adopted Staff's memo recommending approval of Portland General Electric Company's (PGE) application to refresh a revolving credit facility.[11] Staff's memo contained similar observations about the TCJA and credit ratings:

> Of concern to Staff is Moody's approach to the impacts of the [TCJA]. While one might expect lower taxes would be inherently positive news for utilities, Moody's has focused in on cash flow metrics that are stressed by the recent tax reform. Timely refreshment of this credit facility while PGE is under no heavy time or market pressure is consistent with provision for ongoing liquidity in support of current credit ratings. While approval of this Application does not by itself answer all of Moody's concerns regarding tax reform impacts on the utility sector, the proposed replacement credit facility is consistent with prudent financial management by the Company and will likely be seen as credit positive by both Standard and Poor's and Moody's. As the spreads over benchmark interest rates applicable to PGE depend on the level of the Company's credit ratings, this will be an area for the Commission to continue to monitor.[12]

Rating Agency Debt Imputations

Q. Is PacifiCorp subject to rating agency debt imputation associated with power purchase agreements (PPAs)?

A. Yes. Rating agencies and financial analysts consider PPAs to be debt-like and will impute debt and related interest when calculating financial ratios. For example, S&P

[10] *In the matter of Avista Corp., dba Avista Util., Application for Authorization to Issue and Sell $600,000,000 of Debt Securities*, Docket No. UF 4313, Order No. 19-249 (July 30, 2019).
[11] *In the matter of Portland Gen. Elec. Co., Request for Authority to Extend the Maturity of an Existing $500 Million Revolving Credit Agreement,* Docket No. UF 4272(3), Order No. 19-025 (Jan. 23, 2019).
[12] *Id.* at Appendix A, p.9.

will adjust PacifiCorp's published financial results and impute debt balances and interest expense resulting from PPAs when assessing creditworthiness. They do so to obtain a more accurate assessment of a Company's financial commitments and fixed payments. S&P Ratings Direct November 19, 2013, details its view of the debt aspects of PPAs and other debt imputations, and is included as Confidential Exhibit PAC/304.

Q. How does this impact PacifiCorp?

A. In its most recent evaluation of PacifiCorp, S&P added approximately $479 million of additional debt and $21 million of related interest expense to the Company's debt and coverage tests for PPAs and other liabilities of the Company that are considered to be debt-like by S&P.

Q. How does inclusion of the PPA-related debt and these other adjustments affect PacifiCorp's capital structure as S&P reviews the Company's credit metrics?

A. Negatively. By including the imputed debt resulting from PPAs and these other adjustments, PacifiCorp's capital structure has a lower equity component as a corollary to the higher debt component, lower coverage ratios, and reduced financial flexibility than what might otherwise appear to be the case from a review of the book value capital structure. For example, as shown in Table 4, if one were to apply the total $479 million amount of debt adjustments that S&P most recently made to PacifiCorp's proposed capital structure in this case, the resulting common equity percentage would decline from 53.52 percent to 52.15 percent. The corresponding higher average adjusted debt percentage of 47.85 percent over the test period reflects an adjusted capital structure that approximates the 48/52 percent baseline mix of debt and common equity capital that PacifiCorp targets.

Table 4: Rating Agency Adjusted Capital

	Proposed Cap Structure		Rating Agency Adjustments	Adjusted Cap Structure	
	Book Values	% of Total		Book Values	% of Total
Long-Term Debt	$8,433	46.47%	$479	$8,912	47.85 %
Preferred Stock	2	0.01%	(1)	1	— %
Common Equity	9,713	53.52%	-	9,713	52.15 %
	$18,148	100.00%	$478	$18,626	100.00 %

IV. CAPITAL STRUCTURE DETERMINATION

Q. How did the Company determine its recommended capital structure?

A. The capital structure is based on the actual capital structure at December 31, 2019 and forecasted capital activity, including known and measurable changes, through December 31, 2021. PacifiCorp averaged the five quarter-end capital structures measured beginning at December 31, 2020, and concluding with December 31, 2021, resulting in a capital structure with an equity component of 53.52 percent. The support for these five quarter-end capital structures, spanning the 12-month test period, are provided by the Company in response to Standard Data Request 38 in this general rate case docket. The capital activity includes known maturities of certain debt issues that were outstanding at December 31, 2019, subsequent issuances of long-term debt, and any capital contributions received or dividends paid. The known and measurable changes represent forecasted capital activity since December 31, 2019.

Q. Why does the Company propose a capital structure calculated using a five-quarter average?

A. This approach smooths volatility in the capital structure, which will fluctuate as the Company expends capital, issues or retires debt, retains earnings, or declares dividends.

Q. Why is PacifiCorp using capital balances for the 12-month period ending December 31, 2021, rather than the projected capital structure as of the rate effective date?

A. This approach best captures the actual capital structure PacifiCorp forecasts for the rate effective period.

Q. How does the Company's proposed capital structure compare to recent actual capital structures and to the capital structure authorized in PacifiCorp's last general rate case, docket UE 263 (2013 Rate Case)?

A. The capital structures are compared in Table 5 below.

Table 5: Forecast and Actual Capital Structures

PacifiCorp's Comparison of % Capital Structures						
	Dec 31, 2021 Forecast*	Dec 31, 2020 Forecast*	Dec 31, 2019 Actual*	Dec 31, 2018 Actual*	Dec 31, 2017 Actual*	UE 263 Stipulated Capital Structure
Long-Term Debt	46.47%	47.44%	48.36%	47.89%	48.49%	47.6%
Preferred Stock	0.01%	0.01%	0.02%	0.02%	0.02%	0.3%
Common Equity	53.52%	52.55%	51.62%	52.09%	51.49%	52.1%
Totals	100.00%	100.00%	100.00%	100.00%	100.00%	100.0%

*Five quarter-end average % Capital Structure calculated for trailing 12 month period ending

The percentage increase in the common equity component of the capital structure from the actual December 31, 2019 five-quarter average to that projected for the 2021 forecast test period is due to earnings offset by debt issuances and the forgoing of any common dividend payments in 2020. Further, both of the Company's projected capital structures for 2020 and 2021 contain a higher common equity component than what was approved by the Commission in the 2013 Rate Case. As discussed above, PacifiCorp's increased capital investment requirements and ratings pressure caused by the TCJA require PacifiCorp to increase the equity in its capital structure to maintain its current ratings.

V. FINANCING COST CALCULATIONS

Q. How did you calculate the Company's embedded costs of long-term debt and preferred stock?

A. Consistent with my determination of the percentage capital structure discussed previously, I have similarly calculated the embedded costs of debt and preferred stock as an average of the five quarter-end cost calculations spanning the test period, beginning at December 31, 2020, and concluding with December 31, 2021.

Q. Please explain the cost of long-term debt calculation.

A. I calculated the cost of debt by issue, based on each debt series' interest rate and net proceeds at the issuance date, to produce a bond yield to maturity for each series of debt outstanding as of each of the five quarter-ending dates spanning the 12-month calendar 2021 test year. It should be noted that in the event a bond was issued to refinance a higher cost bond, the pre-tax premium and unamortized costs, if any, associated with the refinancing were subtracted from the net proceeds of the bonds that were issued. Each bond yield was then multiplied by the principal amount outstanding of each debt issue, resulting in an annualized cost of each debt issue.

Aggregating the annual cost of each debt issue produces the total annualized cost of debt. Dividing the total annualized cost of debt by the total principal amount of debt outstanding produces the weighted average cost for all debt issues. The support for each of these pro-forma weighted average cost of debt calculations as of each of the five quarter-ending dates spanning calendar year 2021 are provided as attachments by the Company in response to Standard Data Request 12. The average of these five annualized cost of debt calculations, as summarized below, is PacifiCorp's embedded cost of long-term debt for this proceeding:

Table 6: PacifiCorp Embedded Cost of Long-Term Debt

	Forecast LT Debt O/S ($m)	Wt Ave Pro-forma Cost of LT Debt	Cost of Debt calcs provided in response to OR GRC SDR 12
12/31/20	$8,517	4.79%	attach SDR 12-2
03/31/21	8,517	4.80%	attach SDR 12-3
06/30/21	8,117	4.86%	attach SDR 12-4
09/30/21	8,517	4.73%	attach SDR 12-5
12/31/21	8,497	4.70%	attach SDR 12-6
5QE Ave	$8,433	4.77%	

Q. Please describe the changes to the amount of outstanding long-term debt between December 31, 2019, and December 31, 2021?

A. Approximately $38 million and $420 million of the Company's variable and fixed rate long-term debt, respectively, will mature during this period and I have therefore repriced or removed this debt when appropriate in the determination of the proposed average cost of debt. Also, as reflected in Exhibit PAC/301, Pro forma Cost of Long-Term Debt, the Company anticipates new fixed rate long-term debt during the period, a 10- and 30-year split term issuance totaling $850 million in 2020 and a 30-year term issuance totaling $400 million in 2021.

Q. Regarding the $850 million of new long-term issuances in 2020, how did you determine the interest rate and resulting cost for this new long-term debt?

A. The Company's current estimated credit spread for 10-year and 30-year debt is 0.75 and 1.03 percent, respectively. The recent forward 10-year and 30-year U.S. Treasury rates for July 2020 are approximately 1.95 and 2.33 percent, respectively. Issuance costs for 10-year and 30-year debt of this type adds approximately 0.08 and 0.05 percent to the all-in cost, respectively. Therefore, as reflected in Exhibit PAC/301, Pro forma Cost of Long-Term Debt, the Company projects a total all-in cost of long-term debt of 2.78 percent and 3.41 percent, respectively, for the projected new 10-year and 30-year long-term debt.

Q. Regarding the $400 million of new long-term issuances in 2021, how did you determine the interest rate and resulting cost for this new long-term debt?

A. The Company's current estimated credit spread for 30-year debt is 1.03 percent and the recent forward 30-year U.S. Treasury rates for July 2021 is approximately 2.37 percent. Issuance costs for 30-year debt of this type adds approximately 0.05 percent to the all-in cost. Therefore, as reflected in Exhibit PAC/301, Pro forma Cost of Long-Term Debt, the Company projects a total all-in cost of long-term debt of 3.45 percent, for the projected new 30-year long-term debt.

Q. A portion of the securities in PacifiCorp's debt portfolio bears variable rates. What is the basis for the projected interest rates used by PacifiCorp?

A. The Company's variable rate long-term debt in this case is in the form of tax-exempt debt. Exhibit PAC/305, Variable Rate Pollution Control Revenue Bonds, shows that, on average, these securities have been trading at approximately 84 percent of the 30-day London Inter Bank Offer Rate (LIBOR) for the period January 2000 through December 2019. Therefore, the Company has applied a factor of 84 percent to the forward 30-day LIBOR rate as of each of the five quarter-ending dates spanning calendar year 2021 and then added the respective credit facility and remarketing fees for each floating rate tax-exempt bond outstanding during the period. Credit facility and remarketing fees are included in the interest component because these are costs which contribute directly to the interest rate on the securities and are charged to interest expense. This method is consistent with the Company's past practices when determining the cost of debt in previous Oregon general rate cases as well as in other states that regulate PacifiCorp.

Q. Did you make any further adjustments in your pro-forma calculations of the Company's weighted cost of debt over the calendar 2021 test period?

A. Yes. For the pro-forma weighted average cost of debt calculations made for each of the five quarter-ending dates spanning calendar year 2021, as evidenced in the attachments provided by the Company in response to Standard Data Request 12, I adjusted the interest rate on the then existing long-term debt scheduled to mature within one year to reflect expected financing rates. This adjustment is consistent with the Commission practice as set forth in Order 01-787[13] and with the Company's practice in cases since that order.

Q. How did you calculate the embedded cost of preferred stock?

A. The embedded cost of preferred stock was calculated by first determining the cost of money for each issue. I began by dividing the annual dividend per share by the per share net proceeds for each series of preferred stock. The resulting cost rate associated with each series was then multiplied by the total par or stated value outstanding for each issue to yield the annualized cost for each issue. The sum of annualized costs for each issue produces the total annual cost for the entire preferred stock portfolio. I then divided the total annual cost by the total amount of preferred stock outstanding to produce the weighted average cost for all issues. The result is PacifiCorp's embedded cost of preferred stock.

Embedded Cost of Long-Term Debt

Q. What is PacifiCorp's embedded cost of long-term debt?

A. The cost of long-term debt is 4.77 percent, as shown in Exhibit PAC/301, Pro forma Cost of Long-Term Debt.

Embedded Cost of Preferred Stock

Q. What is PacifiCorp's embedded cost of preferred stock?

A. Exhibit PAC/306, Cost of Preferred Stock, shows the embedded costs of preferred stock to be 6.75 percent.

---

[13] *In the matter of PacifiCorp's Proposal to Restructure and Reprice its Services in Accordance with the Provisions of SB 1149*, Docket No. UE 116, Order No. 01-787 (Sept. 7, 2001).

VI. IMPLEMENTATION OF TCJA TAX BENEFITS IN RATES

Q. How does PacifiCorp propose to include the benefits of the TCJA's lower tax rate in this proceeding?

A. PacifiCorp will include the tax benefits by: (1) embedding the lower tax rate in base rates as discussed in the testimony of Ms. Shelley E. McCoy, (2) including a rate base deduction for unamortized protected EDIT and lowering income tax expense for the annual level of amortization, and (3) returning to customers the tax benefits deferred as of December 31, 2020.

These actions are consistent with the Commission's decisions in docket UM 1917, docket UM 1985, and docket UE 352.[14]

Q. Please quantify the TCJA balances deferred as of December 31, 2020, that will be refunded to customers.

A. The total amount of deferred TCJA tax benefits projected to be available as of December 31, 2020, is $71.7 million. This consists of the deferral of current tax benefits for the calendar year ending December 31, 2020, of $50.6 million and non-protected EDIT of $21.1 million.[15] PacifiCorp's proposal to return this balance to customers and the related revenue requirement impacts is explained in the direct testimony of Ms. McCoy.

[14] *In the matter of PacifiCorp, dba Pacific Power, Application for Approval of Deferred Accounting Related to the Federal Tax Act*, Docket No. UM 1917, Order No. 19-017 (Jan. 18, 2019); *In the matter of PacifiCorp, dba Pacific Power, Application for an Accounting Order and Request for Amortization Related to the Federal Tax Act*, Docket No. UM 1985, Order No. 19-028 (Jan. 29, 2019); *In the matter of PacifiCorp, dba Pacific Power, 2019 Renewable Adjustment Clause*, Docket No. UE 352, Order No. 19-304 (Sept. 16, 2019). *See* Exhibit PAC/1300 for a discussion of the specific treatment of the benefits of the TCJA.
[15] Exhibit PAC/307.

Q. How do the EDIT balances presented in this case differ from the balances provided by PacifiCorp in dockets UM 1985 and UM 1917?

A. Since PacifiCorp filed its applications in dockets UM 1985 and UM 1917, the Company has made two changes of note, as quantified in Exhibit PAC/307.

First, while total EDIT has not changed, PacifiCorp made a correction in the classification between protected and non-protected amounts since the balances were presented in docket UM 1917. The misclassification was identified during the process of extracting non-protected property EDIT balances from the Company's tax fixed asset system so that they can be deferred and returned to customers over a period of time approved by the Commission. The correction resulted in more EDIT classified as protected and less classified as non-protected.

Second, PacifiCorp will be using the Reverse South Georgia Method (RSGM) to amortize protected EDIT, retroactive to January 1, 2018, because the Company's books and underlying records do not contain the necessary vintage account data to use the Average Rate Assumption Method (ARAM) as originally contemplated. The amortization of PacifiCorp's protected EDIT for 2018, 2019, and 2020 is greater under the RSGM as compared to the Company's ARAM projections. Per Order 19-304 in the 2019 Renewable Adjustment Clause, the non-protected EDIT, including the deferred amortization of protected EDIT for 2018, 2019, and 2020, will be used to offset the Oregon-allocated net book value of the undepreciated plant that is replaced as a result of wind repowering.[16]

[16] *See In the matter of PacifiCorp dba Pacific Power's 2019 Renewable Adjustment Clause*, Docket No. UE 352, Order No. 19-304 (Sept. 16, 2019).

The Reverse South Georgia Method

Q. Please explain why PacifiCorp's books and underlying records do not contain the necessary vintage account data to use the ARAM.

A. For some assets and in certain circumstances, PacifiCorp records situs book depreciation on system-allocated assets. For background, PacifiCorp depreciates system-allocated assets using a base composite life; this base level of book depreciation is system-allocated. An incremental amount of book depreciation is calculated for jurisdictions that approve a composite life different from the base or otherwise approve accelerated book depreciation for system-allocated assets; this incremental amount of book depreciation is situs allocated.

To use the ARAM, book depreciation is required at a jurisdictional level by vintage and tax class to have the necessary vintage account data. Because book depreciation is not maintained at this level for book accounting purposes, PacifiCorp relies on its tax fixed asset system to produce the necessary vintage account data for tax purposes by performing a procedure to allocate book depreciation.

As presently configured, the book depreciation allocation procedure cannot process situs book depreciation on system-allocated assets in a manner that impacts only the vintage account data of the jurisdiction to which the situs book depreciation inures. As a result, the situs book depreciation must be accounted for separately as a tax class of its own, thereby rendering the jurisdictional vintage account data to which the EDIT is actually attached incomplete for the purposes of using the ARAM.

Q. How are the issues with situs book depreciation addressed by the RSGM?

A. Unlike the ARAM, book depreciation is not required at the jurisdictional level by vintage and tax class for amortization of EDIT when using the RSGM. The RSGM requires only the use of a remaining regulatory life for an asset or group of assets to amortize the EDIT on a straight-line basis.

To implement the RSGM, PacifiCorp categorized Oregon-allocated protected EDIT at the level of detail presented in the Company's most recently filed depreciation study. The protected EDIT is then amortized straight-line over Oregon's approved remaining regulatory life for each respective asset or group of assets. For tax years 2018 to 2020, the remaining lives are based on Oregon's most recently approved depreciation study. Beginning in 2021, the remaining lives will be updated to match those approved in the presently pending depreciation study and then again for each depreciation study approved thereafter. If the Commission approves regulatory lives different from those proposed by the Company in this case and the ongoing depreciation study, the protected EDIT amortization included in this case will need to be updated accordingly.

Q. Do PacifiCorp's facts meet the statutory requirements for using the RSGM?

A. Yes. Although there are uncertainties with respect to the proper application of section 13001(d) of the TCJA, PacifiCorp has carefully considered this matter and, based on its facts and circumstances, believes that the use of the RSGM is permitted as a normalization method of accounting.

Q. Does the Internal Revenue Service (IRS) recognize the need for clarity with regard to the EDIT normalization requirements in light of the TCJA?

A. Yes. In Notice 2019-33, the IRS announced its intent to issue guidance to clarify the EDIT normalization requirements, which may include guidance on the use of the RSGM; the Company anticipates this guidance will be issued in 2020. In comments submitted in response to Notice 2019-33, the Edison Electric Institute has requested that the IRS issue transitional guidance that allows taxpayers to correct potential normalization violations on a prospective basis and that the violations be forgiven without penalty. If uncertainties still exist after the guidance is issued, the Company will evaluate the need to file a private letter ruling request.

VII. PENSION COSTS

Q. Please describe the status of PacifiCorp's defined benefit pension plans.

A. To reduce the risk profile of its defined benefit pension plans, PacifiCorp has over time, shifted the accrual of new benefits to its defined contribution 401(k) plan. All non-represented employees hired after January 1, 2008 and all represented employees hired after June 30, 2013, receive retirement benefits solely through the 401(k) plan. Retirement plan benefits for represented employees are determined through the collective bargaining process through which the Company has maintained its focus on shifting to providing benefits through its 401(k) plan. The Company provided non-represented employees hired before January 1, 2008, the ability to receive their retirement through either the pension plan or the 401(k) plan. This choice was offered in 2008, and 41 percent of the eligible participants migrated to the 401(k) plan. The remaining non-represented employees in the defined benefit pension plan continued to receive benefit accruals until accruals were frozen December 31, 2016.

Q. Does this case reflect costs associated with PacifiCorp's defined benefit pension plans?

A. Yes. The Company still incurs net periodic benefit costs for its defined benefit pension plans. The Company's net periodic benefit costs generally include interest costs associated with discounting the projected benefit obligation and amortization of net unrecognized gains and losses, offset by the expected return on plan investments. The level of these costs will be driven by various assumptions including the interest rate used to discount the liability, life expectancy and other demographics of the Company's plan participants, and the expected long-term rate of return based on the mix of investments. This filing reflects pension costs of $8.8 million, including a projected settlement loss of approximately $11.9 million during the 2021 test period.

Q. What is a settlement loss?

A. Accounting guidance provides for delayed recognition of certain gains and losses. These unrecognized costs include an accumulation of past actuarial gains and losses that result from changes in actuarial assumptions, such as the discount rate, and the difference between expected and actual experience, for example asset returns that exceed or underperform the level assumed in determining net periodic benefit cost. Under the Financial Accounting Standards Board's Accounting Standards Codification (ACS) 715, Compensation - Retirement Benefits[17] and ASC 980, Regulated Operations, the majority of the Company's unrecognized net loss is

[17] Formerly known as "FAS 87."

currently amortized over approximately 21 years, which represents the average remaining life expectancy of plan participants. A settlement loss occurs when the aggregate lump sum cash distributions in a calendar year exceed a defined threshold (service cost plus interest cost), requiring under ASC 715 immediate recognition in earnings of a portion of the unrecognized actuarial gains or losses. If not for this requirement, such portion of the net actuarial loss would eventually flow through expense as part of the ongoing amortization over the approximately 21-year period.

Q. Why are actuarial gains and losses an important component of on-going pension expense under ASC 715?

A. Actuarial gains and losses arise annually as remeasurement occurs each year-end under ASC 715 due to changes in assumptions, differences between expected and actual asset returns, actuarial experience, etc. As of December 31, 2019, the Company had $422 million of unrecognized net actuarial losses recorded as a regulatory asset that will generally be recognized to expense over the average remaining life of plan participants (currently approximately 21 years), making it a significant portion of the Company's annual pension expense. Recognition of actuarial gains and losses are amortized over time rather than in the year they occur, which can help minimize volatility in expense from year to year. However, as I described above, settlement accounting under ASC 715 can trigger accelerated recognition of a portion of the unrecognized net actuarial losses. The Company last recognized a settlement loss in 2018 on a total-company basis of $22 million, approximately $6 million of which was Oregon's share. In docket UM 1992, the Company requested approval of deferred accounting treatment related to this settlement loss. However, the Commission denied the application as "a higher number of retirees taking lump sum distributions may be viewed as being a reasonably possible outcome resulting from PacifiCorp's business decisions. It falls within the range of reasonably foreseeable possible outcomes in the then-existing environment of low service costs, stable interest rates and low inflation...[.]"[18]

Q. Does the Company anticipate that settlement losses under ASC 715 will be triggered during the next few years and if so, what is the driver?

A. Yes. Recent history demonstrates that during periods of low interest rates, a higher percentage of participants elect lump sum distributions. Thus, with the very low interest rate environment present at the time the Company's projections for this filing were compiled and the knowledge of what the Company experienced in 2018 when interest rates were similarly low, the Company anticipates that additional settlement losses will occur. Based on actuarial projections, settlement losses of $18.5 million and $11.9 million are forecast during 2020 and 2021, respectively, justifying the inclusion of these costs in base rates.

In periods of low interest rates, the Company experiences lower interest cost on the benefit obligation, which keeps the threshold for determining settlement accounting at a low level. Table 7 below shows the settlement threshold for the last seven years along with the projections for 2020 and 2021. The declining threshold is primarily driven by the low interest rate environment. The Company is likely to be subject to a settlement charge each year that interest rates are sufficiently low.

---

[18] *In the matter of PacifiCorp, dba Pacific Power, Application for Approval of Deferred Accounting and Accounting Order related to Non-Contributory Defined Benefit Pension Plans,* Docket No. UM 1992, Order No. 20-004, at 8 (Jan. 8, 2020).

Table 7: Recent History and Projections of Settlement Threshold ($ in millions)

	2013	2014	2015	2016	2017	2018	2019	2020	Projected 2021
Service cost	$ 5.9	$ 5.3	$ 4.7	$ 4.1	$ —	$ —	$ —	$ —	$ —
Interest cost	$ 51.9	$ 54.0	$ 50.6	$ 51.8	$ 47.3	$ 41.1	$ 42.6	$ 34.4	$ 31.9
Settlement threshold (service cost + interest cost)	$ 57.8	$ 59.3	$ 55.3	$ 55.9	$ 47.3	$ 41.1	$ 42.6	$ 34.4	$ 31.9

In addition to a low settlement threshold, the Company has made assumptions about the number of participants who will take lump sum distributions upon retirement along with their estimated payout. For purposes of valuing the pension benefit obligation, the Company's actuaries generally assume (based on historical experience) that 60 percent of participants will elect lump sum distributions. However, in performing the annual remeasurement of the pension benefit obligation at December 31, 2019, the Company's actuaries assumed 80 percent of participants would elect lump sum distributions in 2020 in anticipation of an increase in the percentage of retiring participants electing lump sums due to the unprecedentedly low interest rates. For 2021, 60 percent of participants are assumed to elect lump sum distributions. In any given year, the actual percentage of participants electing lump sum distributions will differ from what was assumed.

Table 8 below shows the historical number of participants electing lump sums distributions and the resulting value paid out of the plan along with the projections for 2020 and 2021. Table 8 also presents the percentage of participants electing lump sum distributions with 2018, the year in which the Company incurred a $22 million settlement loss, being an outlier at over 73 percent.

Table 8: Historical and Projected Lump Sum Distribution Information ($ in millions)

	2013	2014	2015	2016	2017	2018	2019	Projected 2020	Projected 2021
Lump Sum Distributions	$ 52.2	$ 22.0	$ 40.5	$ 31.9	$ 40.0	$ 52.3	$ 22.7	$ 50.8	$ 34.4
Distributions in Excess of Threshold	$ —	$ —	$ —	$ —	$ —	$ 11.2	$ —	$ 16.4	$ 2.5
Discount Rate	4.05%	4.80%	4.00%	4.40%	4.05%	3.60%	4.25%	3.25%	3.25%
Minimum Present Value Segment Rates(1)	1.02% 3.71% 4.67%	1.40% 4.66% 5.62%	1.40% 3.98% 5.04%	1.69% 4.11% 5.07%	1.47% 3.34% 4.30%	1.96% 3.58% 4.35%	3.21% 4.26% 4.55%	2.13% 3.07% 3.65%	2.04% 3.09% 3.68%
Number of Participants Electing Lump Sums	204	150	216	224	205	211	114	231	172
Percentage of Participants Electing Lump Sums	66.3%	50.2%	64.9%	68.7%	58.4%	73.3%	67.1%	80%	60%

(1) Other than for 2021, represents the IRS's published minimum present value segment rates from September of the preceding year, which are used to value lump sum distributions taken in the subsequent year, in accordance with the Company's pension plan document. For example, the 2.13%/3.07%/3.65% presented under 2020 are the September 2019 rates applicable to lump sum distributions to be taken in 2020. Rates included for 2021 are based on the November 2019 rates published by the IRS, which were the most recently available at the time the projections were compiled. The December 2019 rates were 2.03%/3.06%/3.59%.

As of December 31, 2019, interest rates decreased significantly, resulting in a 3.25 percent discount rate used to perform the annual remeasurement of the Company's benefit obligation and determine the interest cost component of the Company's net periodic benefit cost for 2020. This compares to a 4.25 percent discount rate at December 31, 2018. As presented in Table 7, this decrease results in lower interest cost and thus a lower settlement loss threshold. As presented in Table 8, the applicable minimum present value segment rates for 2020 lump sum distributions are very low; thus, the Company projects higher lump sum distributions and the triggering of a settlement loss in 2020 of an estimated $18.5 million. Based on the current low interest rate environment, the Company projects a settlement loss of $11.9 million in 2021 using the assumptions presented in Table 8. When similar circumstances were present in 2018, the Company incurred a settlement loss of $22 million.

VIII. CONCLUSION

Q. Please summarize your recommendations to the Commission.

A. I respectfully request the Commission adopt PacifiCorp's proposed capital structure with a common equity level of 53.52 percent. This capital structure balances the financial integrity of the Company and costs to customers by reflecting the minimum equity ratio necessary for PacifiCorp to maintain its ratings under current market conditions, especially given the passage of the TCJA. When combined with PacifiCorp's updated cost of long-term debt of 4.77 percent and the cost of equity of 10.20 percent recommended by Ms. Bulkley, this produces a reasonable overall cost of capital of 7.68 percent.

In addition, the Commission should acknowledge the reasonableness of PacifiCorp's treatment of its TCJA tax benefits in rates, and approve PacifiCorp's projected pension costs included in this case.

Q. Does this conclude your direct testimony?

A. Yes.

DOCKETED
OCT 17 2008
DOCKETED BY

Commissioner Kristin K. Mayes
Arizona Corporation Commission
1200 West Washington
Phoenix, Arizona 85007

Re: Docket No. E-01345A-08-0172 (Interim Rate Motion)

Dear Commissioner Mayes:

On October 8, 2008, you filed a letter in which you requested Arizona Public Service Company ("APS" or "Company") to respond to five specific issues covering a range of subjects. Because several of these issues are germane to the Company's pending Motion for Interim Rates, the Company has chosen to submit its response in the above docket. For the convenience of the parties to this proceeding, I have attached a copy of your October 8th letter as Appendix A.

APS Access to Commercial Paper Market and *Other Credit-Related Issues*

APS first began experiencing trouble accessing the commercial paper market in August of 2007 when the sub-prime credit issues began to impact the capital markets. Access has continued to be sporadic throughout 2008, with the amount of commercial paper APS can issue often being limited even when access to the market was possible. Beginning September 17, 2008, the commercial paper market has been completely closed to APS.

As discussed during the hearing, APS had total lines of credit of $900 million. The first line of $400 million expires at the end of 2010, with a second for $500 million expiring at the end of 2011. The purpose of these lines of credit is to provide the Company with liquidity and working capital when commercial paper cannot be utilized – not fund capital expenditures.[1] Indeed, Decision No. 69947 (October 30, 2007) specifically limited the use of the $500 million line of credit to fuel/purchased power requirements and thus cannot be used to fund the Company's capital requirements. As of September 30, 2008, approximately $270 million had to be drawn down due to the problems in the commercial paper market described above. Also, $34 million of the Company's credit line was with bankrupt Lehman Brothers and thus no longer

[1] Borrowing on bank lines of credit is normally 25 to 50 basis points more expensive than commercial paper.

exists. Another $36 million was with Wachovia, which is in the process of being acquired by Wells Fargo. Whether the new owner of Wachovia will assume the $36 million commitment is uncertain, to say the least. Accordingly, APS's previous $900 million lines of credit are now no more than $866 million, and may be as low as $830 million. Finally, as a result of recent write-downs of bank assets, there is $2 trillion less credit capacity in the U.S. banking system than there was before this global financial crisis began. As a result, APS will likely encounter difficulty in maintaining its remaining lines of credit in the future, and there is no doubt that these lines of credit would, in any case, be insufficient to meet APS's capital expenditure needs over the next few years.

Liquidity is absolutely vital to the financial integrity of an electric utility. APS itself was contacted by each of the three rating agencies after the Lehman Brothers bankruptcy and asked about the Company's exposure to Lehman, Morgan Stanley, Merrill Lynch and Goldman Sachs, as well as its ability to count on its lines of credit given the chaos in the short-term credit markets. A recent example of the critical importance of liquidity is Constellation Energy, the parent of Baltimore Gas & Electric Company, which began 2008 with a stock price of over $100 per share. After facing a liquidity crisis driven by threatened credit rating downgrades and the resultant cash collateral calls that nearly drove Constellation to the brink of bankruptcy, it was forced to sell itself to MidAmerican Energy (the same entity that bought out PacifiCorp) for $26.50 per share.

And the damage has not been limited to the short-term debt market. Despite massive efforts by our Federal government and governments in Europe and Asia to pump liquidity into the national and international credit markets, access to the corporate debt market is extremely strained, with only the most highly-rated corporations being successful in raising long-term debt capital. At present, APS likely could not successfully issue long-term debt. Whether this financial market environment will improve by the spring of next year, when APS likely will need to issue debt, is unknown.

Geo*Smart* Solar Financing Program

On Thursday, September 25, 2008 GE Money announced that it will no longer offer unsecured installment consumer financing for its energy efficiency and renewable energy programs after October 23, 2008 because of the current turmoil in the credit markets. The action specifically affected the Electric & Gas Industries Association's ("EGIA") GEO*Smart* Financing Program offered by APS because GE Money provided the financial support for the program. Although APS had no prior warning of GE Money's actions, APS remains committed to its partnership with EGIA. EGIA, as a non-profit entity implementing similar financing programs for utilities around the country, is situated to identify other suitable financial institutions to back the Geo*Smart* program. In recent conversations, EGIA informed APS that a number of financial institutions have been identified that **may** be able to provide funding for GEO*Smart*. APS remains hopeful but cannot offer any assurance that EGIA will secure other financial backing in the future.

Transactions with Investment Banks or Similar Financial Institutions

Attached as Appendix B is a list of the banks with which APS has existing lines of credit. As noted before, Lehman Brothers and Wachovia are in that group. APS has also submitted a $1.1 million claim against Lehman Brothers in bankruptcy over a hedging transaction. APS has conducted numerous transactions with Morgan Stanley and Goldman Sachs, who together are major players in the U.S energy markets. Although it would seriously reduce the overall liquidity of these energy markets should Morgan Stanley and/or Goldman Sachs bow out of the energy market, APS itself had controls in place well before all these problems began that limited its exposure to any single trading partner, including those discussed above. However, with chaotic and unprecedented market events such as we are presently experiencing, no amount of internal controls can provide complete protection against potential losses.[2] Finally, AIG is a carrier for APS property and casualty insurance. APS believes that these insurance policies will continue to be honored.

Auction Rate Securities

APS does not have any funds invested in auction rate securities ("ARS"). APS is an issuer of ARS, with $343 million outstanding and with maturities in 2029 and 2034. The average rate of interest paid on these securities has been 3.2%, thus providing very attractive financing for APS and its customers.

Palo Verde

Palo Verde Unit 3 experienced two relatively brief unplanned outages recently. The first was from September 16 to September 20 when a failed transmitter in the control circuitry for one of the two power supplies to the reactor control rods required the unit to be shut down. That was safely accomplished, and after the electronic card that included the failed component was replaced, the unit was returned to full power without incident. The second was from September 27 to 30 when high sulfate levels were detected in the secondary steam system (the system that connects the steam generators with the steam turbine). After operators had shut down the unit, the secondary system chemistry was returned to normal, the unit again returned to service without incident and has been operating at full power since then. APS estimates that the amount of additional fuel and purchased power costs deferred for recovery through the PSA to be approximately $3 million.[3]

Neither outage involved what could be characterized as an unusual event for a nuclear power plant and is the sort of occurrence anticipated in the budgeted effective forced outage rate ("EFOR") for Palo Verde. Palo Verde, like all generators, including all APS generators, has an

---

[2] Although such transactions are not directly with APS, the APS decommissioning trusts and the Pinnacle West retirement funds have relatively small investments in some of the troubled entities identified in your letter, as likely do most if not all large investment funds in this country.

[3] As the Commission is aware, APS absorbs 10% of higher fuel costs, and a portion of outage costs are embedded in the base fuel cost. In addition, a small amount is allocated to wholesale customers. Thus, the total cost of the outages was $4.4 million.

anticipated EFOR based primarily on past operations. This is merely an acknowledgement that all machines, no matter how well designed, constructed, operated, and maintained, will sometimes fail. Electric generators are no exception to that rule.

To date this year, the overall Palo Verde capacity factor has been 98% (excluding refueling outages). This past summer, Palo Verde set an all-time record for generation.

Throughout both outage events, Palo Verde staff demonstrated their safety-first focus by using effective problem identification and resolution behaviors, took proper action during troubleshooting (including developing contingency plans) and work planning. They executed all needed repairs with a focus on human performance. The NRC was kept fully informed throughout these outages and monitored Palo Verde's decision-making process and the actions taken. APS does not believe these outages have had any negative impact on APS's substantial progress in resolving the NRC's Confirmatory Action Letter.

Sincerely,

Thomas L. Mumaw

Re: Impact of recent financial crisis on APS' access to commercial paper markets and ability to finance capital projects; forced cancellation of GeoSmart Solar Loan Program; transactions with investment banks; exposure to auction rate securities; status of outages at Palo Verde Nuclear Generating Station's Unit 3.

Dear Mr. Brandt:

As you know, the recent upheaval in America's financial markets has had an unsettling effect on our national and local economies. It has also had serious consequences for individuals and companies who need to access financing, as credit tightens and capital markets become less fluid.

In recognition of the current environment, I write to request that you provide the Commission with information regarding whether the unfolding events on Wall Street have had an impact on Arizona Public Service Company ("APS"), with a particular focus on several areas.

First, please tell the Commission whether APS has experienced difficulty gaining access to short or long term debt markets. In particular, have you seen a decline in the Company's ability to issue commercial paper, a practice that has become common among large utilities seeking to make payments for short term capital expenditures and operating expenses. If so, please describe the ways in which you have responded to this deficiency in order to meet the Company's capital needs. Have you experienced additional expenses associated with accessing these markets? What is the short-term and long-term impact to APS' planned capital projects?

Second, APS recently reported to my office that it was forced to scuttle its GeoSmart Solar Financing Program – the program by which APS was offering loans to customers wishing to install solar panels who could not afford to do so solely using rebates – because General Electric pulled its funding due to the credit crisis. Please detail the circumstances surrounding this program suspension and whether you believe APS will be able to re-start the program in the future. Please also inform the Commission whether any other renewable energy or other capital expenditure programs have been threatened or come under pressure as a result of the tightened credit markets, and the Company's strategy for addressing these pressures.

Third, please tell the Commission whether APS engaged in any significant financial transactions with Lehman Brothers, American International Group, Bear Stearns, or any other investment firm that has been the subject of recent bankruptcies or governmental takeovers. If so, please detail those transactions, and to what extent they have impacted the Company.

Fourth, it is my understanding that APS has had some exposure to auction rate securities. As you know, the auction rate securities market recently collapsed. Please describe the Company's auction rate securities holdings, what worth those securities now have, and what the Company intends to do with those securities in order to minimize any losses associated with them.

Finally, as you know, Palo Verde Nuclear Generating Station's ("PVNGS") Unit Three was down from September 27th to October 1st – making for a second outage in less than a month. Please tell the Commission how these Unit Three outages will impact the Company's efforts to resolve PVNGS' Category Four status with the Nuclear Regulatory Commission, as well as the estimated replacement costs that have been passed through the Company's Purchased Power and Fuel Adjustment Clause as a result of these outages.

Thank you for your attention to these questions.

Sincerely,

Kris Mayes
Commissioner

Direct Testimony of Ann E. Bulkley

February 2020

TABLE OF CONTENTS

ATTACHED EXHIBITS

I. INTRODUCTION AND QUALIFICATIONS

Q. Please state your name and business address.

A. My name is Ann E. Bulkley. My business address is 293 Boston Post Road West, Suite 500, Marlborough, Massachusetts 01752.

Q. What is your position with Concentric Energy Advisors, Inc. (Concentric)?

A. I am employed by Concentric as a Senior Vice President.

Q. On whose behalf are you submitting this direct testimony?

A. I am submitting this direct testimony before the Public Utility Commission of Oregon (Commission) on behalf of PacifiCorp, which is an indirect wholly owned subsidiary of Berkshire Hathaway Energy Company (BHE).

Q. Please describe your education and experience.

A. I hold a Bachelor's degree in Economics and Finance from Simmons College and a Master's degree in Economics from Boston University, with more than 20 years of experience consulting to the energy industry. I have advised numerous energy and utility clients on a wide range of financial and economic issues, with primary concentrations in valuation and utility rate matters. Many of these assignments have included the determination of the cost of capital for valuation and ratemaking purposes. I have included my resume, a description of Concentric's energy and utility practice, and a summary of testimony that I have filed in other proceedings as Exhibit PAC/401 to this testimony.

Q. Have you previously testified before the Commission or other regulatory authorities?

A. Yes. A list of proceedings in which I have provided testimony is provided in Exhibit PAC/401 to this testimony.

II. PURPOSE AND OVERVIEW OF DIRECT TESTIMONY

Q. What is the purpose of your direct testimony?

A. The purpose of my direct testimony is to present evidence and provide a recommendation regarding the appropriate Return on Equity (ROE)[1] for PacifiCorp's electric utility operations in Oregon and to provide an assessment of its proposed capital structure to be used for ratemaking purposes. A summary of my ROE analyses results is provided in Exhibit PAC/402. My analyses and recommendations are supported by the data presented in Exhibit PAC/403 through Exhibit PAC/413, which were prepared by me or under my direction.

Q. Please provide a brief overview of the analyses that led to your ROE recommendation.

A. As discussed in more detail in Section VII, I applied the Constant Growth, Multi-Stage, and Projected forms of the Discounted Cash Flow (DCF) model, the Capital Asset Pricing Model (CAPM), Empirical Capital Asset Pricing Model (ECAPM), the Risk Premium approach, and the Expected Earnings analysis. My recommendation also takes into consideration: (1) PacifiCorp's capital expenditure requirements; (2) the regulatory environment in which PacifiCorp operates; (3) PacifiCorp's adjustment mechanisms; and (4) the fuel sources of PacifiCorp's generation portfolio.

[1] Throughout my direct testimony, I interchangeably use the terms "ROE" and "cost of equity".

Finally, I considered PacifiCorp's proposed capital structure as compared to the capital structures of the proxy companies.[2] While I did not make any specific adjustments to my ROE estimates for any of these factors, I did take them into consideration in aggregate when determining where PacifiCorp's ROE falls within the range of analytical results.

Q. How is the remainder of your direct testimony organized?

A. Section III provides a summary of my analyses and conclusions. Section IV reviews the regulatory guidelines pertinent to the development of the cost of capital. Section V discusses current and projected capital market conditions and the effect of those conditions on PacifiCorp's cost of equity in Oregon. Section VI explains my selection of a proxy group of electric utilities. Section VII describes my analyses and the analytical basis for the recommendation of the appropriate ROE for PacifiCorp. Section VIII provides a discussion of specific regulatory, business, and financial risks that have a direct bearing on the ROE to be authorized for PacifiCorp in this case. Section IX assesses the proposed capital structure of PacifiCorp as compared with the capital structures of the utility operating subsidiaries of the proxy group companies. Section X presents my conclusions and recommendations for the market cost of equity.

---

[2] The selection and purpose of developing a group of comparable companies is discussed in detail in Section VI of my direct testimony.

III. SUMMARY OF ANALYSES AND CONCLUSIONS

Q. What is your recommended ROE for PacifiCorp?

A. Based on the analytical results presented in Figure 1 below, I believe a range from 9.75 percent to 10.25 percent is reasonable. Within that range, a return of 10.20 percent is reasonable. This recommendation reflects the range of results for the proxy group companies, the relative business, financial, and regulatory risk of PacifiCorp's electric operations in Oregon as compared to the proxy group, and current capital market conditions.

Q. Please summarize the key factors considered in your analyses and upon which you base your recommended ROE.

A. In developing my recommended ROE for PacifiCorp, I considered the following:

- The *Hope* and *Bluefield* decisions[3] that established the standards for determining a fair and reasonable allowed ROE, including consistency of the allowed return with other businesses having similar risk, adequacy of the return to provide access to capital and support credit quality, and that the end result must lead to just and reasonable rates.
- The effect of current and projected capital market conditions on investors' return requirements.
- The results of several analytical approaches that provide estimates of PacifiCorp's cost of equity.
- PacifiCorp's regulatory, business, and financial risks relative to the proxy group of comparable companies and the implications of those risks.

Q. Please explain how you considered those factors.

A. I relied on several analytical approaches to estimate PacifiCorp's cost of equity based on a proxy group of publicly-traded companies. As shown in Figure 1, those ROE

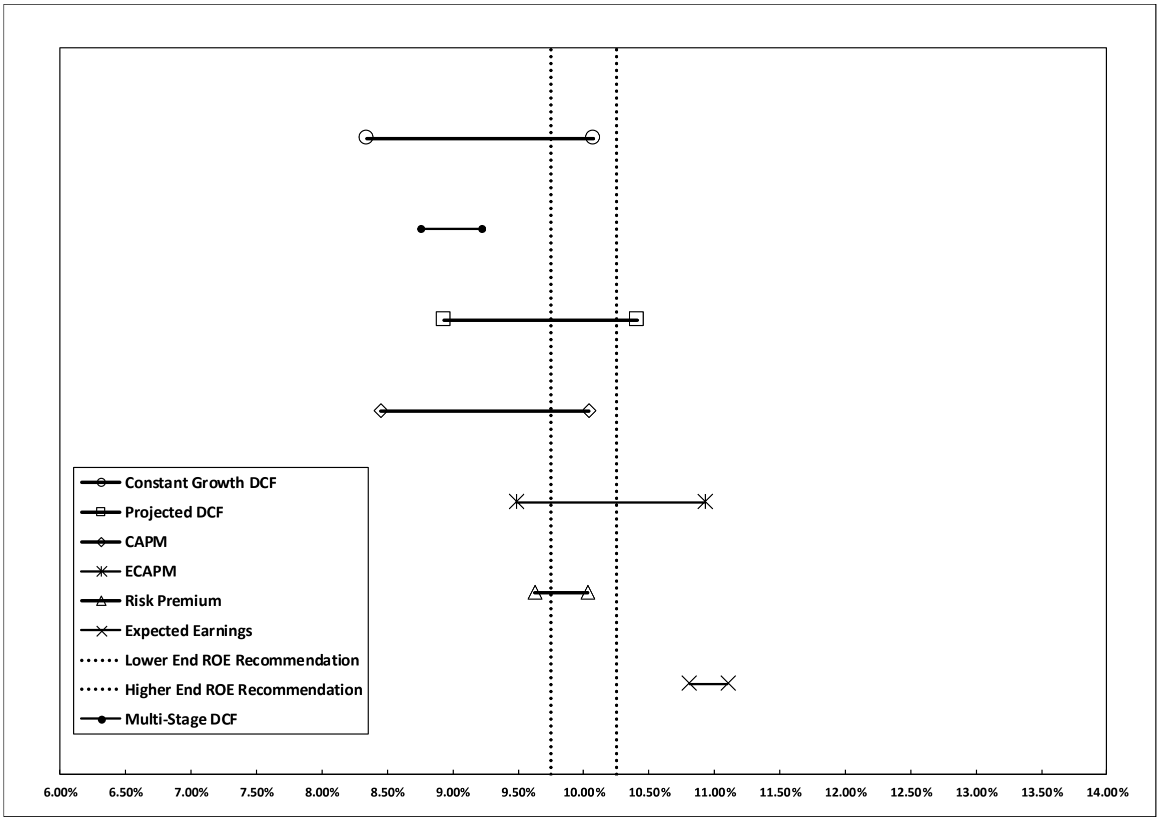
[3] *See Fed. Power Comm'n v. Hope Natural Gas Co.,* 320 U.S. 591 (1944); *Bluefield Waterworks & Improvement Co. v. Pub. Serv. Comm'n of W. Va*, 262 U.S. 679 (1923).

estimation models produce a wide range of results. My conclusion about where within that range of results PacifiCorp's ROE falls is based on PacifiCorp's business and financial risk relative to the proxy group. Although the companies in my proxy group are generally comparable to PacifiCorp, each company is unique, and no two companies have the exact same business and financial risk profiles. Accordingly, I selected a proxy group with similar, but not identical risk profiles, and I adjusted the results of my analysis either upward or downward within the reasonable range of results to account for any residual differences in risk.

Q. Please summarize the ROE estimation models that you considered to establish the range of ROEs for PacifiCorp's Oregon operations.

A. I considered the results of three forms of the DCF model: the Constant Growth DCF, the Multi-Stage DCF, and a Projected DCF. In addition, I considered the results of the CAPM, ECAPM, Risk Premium, and Expected Earnings methodologies. The results of these analyses are summarized in Figure 1 below.

Figure 1: Summary of Cost of Equity Analytical Results[4]



As shown in Figure 1 (and in Exhibit PAC/404), the range of the Constant Growth DCF model results is wide, particularly in relation to the results of the other methodologies. While it is common to consider multiple models to estimate the cost of equity, it is particularly important when the range of results is wide.

Furthermore, as shown in Exhibit PAC/404, the mean low Constant Growth DCF[5] results (prior to exclusions for outliers) for the proxy group, range from 7.53 percent to 7.72 percent for the 30-, 90-, and 180-day averaging periods. Thus,

---

[4] The analytical results reflect the results of the Constant Growth DCF analysis excluding the results for individual companies that did not meet the minimum threshold of 7.00 percent.

[5] My DCF models generated a mean low, mean, and mean high result. The mean low result is the mean of the proxy group DCF results calculated using the lowest earnings growth rate for each company from Value Line, Yahoo! Finance or Zacks.

the mean low Constant Growth DCF results are below any authorized ROE for an electric or natural gas utility in the U.S. since at least 1980.[6] Therefore, I conclude that the mean low DCF results do not provide a sufficient risk premium to compensate equity investors for the residual risks of ownership, including the risk that they have the lowest claim on the assets and income of PacifiCorp.

Although I have concerns about the results produced by the DCF models, my ROE recommendation considers the range between the mean and mean-high results of the DCF models. In addition, I consider the results of forward-looking CAPM and ECAPM analyses, a Bond Yield Plus Risk Premium analysis, and an Expected Earnings analysis. I also consider company-specific risk factors, and current and prospective capital market conditions.

Q. Please summarize the analysis you conducted in determining that PacifiCorp's requested capital structure is reasonable and appropriate.

A. Based on the analysis presented in Section IX of my testimony, I conclude that PacifiCorp's proposed common equity ratio of 53.52 percent is reasonable. To make this determination, I reviewed the capital structures of the utility operating subsidiaries of the proxy companies. As shown in Exhibit PAC/413, the results of that analysis demonstrate that the equity ratios for the utility operating companies held by the proxy group range from 39.98 percent to 61.54 percent with an average of 52.87 percent. PacifiCorp's proposed common equity ratio of 53.52 percent closely approximates the average equity ratio for the utility operating subsidiaries of the proxy group companies and is well below the high-end of the range. Moreover,

[6] Source: Regulatory Research Associates, January 1, 1980 - November 29, 2019.

PacifiCorp's proposed common equity ratio is reasonable considering that federal tax reform legislation has had a negative effect on the cash flows and credit metrics of regulated utilities.

Furthermore, a fundamental aspect of the financial regulation of utilities is assuring that the subject utility has a reasonable opportunity to earn a return on capital consistent with the return available on investments of similar risk. While this principle is most often discussed in terms of the allowed ROE, it is equally applicable to all aspects of the overall Rate of Return (ROR). The equity return, which is the product of the ROE and the equity ratio, (*i.e.*, the Weighted Return on Equity (WROE)), ultimately defines the return to shareholders, and the product of the cost of debt and the debt ratio ensures that a company's debt obligations are met. Therefore, it is necessary to consider both the rates that are applied to debt and equity and the composition of the capital structure to determine the reasonableness of the ROR. Taken together, PacifiCorp's proposed common equity ratio of 53.52 percent and its requested ROE of 10.20 percent, result in a WROE of 5.46 percent. This return reasonably balances the interests of customers and shareholders by enabling PacifiCorp to maintain its financial integrity and therefore its ability to attract capital at reasonable terms and conditions under a variety of economic and financial market conditions.

IV. REGULATORY GUIDELINES

Q. Please describe the guiding principles used in establishing the cost of capital for a regulated utility.

A. The United States Supreme Court's precedent-setting *Hope* and *Bluefield* cases established the standards for determining the fairness or reasonableness of a utility's allowed ROE. Among the standards established by the Court in those cases are: (1) consistency with other businesses having similar or comparable risks; (2) adequacy of the return to support credit quality and access to capital; and (3) that the end result, as opposed to the methodology employed, is the controlling factor in arriving at just and reasonable rates.[7]

Q. Has the Commission provided similar guidance in establishing the appropriate return on common equity?

A. Yes, it has. The Commission has acknowledged the legal precedent for a just and reasonable return established in the *Hope* and *Bluefield* decisions. In particular, in a 2007 decision for Portland General Electric Company, the Commission stated:

> Under these decisions, a utility's authorized rate of return, and the resulting overall rates, should be sufficient to maintain financial integrity, allow the utility to attract capital under reasonable terms, and be commensurate with returns investors could earn by investing in other enterprises of comparable risk. This standard has been codified in Oregon law. *See* ORS 756.040.[8]

This guidance is in accordance with the *Hope* and *Bluefield* decisions and the principles that I employed to estimate the ROE for PacifiCorp, including the principle that an allowed rate of return must be sufficient to enable regulated companies like PacifiCorp to attract capital on reasonable terms.

Q. Why is it important for a utility to be allowed the opportunity to earn an ROE that is adequate to attract capital at reasonable terms?

A. An ROE that is adequate to attract capital at reasonable terms enables a utility to

---

[7] *Hope,* 320 U.S. 591; *Bluefield*, 262 U.S. 679.

[8] *In the Matter of Portland General Elec. Co. Request for a General Rate Revision*, Docket Nos. UE 180, UE 181, and UE 184, Order No. 07-015 at 28 (Jan. 12, 2007).

continue to provide safe, reliable service while maintaining its financial integrity. To the extent the utility is provided the opportunity to earn its market-based cost of capital, neither customers nor shareholders are disadvantaged.

Q. Is a utility's ability to attract capital also affected by the ROEs that are authorized for other utilities?

A. Yes. Utilities compete directly for capital with other investments of similar risk, which include other natural gas and electric utilities. Therefore, the authorized ROE for a utility sends an important signal to investors regarding the level of regulatory support for financial integrity, dividends, growth, and fair compensation for business and financial risk. The cost of capital represents an opportunity cost to investors. If higher returns are available for other investments of comparable risk, investors have an incentive to direct their capital to those investments. Thus, an authorized ROE significantly below authorized ROEs for other natural gas and electric utilities can inhibit PacifiCorp's ability to attract capital for investment.

Q. What are your conclusions regarding regulatory guidelines?

A. The ratemaking process is premised on the principle that, for investors and companies to commit the capital needed to provide safe and reliable utility services, a utility must have the opportunity to recover the return of, and the market-required return on, its invested capital. Because utility operations are capital-intensive, regulatory decisions should enable the utility to attract capital at reasonable terms under a variety of economic and financial market conditions; doing so balances the long-term interests of the utility and its customers.

The financial community carefully monitors the current and expected financial condition of utility companies, and the regulatory framework in which they operate. In that respect, the regulatory framework is one of the most important factors in both debt and equity investors' assessments of risk. The Commission's order in this proceeding, therefore, should establish rates that provide PacifiCorp with the opportunity to earn an ROE that is: (1) adequate to attract capital at reasonable terms under a variety of economic and financial market conditions; (2) sufficient to ensure good financial management and firm integrity; and (3) commensurate with returns on investments in enterprises with similar risk. To the extent PacifiCorp is authorized the opportunity to earn its market-based cost of capital, the proper balance is achieved between customers' and shareholders' interests.

V. CAPITAL MARKET CONDITIONS

Q. Why is it important to analyze capital market conditions?

A. ROE estimation models rely on market data that are either specific to the proxy group, in the case of the DCF model, or to the expectations of market risk, in the case of the CAPM. The results of ROE estimation models can be affected by prevailing market conditions at the time the analysis is performed. While the ROE established in a rate proceeding is intended to be forward-looking, analysts use current and projected market data, specifically stock prices, dividends, growth rates and interest rates in ROE estimation models to estimate the required return for the subject company.

As discussed in the remainder of this section, analysts and regulatory commissions have concluded that current market conditions affect the results of ROE estimation models. As a result, it is important to consider the effect of these conditions on ROE estimation models when determining the appropriate range and recommended ROE for a future period. If investors do not expect current market conditions to be sustained in the future, it is possible that ROE estimation models will not provide an accurate estimate of investors' required return during that rate period. Therefore, it is very important to consider projected market data to estimate the return for that forward-looking period.

Q. What factors are affecting the cost of equity for regulated utilities in the current and prospective capital markets?

A. The cost of equity for regulated utility companies is being affected by several factors in the current and prospective capital markets, including: (1) valuations of utility stocks that are at historically high levels, which has an inverse relationship to dividend yields; (2) recent market uncertainty, its current effect on interest rates, and long-term expectations for interest rates; and (3) recent Federal tax reform. In this section, I discuss each of these factors and how it affects the models used to estimate the cost of equity for regulated utilities.

The Effect of Market Conditions on Valuations

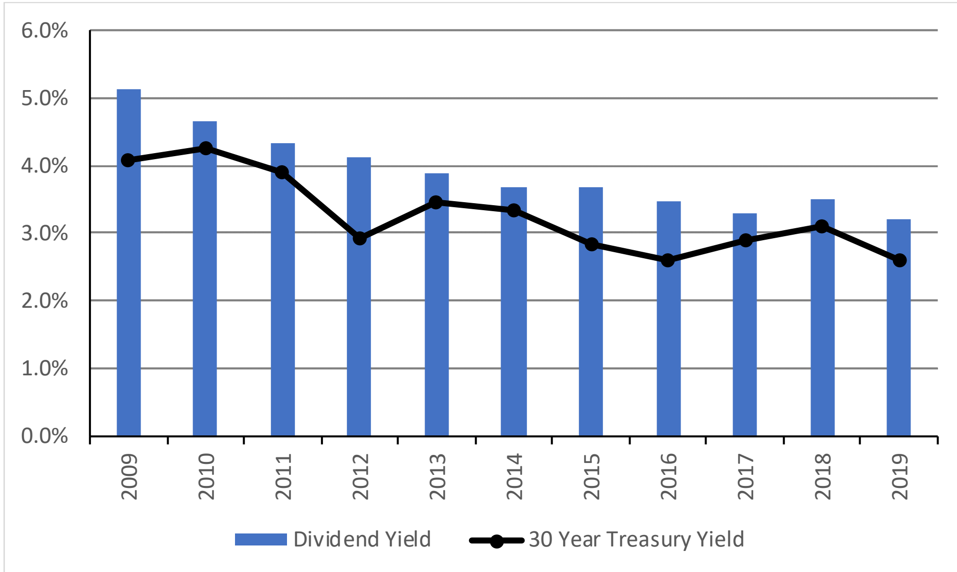
Q. How has the Federal Reserve's monetary policy affected capital markets in recent years?

A. Extraordinary and persistent federal intervention in capital markets artificially lowered government bond yields after the Great Recession of 2008–2009, as the Federal Open Market Committee (FOMC) used monetary policy (both reductions in short-term interest rates and purchases of Treasury bonds and mortgage-backed securities) to stimulate the U.S. economy. As a result of very low or zero returns on short-term government bonds, yield-seeking investors have moved into longer-term instruments, bidding up prices and reducing yields on those investments. As investors have moved along the risk spectrum in search of higher yields that meet their return requirements, there has been increased demand for dividend-paying equities, such as natural gas and electric utility stocks.

Q. How has the period of abnormally low interest rates affected the valuations and dividend yields of utility shares?

A. The Federal Reserve's accommodative monetary policy has caused investors to seek alternatives to the historically low interest rates available on Treasury bonds. As a result of this search for higher yield, share prices for many common stocks, especially dividend-paying stocks such as utilities, have been driven higher while the dividend yields (which are computed by dividing the dividend payment by the stock price) have decreased to levels well below the historical average. As shown in Figure 2, from 2009 through 2019, since the Federal Reserve intervened to stabilize financial markets and support the economic recovery after the Great Recession of 2008–2009, Treasury bond yields and utility dividend yields have declined. Specifically, Treasury bond yields declined by approximately 147 basis points, and electric utility dividend yields have decreased by about 194 basis points over this same period.

Figure 2: Dividend Yields for Electric Utility Stocks[9]



Q. How have higher stock valuations and lower dividend yields for utility companies affected the results of the DCF model?

A. During periods of general economic and capital market stability, the DCF model may adequately reflect market conditions and investor expectations. However, in the current market environment, the DCF model results are distorted by the historically low level of interest rates and the higher valuation of utility stocks. In October and December of 2019, Value Line addressed the high valuations of electric utilities:

> Most stocks covered in the Electric Utility Industry have fared very well in 2019. For the vast majority of these issues, the price has risen more than 10%. For some stocks, including Entergy, the quotation has soared 35%. The aforementioned reduction in interest rates (from a level that was already low) has induced income-oriented investors to reach for yield. This is despite the fact that the valuations of electric utility issues are historically high. The group's average dividend yield is just 3.2%, and the price-earnings ratios of most of these stocks is well above that

[9] Source: Bloomberg Professional. Figure 2 includes 2019 data through November 29, 2019.

> of the market. In fact, some recent quotations are above the 2022-2024 Target Price Range.[10]
>
> ***
>
> We advise investors to take a cautious stance due to the group's high valuation. The 18-month Target Price Ranges shown on the full-page reports for each stock do not reflect dividends, but even when dividends are added to these estimates, they do not suggest attractive total returns for this time frame. We do provide total return projections for the 3- to 5-year period. These are not appealing, either. In fact, the recent quotations for most of these stocks are within their 2022-2024 Target Price Range, and in some cases (such as IDACORP), the price is above this range.[11]

This is further supported by a recent Edward Jones report on the utility sector:

> Utility valuations have climbed back to record levels as 10-year Treasury bond rates have fallen back below 2%. On a price-to-earnings basis, [utility valuations] remain significantly above their historical average, and have been trading near all-time highs. We have seen utility valuations moving in line with interest rate movements, although there have been exceptions to this. Overall, however, we believe the low-interest-rate environment has been the biggest factor in pushing utilities higher since many investors buy them for their dividend yield.
>
> Utilities recently hit new all-time highs, and are still trading significantly above their average price-to-earnings ratio over the past decade. The premium valuation continues to reflect not only the low interest rate environment, but also the stable and predominantly regulated earnings growth we foresee.[12]

Furthermore, Bank of America Merrill Lynch recently commented on the risks of underperformance for certain utilities based on concerns about the valuation of the

[12] Andy Smith. EDWARD JONES, *Utilities Sector Outlook* at 2 (October 18, 2019) (Reference to figure omitted).

sector, in particular the concern that the current premium on share prices may be largely unwarranted.[13]

As noted by equity analysts, over the last few years, utility stocks have experienced high valuations and low dividend yields driven by investors moving into dividend-paying stocks from bonds due to the low interest rates in the bond market. Conversely, if interest rates increase, bonds become a substitute for utility stocks, which results in an increase in dividend yields. As noted in the next section of my testimony, this change in market conditions that is expected over the long-term implies that the ROE calculated using historical market data in the DCF model may understate the forward-looking cost of equity.

Q. What is the effect of high valuations on utility stocks on the DCF model?

A. High valuations have the effect of depressing the dividend yields, which results in overall lower estimates of the cost of equity from the DCF model.

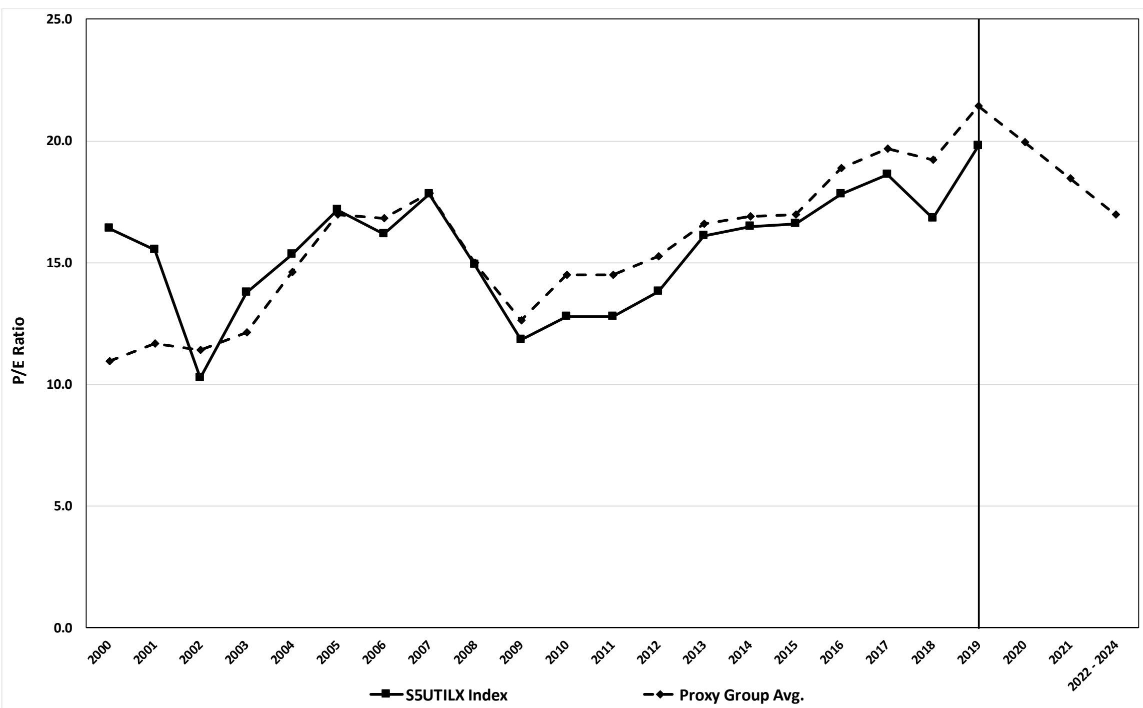
Q. How do current valuations of public utilities compare to the historical average?

A. Figure 3 summarizes the average historical and projected Price-to-Earnings (P/E) ratios for the proxy companies calculated using data from Bloomberg Professional and Value Line.[14] As shown in Figure 3, the average P/E ratio for the proxy companies increased from 2018 to 2019 as a result of uncertainty in markets surrounding the trade dispute between the U.S. and China. The uncertainty has resulted in investors shifting to defensive sectors such as utilities and consumer

[13] BofAML, *American Water Works AWKward valuation: Downgrading premium utility to underperform*, July 15, 2019. BofAML, *Eversource Energy, Reiterating our Underperform: Shares pricey relative to few updates*, July 15, 2019.
[14] Selection of the Proxy Companies is discussed in detail in Section VI of my direct testimony.

staples. This has driven the prices of utility stocks and thus the P/E ratios to unsustainable levels. In 2019, the average P/E ratio for the proxy companies has been 21.42, which is well above the average for the period of 2000–2018 of 15.39. It is not reasonable to expect the proxy companies to maintain P/E ratios that are well above long-term averages. As shown in Figure 3, Value Line is projecting that P/E ratios for the proxy companies will decline over the period of 2019 through 2022. All else equal, if P/E ratios for the proxy companies decline, as Value Line projects, the ROE results from the DCF model would be higher. Therefore, the DCF model using historical market data is likely understating the forward-looking cost of equity for the proxy group companies.

Figure 3: Average Historical Proxy Group P/E Ratios[15]



[15] Bloomberg Professional, historical data through November 29, 2019, and projected data from Value Line Investment Survey, July 26, 2019, August 16, 2019, and September 13, 2019.

Q. Have you reviewed any other market indicators that compare the current valuation of utilities to the historical average?

A. Yes. To further assess how the current low interest rate environment has affected the valuations of the companies in my proxy group, I reviewed the price/earnings to growth (PEG) ratio for the Standard & Poor's (S&P) Utilities Index. The PEG ratio is commonly used by investors to determine if a company is considered over- or under-valued. The ratio compares the P/E ratio of a company to the expected growth rate of future earnings. This allows investors to compare companies with similar P/E ratios but different earnings growth projections. If two companies have a P/E ratio of 20, but company A is growing at a rate of six percent and company B is growing at a rate of 15 percent, then on a relative valuation basis company B is the better investment.

As shown in a report published by Yardeni Research, Inc., the PEG ratio for the S&P Utilities Index is significantly higher than it has historically been because of the accommodative monetary policy pursued by the Federal Reserve following the Great Recession of 2008–2009.[16] While the PEG ratio has declined in recent years due to the Federal Reserve's shift to normalize monetary policy, the PEG ratio for the S&P Utilities Index is still above the historical average. In general, stocks with lower long-term PEG ratios are considered better values. As the PEG ratio increases above the long-term historical average, as has been the case with the S&P Utilities Index, then the stocks are considered relatively over-valued unless the growth rate increases to support the higher valuation. As of December 2019, the PEG ratio for the S&P

[16] YARDENI RESEARCH, INC., *S&P 500 Industry Briefing: Utilities* at 5 (December 16, 2019).

Utilities Index is close to 4.0, which indicates that many of the stocks in the index are currently trading at levels well above the historical average. This analysis supports Value Line's expectation that the P/E ratios of utilities will decline over the near to intermediate term.

Q. How do equity investors view the utilities sector based on these recent market conditions?

A. Investment advisors have suggested that utility stocks may underperform as a result of market conditions. Denise Chisholm, sector strategist at Fidelity Investments, recently commented that the high valuations of defensive sector stocks such as utilities are likely to result in sector rotation. Specifically, Ms. Chisholm explained that:

> Consumer staples, utilities, and health care are the most expensive they've been since 1970, in the top percentile. That data point has been not just informative, but also predictive in history. It's a rare signal that has only really occurred five times. You see a 1,000-basis-point rotation back to the economically sensitive sectors and an average underperformance of the defensive sectors.[17]

The Current and Expected Interest Rate Environment

Q. Please provide a brief summary of the recent monetary policy actions of the Federal Reserve.

A. At its December 2019 meeting, the Federal Reserve decided to maintain the current federal funds rate range of 1.50 percent to 1.75 percent and noted that the current range was appropriate for sustaining the current economic expansion and satisfying the Federal Reserve's goals of full employment and price stability.[18] Prior to the

[17] Leslie P. Norton, *It's time to stop playing defense in Stocks,* Barron's (Oct. 28, 2019) *available at* https://www.barrons.com/articles/its-time-to-stop-playing-defense-in-stocks-51571418847.
[18] Press Release, Federal Reserve, *FOMC* (Dec. 11, 2019).

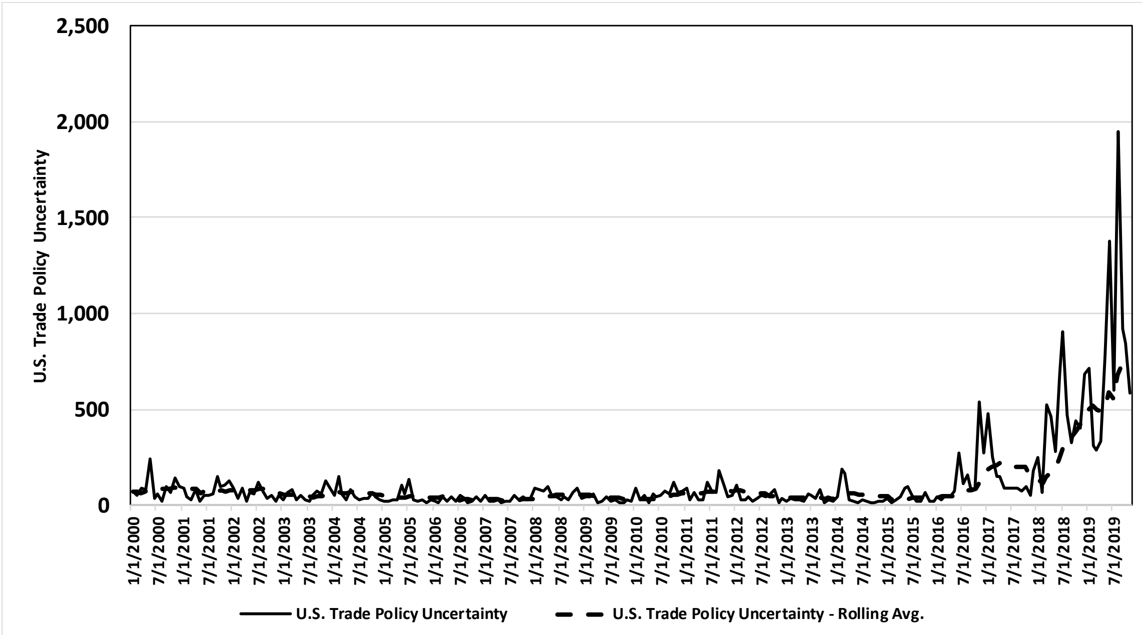
December 2019 meeting, the Federal Reserve reduced the federal funds rate three times in 2019 in response to economic effects of the trade dispute between the U.S. and China. The ongoing trade dispute has affected the global economy and caused a rise in volatility in financial markets; thus, the Federal Reserve reacted by reducing the federal funds rate to sustain the current economic expansion.

Q. Have you reviewed any market indicators that measure uncertainty in the market related to U.S. trade policy?

A. Yes. I reviewed the U.S. trade policy uncertainty index developed by economists Scott Baker, Nicholas Bloom, and Steven Davis. The index measures the frequency that articles in U.S. publications discuss economic policy uncertainty and reference trade policy.[19] As shown in Figure 4, uncertainty regarding U.S. trade policy is at its highest level since at least 2000, with the largest increase occurring in the last two years as a result of the escalating trade dispute between the U.S. and China.

[19] Source: Economic Policy Uncertainty: https://www.policyuncertainty.com/index.html.

Figure 4: U.S. Trade Policy Uncertainty Index



Q. How have the trade dispute with China and the recent uncertainty in the market affected the yields on long-term government bonds?

A. The uncertainty surrounding the trade dispute between the U.S. and China has resulted in a flight-to-quality as investors have purchased safer assets such as U.S. Treasuries due to increased fears of a possible recession. This has been increasingly evident over the past few months as investors responded to news of increases in tariffs by both China and the U.S.

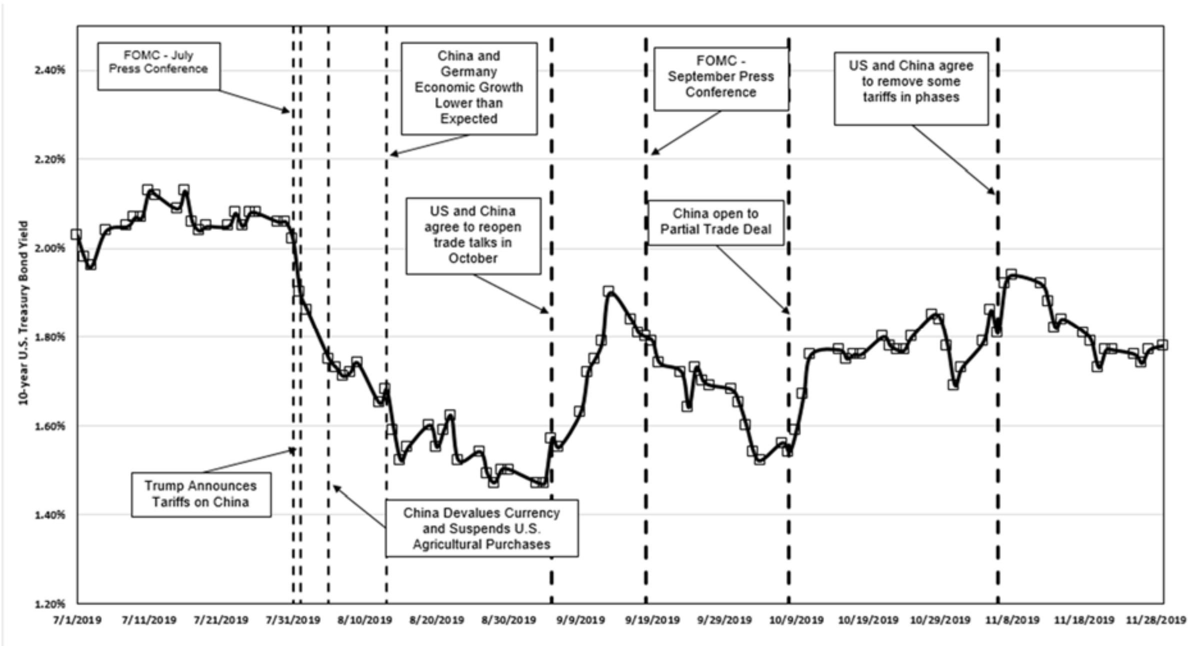
To illustrate the recent reactions of investors, I conducted an event study of the yield on the 10-year U.S. Treasury bond between July 1, 2019, and November 29, 2019. As shown in Figure 5, the yield on the 10-year U.S. Treasury Bond was relatively stable for the month of July; however, the yield decreased by approximately 50 basis points from the end of July to the middle of August. The recent decline was due to investors responding to events associated with the trade dispute. For example, the market reacted negatively to Chairman Powell's comments following the FOMC meeting at the end of July and President Trump's announcement that the U.S. was going to impose tariffs on the remaining set of goods imported from China. These two events accounted for a decrease of approximately 25 basis points in the yield on the 10-year Treasury between July 30, 2019, and August 5, 2019.

Conversely, positive developments in the trade dispute between the U.S. and China have led to increases in the yield on the 10-year Treasury bond. For example, the yield on the 10-year Treasury bond increased following news on September 5, 2019, that the U.S. and China would reopen trade discussions in October 2019. Moreover, recent news of a partial trade deal and the removal of some of the tariffs in phases has the 10-year Treasury bond yield at 1.78 percent as of November 29, 2019, which is a 31-basis point increase over the recent low in August 2019 of 1.47 percent. On January 15, 2020, the U.S. and China signed a Phase I trade deal. This deal does not resolve all of the trade dispute, however, and negotiations continue between the two countries on other aspects of the trade agreement.

The recent volatility in the market as a result of the trade dispute led Bloomberg to note in an article that volatility in the market on any given day is being determined more and more by the words and actions of Chairman Powell, President Trump, and the President of China, Xi Jinping.[20]

[20] Michael P. Regan, *Powell Speaks, Trump Tweets, China Reacts, Markets Freak. Repeat*, BLOOMBERG, (8 Aug. 2019) *available at* www.bloomberg.com/news/articles/2019-08-08/powell-speaks-trump-tweets-china-reacts-markets-freak-repeat.

Figure 5: 10-year U.S. Treasury Bond Yield



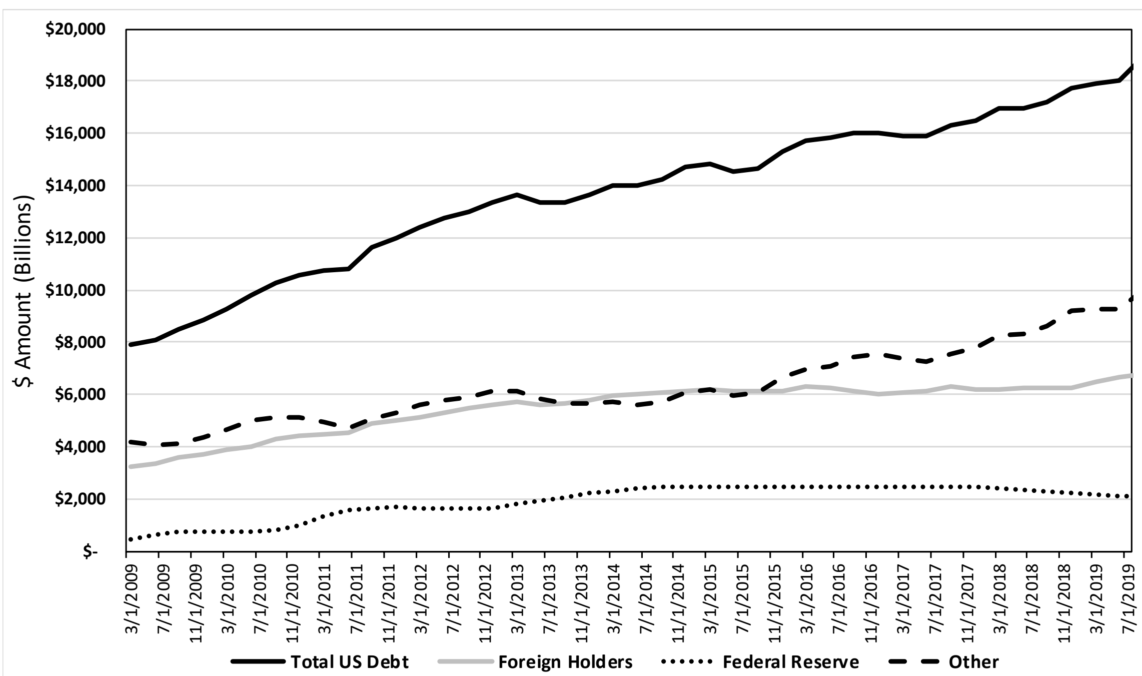
Q. Is the recent decline in long-term government bond yields as a result of U.S. trade policy uncertainty indicative of the longer-term outlook for yields on these instruments?

A. No. While the yields on long-term government bonds have decreased recently, this is not indicative of a long-term trend. It is more indicative of a shift in the type of investors purchasing the long-term government bonds. As shown in Figure 6, the total amount of debt owned by the Federal Reserve and Foreign Holders has been relatively stable or slightly declining over the past few years, while the demand from private sector investors has been increasing. This is important because private sector investors are more price-sensitive and more likely to respond quickly to changes that occur in the market. This explains the decline in long-term government bond yields that occurred in recent months as investors reacted to the uncertain economic conditions due to the trade dispute between the U.S. and China. As a result, long-term bond yields could increase quickly if a trade agreement is reached between the U.S. and China. For example, Kiplinger recently noted:

> While the trade war lasts, 10-year Treasury note rates are likely to remain 2% or a bit lower. Mortgage rates will stay around the current 3.6% for 30-year fixed, 3.1% for 15-year. If the trade war relents, we expect that 10-year Treasury notes could rise to the mid-to-upper 2% range. The 30-year fixed-rate mortgage would also rise to 4.2%, and the 15-year fixed-rate mortgage to 3.7%.[21]

In fact, as shown in Figure 5, long-term bond yields have increased between August 2019 and November 2019 in response to positive developments in the trade dispute between the U.S. and China.

Figure 6: Ownership of U.S. Debt – 2009 – 2019[22]



[21] David Payne. *Expect Two More Interest-Rate Cuts by the Fed.*, Kiplinger's Personal Finance (12 August 2019).

[22] Bloomberg Professional, Data through November 29, 2019.

Q. What is the financial market's perspective on the future path of long-term government bond yields?

A. According to the December 2019 issue of Blue Chip Financial Forecasts, the yields on 10- and 30-year Treasury bonds are expected to increase over the near-term of Q1 2020 to Q1 2021.[23] Similarly, strategists at both JP Morgan Chase and Merrill Lynch are projecting increases in long-term government bond yields over the near-term. Merrill Lynch is projecting that the yield on the 10-year Treasury Bond will increase to 2.00 percent by the end of 2019,[24] while strategists at JP Morgan Chase indicated that yields on the 10-year Treasury Bond could increase up to 100 basis points over the next six months.[25]

Q. What are your conclusions regarding the current interest rate environment and its effect on the cost of equity for PacifiCorp?

A. Investors have responded to the recent escalation in the trade war between the U.S. and China by divesting higher-risk assets and purchasing lower-risk assets such as U.S. Treasury bonds. However, the trade dispute between the U.S. and China is not expected to continue over the long-term. This view is consistent with that of Chairman Powell who, as noted above, sees an improvement in the risk associated with trade policy. As interest rates increase, the cost of equity for the proxy companies using the DCF model is likely to be an overly-conservative estimate of investors' required returns because the proxy group average dividend yield reflects

[23] Blue Chip Financial Forecasts, Vol. 38, No. 12, December 1, 2019, at 2.

the increase in stock prices that resulted from substantially lower interest rates. As such, the real prospect of rising interest rates supports the selection of a return well above the mean ROE estimate from the DCF analysis. Alternatively, my CAPM and Bond Yield Plus Risk Premium analyses also include estimated returns based on projected interest rates, reflecting investors' expectations of market conditions over the period that the rates established in this proceeding will be in effect.

Effect of Tax Reform on the ROE and Capital Structure

Q. Are there other factors that should be considered in determining the cost of equity for PacifiCorp?

A. Yes. The effect of the Tax Cuts and Jobs Act (TCJA) should also be considered in the determination of the cost of equity. It is also relevant to setting the equity ratio in the capital structure, which I address in Section IX of my direct testimony. The credit rating agencies have commented on the effect of the TCJA on regulated utilities. In summary, the TCJA is expected to reduce utility revenues due to the lower federal income taxes, the end of bonus depreciation, and the requirement to return excess Accumulated Deferred Income Taxes (ADIT). This change in revenue is expected to reduce Funds From Operations (FFO) metrics across the sector, and absent regulatory mitigation strategies, is expected to lead to weaker credit metrics and negative ratings actions for some utilities.[26]

Q. Have credit or equity analysts commented on the effect of the TCJA on utilities?

A. Yes. Each of the credit rating agencies has indicated that the TCJA would have an

[26] FITCHRATINGS, *Special Report, What Investors Want to Know, Tax Reform Impact on the U.S. Utilities, Power & Gas Sector* (Jan. 24, 2018).

overall negative credit impact on regulated operating companies of utilities and their holding companies due to the reduction in cash flow that results from the change in the federal tax rate and the loss of bonus depreciation.

Moody's noted that the rates that regulators allow utilities to charge customers is based on a cost-plus model, with tax expense being one of the pass-through items. Utilities will collect less income tax at a lower rate, reducing revenue. In addition, with the loss of bonus depreciation, the timing of future cash tax payments will be accelerated. Therefore, utilities will collect less tax revenue as a result of the lower tax rate and retain less of the collected taxes as a result of the loss of bonus depreciation. All else being equal, the changes will have a negative effect on utility cash flows and will, ultimately, negatively impact the utilities' ability to fund ongoing operations and capital improvement programs.

In S&P's 2019 trends report, the rating agency notes that the utility industry's financial measures weakened in 2018 and attributed that to tax reform, capital spending, and negative load growth. In addition, S&P expects that weaker credit metrics will continue into 2019 for those utilities operating with minimal financial cushion. S&P further expects that these utilities will look to offset the revenue reductions from tax reform with equity issuances. That rating agency reported that in 2018 regulated utilities issued nearly $35 billion in equity, which is more than twice the equity issuances in either 2016 or 2017.[27]

FitchRatings (Fitch) also indicated that any ratings actions will be guided by the response of regulators and the management of the utilities. Fitch notes that the

[27] Standard & Poor's Ratings, *Industry Top Trends 2019, North America Regulated Utilities*, November 8, 2018.

solution will depend on the ability of utility management to manage the cash flow implications of the TCJA. Fitch offered several solutions to provide rate stability and to moderate changes to cash flow in the near term, including increasing the authorized ROE and/or equity ratio.[28]

Q. Has Moody's responded to the increased risk for utilities resulting from the TCJA?

A. Yes. In 2018, Moody's issued a report changing the rating outlook for several regulated utilities from Stable to Negative.[29] Moody's noted that the rating change affected companies with limited cushion in their ratings for deterioration in financial performance. Later that year, Moody's downgraded the outlook for the entire regulated utility industry from Stable to Negative for the first time ever, citing ongoing concerns about the negative effect of the TCJA on cash flows of regulated utilities. Since mid-2018, Moody's has downgraded the credit ratings of several utilities based in part on the effects of tax reform on financial metrics. As shown in Figure 7, the downgrades have continued throughout 2019.

Oklahoma Gas & Electric Company	Moody's	A1	A2	7/5/2018

Q. Is it reasonable to expect that investors have included the negative effects of the TCJA on the cash flows of utilities in their valuation models?

A. Not entirely. It is reasonable to expect that investors have reviewed the reports published by the credit rating agencies such as Moody's, S&P, and Fitch and are therefore considering the effects of the TCJA. However, utilities are still managing the negative effects of the TCJA and are working with regulators to determine appropriate solutions to mitigate the effect of the TCJA on cash flows. As Moody's noted in its November 2018 report, the TCJA is expected to continue to have a near-term effect on the cash flows of utilities, which resulted in Moody's negative outlook on the industry for 2019.[30] Furthermore, as shown in Figure 7, Moody's is continuing to evaluate the effect of the TCJA on the cash flows of individual utilities. As part of the credit evaluation, rating agencies are specifically considering the recent rate case decisions of utilities to determine if the results of these cases help to mitigate the effect of the TCJA on cash flows. Therefore, the credit rating agencies appear to be continuing to monitor the effects of the TCJA on utilities.

Q. Has the Commission recognized that the TCJA has had an adverse impact on utility cash flows and credit ratings?

A. Yes. In February 2019, the Commission adopted Staff's memorandum recommending approval of an application by Avista Corp. (Avista) to issue stock.[31]

---

[30] MOODY'S INVESTORS SERVICE, *Regulated utilities – US: 2019 outlook shifts to negative due to weaker cash flows, continued high leverage* at 3 (June 18, 2018).

[31] *In the matter of Avista Corp., dba Avista Utilities, Application for Authorization to Issue 3,500,000 Shares of Common Stock*, Docket No. UF 4308, Order No. 19-067 (Feb. 23, 2019).

Staff's memorandum included the following statements about the TCJA and the importance of maintaining strong credit ratings:

> Staff finds that the Tax Cuts and Jobs Act of 2017 created unanticipated stresses on the Company's credit ratings. The requested authorization signals to rating agencies that the Company is committed to the equity portion of its capital structure. However, it is Staff's finding that restoring a notch in credit ratings involves more than just remedying the cause for the downgrade. On December 21, 2018, Moody's stated, "Avista's credit profile reflects its low-risk vertically integrated electric and gas utility business, regulatory uncertainty in WA and the expected negative cash flow impact of tax reform." Authorization herein as recommended by Staff starts the process of addressing rating agency concerns and restoring a positive credit outlook.

In July 2019, the Commission approved Avista's application to issue debt securities, adopting the Staff's memorandum stating that "raising the Company's credit ratings back up a notch will require hard work and persistence on the part of Avista's finance group as well as a supportive regulatory environment and achieving target metrics."[32]

In January 2019, the Commission adopted Staff's memorandum recommending approval of Portland General Electric Company's (PGE) application to refresh a revolving credit facility. Staff's memorandum contained similar observations about the TCJA and credit ratings:

> Of concern to Staff is Moody's approach to the impacts of the [TCJA]. While one might expect lower taxes would be inherently positive news for utilities, Moody's has focused in on cash flow metrics that are stressed by the recent tax reform. Timely refreshment of this credit facility while PGE is under no heavy time or market pressure is consistent with provision for ongoing liquidity in support of current credit ratings. While approval of this Application does not by itself answer all of Moody's

[32] *In the matter of Avista Corporation, dba Avista Utilities, Application for Authorization to Issue and Sell $600,000,000 of Debt Securities,* Docket UF 4313, Order No. 19-249 (July 30, 2019).

> concerns regarding tax reform impacts on the utility sector, the proposed replacement credit facility is consistent with prudent financial management by the Company and will likely be seen as credit positive by both Standard and Poor's and Moody's. As the spreads over benchmark interest rates applicable to PGE depend on the level of the Company's credit ratings, this will be an area for the Commission to continue to monitor.[33]

Q. Have other state regulatory commissions considered market events and the utility's ability to attract capital in determining the equity return?

A. Yes. In a recent rate case for Consumers Energy Company in Michigan, Case No. U-18322, the Michigan Public Service Commission (Michigan PSC) Staff recommended a 9.80 percent ROE based on the results of the DCF, CAPM, and Risk Premium approaches, which was supported by the Administrative Law Judge (ALJ).[34] In its Order issued on March 29, 2018, however, the Michigan PSC partly disagreed with the ALJ and Staff regarding expected market conditions and authorized a 10.00 percent ROE for Consumers Energy Company. The Michigan PSC noted that:

> [i]n setting the ROE at 10.00%, the Commission believes there is an opportunity for the company to earn a fair return during this period of atypical market conditions. This decision also reinforces the Commission's belief that customers do not benefit from a lower ROE if it means the utility has difficulty accessing capital at attractive terms and in a timely manner. The fact that other utilities have been able to access capital despite lower ROEs, as argued by many intervenors, is also a relevant consideration. It is also important to consider how extreme market reactions to singular events, as have occurred in the recent past, may impact how easily capital will be able to be accessed during the future test period should an unforeseen market shock occur. The Commission will continue to monitor a variety of market factors in future rate

[33] *In the matter of Portland Gen. Elect. Co., Request for Authority to Extend the Maturity of an Existing $500 Million Revolving Credit Agreement,* Docket UF 4272(3), Order No. 19-025 at Appendix A, p. 9 (Jan. 23, 2019) (emphasis added).

[34] *In the matter of the application of Consumers Energy Company for authority to increase its rates for the generation and distribution of electricity and for other relief*, Mich. Pub. Serv. Comm'n, Cause No. U-18322, Order at 37 (March 29, 2018).

> cases to gauge whether volatility and uncertainty continue to be prevalent issues that merit more consideration in setting the ROE.[35]

The Michigan PSC references "singular events" and the overall effect the events could have on the ability of a utility to access capital. Consistent with the Michigan PSC's views, it is important to consider that the TCJA has had a negative effect on the cash flows of utilities. In addition, it is important to consider this reduced cash flow in the context of overall market conditions when determining the appropriate ROE and equity ratio to enable PacifiCorp the ability to attract capital. As a result, it is imperative that the Commission authorize an ROE that will allow PacifiCorp to attract capital at reasonable terms during the period that rates will be in effect.

Q. What conclusions do you draw from your analysis of capital market conditions?

A. The important conclusions resulting from capital market conditions are:

- The assumptions used in the ROE estimation models have been affected by recent historical market conditions.
- Recent market conditions are not expected to persist as yields on long-term bonds are expected to increase. As a result, the recent historical market conditions are not reflective of the market conditions that will be present when the rates for PacifiCorp will be in effect.
- It is important to consider the results of a variety of ROE estimation models, using forward-looking assumptions to estimate the cost of equity.
- Without adequate regulatory support, the TCJA will have a negative effect on utility cash flows, which increases investor risk expectations for utilities.

[35] *Id.* at 43.

VI. PROXY GROUP SELECTION

Q. Why have you used a group of proxy companies to estimate the cost of equity for PacifiCorp?

A. In this proceeding, I am estimating the cost of equity for an electric utility company that is not itself publicly traded. Because the cost of equity is a market-based concept and given that PacifiCorp's electric operations in Oregon do not make up the entirety of a publicly traded entity, it is necessary to establish a group of companies that is both publicly traded and comparable to PacifiCorp in certain fundamental business and financial respects to serve as its "proxy" in the ROE estimation process.

Even if PacifiCorp were a publicly traded entity, it is possible that transitory events could bias its market value over a given period. A significant benefit of using a proxy group is that it moderates the effects of unusual events that may be associated with any one company. The proxy companies used in my analyses all possess a set of operating and risk characteristics that are substantially comparable to PacifiCorp, and thus provide a reasonable basis to derive an estimate of the appropriate ROE for PacifiCorp.

Q. Please provide a brief profile of PacifiCorp.

A. PacifiCorp is an indirect, wholly owned subsidiary of BHE. PacifiCorp provides electric utility service to approximately 1.9 million residential, commercial and industrial customers in California, Idaho, Oregon, Utah, Washington, and Wyoming.[36] In Oregon, PacifiCorp provides electric service to approximately 615,000 residential,

[36] Berkshire Hathaway Energy Co., 2018 Form 10-K, at 2.

commercial, and industrial customers.[37] As of December 31, 2018, PacifiCorp owned net utility electric plant in Oregon of approximately $4.5 billion.[38] PacifiCorp's electric operations in Oregon represented 23 percent of PacifiCorp's electric sales in 2018.[39] PacifiCorp currently has an investment grade long-term rating of A (Outlook: Stable) from S&P and A3 (Outlook: Stable) from Moody's.[40]

Q. How did you select the companies included in your proxy group?

A. I began with the group of 37 companies that Value Line classifies as Electric Utilities and applied the following screening criteria to select companies that:

- pay consistent quarterly cash dividends, because companies that do not cannot be analyzed using the Constant Growth DCF model;
- have investment grade long-term issuer ratings from S&P and/or Moody's;
- are covered by at least two utility industry analysts;
- have positive long-term earnings growth forecasts from at least two utility industry equity analysts;
- own regulated generation assets that are in rate base;
- have more than five percent of owned regulated generation capacity come from regulated coal-fired power plants;
- derive more than 60.00 percent of their total operating income from regulated operations;
- derive more than 60.00 percent of regulated operating income from regulated electric operations; and
- were not parties to a merger or transformative transaction during the analytical periods relied on.

VII. COST OF EQUITY ESTIMATION

Q. Please briefly discuss the ROE in the context of the regulated rate of return.

A. The overall ROR for a regulated utility is based on its weighted average cost of capital, in which the cost rates of the individual sources of capital are weighted by their respective book values. While the costs of debt and preferred stock can be directly observed, the cost of equity is market-based and, therefore, must be estimated based on observable market data.

Q. How is the required ROE determined?

A. The required ROE is estimated by using one or more analytical techniques that rely on market-based data to quantify investor expectations regarding required equity returns, adjusted for certain incremental costs and risks. Informed judgment is then applied to determine where the company's cost of equity falls within the range of results. The key consideration in determining the cost of equity is to ensure that the methodologies employed reasonably reflect investors' views of the financial markets in general, as well as the subject company (in the context of the proxy group), in particular.

Q. What methods did you use to determine PacifiCorp's ROE?

A. I considered the results of the Constant Growth DCF model, a Multi-Stage DCF model, a Projected Constant Growth DCF model, the CAPM and ECAPM, the Bond Yield Plus Risk Premium approach, and an Expected Earnings analysis. As discussed in more detail below, a reasonable ROE estimate appropriately considers alternative methodologies and the reasonableness of their individual and collective results.

Importance of Multiple Analytical Approaches

Q. Why is it important to use more than one analytical approach?

A. Because the cost of equity is not directly observable, it must be estimated based on both quantitative and qualitative information. When faced with the task of estimating the cost of equity, analysts and investors are inclined to gather and evaluate as much relevant data as reasonably can be analyzed. Several models have been developed to estimate the cost of equity, and I use multiple approaches to estimate the cost of equity. As a practical matter, however, all of the models available for estimating the cost of equity are subject to limiting assumptions or other methodological constraints. Consequently, many well-regarded finance texts recommend using multiple approaches when estimating the cost of equity. For example, Copeland, Koller, and Murrin[41] suggest using the CAPM and Arbitrage Pricing Theory model, while Brigham and Gapenski[42] recommend the CAPM, DCF, and Bond Yield Plus Risk Premium approaches.

Q. Is it important given current market conditions to use more than one analytical approach?

A. Yes. Low interest rates and the effects of the investor "flight to quality" can be seen in high utility share valuations, relative to historical levels and relative to the broader market. Higher utility stock valuations produce lower dividend yields and result in lower cost of equity estimates from a DCF analysis. Low interest rates also affect the CAPM in two ways: (1) the risk-free rate is lower; and (2) because the market risk

[42] EUGENE BRIGHAM, LOUIS GAPENSKI, FINANCIAL MANAGEMENT: THEORY AND PRACTICE at 341 (7th ed. 1994).

premium is a function of interest rates, (i.e., it is the return on the broad stock market less the risk-free interest rate), the risk premium should move higher when interest rates are lower. Therefore, it is important to use multiple analytical approaches to moderate the impact that the current low interest rate environment is having on the ROE estimates for the proxy group and, where possible, consider using projected market data in the models to estimate the return for the forward-looking period.

Q. Has the Commission recognized that it is important to consider the results of multiple ROE estimation models?

A. Yes. In previous cases, the Commission has considered the results of many ROE estimation models and determined, based on the results of those models, whether or not to place any weight on the model in its final determination. Specifically, in prior PacifiCorp and PGE cases, the Commission considered the results of DCF and CAPM models and concluded that the results of the CAPM were too low to be reasonable. Importantly, in those cases, the Commission did not reject the methodology entirely, but rather concluded that based on the specification of the model, the results were unreasonable and therefore should be given no weight. In the order in PacifiCorp's case, the Commission stated:

> While the results in this case cast further doubt on the validity of Staff's CAPM methodology, we do not believe that CAPM should be rejected in its entirety. We continue to believe that, in certain cases, CAPM analyses may provide a useful and reliable addition to the DCF results for determining cost of equity. After our review of the results in this case, however, we further conclude that the CAPM does not provide supportable and reasonable results in this docket. Accordingly, we give no weight to the CAPM results in determining an appropriate cost of equity for PacifiCorp.[43]

[43] *In the Matter of PacifiCorp's Proposal to Restructure and Reprice Its Services In Accordance with Senate Bill 1149*, Docket No. UE 116, Order No. 01-787 (Sept. 7, 2001).

The Commission reached the same conclusion in the concurrent PGE case.[44]

Q. Are you aware of any other regulatory commissions that have recognized that recent conditions in capital markets are causing ROE recommendations based on DCF models to be unreasonable?

A. Yes, several regulatory commissions have addressed the effect of capital market conditions on the DCF model, including the Illinois Commerce Commission (ICC), the Pennsylvania Public Utility Commission (PPUC), the Missouri Public Service Commission (Missouri PSC), and the New Jersey Board of Public Utilities (NJ Board).

Q. How have the PPUC, the ICC, the Missouri PSC, and the NJ Board addressed the effect of market conditions on the DCF?

A. In a 2012 decision for PPL Electric Utilities, the PPUC noted that it had traditionally relied primarily on the DCF method to estimate the cost of equity for regulated utilities, but the PPUC recognized that market conditions were causing the DCF model to produce results that were much lower than other models such as the CAPM and Bond Yield Plus Risk Premium. The PPUC's Order supported the consideration of multiple ROE estimation methodologies.[45]

The PPUC ultimately concluded:

> As such, where evidence based on the CAPM and RP methods suggest that the DCF-only results may understate the utility's current cost of equity capital, we will give consideration to those

[44] *In the Matter of Portland Gen. Elec. Proposal to Restructure and Reprice Its Services In Accordance with Senate Bill 1149*, Docket No. UE 115, Order No. 01-777 (Aug. 31, 2001).
[45] Pennsylvania Pub. Util. Comm'n, PPL Elec. Utilities, R-2012-2290597, meeting held December 5, 2012, at 80.

> other methods, to some degree, in determining the appropriate range of reasonableness for our equity return determination.[46]

In a 2016 ICC case involving Illinois-American Water Company, Staff relied on a DCF analysis that resulted in average returns for their proxy groups of 7.24 percent to 7.51 percent. The company demonstrated that these results were uncharacteristically low by comparing the results of Staff's models to recently authorized ROEs for regulated utilities and the return on the S&P 500.[47] The ICC agreed with the company that Staff's proposed ROE of 8.04 percent was anomalous and recognized that a return that is not competitive will deter investment in Illinois.[48] In setting the return in that proceeding, the ICC recognized that it was necessary to consider other factors beyond the outputs of the financial models, particularly whether the return is sufficient to attract capital, to maintain financial integrity, and to produce returns commensurate with returns for companies of comparable risk, while balancing the interests of customers and shareholders.[49]

In February 2018, the Missouri PSC issued a decision in Spire's 2017 natural gas rate case, in which the allowed ROE was set at 9.80 percent. In explaining the rationale for its decision, the Missouri PSC cited the importance of considering multiple methodologies to estimate the cost of equity and the need for the authorized

ROE to be consistent with returns in other jurisdictions and to reflect the growing economy and investor expectations for higher interest rates.[50]

Finally, in its order in docket ER12111052 for Jersey Central Power and Light Company, the NJ Board noted that rate of return experts use a number of models including the DCF, CAPM, Risk Premium, and Comparable Earnings to estimate the return required by investors.[51] Moreover, the NJ Board stated that each of these models provide estimates of the return required by investors; however, the estimates are not necessarily precise and have been affected by the current economic environment, which is still recovering from the Great Recession of 2008-2009.[52] In the order, the NJ Board accepted the ROE recommendation by Staff, which was supported by the ALJ and based on a review of each of the model results presented by the witnesses in the case and recently authorized ROEs in other jurisdictions.[53] In supporting the recommendation of Staff, the ALJ concluded that the results of each model are affected by multiple factors, including current market conditions.

Q. What are your conclusions about the results of the DCF and CAPM models?

A. Recent market data that is used as the basis for the assumptions for both models have been affected by market conditions. As a result, relying exclusively on historical assumptions in these models, without considering whether these assumptions are consistent with investors' future expectations, will underestimate the cost of equity

[50] File No. GR-2017-0215 and File No. GR-2017-0216, Missouri Pub. Serv. Comm'n, Report and Order, Issue Date February 21, 2018, at 34.

[52] *Id.*
[53] *Id.* at 10.

that investors would require over the period that the rates in this case are to be in effect. In this instance, relying on the historically low dividend yields that are not expected to continue over the period that the new rates will be in effect would underestimate the ROE for PacifiCorp.

The use of recent historical Treasury bond yields in the CAPM also tends to underestimate the projected cost of equity. Recent experience indicates that interest rates will increase over the near-term. The expectation that bond yields will not remain at currently low levels means that the expected cost of equity would be higher than is suggested by the CAPM using historical average yields. The use of projected yields on Treasury bonds results in CAPM estimates that are more reflective of the market conditions that investors expect during the period that PacifiCorp's rates will be in effect.

Constant Growth DCF Model

Q. Please describe the DCF approach.

A. The DCF approach is based on the theory that a stock's current price represents the present value of all expected future cash flows. In its most general form, the DCF model is expressed as follows:

$$P_0 = \frac{D_1}{(1+k)} + \frac{D_2}{(1+k)^2} + \ldots + \frac{D_\infty}{(1+k)^\infty} \quad [1]$$

Where P_0 represents the current stock price, $D_1 \ldots D_\infty$ are all expected future dividends, and k is the discount rate, or required ROE. Equation [1] is a standard present value calculation that can be simplified and rearranged into the following form:

$$k = \frac{D_0(1+g)}{P_0} + g \qquad [2]$$

Equation [2] is often referred to as the Constant Growth DCF model in which the first term is the expected dividend yield and the second term is the expected long-term growth rate.

Q. What assumptions are required for the Constant Growth DCF model?

A. The Constant Growth DCF model requires the following four assumptions: (1) a constant growth rate for earnings and dividends; (2) a stable dividend payout ratio; (3) a constant P/E ratio; and (4) a discount rate greater than the expected growth rate. To the extent that any of these assumptions is violated, considered judgment and/or specific adjustments should be applied to the results.

Q. What market data did you use to calculate the dividend yield in your Constant Growth DCF model?

A. The dividend yield in my Constant Growth DCF model is based on the proxy companies' current annualized dividend and average closing stock prices over the 30-, 90-, and 180-trading days ended November 29, 2019.

Q. Why did you use 30-, 90-, and 180-day averaging periods?

A. In my Constant Growth DCF model, I use an average of recent trading days to calculate the term P_0 in the DCF model to ensure that the ROE is not skewed by anomalous events that may affect stock prices on any given trading day. The averaging period should also be reasonably representative of expected capital market conditions over the long-term. However, the averaging periods that I use rely on historical prices which, as discussed above, are currently at unsustainably high levels that are not expected to continue during the period that PacifiCorp's rates will be in effect. The use of current prices in the Constant Growth DCF model is not consistent with forward-looking market expectations. Therefore, the results of my Constant Growth DCF model using historical data may underestimate the forward-looking cost of equity. As a result, I place more weight on the mean to mean-high results produced by my Constant Growth DCF model.

Q. Did you make any adjustments to the dividend yield to account for periodic growth in dividends?

A. Yes, I did. Because utility companies tend to increase their quarterly dividends at different times throughout the year, it is reasonable to assume that dividend increases will be evenly distributed over calendar quarters. Given that assumption, it is reasonable to apply one-half of the expected annual dividend growth rate for purposes of calculating the expected dividend yield component of the DCF model. This adjustment ensures that the expected first year dividend yield is, on average, representative of the coming 12-month period, and does not overstate the aggregated dividends to be paid during that time.

Q. Why is it important to select appropriate measures of long-term growth in applying the DCF model?

A. In its Constant Growth form, the DCF model (*i.e.*, Equation [2]) assumes a single growth estimate in perpetuity. To reduce the long-term growth rate to a single measure, one must assume that the payout ratio remains constant and that earnings per share, dividends per share and book value per share all grow at the same constant rate. Over the long run, however, dividend growth can only be sustained by earnings growth. Therefore, it is important to incorporate a variety of sources of long-term earnings growth rates into the Constant Growth DCF model.

Q. Which sources of long-term earnings growth rates did you use?

A. My Constant Growth DCF model incorporates three sources of long-term earnings growth rates: (1) Zacks Investment Research; (2) Thomson First Call (provided by Yahoo! Finance); and (3) Value Line Investment Survey.

Multi-Stage DCF Model

Q. What other forms of the DCF model have you considered?

A. Consistent with Commission precedent, I also considered the results of a Multi-Stage form of the DCF model. As with the Constant Growth DCF model, the Multi-Stage form defines the cost of equity as the discount rate that sets the current price equal to the discounted value of future cash flows. While the Multi-Stage DCF model is a method the Commission has relied upon in the past, as noted above, the Commission has also recognized that it is important to consider whether a model used to estimate the ROE is producing just and reasonable results at a given point in time.[54] This can be accomplished by comparing the individual and collective results of the various models used to estimate the cost of equity, and by evaluating whether the inputs and assumptions of the models are affected by conditions in capital markets or the economy. In the current market environment, high valuations and low dividend yields for utility stocks are causing both the Constant Growth and Multi-Stage DCF model to produce unreliable results. Earnings growth rates for utility companies, a

[54] Order No. 01-787.

focus of the Multi-Stage DCF model, have generally remained within the traditional range of five to seven percent.

Q. Has the Commission also recognized the importance of checking the reasonableness of the results produced by the Multi-Stage DCF model?

A. Yes. In a 2007 order for PGE, the Commission indicated that it was important to check the reasonableness of the DCF results by reference to the results of other models, including the CAPM and Risk Premium models, and by comparison to authorized returns in other jurisdictions.[55]

Q. What are the benefits of using the Multi-Stage form of the DCF model?

A. The Multi-Stage DCF model, which is an extension of the Constant Growth form, enables the analyst to specify different growth rates over multiple stages. The Multi-Stage DCF model allows for a gradual transition from the first-stage growth rate to the long-term growth rate, thereby avoiding the unrealistic assumption that growth changes abruptly between the first and final stages.

Q. Please generally describe the structure of your Multi-Stage DCF model.

A. The Multi-Stage DCF model sets a company's current stock price equal to the present value of future cash flows received over three "stages." In all three stages, cash flows are equal to the annual dividend payments that stockholders receive. Stage One is a short-term growth period that consists of the first five years; Stage Two is a transition period from the short-term growth rate to the long-term growth rate (i.e., years six through 10); and Stage Three is a long-term growth period that begins in year 11 and continues in perpetuity (i.e., year 200). The ROE is then calculated as the rate of

[55] Order No. 07-015 at 47-48.

return that results from the initial stock investment and the dividend payments over the analytical period.

Q. Please summarize the earnings per share (EPS) growth rates used in your Multi-Stage DCF model.

A. As shown in Exhibit PAC/405, I began with the current annualized dividend as of November 29, 2019, for each proxy group company. In the first stage of the model, the current annualized dividend is escalated based on the average of the three- to five-year earnings growth estimates reported by Zacks, Thomson First Call, and Value Line. For the third stage, I relied on long-term projected growth in Gross Domestic Product (GDP). The second stage growth rate is a transition from the first stage growth rate to the long-term growth rate on a geometric average basis.

Q. How did you calculate the long-term GDP growth rate?

A. As shown in Exhibit PAC/406, the long-term growth rate of 5.53 percent is based on real GDP growth rate of 3.22 percent from 1929 through 2018,[56] and a projected inflation rate of 2.23 percent. The projected inflation rate is based on three measures: (1) the average long-term projected growth rate in the Consumer Price Index (CPI) of 2.10 percent;[57] (2) the compound annual growth rate of the CPI for all urban consumers for 2029-2050 of 2.31 percent as projected by the Energy Information Administration (EIA); and (3) the compound annual growth rate of the GDP chain-type price index for 2029–2050 of 2.29 percent, also reported by the EIA.[58]

[56] U.S. Department of Commerce, Bureau of Economic Analysis, National Income and Product Accounts Tables, Table 1.1.1, November 27, 2019.

[57] Blue Chip Financial Forecasts, Vol. 38, No. 6, June 1, 2019, at 14.

[58] U.S. Energy Information Administration, Annual Energy Outlook 2019, Table 20, Macroeconomic Indicators.

Q. Do the assumptions used in the Multi-Stage DCF model address the effect of low dividend yields on the DCF results?

A. No, they do not. While the Multi-Stage DCF model provides for changes in growth over time, it does not address the abnormally low dividend yields for utility stocks and the effect of those low dividend yields on the DCF model, specifically the understated ROEs that result from the use of these assumptions. For that reason, I have also considered the results of alternative risk-premium based methodologies, which I will discuss later in my direct testimony.

Discounted Cash Flow Model Results

Q. How did you calculate the range of results for the Constant Growth and Multi-Stage DCF models?

A. I calculated the low result for both DCF models using the minimum growth rate (*i.e.*, the lowest of the First Call, Zacks, and Value Line earnings growth rates) for each of the proxy group companies. Thus, the low result reflects the minimum DCF result for the proxy group. I used a similar approach to calculate the high results, using the highest growth rate for each proxy group company. The mean results were calculated using the average growth rates from all sources.

Q. Have you excluded any of the Constant Growth DCF results for individual companies in your proxy group?

A. Yes, I have. It is appropriate to exclude Constant Growth DCF results below a specified threshold at which equity investors would consider such returns to provide an insufficient return increment above long-term debt costs. The average credit rating for the companies in my proxy group is BBB+/Baa1. The average yield on Moody's

Baa-rated utility bonds for the 30 trading days ending November 29, 2019, was 3.77 percent.[59] As shown in Exhibit PAC/404, I have eliminated Constant Growth DCF results lower than 7.00 percent because such returns would provide equity investors a risk premium only 323 basis points above Baa-rated utility bonds.

Q. Have you considered the results of any other DCF model?

A. Yes, because of analysts' views that utility stocks may currently be at unsustainably high prices, I have also considered the results of a projected Constant Growth DCF model. The projected DCF analysis relies on Value Line's projected average stock prices and dividends for the 2022–2024 period and the five-year projected EPS growth rates. As shown in Exhibit PAC/407, my analysis demonstrates that using the Value Line projected assumptions in the DCF model increases the ROE by 66 basis points (i.e., 9.59 percent vs. 8.93 percent) as compared with the 90-day average Constant Growth DCF results.

Q. What are the results of your DCF analyses?

A. Figure 9 summarizes the results of my DCF analyses. As shown in Figure 9, the mean Constant Growth DCF results range from 8.93 percent to 9.04 percent and the mean high results are in the range of 10.03 percent to 10.10 percent. The mean Multi-Stage DCF results range from 8.93 percent to 9.03 percent and the mean high results are in the range of 9.19 percent to 9.29 percent. While I also summarize the mean low DCF results, I do not believe that the low Constant Growth and Multi-Stage DCF results provide a reasonable spread over the expected yields on Treasury bonds to

[59] Source: Bloomberg Professional.

compensate investors for the incremental risk related to an equity investment. Finally, the projected DCF results ranged from 8.94 percent to 10.41 percent.

Figure 9: Discounted Cash Flow Results

	Mean Low	**Mean**	**Mean High**
Constant Growth DCF[60]			
30-Day Average	8.34%	9.04%	10.10%
90-Day Average	8.32%	8.93%	10.10%
180-Day Average	8.38%	9.01%	10.03%
Multi-Stage DCF[61]			
30-Day Average	8.73%	8.93%	9.19%
90-Day Average	8.73%	8.94%	9.20%
180-Day Average	8.81%	9.03%	9.29%
Projected DCF[62]			
	Mean Low	Mean	Mean High
2022-2024 Projection	8.94%	9.59%	10.41%

Q. What are your conclusions about the results of the DCF models?

A. As discussed previously, one primary assumption of the DCF models is a constant P/E ratio. That assumption is heavily influenced by the market price of utility stocks. To the extent that utility valuations are high and may not be sustainable, it is important to consider the results of the DCF models with caution. The dividend yield on the 30-day average DCF analysis was 3.16 percent, lower than the average dividend yield for electric utilities over the last 10 years. These data points demonstrate that the results of the current DCF models are significantly below more normal market conditions. Therefore, while I have given weight to the results of the

[60] *See* Exhibit PAC/404.
[61] *See* Exhibit PAC/405.
[62] *See* Exhibit PAC/407.

DCF models, my recommendation also gives weight to the results of other ROE estimation models.

CAPM Analysis

Q. Please briefly describe the Capital Asset Pricing Model.

A. The CAPM is a risk premium approach that estimates the cost of equity for a given security as a function of a risk-free return plus a risk premium to compensate investors for the non-diversifiable or "systematic" risk of that security. This second component is the product of the market risk premium and the Beta coefficient, which measures the relative riskiness of the security being evaluated.

The CAPM is defined by four components, each of which must theoretically be a forward-looking estimate:

$$K_e = r_f + \beta(r_m - r_f) \quad [3]$$

Where:

K_e = the required market ROE;

β = Beta coefficient of an individual security;

r_f = the risk-free rate of return; and

r_m = the required return on the market.

In this specification, the term $(r_m – r_f)$ represents the market risk premium. According to the theory underlying the CAPM, because unsystematic risk can be diversified away, investors should only be concerned with systematic or non-diversifiable risk. Non-diversifiable risk is measured by Beta, which is defined as:

$$\beta = \frac{Covariance(r_e, r_m)}{Variance(r_m)} \quad [4]$$

The variance of the market return (*i.e.*, Variance (r_m)) is a measure of the uncertainty of the general market, and the covariance between the return on a specific security and the general market (*i.e.*, Covariance (r_e, r_m)) reflects the extent to which the return on that security will respond to a given change in the general market return. Thus, Beta represents the risk of the security relative to the general market.

Q. What risk-free rate did you use in your CAPM analysis?

A. I relied on three sources for my estimate of the risk-free rate: (1) the current 30-day average yield on 30-year U.S. Treasury bonds of 2.28 percent;[63] (2) the average projected 30-year U.S. Treasury bond yield for Q1 2020 through Q1 2021 of 2.36 percent;[64] and (3) the average projected 30-year U.S. Treasury bond yield for 2021 through 2025 of 3.20 percent.[65]

Q. Would you place more weight on one of these scenarios?

A. Yes. Based on current market conditions, I place more weight on the results of the projected yields on the 30-year Treasury bonds. As discussed previously, the estimation of the cost of equity in this case should be forward looking because it is the return that investors would receive over the future rate period. Therefore, the inputs and assumptions used in the CAPM analysis should reflect the expectations of the market at that time. As discussed above, leading economists surveyed by Blue Chip are expecting an increase in long-term interest rates on government and corporate bonds over the next five years. This is an important consideration for equity investors as they assess their return requirements. While I have included the

---

[63] Bloomberg Professional, as of November 29, 2019.
[64] Blue Chip Financial Forecasts, Vol. 38, No. 11, November 1, 2019, at 2.
[65] Blue Chip Financial Forecasts, Vol. 38, No. 12, December 1, 2019, at 14.

results of a CAPM analysis that relies on the current average risk-free rate, this analysis fails to take into consideration the effect of the market's expectations for interest rate increases on the cost of equity.

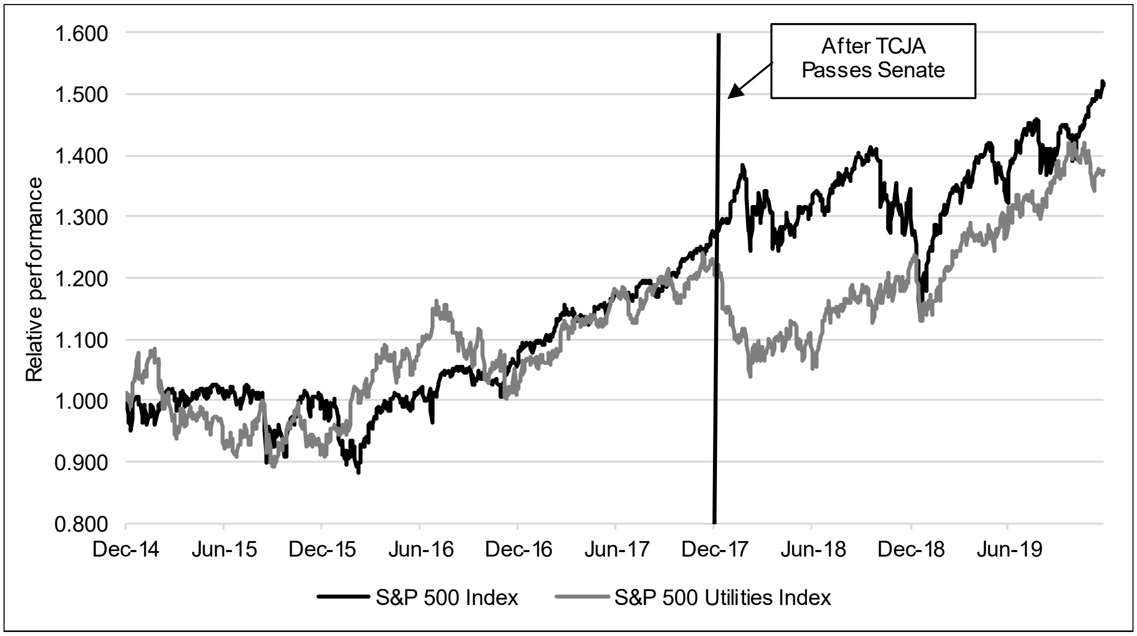
Q. What Beta coefficients did you use in your CAPM analysis?

A. As shown in Exhibit PAC/408 CAPM 1 and Exhibit PAC/408 CAPM 2, I used the Beta coefficients for the proxy group companies as reported by Bloomberg and Value Line. The Beta coefficients reported by Bloomberg were calculated using 10 years of weekly returns relative to the S&P 500 Index. Value Line's calculation is based on five years of weekly returns relative to the New York Stock Exchange Composite Index.

Q. Why did you select a 10-year period to calculate the Beta coefficients from Bloomberg?

A. As I discussed in Section V, the TCJA has had a significant effect on utility companies. While other industries are able to retain the benefits of a reduced corporate income tax rate, this benefit has largely been passed through to customers by utility companies. This fundamental difference affected investors' view of the utility industry relative to other industries. As shown in Figure 10, after the Senate passed the TCJA on December 2, 2017, utilities significantly deviated from the broader market.

Figure 10: Performance of the Utility Industry Relative to the S&P 500[66]



The TCJA's effect on the utility industry relative to other industries caused a significant short-term shift in the returns on the utility industry relative to the broader market. Over the last three-to-five years, volatility for the utility industry has been higher than the broader market (as measured by the S&P 500),[67] suggesting higher beta coefficients for utility companies. However, in short-term calculations of the Beta coefficient, the significant effect of the shift in returns related to the TCJA has outweighed the effect of longer-term measures of relative volatility. As such, to reflect the long-term relationship that suggests utility stocks are less volatile than the broader market (*i.e.* the relative volatility for utility companies has been lower than the S&P 500 over the ten-year measure),[68] I selected a 10-year period to calculate the Beta coefficients from Bloomberg.

---

[66] Bloomberg Professional. Data through November 29, 2019.
[67] *See* S&P Dow Jones Indices, Equity, S&P 500 Utilities, February 28, 2019.
[68] *Id.*

Q. How did you estimate the market risk premium in the CAPM?

A. I used two methods to estimate the forward-looking market risk premium. First, I estimated the market risk premium based on the expected return on S&P 500 Index less the yield on the 30-year Treasury bond. The expected total return on the S&P 500 Index is calculated using the Constant Growth DCF model for thecCompanies in the S&P 500 Index. As shown in Exhibit PAC/408 CAPM 3, based on an estimated market capitalization-weighted dividend yield of 1.89 percent and a weighted long-term growth rate of 10.61 percent, the estimated required market return for the S&P 500 Index is 12.60 percent. The implied Market Risk Premiums over the current and projected yields on the 30-year U.S. Treasury bond range from 9.40 percent to 10.32 percent.

Second, as also shown in Exhibit PAC/408 CAPM 3, I used S&P's estimate of five-year earnings growth for the companies in the S&P 500 Index of 11.56 percent and S&P's estimate of the dividend yield on the S&P 500 of 1.90 percent, which produces an implied total return on the S&P 500 of 13.58 percent.[69] Under this method, the implied Market Risk Premiums over current and projected yields on the 30-year U.S. Treasury bond range from 10.38 percent to 11.30 percent.

Q. Have other regulators endorsed the use of a forward-looking market risk premium?

A. Yes. The Staff of the Maine Public Utilities Commission (Maine PUC) have supported the forward-looking market risk premium. In the Bench Analysis in docket 2018-00194 for Central Maine Power Company, docket 2017-00198 for Emera Maine

[69] Standard and Poor's Earnings and Estimates, November 29, 2019.

and docket 2017-00065 for Northern Utilities, the Staff accepted the forward-looking methodology for calculating the market return that was proposed by the companies.[70] In each case, the market return was the expected return for the S&P 500, which was calculated using a Constant Growth DCF model.

Furthermore, the Maine PUC in docket 2017-0198 used the CAPM results calculated by Staff and Emera Maine as a check on the reasonableness of the DCF results in the case and did not dispute the use of the forward-looking market risk premium by the parties (*i.e.*, Staff and Emera Maine).[71]

Q. What are the results of your CAPM analyses?

A. As shown in Figure 11 (*see also* Exhibits PAC/408 CAPM 1 and PAC/408 CAPM 2), my CAPM analyses produces a range of returns from 8.45 percent to 10.04 percent.

Figure 11: CAPM Results

[71] Emera Maine, Request for Approval of Proposed Rate Increase, Docket No. 2017-00198, June 28, 2018, at 41.

Q. Did you consider another form of the CAPM?

A. Yes. In addition to the "traditional" form of the CAPM, I have also considered the "Empirical CAPM" in estimating the cost of equity for PacifiCorp. The ECAPM calculates the product of the Beta coefficient and the market risk premium and applies a weight of 75 percent to that result. The model then applies a 25 percent weight to the market risk premium, without any effect from the Beta coefficient. The results of the two calculations are summed, along with the risk-free rate, to produce the ECAPM result, as noted in Equation [5] below:

$$k_e = r_f + 0.75\beta(r_m - r_f) + 0.25(r_m - r_f) \quad [5]$$

where:

k_e = the required market ROE

β = Beta coefficient of an individual security

r_f = the risk-free rate of return

r_m = the required return on the market as a whole

The Empirical form of the CAPM addresses the tendency of the "traditional" CAPM to underestimate the cost of equity for companies with low Beta coefficients such as regulated utilities. The ECAPM is not redundant to the use of adjusted Betas; rather, it recognizes the results of academic research indicating that the risk-return relationship is different (in essence, flatter) than estimated by the CAPM, and that the CAPM underestimates the "alpha," or the constant return term.[72]

As with the CAPM, my application of the ECAPM uses the forward-looking market risk premium estimates, the three yields on 30-year Treasury securities noted

[72] Roger A. Morin, *New Regulatory Finance*, Public Utilities Reports, Inc., 2006, at 191.

earlier as the risk-free rate, and the Value Line and Bloomberg beta coefficients. As shown in Figure 12 (*see also* Exhibits PAC/408 CAPM 1 and PAC/408 CAPM 2), my ECAPM analysis produces a range of returns from 9.48 percent to 10.92 percent.

Figure 12: ECAPM Results

	Bloomberg Beta	**Value Line Beta**
Market DCF		
Current Risk-Free Rate (2.28%)	9.96%	9.48%
Q1 2020-Q1 2021 Projected Risk-Free Rate	9.98%	9.51%
2021-2025 Projected Risk-Free Rate (3.20%)	10.20%	9.76%
S&P Earnings and Estimate Report		
Current Risk-Free Rate (2.28%)	10.69%	10.17%
Q1 2020-Q1 2021 Projected Risk-Free Rate	10.71%	10.19%
2021-2025 Projected Risk-Free Rate (3.20%)	10.92%	10.45%

Bond Yield Plus Risk Premium Analysis

Q. Please describe the Bond Yield Plus Risk Premium approach.

A. In general terms, this approach is based on the fundamental principle that equity investors bear the residual risk associated with equity ownership and therefore require a premium over the return they would have earned as a bondholder. That is, because returns to equity holders have greater risk than returns to bondholders, equity investors must be compensated to bear that risk. Risk premium approaches, therefore, estimate the cost of equity as the sum of the equity risk premium and the yield on a particular class of bonds. In my analysis, I used actual authorized returns for electric utility companies as the historical measure of the cost of equity to determine the risk premium.

Q. Are there other considerations that should be addressed in conducting this analysis?

A. Yes. It is important to recognize both academic literature and market evidence indicating that the equity risk premium (as used in this approach) is inversely related to the level of interest rates. That is, as interest rates increase (decrease), the equity risk premium decreases (increases). Consequently, it is also important to develop an analysis that: (1) reflects the inverse relationship between interest rates and the equity risk premium; and (2) relies on recent and expected market conditions. Such an analysis can be developed based on a regression of the risk premium as a function of U.S. Treasury bond yields. Otherwise, if authorized ROEs for electric utilities serve as the measure of required equity returns and the yield on the long-term U.S. Treasury bond serves as the relevant measure of interest rates, the risk premium simply would be the difference between those two points.[73]

Q. Is the Bond Yield Plus Risk Premium analysis relevant to investors?

A. Yes. Investors are aware of ROE awards in other jurisdictions, and they consider those awards as a benchmark for a reasonable level of equity return for utilities of comparable risk operating in other jurisdictions. Because my Bond Yield Plus Risk Premium analysis is based on authorized ROEs for electric utility companies relative

---

[73] *See e.g.*, S. Keith Berry, *Interest Rate Risk and Utility Risk Premia during 1982-93*, MANAGERIAL AND DECISION ECONOMICS, Vol. 19, No. 2 (March, 1998)(in which the author used a methodology similar to the regression approach described below, including using allowed ROEs as the relevant data source, and came to similar conclusions regarding the inverse relationship between risk premia and interest rates); *See also* Robert S. Harris, *Using Analysts' Growth Forecasts to Estimate Shareholders Required Rates of Return*, FINANCIAL MANAGEMENT, Spring 1986 at 66.

to corresponding Treasury yields, it provides relevant information to assess the return expectations of investors.

Q. What did your Bond Yield Plus Risk Premium analysis reveal?

A. As shown in Figure 13 below, from 1992 through November 2019, there was a strong negative relationship between risk premia and interest rates. To estimate that relationship, I conducted a regression analysis using the following equation:

$$RP = a + b(T) \quad [5]$$

Where:

RP = Risk Premium (difference between allowed ROEs and the yield on 30-year U.S. Treasury bonds)

a = intercept term

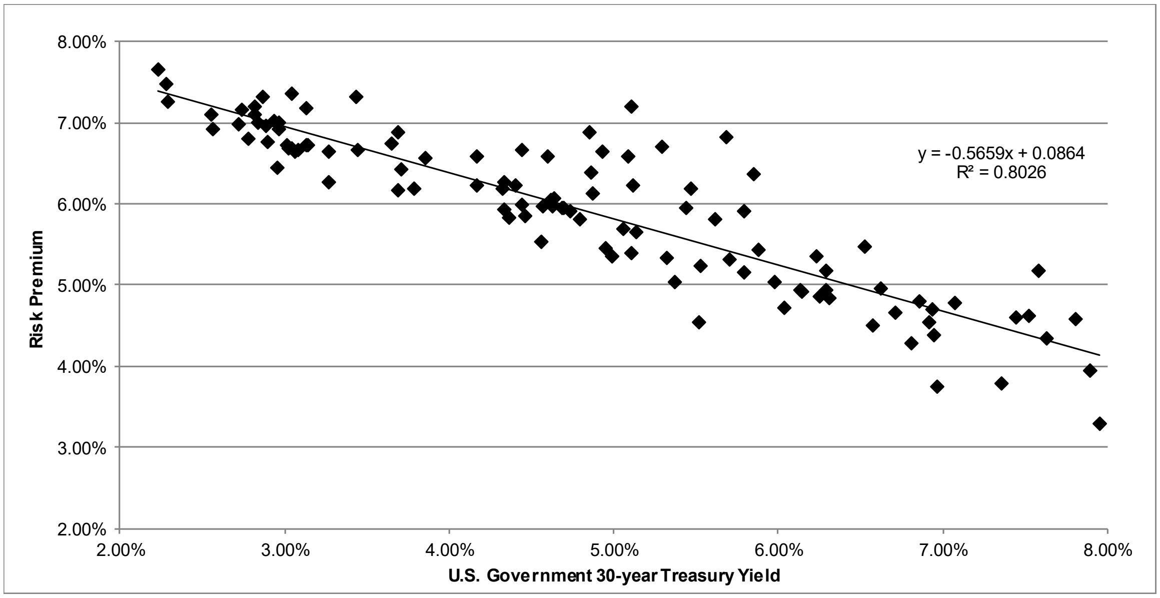
b = slope term

T = 30-year U.S. Treasury bond yield

Data regarding allowed ROEs were derived from 612 integrated electric utility rate cases from 1992 through November 2019 as reported by Regulatory Research Associates (RRA).[74] This equation's coefficients were statistically significant at the 99.00 percent level.

[74] This analysis began with a total of 1,175 cases and was screened to eliminate limited issue rider cases, transmission-only cases, distribution cases and cases that were silent with respect to the authorized ROE. After applying those screening criteria, the analysis was based on data for 612 cases.

Figure 13: Risk Premium Results



As shown in Exhibit PAC/409, based on the current 30-day average of the 30-year U.S. Treasury bond yield (*i.e.*, 2.28 percent), the risk premium would be 7.35 percent, resulting in an estimated ROE of 9.63 percent. Based on the near-term (Q1 2020 – Q1 2021) projections of the 30-year U.S. Treasury bond yield (*i.e.*, 2.36 percent), the risk premium would be 7.31 percent, resulting in an estimated ROE of 9.67 percent. Based on longer-term (2021-2025) projections of the 30-year U.S. Treasury bond yield (*i.e.*, 3.20 percent), the risk premium would be 6.63 percent, resulting in an estimated ROE of 10.03 percent.

Q. How did the results of the Bond Yield Risk Premium inform your recommended ROE for PacifiCorp?

A. I have considered the results of the Bond Yield Risk Premium analysis in setting my recommended ROE for PacifiCorp. The results of my CAPM, ECAPM and Bond Yield Risk Premium analyses provide support for my view that the DCF model is understating investors' return requirements under current market conditions. Also, as noted above, investors will consider the ROE award of a company when assessing the risk of that company as compared to utilities of comparable risk operating in other jurisdictions. The Risk Premium analysis takes into account this comparison by estimating the return expectations of investors based on the current and past ROE awards of electric utilities across the U.S.

Expected Earnings Analysis

Q. Have you considered any additional analysis to estimate the cost of equity for PacifiCorp?

A. Yes. I have considered an Expected Earnings analysis based on the projected ROEs for each of the proxy group companies.

Q. What is an Expected Earnings Analysis?

A. The Expected Earnings methodology is a comparable earnings analysis that calculates the earnings that an investor expects to receive on the book value of a stock. The Expected Earnings analysis is a forward-looking estimate of investors' expected returns. The use of an Expected Earnings approach based on the proxy companies provides a range of the expected returns on a group of risk comparable companies to the subject company. This range is useful in helping to determine the opportunity cost of investing in the subject company, which is relevant in determining a company's ROE.

Q. How did you develop the Expected Earnings Approach?

A. I relied primarily on the projected ROE for the proxy companies as reported by Value Line for the period from 2022-2024. I then adjusted those projected ROEs to account for the fact that the ROEs reported by Value Line are calculated on the basis of common shares outstanding at the end of the period, as opposed to average shares outstanding over the period. As shown in Exhibit PAC/410, the Expected Earnings analysis results in a mean of 11.10 percent and a median of 10.81 percent.

VIII. REGULATORY AND BUSINESS RISKS

Q. Do the DCF, CAPM, Risk Premium, and Expected Earnings results for the proxy group, taken alone, provide an appropriate estimate of the cost of equity for PacifiCorp?

A. No. These results provide only a range of the appropriate estimate of PacifiCorp's cost of equity. There are several additional factors that must be taken into consideration when determining where the Company's cost of equity falls within the range of results. These factors, which are discussed below, should be considered with respect to their overall effect on the Company's risk profile.

Capital Expenditures

Q. Please summarize PacifiCorp's capital expenditure requirements.

A. PacifiCorp's current projections for 2020 through 2024 include approximately $10.7 billion in capital investments for the period.[75] Based on PacifiCorp's net utility plant of approximately $18 billion as of December 31, 2018,[76] the ratio of projected capital expenditures to net utility plant is approximately 60.00 percent.

Q. How is PacifiCorp's risk profile affected by its capital expenditure requirements?

A. As with any utility facing increased capital expenditure requirements, the Company's

[75] Data is provided for PacifiCorp-wide capital expenditures for the 2020-2024 period.
[76] Id.

risk profile may be adversely affected in two significant and related ways: (1) the heightened level of investment increases the risk of under recovery or delayed recovery of the invested capital; and (2) an inadequate return would put downward pressure on key credit metrics.

Q. Do credit rating agencies recognize the risks associated with elevated levels of capital expenditures?

A. Yes. From a credit perspective, the additional pressure on cash flows associated with higher levels of capital expenditures exerts corresponding pressure on credit metrics and, therefore, credit ratings. To that point, S&P explains the importance of regulatory support for large capital projects:

> When applicable, a jurisdiction's willingness to support large capital projects with cash during construction is an important aspect of our analysis. This is especially true when the project represents a major addition to rate base and entails long lead times and technological risks that make it susceptible to construction delays. Broad support for all capital spending is the most credit-sustaining. Support for only specific types of capital spending, such as specific environmental projects or system integrity plans, is less so, but still favorable for creditors. Allowance of a cash return on construction work-in-progress or similar ratemaking methods historically were extraordinary measures for use in unusual circumstances, but when construction costs are rising, cash flow support could be crucial to maintain credit quality through the spending program. Even more favorable are those jurisdictions that present an opportunity for a higher return on capital projects as an incentive to investors.[77]

Therefore, to the extent that PacifiCorp's rates do not permit the opportunity to recover its full cost of doing business, the Company will face increased recovery risk and thus increased pressure on its credit metrics.

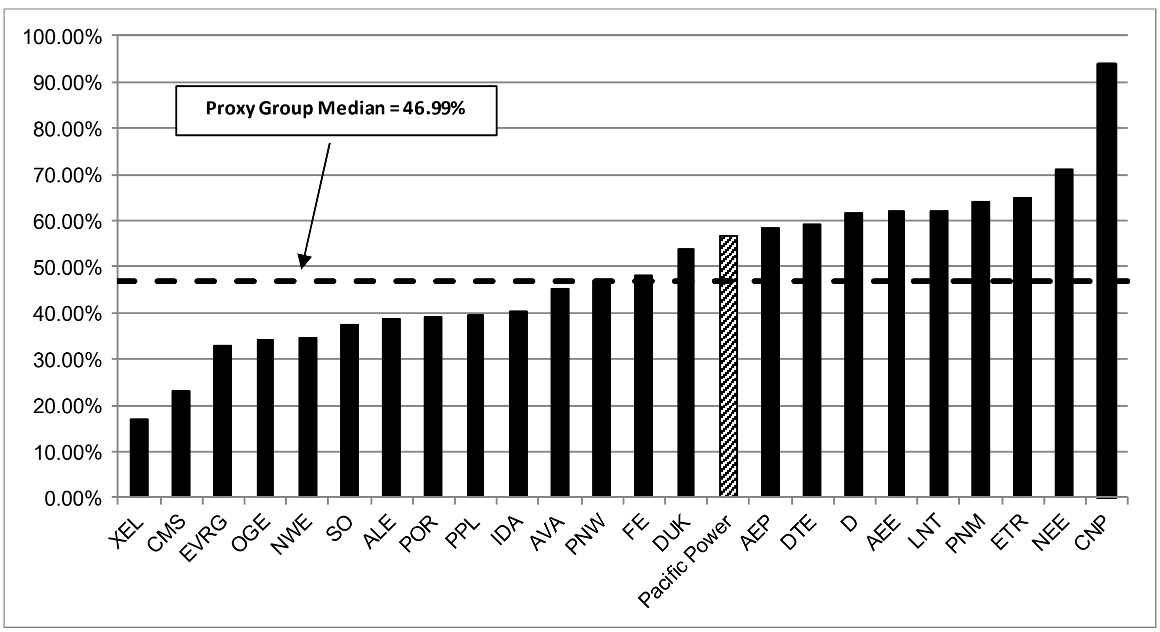
---

[77] S&P GLOBAL RATINGS, *Assessing U.S. Investor-Owned Utility Regulatory Environments* at 7 (August 10, 2016).

Q. How do PacifiCorp's capital expenditure requirements compare to those of the proxy group companies?

A. As shown in Exhibit PAC/411 CapEx 1, I calculated the ratio of expected capital expenditures to net utility plant for PacifiCorp and each of the companies in the proxy group by dividing each company's projected capital expenditures for the period from 2020-2024 by its total net utility plant as of December 31, 2018. As shown in Exhibit PAC/411 CapEx 2 (*see also* Figure 14 below), PacifiCorp's ratio of capital expenditures as a percentage of net utility plant of 60.00 percent is approximately 1.14 times the median for the proxy group companies of 52.52 percent. This result indicates slightly greater risk relative to the companies in the proxy group.

Figure 14: Comparison of Capital Expenditures – Proxy Group Companies



Q. Does PacifiCorp have a capital tracking mechanism to recover the costs associated with its capital expenditures plan between rate cases?

A. Only for certain investments, namely the costs to construct or otherwise acquire renewable generation facilities and the associated transmission. As shown in Exhibit

PAC/411, 52.52 percent of the proxy group utilities recover costs through capital tracking mechanisms.

Q. What are your conclusions regarding the effect of the Company's capital spending requirements on its risk profile and cost of capital?

A. PacifiCorp's capital expenditure requirements as a percentage of net utility plant are increasing and will continue over the next few years. Additionally, unlike a number of the operating subsidiaries of the proxy group, PacifiCorp does not have a comprehensive capital tracking mechanism to recover projected capital expenditures. Therefore, PacifiCorp's elevated capital expenditure requirements result in a risk profile that is greater than that of the proxy group and supports an ROE toward the higher end of the reasonable range of ROEs.

Regulatory Risk

Q. Please explain how the regulatory environment affects investors' risk assessments.

A. The ratemaking process is premised on the principle that, for investors and companies to commit the capital needed to provide safe and reliable utility service, the subject utility must have the opportunity to recover the return of, and the market-required return on, invested capital. Regulatory authorities recognize that because utility operations are capital intensive, regulatory decisions should enable the utility to attract capital at reasonable terms; doing so balances the long-term interests of investors and customers. Utilities must finance their operations and require the opportunity to earn a reasonable return on their invested capital to maintain their financial profiles. PacifiCorp is no exception. In that respect, the regulatory environment is one of the most important factors considered in both debt and equity investors' risk assessments.

From the perspective of debt investors, the authorized return should enable the utility to generate the cash flow needed to meet its near-term financial obligations, make the capital investments needed to maintain and expand its systems, and maintain the necessary levels of liquidity to fund unexpected events. This financial liquidity must be derived not only from internally generated funds, but also by efficient access to capital markets. Moreover, because fixed income investors have many investment alternatives, even within a given market sector, the utility's financial profile must be adequate on a relative basis to ensure its ability to attract capital under a variety of economic and financial market conditions.

Equity investors require that the authorized return be adequate to provide a risk-comparable return on the equity portion of the utility's capital investments. Because equity investors are the residual claimants on the utility's cash flows (which is to say that the equity return is subordinate to interest payments), they are particularly concerned with the strength of regulatory support and its effect on future cash flows.

Q. Please explain how credit rating agencies consider regulatory risk in establishing a company's credit rating.

A. Both S&P and Moody's consider the overall regulatory framework in establishing credit ratings. Moody's establishes credit ratings based on four key factors: (1) regulatory framework; (2) the ability to recover costs and earn returns; (3) diversification; and (4) financial strength, liquidity and key financial metrics. Of these criteria, regulatory framework and the ability to recover costs and earn returns are each given a broad rating factor of 25.00 percent. Therefore, Moody's assigns regulatory risk a 50.00 percent weighting in the overall assessment of business and financial risk for regulated utilities.[78]

S&P also identifies the regulatory framework as an important factor in credit ratings for regulated utilities, stating: "One significant aspect of regulatory risk that influences credit quality is the regulatory environment in the jurisdictions in which a utility operates."[79] S&P identifies four specific factors that it uses to assess the credit implications of the regulatory jurisdictions of investor-owned regulated utilities: (1) regulatory stability; (2) tariff-setting procedures and design; (3) financial stability; and (4) regulatory independence and insulation.[80]

Q. How does the regulatory environment in which a utility operates affect its access to and cost of capital?

A. The regulatory environment can significantly affect both the access to, and cost of capital in several ways. First, the proportion and cost of debt capital available to utility companies are influenced by the rating agencies' assessment of the regulatory environment. As noted by Moody's, "[f]or rate regulated utilities, which typically operate as a monopoly, the regulatory environment and how the utility adapts to that environment are the most important credit considerations."[81] Moody's further

[81] MOODY'S INVESTORS SERVICE, *Rating Methodology: Regulated Electric and Gas Utilities* at 6 (Jun. 23, 2017).

highlighted the relevance of a stable and predictable regulatory environment to a utility's credit quality, noting: "[b]roadly speaking, the Regulatory Framework is the foundation for how all the decisions that affect utilities are made (including the setting of rates), as well as the predictability and consistency of decision-making provided by that foundation."[82]

Q. Have you conducted any analysis of the regulatory framework in Oregon relative to the jurisdictions in which the companies in your proxy group operate?

A. Yes. I have evaluated the regulatory framework in Oregon on five factors that are important in terms of providing a regulated utility an opportunity to earn its authorized ROE. These are: (1) fuel cost recovery; (2) test year convention (*i.e.*, forecast vs. historical); (3) method for determining rate base (*i.e.*, average vs. year-end); (4) use of revenue decoupling mechanisms or other clauses that mitigate volumetric risk; and (5) prevalence of capital cost recovery between rate cases. The results of this regulatory risk assessment are shown in Exhibit PAC/412 and summarized below.

Fuel Cost Recovery: PacifiCorp has a Power Cost Adjustment Mechanism (PCAM) to recover power costs. However, while traditional fuel cost recovery mechanisms allow all variances between projected fuel costs and actual fuel costs to be recovered from or refunded to customers, the PCAM for PacifiCorp has a deadband that requires PacifiCorp to absorb some portion of the variation in power costs. If the power cost variation falls within this deadband, there will be no power cost rate adjustment. The PCAM has an asymmetrical deadband, with a negative

[82] Id.

annual power cost variance deadband of $15 million, and a positive annual power cost variance deadband of $30 million. The PCAM also has a sharing mechanism, whereby any power cost variance outside the deadband will be shared 90 percent by customers and 10 percent by PacifiCorp. In addition, under the PCAM, there is an earnings test of +/- 100 basis points around PacifiCorp's authorized ROE. If PacifiCorp is earning within this range of its authorized ROE, there will be no power cost adjustment for that year. Finally, amortization of deferred amounts in any one year under the PCAM is limited to six percent of PacifiCorp's revenues in the preceding calendar year.[83]

As a result, the PCAM does not fully mitigate the power cost risk for PacifiCorp. This is important to investors because fuel and purchased power costs typically account for 50 – 60 percent of the total operating costs for a regulated utility. Moreover, according to SNL Financial, there are only nine states (*i.e.*, Arizona, Hawaii, Idaho, Missouri, Montana, Oregon, Vermont, Washington, and Wyoming) that have fuel cost recovery mechanisms with sharing bands. The remaining 41 states either have restructured and the electric utilities do not own generation or have fuel cost recovery mechanisms with a true-up between actual and forecasted fuel costs.[84]

In addition, 91.23 percent of the operating companies held by the proxy group are allowed to pass through fuel costs and purchased power costs directly to customers, without deadbands, sharing bands and earnings tests.

---

[83] *In the matter of PacifiCorp, dba Pacific Power Request for a General Rate Revision*, Docket No. UE 246, Order No. 12-493 at 14–15 (Dec. 20, 2012).
[84] Source: SNL Financial, Commission Profiles as of November 20, 2019.

Test year convention: PacifiCorp is using a fully forecasted test period for the calendar year 2021 with the exception of new plant in-service which is only included through the rate effective date. Likewise, 50.00 percent of the operating companies held by the proxy group provide service in jurisdictions that use a fully or partially forecast test year.

Rate Base: The Company's rate base in this proceeding is based on December 2020 year end for plant-related balances and 2021 average rate base for all other balances. In contrast, the majority (*i.e.*, 51.75 percent) of the operating subsidiaries held by the proxy group are allowed to use year-end rate base, meaning that the rate base includes capital additions that occurred in the second half of the test year and is more reflective of net utility plant going forward.

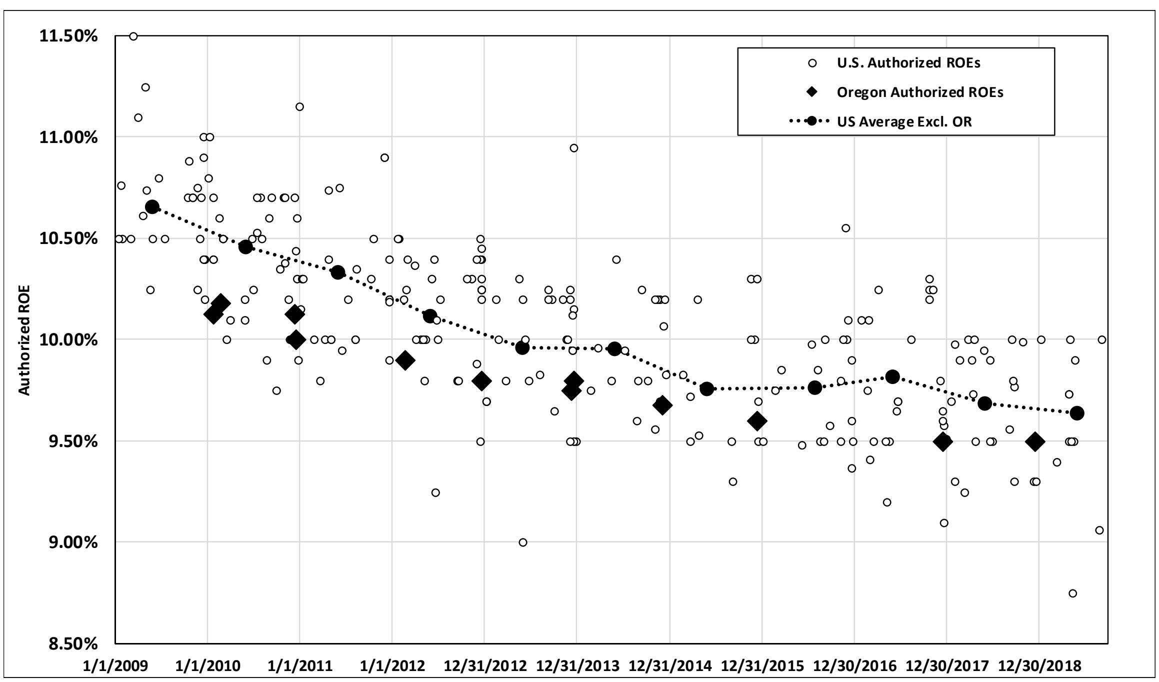
Volumetric Risk: PacifiCorp does not have protection against volumetric risk in Oregon. In contrast, 52.63 percent of the operating companies held by the proxy group have some form of protection against volumetric risk through either a partial or full revenue decoupling mechanism that mitigates the effect of fluctuations in volume on revenues.

Capital Cost Recovery: PacifiCorp is authorized to separately file to recover capital costs to construct or otherwise acquire renewable generation facilities and the associated transmission. However, utilities in Oregon are prohibited by law from the inclusion of construction work in progress in rate base, and deferred accounting is not available for recovery of capital expenditures. By comparison, 55.26 percent of the operating companies held by the proxy group also have some form of capital cost recovery mechanism in place that allows for recovery of capital costs between rate cases.

Q. How do recent returns in Oregon compare to the authorized returns in other jurisdictions?

A. As noted in RRA's evaluation above, the authorized ROEs for electric and natural gas utilities in Oregon, while largely the result of settlement agreements approved by the Commission, have been below the prevailing industry average for electric and natural gas utilities across the U.S. Figure 15 below shows the authorized returns for vertically integrated electric utilities in other jurisdictions since January 2009, and the returns authorized in Oregon for electric companies. As shown in Figure 15, the authorized returns for electric utilities in Oregon have been at the low end of the range of authorized ROEs in other state jurisdictions for 2009 through 2019.

Figure 15: Comparison of Oregon and U.S. Authorized Electric Returns



Q. Is there any reason that the Commission should be concerned about authorizing equity returns that are at the low end of the range established by other state regulatory jurisdictions?

A. Yes. Credit rating agencies take the authorized ROE into consideration in the overall risk analysis of a company. Therefore, to the extent that the returns in a jurisdiction are lower than the returns that have been authorized more broadly, credit rating agencies will consider this in the overall risk assessment of the regulatory jurisdiction in which the company operates. For example, Moody's recently downgraded ALLETE, Inc. from A3 to Baa1 for reasons that included the less than favorable outcome in Minnesota Power's last rate case in Minnesota. Moody's viewed Minnesota Power's recent rate case decision as credit negative for reasons which included: (1) the below average authorized ROE of 9.25 percent which resulted in a reduction of approximately $20 million between the requested and approved revenue requirement; (2) the disallowance of certain expenses such as prepaid pension expenses; and (3) the decision to not adopt the annual rate review mechanism, which if adopted would have mitigated the effect of industrial customers scaling back production in response to changes in economic conditions.[85] PacifiCorp must compete for capital with other utilities and businesses. Placing PacifiCorp at the lower end of authorized ROEs outside Oregon over the longer term could negatively impact its access to capital.

[85] MOODY'S INVESTORS SERVICE, *Credit Opinion: ALLETE, Inc. Update following downgrade* at 3 (April 3, 2019).

Q. How should the Commission use the information regarding authorized ROEs in other jurisdictions in determining the ROE for PacifiCorp?

A. As discussed above, the companies in the proxy group operate in multiple jurisdictions across the U.S. Since PacifiCorp must compete directly for capital with investments of similar risk, it is appropriate to review the authorized ROEs in other jurisdictions. The comparison is important because investors are considering the authorized returns across the U.S. and are likely to invest equity in those utilities with the highest returns. Furthermore, investors are also likely to consider business and financial risks for a company like PacifiCorp which faces increased risk as a result of the company's capital expenditure plan and limited cost recovery mechanisms. Therefore, authorizing an ROE for PacifiCorp that is equivalent to the average authorized ROE for other vertically integrated electric utilities is not sufficient to compensate investors for the added risk of PacifiCorp. As such, it is important that the Commission consider, as I have in my recommendation, the additional risk of PacifiCorp and place the authorized ROE for PacifiCorp towards the high end of authorized ROEs for other vertically integrated electric utilities.

Q. What are your conclusions regarding the perceived risks related to the Oregon regulatory environment?

A. As discussed throughout this section of my testimony, both Moody's and S&P have identified the supportiveness of the regulatory environment as an important consideration in developing their overall credit ratings for regulated utilities. Considering the regulatory adjustment mechanisms, many of the companies in the proxy group have more timely cost recovery through fuel cost recovery mechanisms, fully forecasted test years, year-end rate base in all cases, capital cost recovery trackers, and revenue stabilization mechanisms than PacifiCorp has in Oregon. Additionally, authorized ROEs in Oregon have been below the average authorized ROEs for electric and gas utilities across the U.S. For these reasons, I conclude that the authorized ROE for PacifiCorp should be higher than the proxy group mean.

Generation Ownership

Q. How does the business risk of vertically integrated electric utilities compare to the business risk of other regulated utilities?

A. According to Moody's, generation ownership causes vertically integrated electric utilities to have higher business risk than either electric transmission and distribution companies, or natural gas distribution or transportation companies.[86] As a result of this higher business risk, integrated electric utilities typically require a higher ROE or percentage of equity in the capital structure than other electric or gas utilities.

Q. Are there other risk factors specific to vertically integrated electric utilities that the credit rating agencies consider when determining the credit rating of a company that owns generation?

A. Yes. As discussed above, Moody's establishes credit ratings based on four key factors: (1) regulatory framework; (2) the ability to recover costs and earn returns; (3) diversification; and (4) financial strength, liquidity and key financial metrics. The third factor diversification, which Moody's assigns a 10.00 percent weighting in the

[86] MOODY'S INVESTORS SERVICE, *Rating Methodology: Regulated Electric and Gas Utilities* at 21-22 (June 23, 2017).

overall assessments of a company's business risk, considers the fuel source diversity of a utility with generation. Moody's notes:

> For utilities with electric generation, fuel source diversity can mitigate the impact (to the utility and to its rate-payers) of changes in commodity prices, hydrology and water flow, and environmental or other regulations affecting plant operations and economics. We have observed that utilities' regulatory environments are most likely to become unfavorable during periods of rapid rate increases (which are more important than absolute rate levels) and that fuel diversity leads to more stable rates over time.
>
> For that reason, fuel diversity can be important even if fuel and purchased power expenses are an automatic pass-through to the utility's ratepayers. Changes in environmental, safety and other regulations have caused vulnerabilities for certain technologies and fuel sources during the past five years. These vulnerabilities have varied widely in different countries and have changed over time.[87]

Q. Has Oregon enacted legislative requirements related to renewable energy?

A. Yes. As described in PacifiCorp's 2018 Form 10-K, the Oregon Renewable Energy Act (OREA) provides a comprehensive renewable energy policy and renewable portfolio standard (RPS) for Oregon. Subject to certain exemptions and cost limitations established in the law, PacifiCorp and other qualifying electric utilities must meet minimum qualifying electricity requirements for electricity sold to retail customers of at least five percent in 2011 through 2014, 15 percent in 2015 through 2019, and 20 percent in 2020 through 2024. In March 2016, Oregon Senate Bill (SB) 1547, the Clean Electricity and Coal Transition Plan, was signed into law. SB 1547 requires that coal-fueled resources are eliminated from Oregon's allocation of electricity by January 1, 2030, and increases the current RPS target from 25 percent in

---

[87] *Id.* at 16.

2025 to 50 percent by 2040. SB 1547 also implements new renewable energy certificate banking provisions, as well as the following interim RPS targets: 27 percent in 2025 through 2029, 35 percent in 2030 through 2034, 45 percent in 2035 through 2039, and 50 percent by 2040 and subsequent years. As required by the OREA, the Commission has approved an automatic adjustment clause to allow an electric utility, including PacifiCorp, to recover prudently incurred costs of its investments in renewable energy generating facilities and associated transmission costs.

Q. Is a transition to renewable resources supported by all regulatory jurisdictions where PacifiCorp operates?

A. No, it is not. Currently SB 1547 is in conflict with legislation that has been passed in Wyoming, Senate File (SF) 159. While the Oregon legislation seeks to transition from coal to renewable resources, Wyoming SF159 would require the Company to attempt to sell any generating assets that it intends to retire before it could request recovery of the costs of replacement generating assets. In addition, the legislation requires that the Company enter into a purchase power agreement to repurchase the power from the coal facility. While the rulemaking associated with Wyoming SF159 is still in discussion, the conflict between the Oregon and Wyoming legislation creates risk for the Company that is not uniformly represented in the proxy group companies.

Q. Have you conducted an analysis to compare the fuel sources for the generation portfolio of PacifiCorp to the companies in your proxy group?

A. Yes, I have. Specifically, I calculated for PacifiCorp, and each company in the proxy group, the percentage of regulated owned generation capacity that was derived from one of the following fuel sources: oil/natural gas, coal, nuclear, hydro, and other. As shown in Figure 16, approximately 52.47 percent of PacifiCorp's regulated, owned generation came from coal-fired power plants with approximately 79.20 percent coming from either oil, natural gas, or coal-fired power plants. Therefore, PacifiCorp is more reliant on a limited number of fuel sources for its regulated generation and overall slightly less diversified than the companies in the proxy group.

Figure 16: Regulated Owned Generation Capacity - Fuel Mix for PacifiCorp and Proxy Group

Company	Oil & Natural Gas	Coal	Nuclear	Hydro	Other	Total Generation
Avista Corporation	33.60%	10.41%	0.00%	53.55%	2.43%	100.00%

OGE Energy Corp.	55.16%	37.97%	0.00%	0.00%	6.86%	100.00%
PPL Corporation	36.56%	61.74%	0.00%	1.58%	0.12%	100.00%
CenterPoint Energy, Inc.	19.36%	80.16%	0.00%	0.00%	0.48%	100.00%

Q. Is PacifiCorp's generation portfolio currently in a state of transition?

A. Yes. As further discussed in the testimonies of Mr. Stefan A. Bird and of Ms. Etta Lockey, the Company is responding to changing market conditions and, as indicated by the 2019 Integrated Resource Plan (IRP) action plan, is taking near term actions to retire certain coal units, invest in new renewable generation, and invest in associated transmission.

Q. How does PacifiCorp's generation investment plan affect its business risk?

A. The Company's 2019 IRP action plan includes a significant investment in building transmission and adding new wind and solar generation. This significant investment in transmission and renewable energy will require continued access to capital markets, which highlights the importance of granting PacifiCorp an allowed ROE and equity ratio that is sufficient to attract capital at reasonable terms.

Q. What are your conclusions regarding the perceived risks related to the fuel mix of PacifiCorp's generation portfolio?

A. PacifiCorp's coal-fired generation is subject to increased environmental regulations aimed at cutting power plant emissions. The environmental regulations pose additional business risk as sizable future capital expenditures may be required to comply with regulations. Furthermore, the Company recently outlined plans for reshaping its generation portfolio. While the Company intends to improve fuel diversity over the long-run, the plans will require continued access to capital markets to finance the new investments. The Company's existing generation portfolio and proposed transmission and generation investment plans increase the overall risk profile as compared with the proxy group.

IX. CAPITAL STRUCTURE

Q. Is the capital structure of the Company an important consideration in the determination of the appropriate ROE?

A. Yes. Assuming other factors equal, a higher debt ratio increases the risk to investors. For debt holders, higher debt ratios result in a greater portion of the available cash flow being required to meet debt service, thereby increasing the risk associated with the payments on debt. The result of increased risk is a higher interest rate. The incremental risk of a higher debt ratio is more significant for common equity shareholders. Common shareholders are the residual claimants on the cash flow of the company. Therefore, the greater the debt service requirement, the less cash flow available for common equity holders.

Q. What is PacifiCorp's proposed capital structure?

A. As described by PacifiCorp witness Ms. Nikki L. Kobliha, PacifiCorp's proposed capital structure for ratemaking purposes consists of 53.52 percent common equity, 46.47 percent long-term debt and 0.01 percent preferred equity.

Q. Did you conduct any analysis to determine if this requested equity ratio was reasonable?

A. Yes, I did. I reviewed the Company's historical actual capital structure and the capital structures of the utility operating subsidiaries of the proxy companies. Because the ROE is set based on the return that is derived from the risk-comparable proxy group, it is reasonable to look to the proxy group average capital structure to benchmark the equity ratio for the Company.

Q. Please discuss your analysis of the capital structures of the proxy group companies.

A. I calculated the mean proportions of common equity, long-term debt, short-term debt and preferred equity over the most recent eight quarters[88] for each of the companies in the proxy group at the operating subsidiary level. My analysis of the capital structures of the proxy group companies is provided in Exhibit PAC/413. As shown in that Exhibit, the equity ratios for the proxy group at the operating utility company level ranged from 39.98 percent to 61.54 percent with an average of 52.43 percent. PacifiCorp's proposed equity ratio of 53.52 percent approximates the average equity ratio for the proxy group and is well below the high end of the range of equity ratios for the utility operating subsidiaries. Therefore, I conclude that PacifiCorp's proposed capital structure is reasonable.

Q. Are there other factors to be considered in setting the company's capital structure?

A. Yes. The credit rating agencies' response to the TCJA must also be considered when determining the equity ratio. As discussed previously in my testimony, all three rating agencies have noted that the TCJA has negative implications for utility cash flows. S&P and Fitch have specifically identified increasing the equity ratio as one approach to ensure that utilities have sufficient cash flows following the tax cuts and the loss of bonus depreciation. Furthermore, Moody's unprecedented downgrade of

---

[88] The source data for this analysis is the operating company data provided in Federal Energy Regulatory Commission Form 1 reports. Due to the timing of those filings, my average capital structure analysis uses the quarterly capital structures reported for the proxy group companies for the period from the fourth quarter of 2017 through the third quarter of 2019.

the rating outlook for the entire utilities sector in June 2018 stresses the importance of maintaining adequate cash flow metrics for the industry as a whole and PacifiCorp in the context of this proceeding.

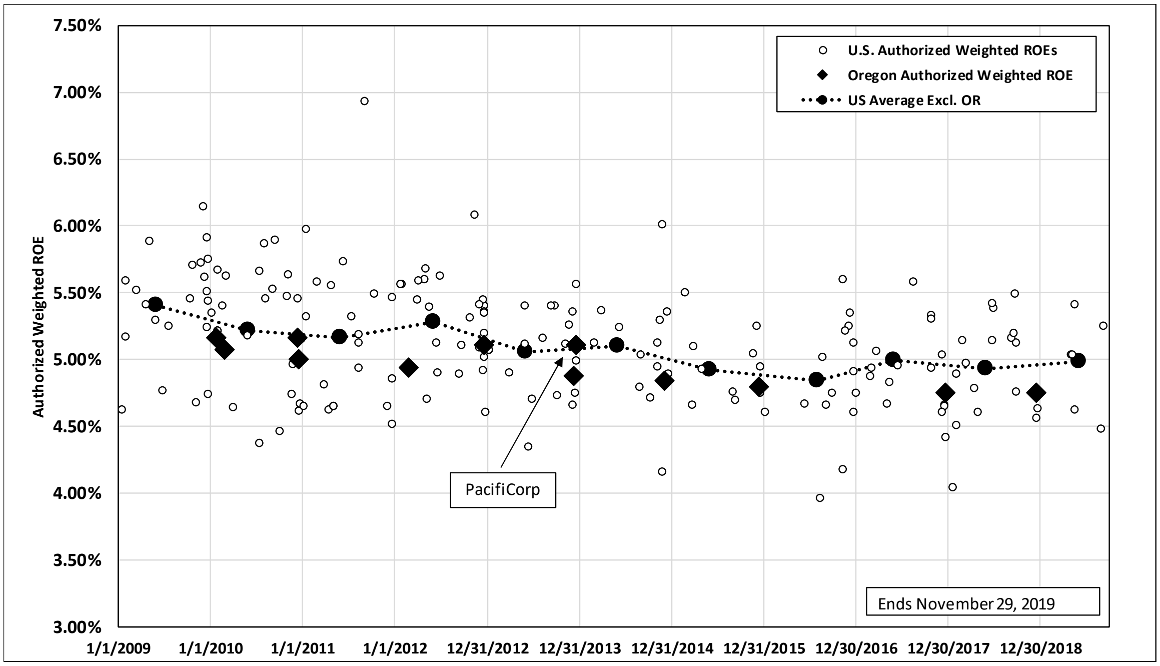
Q. Is there a relationship between the equity ratio and the authorized ROE?

A. Yes. The equity ratio is the primary indicator of financial risk for a regulated utility such as PacifiCorp. To the extent the equity ratio is reduced, it is necessary to increase the authorized ROE to compensate investors for the greater financial risk associated with a lower equity ratio.

Q. Have you conducted an analysis to examine how the Commission's recent authorized equity ratios and authorized ROEs compare to those authorized in other jurisdictions?

A. Yes. As shown in Figure 17, I compared the authorized WROEs (*i.e.*, authorized ROE times the authorized equity ratio) for integrated electric utilities in Oregon to the authorized WROEs in other jurisdictions since January 2009. As shown in Figure 17, the authorized WROEs for integrated electric utilities in Oregon have been somewhat lower than the nationwide average of WROEs authorized by state jurisdictions.

Figure 17: Comparison of Oregon and U.S. Authorized Weighted Equity Ratios for Electric Utilities[89]



Q. Is it appropriate to consider the WROE that has been authorized in other jurisdictions when considering the appropriate equity ratio for Oregon?

A. Yes. One of the most important principles in determining the ROE for a company is to ensure the company has the opportunity to earn a reasonable return on capital that is consistent with the returns available on investments of comparable risk. While it is referenced most often in the discussion of the appropriate ROE, it is equally as important to consider the equity ratio. It is the combination of the equity ratio and the authorized ROE that defines the return to investors. Therefore, the Commission must consider the equity ratio as well as the authorized ROE in establishing a risk-comparable return.

[89] Rate cases in Arkansas, Florida, Indiana, and Michigan have been excluded from Figure 17 since the authorized capital structure approved in the cases includes deferred taxes and other credits at zero or low cost. The additional items have the effect of reducing both the equity and debt ratios used to establish the rate of return which, in turn, produces results that are not comparable to allowed equity ratios in other states.

Q. What is your conclusion regarding an appropriate capital structure for PacifiCorp?

A. Considering the actual capital structures of the proxy group operating companies, I believe that PacifiCorp's proposed common equity ratio of 53.52 percent is reasonable. The proposed equity ratio is well within the range established by the capital structures of the utility operating subsidiaries of the proxy companies and approximates the average. In addition, it is reasonable to rely on a higher equity ratio than the company may have relied on in prior cases as a result of: (a) the cash flow concerns raised by credit rating agencies as a result of the TCJA; and (b) the Company's above average business risk profile as compared to the proxy group. The proposed equity ratio in combination with my recommended ROE are reasonable and would be adequate to support capital attraction on reasonable terms.

X. CONCLUSIONS AND RECOMMENDATION

Q. What is your conclusion regarding a fair ROE for PacifiCorp?

A. Based on the analytical results discussed throughout my direct testimony, and summarized in Figure 18, below, I believe a range from 9.75 percent to 10.25 percent is reasonable. Within that range, an authorized return of 10.20 percent is reasonable for PacifiCorp. This recommendation reflects the range of results for the proxy group companies, the relative business, financial, and regulatory risk of PacifiCorp's electric operations in Oregon as compared to the proxy group, and current capital market conditions. This ROE would enable the company to maintain its financial integrity and therefore its ability to attract capital at reasonable terms under a variety of economic and financial market conditions, while continuing to provide safe, reliable and affordable electric utility service to customers in Oregon.

Q. What is your conclusion with respect to PacifiCorp's proposed capital structure?

A. My conclusion is that PacifiCorp's proposal to establish a capital structure consisting of 53.52 percent common equity, 46.47 percent long-term debt, and 0.01 percent preferred equity is reasonable when compared to the capital structures of the operating utility companies in the proxy group and taking in consideration the impact of the TCJA on the cash flows of PacifiCorp, and therefore should be adopted.

Q. Does this conclude your direct testimony?

A. Yes.

Docket No. UE 374
Exhibit PAC/401
Witness: Ann E. Bulkley

BEFORE THE PUBLIC UTILITY COMMISSION

OF OREGON

PACIFICORP

Exhibit Accompanying Direct Testimony of Ann E. Bulkley

Resume and Testimony Listing of Ann E. Bulkley

February 2020

ANN E. BULKLEY

Senior Vice President

Ms. Bulkley has more than two decades of management and economic consulting experience in the energy industry. Ms. Bulkley has extensive state and federal regulatory experience on both electric and natural gas issues including rate of return, cost of equity and capital structure issues. Ms. Bulkley has provided expert testimony on the cost of capital in more than 30 regulatory proceedings before regulatory commissions in Arizona, Arkansas, Colorado, Connecticut, Kansas, Massachusetts, Michigan, Minnesota, Missouri, New Jersey, New Mexico, New York, North Dakota, Oklahoma, Pennsylvania, Texas, South Dakota, West Virginia, and the Federal Energy Regulatory Commission. In addition, Ms. Bulkley has prepared and provided supporting analysis for at least forty Federal and State regulatory proceedings. In addition, Ms. Bulkley has worked on acquisition teams with investors seeking to acquire utility assets, providing valuation services including an understanding of regulation, market expected returns, and the assessment of utility risk factors. Ms. Bulkley has assisted clients with valuations of public utility and industrial properties for ratemaking, purchase and sale considerations, ad valorem tax assessments, and accounting and financial purposes. In addition, Ms. Bulkley has experience in the areas of contract and business unit valuation, strategic alliances, market restructuring and regulatory and litigation support. Prior to joining Concentric, Ms. Bulkley held senior expertise-based consulting positions at several firms, including Reed Consulting Group and Navigant Consulting, Inc. where she specialized in valuation. Ms. Bulkley holds an M.A. in economics from Boston University and a B.A. in economics and finance from Simmons College. Ms. Bulkley is a Certified General Appraiser licensed in the Commonwealth of Massachusetts and the State of New Hampshire.

REPRESENTATIVE PROJECT EXPERIENCE

Regulatory Analysis and Ratemaking

Ms. Bulkley has provided a range of advisory services relating to regulatory policy analysis and many aspects of utility ratemaking. Specific services have included: cost of capital and return on equity testimony, cost of service and rate design analysis and testimony, development of ratemaking strategies; development of merchant function exit strategies; analysis and program development to address residual energy supply and/or provider of last resort obligations; stranded costs assessment and recovery; performance-based ratemaking analysis and design; and many aspects of traditional utility ratemaking (e.g., rate design, rate base valuation).

Cost of Capital

Ms. Bulkley has provided expert testimony on the cost of capital in more than 30 regulatory proceedings before regulatory commissions in Arizona, Arkansas, Colorado, Connecticut, Kansas, Massachusetts, Michigan, Minnesota, Missouri, New Jersey, New Mexico, New York, North Dakota, Oklahoma, Pennsylvania, Texas, South Dakota, West Virginia, and the Federal Energy Regulatory Commission. In addition, Ms. Bulkley has prepared and provided supporting analysis for at least forty Federal and State regulatory proceedings in which she did not testify.

Valuation

Ms. Bulkley has provided valuation services to utility clients, unregulated generators and private equity clients for a variety of purposes including ratemaking, fair value, ad valorem tax, litigation and damages, and acquisition. Ms. Bulkley's appraisal practices are consistent with the national standards established by the Uniform Standards of Professional Appraisal Practice.

Representative projects/clients have included:

- Northern Indiana Fuel and Light: Provided expert testimony regarding the fair value of the company's natural gas distribution system assets. Valuation relied on cost approach.
- Kokomo Gas: Provided expert testimony regarding the fair value of the company's natural gas distribution system assets. Valuation relied on cost approach.
- Prepared fair value rate base analyses for Northern Indiana Public Service Company for several electric rate proceedings. Valuation approaches used in this project included income, cost and comparable sales approaches.
- Confidential Utility Client: Prepared valuation of fossil and nuclear generation assets for financing purposes for regulated utility client.
- Prepared a valuation of a portfolio of generation assets for a large energy utility to be used for strategic planning purposes. Valuation approach included an income approach, a real options analysis and a risk analysis.
- Assisted clients in the restructuring of NUG contracts through the valuation of the underlying assets. Performed analysis to determine the option value of a plant in a competitively priced electricity market following the settlement of the NUG contract.
- Prepared market valuations of several purchase power contracts for large electric utilities in the sale of purchase power contracts. Assignment included an assessment of the regional power market, analysis of the underlying purchase power contracts, a traditional discounted cash flow valuation approach, as well as a risk analysis. Analyzed bids from potential acquirers using income and risk analysis approached. Prepared an assessment of the credit issues and value at risk for the selling utility.
- Prepared appraisal of a portfolio of generating facilities for a large electric utility to be used for financing purposes.
- Prepared an appraisal of a fleet of fossil generating assets for a large electric utility to establish the value of assets transferred from utility property.
- Conducted due diligence on an electric transmission and distribution system as part of a buy-side due diligence team.
- Provided analytical support for and prepared appraisal reports of generation assets to be used in ad valorem tax disputes.
- Provided analytical support and prepared testimony regarding the valuation of electric distribution system assets in five communities in a condemnation proceeding.
- Valued purchase power agreements in the transfer of assets to a deregulated electric market.

Ratemaking

Ms. Bulkley has assisted several clients with analysis to support investor-owned and municipal utility clients in the preparation of rate cases. Sample engagements include:

- Assisted several investor-owned and municipal clients on cost allocation and rate design issues including the development of expert testimony supporting recommended rate alternatives.

Worked with Canadian regulatory staff to establish filing requirements for a rate review of a newly regulated electric utility. Analyzed and evaluated rate application. Attended hearings and conducted investigation of rate application for regulatory staff. Prepared, supported and defended recommendations for revenue requirements and rates for the company. Developed rates for gas utility for transportation program and ancillary services.

Strategic and Financial Advisory Services

Ms. Bulkley has assisted several clients across North America with analytically based strategic planning, due diligence and financial advisory services.

Representative projects include:

- Preparation of feasibility studies for bond issuances for municipal and district steam clients.
- Assisted in the development of a generation strategy for an electric utility. Analyzed various NERC regions to identify potential market entry points. Evaluated potential competitors and alliance partners. Assisted in the development of gas and electric price forecasts. Developed a framework for the implementation of a risk management program.
- Assisted clients in identifying potential joint venture opportunities and alliance partners. Contacted interviewed and evaluated potential alliance candidates based on company-established criteria for several LDCs and marketing companies. Worked with several LDCs and unregulated marketing companies to establish alliances to enter into the retail energy market. Prepared testimony in support of several merger cases and participated in the regulatory process to obtain approval for these mergers.
- Assisted clients in several buy-side due diligence efforts, providing regulatory insight and developing valuation recommendations for acquisitions of both electric and gas properties.

PROFESSIONAL HISTORY

Docket No. UE 374
Exhibit PAC/500
Witness: Michael G. Wilding

BEFORE THE PUBLIC UTILITY COMMISSION

OF OREGON

PACIFICORP

Direct Testimony of Michael G. Wilding

February 2020

TABLE OF CONTENTS

ATTACHED EXHIBITS

I. INTRODUCTION AND QUALIFICATIONS

Q. Please state your name, business address, and present position with PacifiCorp d/b/a Pacific Power (PacifiCorp or the Company).

A. My name is Michael G. Wilding. My business address is 825 NE Multnomah Street, Suite 2000, Portland, Oregon 97232. My title is Director, Net Power Costs and Regulatory Policy.

Q. Briefly describe your education and business experience.

A. I received a Master of Accounting from Weber State University and a Bachelor of Science degree in accounting from Utah State University and am a Certified Public Accountant licensed in the state of Utah. During my tenure at the Company, I have worked on various regulatory projects including general rate cases, the multi-state protocol, and net power cost filings. I have been employed by PacifiCorp since 2014.

Q. Have you testified in previous regulatory proceedings?

A. Yes. I have filed testimony in proceedings before the Public Utility Commission of Oregon (Commission), and the public utility commissions in California, Idaho, Utah, Washington, and Wyoming.

II. PURPOSE OF TESTIMONY

Q. What is the purpose of your testimony in this proceeding?

A. My testimony describes how net power costs (NPC) are currently forecast, recovered and trued-up by the Company; proposes consolidation of the Transition Adjustment Mechanism (TAM) and Power Cost Adjustment Mechanism (PCAM) filings into a single annual filing, the Annual Power Cost Adjustment (APCA); and proposes changes to the annual power cost true-up to remove the sharing bands, deadbands, and earnings test. Finally, my testimony addresses several drivers supporting these proposed changes.

III. NPC RECOVERY

Q. Please describe how PacifiCorp recovers its Oregon-allocated NPC.

A. In Oregon, PacifiCorp forecasts a level of NPC for the following calendar year (test year) through the TAM. PacifiCorp uses its Generation and Regulation Initiative Decision Tools (GRID) model to forecast NPC for the test year. This forecast level of NPC is recovered through Schedule 201 during the test year. In the year following the test year, PacifiCorp files a PCAM, which is a mechanism that allows for recovery of un-forecasted deviations in NPC. PacifiCorp has never triggered a rate change through the PCAM.

Q. Why are NPC reset annually?

A. In approving annual power cost updates through the TAM, the Commission has recognized that "it is important to update the forecast of power costs included in rates to account for new information, *e.g.,* on expected market prices for electricity and natural gas, and for new…purchase power contracts" and that "[i]f the forecast is not updated each year, then [the utility] will be exposed to more than normal business risk."[1] NPC can vary significantly year-to-year for a variety of reasons, including changes to loads, fuel costs, market prices, and renewable resource availability. This variability makes it difficult to accurately forecast NPC for ratemaking purposes.

[1] *In the matter of Portland General Elec. Co.*, *Request for a General Rate Revision,* et al, Docket Nos. UE 180, UE 181, and UE 184, Order No. 07-015 at 18 (Jan. 12, 2007).

Q. Please briefly describe the TAM.

A. The purpose of the TAM is to capture costs associated with direct access and prevent unwarranted cost shifting between cost of service customers and customers that elect direct access service.[2] Significantly, the TAM also sets PacifiCorp's Oregon-allocated NPC for the upcoming year.[3] The direct access transition adjustments are calculated by comparing the value of energy used to serve direct access loads with the cost of service rate under the customers' specific energy-only tariff. The Commission adopted an annual NPC update to ensure that both the value of freed-up energy and the cost of service rate are calculated for the same period using the same data. The Commission has articulated the importance of accurate NPC modeling in the TAM:

> PacifiCorp's TAM is an annual filing in which PacifiCorp projects the amount of [NPC] to be reflected in customer rates for the following year, as well as to set transition charges for customers electing to move to direct access. The TAM effectively removes regulatory lag for the company because the forecasts are used to adjust rates. For that reason, the accuracy of the forecasts is of significant importance to setting fair just and reasonable rates. Our goal, therefore, is to achieve an accurate forecast of PacifiCorp's [NPC] for the upcoming year.[4]

Q. Please briefly describe PacifiCorp's PCAM authorized by the Commission.

A. Commission Order 12-493 approved a PCAM to allow PacifiCorp to recover the difference between actual PCAM costs incurred to serve customers and the base PCAM costs established in PacifiCorp's annual TAM filing.[5] PCAM costs include

NPC, other revenues, and federal production tax credits (PTC). As the Commission observed when it adopted a PCAM for Portland General Electric Company, the PCAM has been designed so that the utility "will bear normal business risk associated with actual power costs varying from forecast."[6]

Q. Please describe the relationship of the TAM and PCAM.

A. Each year the PCAM compares the NPC collected from Oregon customers in rates set in the TAM to the actual Oregon-allocated NPC. The PCAM variance, however, is subject to an asymmetrical deadband between a $30 million under-collection and a $15 million over-collection, a symmetrical sharing band where the Company absorbs 10 percent of the variance outside the deadband, and finally a symmetrical earnings test where the collection or refund of a PCAM variance is limited to amounts that will bring PacifiCorp to within 100 basis points of the Company's authorized return on equity (ROE). Additionally, the amortization of deferred amounts are capped at six percent of the revenue for the preceding calendar year.

Q. Has the current construct of the TAM and PCAM provided PacifiCorp with a reasonable opportunity to recover its prudently incurred NPC?

A. No. Despite persistent and significant under-recovery of NPC since the implementation of the PCAM, due to the operation of the deadbands, sharing bands, and earnings test, PacifiCorp's rates have never been adjusted as the result of the PCAM. Notably, for the time period of 2014 to 2018, PacifiCorp has under-recovered approximately $77 million of NPC and the only year of

[6] Order No. 07-015 at 17-19.

over-recovery was 2016.[7] As further discussed in the testimony of Mr. Frank Graves, this systematic under-recovery of prudently incurred NPC occurs because of the restrictions of the PCAM and the inability to forecast certain system balancing costs in the TAM.

Q. If the TAM and PCAM are prohibitive to the recovery of prudently incurred NPC, why did PacifiCorp over-recover NPC in 2016?

A. As explained in the testimony of Mr. Graves, despite an over-recovery of total Oregon-allocated NPC, PacifiCorp still experienced system balancing costs not captured in the TAM.[8] In 2016, PacifiCorp's hydro generation was within one percent of the TAM forecast and its owned wind generation was more than four percent above the TAM forecast. In addition, natural gas market prices and energy prices were very low relative to other years. The actual average cost of natural gas generation was approximately 15 percent lower than forecast in the TAM and the average price of market purchases was approximately 37 percent lower than forecast in the TAM. These items combined to outweigh the under-collection of the system balancing costs described by Mr. Graves.

Q. How is the energy landscape changing compared to when the PCAM was approved in 2012?

A. As discussed further in the testimony of Mr. Graves, since 2012, the energy landscape in the West has continued to evolve, with an increasing number of states adopting clean energy standards (including Senate Bill (SB) 1547 in Oregon), the development

---

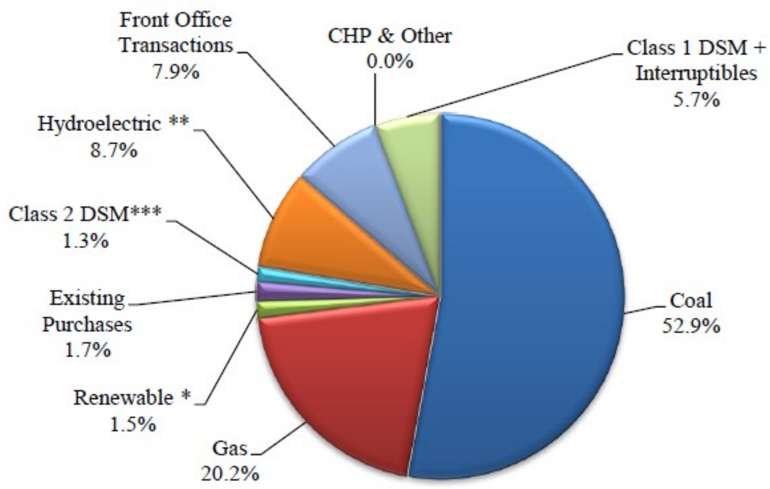
[7] For purposes of this testimony, 2016 Jim Bridger coal costs have been adjusted to remove certain unusual costs that would not be included in a TAM.
[8] PAC/600, Graves/17-20.

of the energy imbalance market (EIM) and, more recently, region-wide discussions regarding regional resource adequacy and possible creation of a day-ahead energy market. In response to shifting energy policy in the West, along with changes in federal energy policy such as the extension of federal PTCs, and changing market conditions, PacifiCorp is in the process of transitioning its existing generation fleet and building new transmission to accommodate additional renewable generation capacity, with approximately 1,500 megawatts of new wind capacity and a 140-mile, 500 kilovolts transmission line coming online by the end of 2020.

Q. How has PacifiCorp's resource mix changed as a result of this shifting energy landscape?

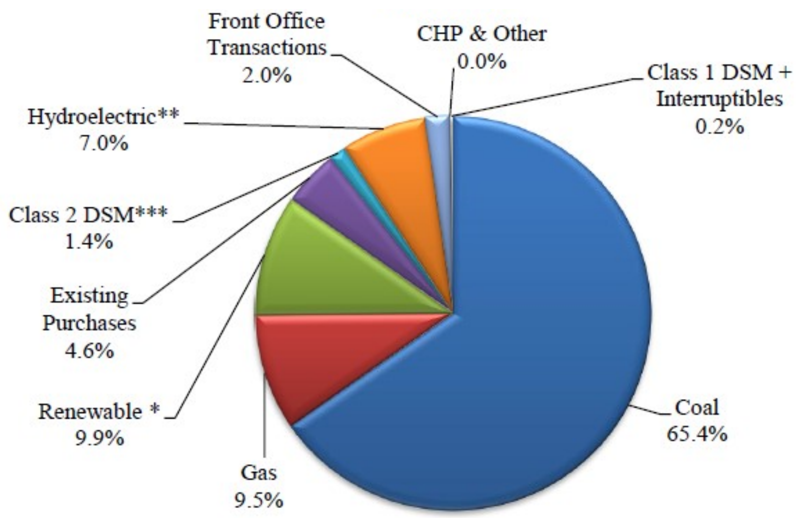
A. PacifiCorp continues to adapt to, among other things, changing market conditions and increasing demand from customers for specific types of generating resources. This adaptation is shown in the figures below. In PacifiCorp's 2013 Integrated Resource Plan (IRP), the energy and capacity resource mix was heavily dependent on thermal resources. Only 1.5 percent of PacifiCorp's resource capacity came from renewable resources. In contrast, the 2019 IRP projects 33 percent of PacifiCorp's resource capacity in 2021 to come from renewable resources. Similarly, PacifiCorp's resource capacity mix from coal-fired generation will drop from 53 percent to 31 percent during this same timeframe.

1 **FIGURE 1[9]**
PACIFICORP'S 2013 CAPACITY MIX



* Renewable resources include wind, solar and geothermal. Wind capacity is reported as the peak load contribution.
** Hydroelectric resouces include owned, qualifying facilities and contract purchases.
*** The contribution of Class 2 DSM represents incremental acquisition of DSM resources over the planning period.

2 **FIGURE 2[10]**
PACIFICORP'S 2013 ENERGY MIX



* Renewable resources include wind, solar and geothermal.
** Hydroelectric resouces include owned, qualifying facilities and contract purchases.
*** The contribution of Class 2 DSM represents incremental acquisition of DSM resources over the planning period.

---

[9] *In the matter of PacifiCorp, dba Pacific Power, 2013 Integrated Resource Plan*, Docket No. LC 57, PacifiCorp's 2013 Integrated Resource Plan at 229 (Apr. 30, 2013).
[10] *Id.* at 230.

FIGURE 3[11]
PACIFICORP'S 2019 CAPACITY MIX

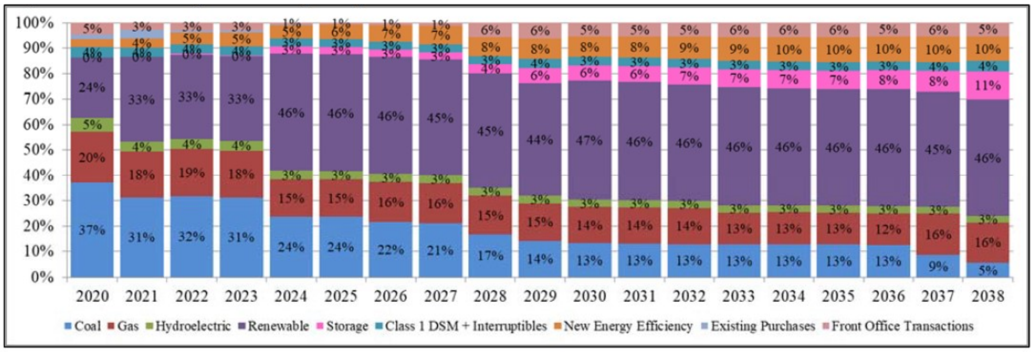


FIGURE 4[12]
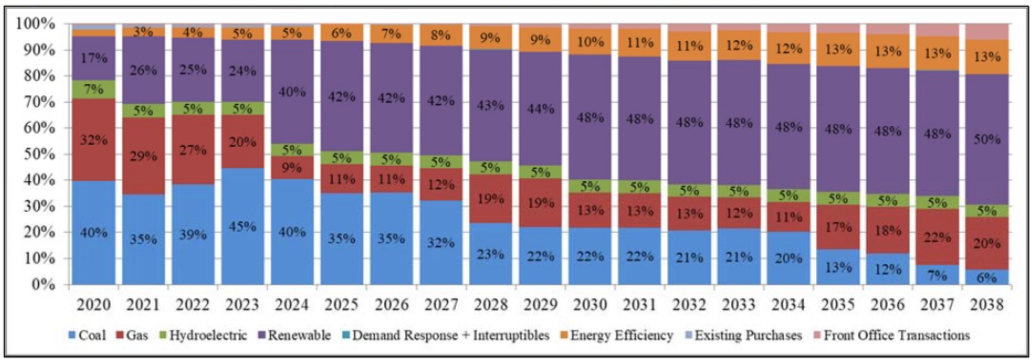
PACIFICORP'S 2019 ENERGY MIX



By 2030, PacifiCorp currently projects that 45 percent of system capacity will come from renewable resources and coal will supply only 13 percent of system capacity.

Q. How has this change in resource mix affected the Company's NPC?

A. The capital costs and the operations and maintenance (O&M) expense of renewable resources owned by PacifiCorp, in this case wind resources, are included in base rates, while the variable energy costs are included in NPC. Importantly, the renewable resource provides zero-fuel-cost energy, or even negative-cost energy when PTCs and other benefits are considered. This means that PacifiCorp's

[11] *In the matter of PacifiCorp, dba Pacific Power, 2019 Integrated Resource Plan*, Docket No. LC 70, PacifiCorp's 2019 Integrated Resource Plan at 257 (Oct. 18, 2019).
[12] *Id.*

customers benefit when they receive the entire energy output of the owned wind resources and those resources are the last to be curtailed when there is an energy surplus.

If the renewable resource is a qualifying facility (QF) or another purchased power agreement (PPA), then the purchase price of the contract is included in NPC. PacifiCorp is required to purchase the entire energy output offered from a QF, with no curtailment rights. Project developers also generally require PacifiCorp to purchase the entire energy output of a facility under non-QF PPAs.

As renewable resources are weather dependent and do not have the same flexibility as a thermal resource, PacifiCorp has limited ability to plan for and control their availability and output. As explained by Mr. Graves, it is impossible to accurately forecast the output of these renewable resources, specifically wind resources, on an hourly basis for an entire year, which makes it increasingly difficult to accurately forecast NPC.

IV. PACIFICORP'S PROPOSAL

Q. What is PacifiCorp's proposal for forecasting and recovering NPC?

A. PacifiCorp proposes to combine the TAM and PCAM into a single NPC mechanism—the APCA—that would be filed on May 15 of every year. The APCA would replace the TAM that is typically filed on April 1 and the PCAM that is filed on May 15. As part of the APCA, PacifiCorp would file a forecast for NPC for the following year (test year), and request an adjustment or true-up for power costs of the previous year. In addition, PacifiCorp proposes to remove the deadbands, sharing bands, and earnings test from the annual true-up of power costs. Using the TAM

Guidelines, PacifiCorp created a set of APCA Guidelines to provide governance for parties. The APCA Guidelines are attached as Exhibit PAC/501. The first APCA would be filed on May 15, 2021, with a forecast for the calendar year 2022 and a true-up of calendar year 2020.

Q. What is the purpose of the APCA?

A. The APCA would provide PacifiCorp with the opportunity to recover its prudently incurred NPC and set the transition adjustments for customers choosing direct access.

Q. Has the Commission expressed an interest in combining PacifiCorp's TAM and PCAM?

A. Yes. In PacifiCorp's latest PCAM, the Commission stated "we consider that integrating the PCAM testimony in PacifiCorp's annual TAM filing may be useful by ensuring the most current information on actual power costs informs the TAM forecast."[13] While PacifiCorp's proposal is a shift from how Oregon has traditionally considered power costs cases, there are compelling reasons for making this change.

Q. Would combining the TAM and PCAM allow the most current information to be incorporated in the NPC forecast as suggested by the Commission?

A. Yes. Currently the TAM forecast uses a base period of actual data for the period ending in June of the prior year, which is nearly a year old when the TAM is filed on April 1. By combining the TAM and PCAM and filing on May 15, the most current information for the period ending in December of the year before the APCA is filed can be used for the NPC forecast.

[13] *In the matter of PacifiCorp, dba Pacific Power's 2018 Power Cost Adjustment Mechanism*, Docket No. UE 361, Order No. 19-415 at 4 (Nov. 25, 2019).

Q. If the TAM is filed at a later date, what parts of the NPC forecast will use more current information?

A. If the TAM were filed on May 15 of every year, most of the NPC forecast data inputs will use more current information. Forecasted wholesales sales and purchased power will include the most recent six months of data. Market prices for electricity and natural gas will use the Official Forward Price Curve (OFPC) at the end of March of the filing year, instead of from December of the prior year. Hydro, thermal and renewable resources generation characteristics will be based on more recent information as well. Fuel expense would also use the most recent information from the Company's fuel contracts.

Q. Does the Company's proposal to file a consolidated APCA on May 15 of each year impact the timeline for Commission review of forecast NPC?

A. Yes. The Company's proposal shortens the Commission review timeline by approximately six weeks. In addition to proposing a consolidated APCA, PacifiCorp also proposes to remove the deadbands, sharing bands, and earnings test from the annual power cost true-up. One effect of these proposed changes to the annual power cost true-up is to invite robust Commission and stakeholder review of the Company's operations as they relate to NPC. Given that no rate changes have ever been proposed in the PCAM as the result of the operation of deadbands, sharing bands, and the earnings test, the Company observes that the PCAM is generally non-contested—in fact, every one of PacifiCorp's PCAMs has been settled. In contrast, the TAM has been fully litigated a number of times with intensive Commission and stakeholder engagement and review of the modeling methodology used to produce the forecast.

The structure of the PCAM—which disfavors any rate change—skews stakeholder resources towards the TAM.

By modifying the PCAM structure to make it more likely that rate changes will occur to account for variations between forecast and actual NPC, PacifiCorp anticipates that stakeholder interest in the PCAM proceeding will increase and stakeholder interest adjudicating modeling methodology will decrease. Indeed, in states where PacifiCorp does not reset base NPC on an annual basis, the annual true-up mechanism has provided a filing for stakeholders to review and audit PacifiCorp's operations as the NPC recovery is based on actual incurred costs versus a forecast.

Additionally, the APCA would have naturally resolved the complex 2020 TAM regarding the new renewable generation coming online in 2020. Stakeholders and the Company came up with innovative but complicated procedures to match the costs and benefits of this new renewable generation. Under the APCA, customers would have automatically received the actual benefits of the new renewable resources, eliminating the need for multiple rate changes in the 2020 TAM.

Q. Will the Company's proposed changes to the annual power cost true-up make the forecast modeling methodology of the TAM irrelevant?

A. No. The modeling methodology used to forecast base NPC in the TAM will continue to be important to the Commission and stakeholders because it is also used to determine the transition adjustment for direct access customers. The Commission has emphasized the need for accurate NPC forecasting to prevent unwarranted cost-shifting caused by direct access.[14] But, as discussed in the testimony of Mr. Graves,

[14] *See, e.g.,* Order No. 05-1050 at 21.

there are major drivers in NPC variances that are both difficult, if not impossible, to accurately forecast and that are not within the control of the Company. Removing the deadbands, sharing bands, and earnings test from the annual power cost true-up puts the focus of inquiry on the prudence of the Company's actions relative to activities it can control (e.g., shifting from accuracy of predicting wind generation to the prudence of how the Company responds in situations when wind generation does not materialize).

Q. Is the APCA in the public interest?

A. Yes. Under the proposed APCA, customers would only pay the actual cost, subject to a prudence review, of the NPC provided to them, no more and no less.

Q. Does PacifiCorp have proposed guidelines describing in detail how this mechanism would function?

A. Yes. As mentioned earlier in my testimony, Exhibit PAC/501 provides guidelines for an APCA proceeding. These guidelines incorporate many elements and procedures that are required in PacifiCorp's TAM and PCAM proceedings.

Q. Besides the filing date, what are the major changes PacifiCorp is proposing to make to the NPC forecast compared to the TAM?

A. Generally speaking, the NPC forecast in the APCA would be very similar to the TAM, with a change that allows PacifiCorp the ability to update coal costs at the Jim Bridger plant as part of the rebuttal update.

Q. Have these changes been reflected in the proposed guidelines attached to your testimony?

A. Yes. I have reflected these edits to the proposed guidelines attached as Exhibit PAC/501, which also include additional provisions that have been incorporated into the TAM guidelines since their adoption in 2009.

Q. Does the APCA make any changes to the direct access transition adjustments?

A. No. The transition adjustments will be calculated the same way and under the same timeframe as they are currently done in the TAM.[15]

Q. What are the major changes PacifiCorp is proposing to make to the NPC true-up compared to the PCAM?

A. PacifiCorp is only requesting the NPC true-up not include any deadbands, sharing bands, or earnings test.

Q. Are there any exceptions to these PCAM changes?

A. Yes. In the 2020 TAM, PacifiCorp agreed to use specified wind capacity factors through a 2025 test year.[16] In the spirit of this agreement, PacifiCorp will continue to use the specified wind capacity factors agreed to in the 2020 TAM and any variation in PTCs would not be subject to the annual true-up through 2025 if the deadbands, sharing bands, and earnings tests are removed.

[15] Consistent with ORS 757.609 and OAR 860-038-0275, final transition adjustment pricing must be available to non-residential customers by November 15 every year. This time-frame is necessary given the annual November/December election window for direct access customers.

[16] *In the matter of PacifiCorp, dba Pacific Power 2020 Transition Adjustment Mechanism,* Docket No. UE 356, Order No. 19-351 at Appendix A, 8-9 (Oct. 30, 2019).

Q. Is combining the TAM and PCAM into a single filing essential to PacifiCorp's request?

A. No. The proposal to combine the TAM and PCAM was born from the Commission's inquiry in the most recent PCAM order.[17] If the Commission determines, however, that the TAM and PCAM be combined into a single proceeding, it is essential the deadbands, sharing bands, and earnings test be removed from the NPC true-up to ensure that the TAM can proceed on a procedural schedule that allows for setting the transition adjustments in time for the direct access election window. If the Commission determines it prefers separate TAM and PCAM proceedings, the Company requests the Commission approve the updated TAM guidelines to allow for Jim Bridger coal to be updated on rebuttal. Additionally, the Company requests the Commission approve changes to the PCAM to eliminate the deadbands, sharing bands, and earnings test.

V. UPCOMING SHIFTS IN THE ALLOCATION OF NET POWER COSTS

Q. What other changes is PacifiCorp anticipating to its generation portfolio?

A. In addition to the changes outlined in the 2019 IRP preferred portfolio, PacifiCorp is anticipating that each state within its service territory could have unique generation portfolios beginning in 2024. The PacifiCorp 2020 Inter-Jurisdictional Allocation Protocol (2020 Protocol)[18] outlines the path to state-specific generation portfolios to comply with state-specific energy policies, such as SB 1547, and establishes certain

---

[17] *See In the matter of PacifiCorp, dba Pacific Power 2018 Power Cost Adjustment Mechanism*, Docket No. UE 361, Order No. 19-415 at 4 (Nov. 25, 2019).

[18] *In the matter of PacifiCorp, dba Pacific Power, Request to Initiate an Investigation of Multi-Jurisdictional Issues and Approval and Inter-Jurisdictional Cost Allocation Protocol,* Docket No. UM 1050, Order No. 20-024 at 8 (Jan. 23, 2020).

"Framework Issues" that need to be resolved. In addition to providing a path for states to have unique resource portfolios, it is important to maintain the benefits of system dispatch and optimization as much as practicable.

Q. Is PacifiCorp currently working on a new approach to allocating NPC?

A. Yes. This is one of the Framework Issues in the 2020 Protocol. This is a complex issue requiring the Company to develop a new system to track the real-time costs of generation based on each state's allocated share of each resource. Additionally, the Company is planning on further discussions within the Framework Issues workgroup within the multi-state process relative to the usage and implementation of a new system for ratemaking purposes beginning in 2024. The new system is referred to as the Nodal Pricing Model (NPM).

Q. Please describe the NPM.

A. The NPM is a tool designed to track NPC by generation resources and by state under an inter-jurisdictional cost allocation that will no longer dynamically allocate costs among states based on their respective loads. Instead, generation-related costs will follow the assignment of those resources. To develop the NPM, PacifiCorp is working with the California Independent System Operator (CAISO) who, acting as a third party vendor, will produce optimal unit commitment and hourly energy schedules for supply resources in the PacifiCorp balancing authority areas using the CAISO day-ahead market model. PacifiCorp will use the NPM to track costs and benefits associated with the different resource portfolios used to serve PacifiCorp's load in each state for ratemaking purposes.

Q. Please describe conceptually how the NPM will work.

A. The NPC associated with each generating resource will be assigned to states based on each generating resource's assignment. For example, if a state is assigned 25 percent of a natural gas plant, then it is also assigned 25 percent of the fuel costs associated with that resource, regardless of load. Each resource also receives a credit based on the locational marginal price (LMP) for its generation, which is also assigned to each state per its assignment of each generating resource. The assigned NPC, less the credit received, will be the states' total NPC.

Q. Please explain the credit received by each generating resource in more detail.

A. Each generating resource will receive a credit for the energy it generates or the reserves it provides, and each state's load will be charged a load aggregated point (LAP) price.[19] The total credits the generating resources receive will equal the dollar amount that each state's load is charged. This facilitates a transfer of energy between states at a fair price based on the LMP and preserves the benefits of a system dispatch and optimization.

Q. How will unique generation portfolios increase the difficulty of forecasting NPC?

A. Moving from a dynamic inter-jurisdictional cost allocation to a static inter-jurisdictional cost allocation for generation costs will increase the pressure to have every NPC line item accurately forecast to mitigate the risk of potential swings in state-allocated NPC. For example, if the total natural gas fuel expense forecast in the TAM matched the actual total natural gas fuel expense, the fuel expense at each plant could still be slightly different between the forecast and actuals. Under a dynamic

[19] The LAP price is the weighted average LMP at each load point or node within the LAP.

allocation where each state is allocated a proportional share of each plant's fuel expense, the allocations are not affected and there is zero difference between the forecast and actual state-allocated total natural gas fuel expense. However, under a static allocation, the differences in each plant will flow through to the states, causing some states' actual natural gas expense to be higher than forecast and others to be lower. Unless there is complete recovery of actual NPC, this could result in an over or under allocation of fuel costs to Oregon.

Additionally, as explained by Mr. Graves, production cost models are generally too smooth and because of their perfect foresight, these models do not capture uncertainty. As described above, the NPM facilitates a transfer of energy between states at a fair price by charging loads the LAP price and crediting generators for their production at the LMP. PacifiCorp is currently working towards a production cost model capable of forecasting LMPs to use in the NPM. However, because of the smoothness of any model it is likely that the forecast LMPs and actual LMPs will be different causing differences between state-allocated NPC.

Q. Do the issues identified above still exist if PacifiCorp joins a regional market such as the Extended Day-Ahead Market (EDAM)?

A. Yes. In fact, participating in a regional day-ahead market would make it even more difficult to recover NPC by only using a forecast such as the TAM. A regional market would optimize the entire footprint of the market and PacifiCorp would be limited to publicly available information in an attempt to model the market optimization. In addition, the market dynamics themselves would be more complicated with LMPs than they have been in the past and would potentially make outcomes more volatile and forecasting more difficult. Despite this complexity, participating in the market will be important as it will provide benefits that will potentially reduce total NPC. As explained by Mr. Graves, most participants of an organized market are able to recover 100 percent of their prudently incurred NPC through some sort of pass-through mechanism.

Q. Does the current construct effectively allow PacifiCorp to meet customer's needs in a changing energy landscape?

A. No. As explained in more detail by Mr. Graves, as PacifiCorp's generation portfolio includes increasing levels of renewable resources, it becomes increasingly difficult to consistently recover prudently incurred NPC using the TAM and PCAM. Additionally, as PacifiCorp's energy landscape evolves to state-specific generation portfolios that provide states a path for compliance with their energy policies, additional forecast error risk is introduced and the ability to fully recover actual NPC is even more important.

VI. CONCLUSION

Q. Please summarize your recommendation to the Commission.

A. I recommend the Commission approve modifications to the design of the PCAM to remove the sharing bands, dead bands, and earnings test, and approve consolidation of the TAM and PCAM into a single proceeding—the APCA.

Q. Does this conclude your direct testimony?

A. Yes.

Docket No. UE 374
Exhibit PAC/501
Witness: Michael G. Wilding

BEFORE THE PUBLIC UTILITY COMMISSION

OF OREGON

PACIFICORP

Exhibit Accompanying Direct Testimony of Michael G. Wilding

Proposed Annual Power Cost Adjustment Guidelines

February 2020

PACIFICORP
OREGON ANNUAL POWER COST ADJUSTMENT (APCA)
General Guidelines

PacifiCorp's Annual Power Cost Adjustment (APCA) is an annual filing with the objective to update the forecast net power costs (NPC) to account for changes in market conditions, with the final forecast update close to the direct access window to capture costs associated with direct access, and to correctly identify the proper amount for the transition adjustment. Additionally, the APCA includes a true-up of actual NPC from the previous year to the forecast NPC of that year.

When filed on a stand-alone basis, the APCA is intended to be narrower and more streamlined than when the APCA is filed in or processed concurrently with a general rate case. In any case, parties to the APCA proceeding should have a full opportunity to review, challenge and litigate issues raised in the case. Parties may address the issue of whether a particular APCA proceeding should have three rounds of testimony or five at the prehearing conference.

Issues related to the prudence of contracts, the appropriate modeling of contracts and known and measurable changes to inputs for existing methodologies are within the proper scope of a stand-alone APCA proceeding. Nothing in these guidelines prevents any Party, including the Company, from advocating in a future general rate case or other proceeding other than a stand-alone APCA, that the APCA should be eliminated or revised.

A. NPC

NPC includes the amounts booked to the following Federal Energy Regulatory Commission (FERC) accounts:

FERC Account	Description
Account 447	Sales for resale, excluding revenues that are not modeled in the NPC forecast
Account 501	Fuel, steam generation; excluding costs that are not modeled in the NPC forecast
Account 503	Steam from other sources
Account 547	Fuel, other generation
Account 555	Purchased power, excluding the Bonneville Power Administration (BPA) residential exchange credit pass-through if applicable

Account 565	Transmission of electricity by others.

B. Initial Filing – Forecast NPC

Each year, on May 15, the Company will make an Initial Filing to recover any variance between the forecast and actual NPC for the previous calendar year, forecast NPC for the following calendar year, and set direct access transition adjustments for the following calendar year. In any future APCA filings after UE 374, the Initial Filing will be consistent with the following provisions:

1. At least 30 days prior to the Initial Filing, the Company will provide a pre-filing notice of substantial changes to the methodologies used to forecast NPC. The Company will include in its APCA filing a justification for each substantial change in forecast methodology, calculation of cost elements, or other major data input changes. For each change, where practical, the Company will also provide workpapers that contain a side-by-side comparison of NPC forecast model results with and without the proposed change.

2. The Company will include in the NPC forecast the variable costs and dispatch benefits of new resources that are not eligible for inclusion in the Renewable Adjustment Clause in its NPC in stand-alone APCA proceedings, irrespective of whether the fixed capital costs of the new resource are already included in rates, if: (a) the Company acquired the resource prior to May 15th of the year of the stand-alone APCA filing, or (b) the Company built the resource and it was used and useful prior to May 15th of the year of the stand-alone APCA filing.

3. The prudence of the decision to build or acquire the resource may be determined in the stand-alone APCA proceeding prior to including the variable costs and dispatch benefits in rates. The Company will provide notice to the parties if a new resource subject to this section will be included in the APCA filing by April 15th of the year of the stand-alone APCA filing.

4. The Initial Filing will include updates to all of the NPC components identified in Section A. These costs will be based on the Company's most recent official forward price curve, forecast load and allocation factors. In a stand-alone APCA filing, the Company will also update other revenues that are tracked in FERC Account 456 - Other Electric Revenue. When an APCA is filed in or processed concurrently with a general rate case, this element may be included in the APCA or the general rate case. Additionally, the APCA forecast will include production tax credits (PTC).

5. In the Initial Filing the Company will identify and provide adequate support for all known contracts it expects to be updated or added in the Rebuttal and Final updates. The Company may update or add a contract not identified in the Initial Filing if the Company demonstrates that it has followed the notification procedures in Section

A4 of these guidelines and: (1) the new contract or contract update is based upon new information of which the Company reasonably became aware after the NPC study for the Initial Filing was completed; or (2) the omission resulted from a mistake that occurred despite the Company's reasonable diligence in meeting its obligations under this Section. The Company will also identify any contracts modeled in the test period under which the Company has made a liquidated damages claim.

6. In the Initial Filing, the Company will reflect forecast changes in Other Revenue for items that have a direct relation to NPC, for which a revenue baseline has been established in rates in Docket UE 375 or subsequent rate case.

7. In any APCA proceeding, the Company has a continuing obligation to provide notice of any correction or omission promptly after the discovery of the error or new information. In addition, the Company will file a summary of all identified corrections or omissions to the components included in the Initial Filing 15 business days before Staff and Intervenor Direct Testimony is due.

8. The Company will provide access to the NPC model to Parties when it makes its Initial Filing, provided that the Party has entered into a confidentiality agreement with the Company or is subject to a protective order applicable to the relevant APCA or general rate proceeding. The Parties preserve their right to challenge the confidential designation of any documents or data.

9. The Company will provide workpapers and other supporting documents as specified in Attachment A.

10. The Parties agree to ask the Commission to make the protective order for the next APCA an ongoing protective order which will continue to be effective in future APCA proceedings.

11. The Company's Initial Filing will include direct testimony covering any unusual expenses incurred over the course of the previous calendar year and identify and discuss any large deviations of actual NPC from forecasted NPC. The Company will also provide with its workpapers a differential worksheet the produces actual minus base power costs for each separate cost category in the recovery of the previous year's NPC on a gross costs and per megawatt-hour (MWh) unit basis.

12. These Guidelines do not limit the ability of other Parties to propose updates consistent with these Guidelines after the Company's Initial Filing.

C. Rebuttal Update Filing – Forecast NPC

At the time the Company makes its Rebuttal Update Filing, it will include an update to forecast NPC consistent with the following provisions:

1. The Company will update the following NPC components, subject to the Guidelines:

    a. Most recent official forward price curve.

    b. New power, fuel and transportation/transmission contracts, both physical and financial, and updates to existing contracts. These contracts include:

        i. wholesale electric sales and purchase contracts that are for long term firm sales and purchases, short term firm sales and purchases, or exchanges and storage with and without energy or capacity prices;

        ii. coal and natural gas sales, purchases and transportation contracts;

        iii. wheeling contracts; and

        iv. coal contracts for mines directly or indirectly owned by the Company.

    These transactions may have fixed prices or prices linked to market indexes. They may require physical deliveries or be settled financially *(e.g.,* swaps). Contracts must be independent and verifiable.

2. In its Rebuttal Update filing, the Company may make corrections to or address omissions in the components included in the Initial Filing. The Company may make corrections or address omissions in the components included in the Rebuttal Update filing within five business days of the date of filing of the Rebuttal Update. The Company agrees to provide notice of any impending correction promptly after the discovery of the error and agrees to correct all errors and omissions within five business days of the initial Rebuttal Update filing.

3. Parties reserve all of their procedural rights, including the right to submit data requests and seek postponement of the hearing, related to the correction of the Rebuttal Update filing.

4. The Company will provide workpapers and the other supporting documents as specified in Attachment A.

D. Final Updates – Forecast NPC

The Company will file Final Updates to forecast NPC and calculate transition adjustments as follows, subject to the Guidelines:

1. At least five business days prior to the direct access window, the Company will:

    a. File an update to forecast NPC, incorporating the following:

i. Commission-ordered adjustments;

ii. Forward Price Curve from within nine days of the filing date;

iii. New contracts, or updates to existing contracts. These contracts include: (a) wholesale electric sales and purchase contracts that are for long term firm sales and purchases, short term firm sales and purchases, or exchanges and storage with and without energy or capacity prices; and (b) natural gas sales and purchase contracts. These transactions may have fixed prices or prices linked to market indexes. They may require physical deliveries or be settled financially (e.g., swaps);

b. Post indicative transition adjustments for Schedules 294 and 295;

c. Provide indicative supply service NPC rates (to be Schedule 201); and

d. Provide an attestation that will confirm that all contracts executed prior to the contract lockdown date have been included in the indicative filing and will identify any exceptions and the reason why such contracts were excluded. The attestation will also include a statement confirming that, for the executed power purchase agreements with new qualifying facilities (QFs) included in the TAM, PacifiCorp has a commercially reasonable good faith belief that these QFs will reach commercial operation during the rate effective period based on the information known to the Company as of the contract lockdown date. This attestation does not require the Company to opine on the commercial viability of any QF.

2. On November 15, in accordance with OAR 860-038-0275(1), the Company will:

a. File an update to NPC incorporating the forward price curve from within seven days of the filing date.

b. Post final transition adjustments for Schedules 294 and 295.

i. Transition Adjustments in Schedules 294 and 295 will be calculated based on the Final Update and consistent with the modification to the calculation described in Section 15 of the Stipulation adopted by the Commission in Order 08-543 in Docket UE-199 and modified so that any remaining monthly thermal generation that is backed down for assumed direct access load will be priced at the simple monthly average of the California-Oregon Border (COB) price, the Mid-Columbia price, and the avoided cost of thermal generation as determined by GRID. The monthly COB and Mid-Columbia prices will be applied to the heavy load hours or light load hours separately. The existing balancing account mechanisms will remain in effect.

ii. Schedule 200 Supply Service rate design will be non-bypassable to direct access customers and will not be subtracted in the calculation of the Transition Adjustment. In addition, the Schedule 201 rate design as proposed by the Company will be allowed to go into effect and will be bypassable to direct access customers. The rate design for proposed Schedule 200 applicable to delivery service Schedules 30, 47, and 48 will be changed from its present energy only cents per kilowatt-hour (kWh) rate design to a two-part rate design which includes a demand charge equal to $1.00 per billing kilowatt (as defined in the respective tariffs) plus a cents per kWh energy charge.

c. Provide supply service NPC rates (to be Schedule 201)

3. The Company will provide workpapers and other supporting documents for both the indicative and final filings as specified in Attachment A.

4. If a Party objects to any aspect of the Final Update, the Party reserves all of its procedural rights to seek review of the controverted issue.

5. The Parties agree to meet and review whether to recommend to the Commission an extension in length for the election window for PacifiCorp's multi-year direct access option beginning in November 2009.

E. Actual NPC True-Up

The ACPA true-up is calculated on a monthly basis. Actual APCA costs are compared to base APCA cost on a per-unit basis. APCA costs are established in the APCA forecast and include NPC, Other Revenues, and PTCs. Any differences in the system per-unit cost are multiplied by the actual megawatt hours of Oregon retail sales in that month to determine Oregon's share of any differential. The calculation uses the following formula:

$$(APCAC_a \div Load_a) - (APCAC_b \div Load_b) = \text{System APCA Unit Cost Differential}$$

$$\text{System APCA Unit Cost Differential} \times Load_o + (SR_a - SR_b) = \text{APCA Differential}$$

Where:

$APCAC_a$	= Total Company Adjusted Actual NPC (Excluding Situs Resources) plus other costs/benefits reflected in Oregon APCA Forecast
$Load_a$	= Actual System Retail Load
$APCAC_b$	= Total Company Base NPC (Excluding Situs Resources) adjusted for Direct Access plus other costs/benefits reflected in Oregon Forecast
$Load_b$	= Base System Retail Load

$Load_o$	= Actual Oregon Retail Load
SR_a	= Actual Situs Resource Value
SR_b	= Forecasted Situs Resource Value

F. Rate Design

1. In the Company's current general rate case, proposed NPC are unbundled from other generation costs. All NPC will be collected through a new Schedule 201, Annual Power Cost Adjustment, which will be applied as a rider to Schedule 200. Schedule 200 will continue to collect other generation costs.

2. In any future APCA filed in or processed concurrently with a general rate case after UE 207, the APCA rate design test year will be the general rate case rate design test year. In a stand-alone APCA, the APCA rate design test year will be the forecast test year during which the Schedule 201 rates will be effective.

3. In any future APCA filed in or processed concurrently with a general rate case after UE 374, proposed Schedule 201 revenues by rate schedule will be determined by spreading the total forecast NPC for the test year to the rate schedules in the same manner as the revenues for Schedule 200 are spread to the rate schedules: based on the functionalized revenue requirement as determined by the Commission based upon a Cost of Service study, or by the method proscribed by the Commission in the most recent general rate case or Commission proceeding regarding rate spread and rate design.

   In any future stand-alone APCA, Proposed Schedule 201 revenues by rate schedule will be determined by spreading the total forecast NPC for the test year to the rate schedules based upon each schedule's proportion of "Present Schedule 201 revenues." "Present Schedule 201 revenues" for the test year shall reflect the projected test year sales forecasts. Proposed Schedule 201 rate design shall reflect the method prescribed by the Commission in the most recent general rate case or other Commission proceeding regarding rate spread and rate design.

G. APCA Filings Made in or Processed Concurrently with a General Rate Case

1. If the Company files a general rate case prior to May 15 in a given year, then the Company may file the APCA before May 15. If the Company chooses not to file a APCA prior to May 15, then it must file on May 15. If the APCA is filed on a stand-alone basis, it will be filed no later than May 15. In order to accommodate the direct access window that begins November 15, the APCA may be bifurcated from the full rate case in order to allow for a Commission decision by November 1. Bifurcation of the APCA does not alter any provision below.

2. When an APCA is filed in or processed concurrently with a general rate case, the Company or any Party may propose changes to how the Company's Rate Mitigation Adjustment or other rate spread tools should operate in a stand-alone APCA filing made before the APCA is again filed in or processed concurrently with a general rate case.

3. When an APCA is filed in or processed concurrently with a general rate case, the APCA will be subject to rebuttal and final updates identifies above and the agreements on workpapers and other supporting documents specific in Attachment A.

H. Other Provisions

1. These guidelines do not limit the ability of the Company or other Parties to propose changes to these guidelines, including changes to the cost elements that will comprise NPC in stand-alone APCA proceedings or in future general rate cases.

Attachment A
APCA Workpapers and Supporting Documents

Workpapers are defined in OAR 860-001-0480(5) as “documents that show the source, calculations, and details supporting the testimony and other exhibits submitted.” In an APCA proceeding, the term “workpapers” means the documents used to develop the final inputs to GRID and the final modeling in GRID. The data relied upon to support the cost details in the filing may include contracts, emails, white papers, studies, PacifiCorp computer programs, Excel spreadsheets, Word documents or pdf, and text files.

If the Commission adopts new minimum filing requirements, rules or guidelines for net power cost filings, these will replace the requirements set forth in this document. Additionally, if the APCA is eliminated, the APCA Design Guidelines to which this document is attached are materially changed, or the Parties otherwise agree, the requirements set forth in this document will cease to be operative. In cases where systems change or are replaced in the future, PacifiCorp will continue to provide substantially the same information as provided in data request responses in PacifiCorp’s 2009 TAM (UE 199), the relevant citations to which are listed below, as long as these filing requirements remain operative.

The Parties agree to continue the current practice of providing all discovery response answers, workpapers, including any other documents produced pursuant to this agreement via email (for non-confidential documents) and overnight mail. The GRID model and its inputs, however, will be produced on the day of the filing electronically to the Parties in accordance with the terms of the stipulation in docket UE 199.

Parties will expeditiously work to rectify any workpaper deficiencies without requiring other Parties to submit follow-up data requests.

In cases where the Company has relied upon documents or workpapers it considers to be “highly confidential” it will notify the Parties of such, and, if the amount of data considered highly confidential is limited, it will redact the highly confidential data or otherwise modify the non-confidential workpapers to prevent disclosure of highly confidential material. If the Company has withheld any information on the grounds that the information is “highly confidential,” the Company will request a “highly confidential” protective order or other special handling measures within five days of providing the non-highly confidential material.

A. Initial Filing by Company

For the Initial Filing, PacifiCorp will provide workpapers and supporting documents as described below. All information will be provided electronically and, in the case of Excel spreadsheets, with all cells and formulas intact.

1. Concurrent with the filing:

    a) Workpapers that show the source, calculations and details supporting the testimony and other exhibits. The workpapers will include, at a minimum, copies of the net power cost report in Excel and the net power cost model database. Access to the power cost model will also be provided.

b) Identification of the Four Year Period used to determine outage rates and other input items in the net power cost model.
c) Compilations of actual net power costs produced by PacifiCorp that were referenced in the testimony or exhibits, to the extent that actual power cost results are discussed or cited in the Company's direct testimony or exhibits. *See, e.g.,* ICNU 1.5-1 in UE 199.
d) A list and explanation of all modeling or logic changes or enhancements to the net power cost model that have been implemented since the most recent Oregon APCA or general rate case. This will include a statement of the direction and amount of change in net power costs resulting from each such change and documentation describing each change as well as net power cost model runs and workpapers quantifying the impacts of these changes.

2. Within five business days after the Initial Filing, the Company will deliver to the Parties:

   a) Workpapers showing the computation of the outage rates (planned and unplanned) used in the power cost model. Include all backup data showing each outage (planned or unplanned, etc.) and duration (planned or unplanned) considered in the four-year period, including NERC cause code, type of event, duration, energy lost, etc. *See, e.g.,* ICNU 1.6-1 and 1.6-2 in UE 199.
   b) The heat rate curves for each resource and the spreadsheets showing the derivation of the heat rate curves. *See, e.g.,* ICNU 1.22 in UE 199.
   c) Workpapers and documentation supporting the inputs contained in the "Other Cost" file as of UE 199, used in the power cost model, including all electronic spreadsheets used to compute any of the line items in the file. This includes test year: wheeling expenses modeled in GRID. *See, e.g.,* ICNU 1.28 in UE 199.
   d) Workpapers and documentation supporting the "Energy Cost" file used in the power cost model, including all electronic spreadsheets used to compute any of the line items in the file. *See, e.g.,* ICNU 1.29 in UE 199.
   e) Workpapers and documentation supporting the "Demand" file used in the power cost model including all electronic spreadsheets used to compute any of the line items in the file. *See, e.g.,* ICNU 1.31 in UE 199.

3. As soon as practical after filing, delivered on an as-ready basis, but no later than 15 days after the Initial Filing, the Company will deliver to the Parties:

   a) All documents, workpapers or other information relied upon by the Company in determining the market caps used in the power cost model for the Pro-Forma Period. See, e.g., ICNU 1.2 in UE 199.

b) The current topology maps in the power cost model along with an explanation for all the differences that have been made to the topology since the last APCA or general rate case and an explanation of why the changes were made. Include supporting documentation, such as contracts resulting in changes to the transfer capabilities used in GRID. *See, e.g.,* ICNU 1.3 and 1.68 in UE 199.

c) The date and a copy of the forward price curve, showing monthly heavy load hour and light load hour forward prices, used in creating the Test Year power cost model studies.

d) Documents showing all short-term firm transactions (including short-term firm indexed transactions and swaps) modeled in the test year power cost study, *see, e.g.,* ICNU 1.11, and as long as the Commission retains an adjustment for wholesale trading margin, the backup for the calculation of the trading margin, *see, e.g.* 1.13 and ICNU Supplemental 18.24 in UE 199. In addition, each contract will have a designation as to its purpose (i.e., trading, arbitrage or balancing.)

e) For all power, fuel and transmission related contracts modeled in GRID that were not included in the most recent Oregon APCA or general rate case:
   1. A copy of the contract (in pdf or electronic format, if available).
   2. Any workpapers or other documents used to develop the power cost model input assumptions related to the contract.

f) Regulatory Fuel Budget filing used for the test year and any other workpapers used in developing the power cost model fuel cost inputs.

g) Workpapers and documentation supporting the "Demand Cost" file used in the power cost model, including all electronic spreadsheets used to compute any of the line items in the file. *See, e.g.,* ICNU 1.30 in UE 199.

h) Identification of each instance in which the Company changed any maximum capacities, minimum up or down times or unit minimum capacities for thermal or hydro generators modeled in the power cost model since the last Oregon APCA or general rate case, if applicable.

i) Workpapers explaining the development of each line of load adjustments presented on the Company's power cost model output reports. *See, e.g.,* ICNU 1.53 in UE 199. These include but are not limited to:
   1. DSM (irrigation)
   2. MagCorp Curtailment
   3. Monsanto Curtailment
   4. Station Service

j) Workpapers used to develop inputs for qualifying facility contracts modeled in GRID. *See, e.g.,* ICNU 1.33b in UE 199.

k) A 40-year hydro data set suitable for input into the GRID model applicable to the test year so long as the Company has been required by regulators in proceedings in other states to produce this material, and the Company proposes to change its hydro modeling from the single (Median hydro) scenario filed in the initial filing in UE 207.

l) Data necessary to calculate forced outages using hourly forced outage shaping as adopted by the Commission in Order 15-394.

m) Sample calculations of the transition adjustments for Schedule 30 Secondary and Schedule 48 Primary in Schedule 294, with all supporting documentation.
n) Workpapers for any screens applied to prevent uneconomic commitment and dispatch of resources in the GRID model.
o) Supporting transaction level detail for compilations of actual power costs produced by PacifiCorp that were referenced in the testimony or exhibits, to the extent that actual power costs results are discussed or cited in the Company's direct testimony or exhibits. *See, e.g.* ICNU 1.5-2 in UE 199.
p) Workpapers and all supporting documents underlying the start-up fuel and start-up operations and maintenance costs included in GRID.

B. Response Filing (or Surrebuttal Filing, if applicable) by Staff and Intervenors

Parties filing testimony in response to the Company's Initial Filing (or Rebuttal Filing, if applicable), will provide workpapers and supporting documents as described below.

1. Concurrent with the filing:

a) Workpapers that show the source, calculations and details supporting the testimony and other exhibits. The workpapers will show on an adjustment-by-adjustment basis, the power cost model input file or files used, the back-up to the input files, and the power cost model study reports or documents showing the impact of the adjustment on net power costs as compared to the comparison scenario. The associated power cost model input files will be provided as well.

C. Rebuttal Update Filing (and Sursurrebuttal Filing, if applicable) and Final Updates by Company

For the Rebuttal Update Filing and Final Updates, PacifiCorp will provide workpapers and supporting documents as described below.

1. Concurrent with the filing:

a) Workpapers that show the source, calculations and details supporting the testimony and other exhibits. The workpapers will include the net power costs report on an adjustment-by-adjustment basis. The workpapers will include, at a minimum, electronic copies of the net power cost report and the net power cost model.
b) For any update, adjustment or correction to the power cost model, the Company will include a description of the change and a calculation of the adjustment amount.

2. As soon as practical after filing, but no later than three days after the filing:
    a) To the extent that any of the items in Section A above change, new versions of the supporting documentation and workpapers will be provided.

Access to the updated runs in power cost model via the designated internet access or power cost model input files containing all inputs and output reports associated with the update filings.

D. Other Items

1. The Company will provide information on new contracts or updates to contracts that are executed after the Rebuttal Filing and will be included in the Final Updates as soon as practical after execution. The Company will track the contracts and produce them in groups as their total number or value become material.

2. The Company will provide broker quotes compared to the Company's forward price curve used in the final net power cost update as soon as practical.

~~PACIFIC POWER~~

PACIFICORP
OREGON ~~TRANSITION~~ANNUAL POWER COST ADJUSTMENT ~~MECHANISM (TAM~~(APCA)
~~Agreement of the Parties on~~ General Guidelines

~~Pacific Power's Transition~~PacifiCorp's Annual Power Cost Adjustment ~~Mechanism (TAM~~(APCA) is an annual filing with the objective to update the forecast net power costs (NPC) to account for changes in market conditions, with the final forecast update close to the direct access window to capture costs associated with direct access, and to correctly identify the proper amount for the transition adjustment. Additionally, the APCA includes a true-up of actual NPC from the previous year to the forecast NPC of that year.

When filed on a stand-alone basis, the ~~TAM~~APCA is intended to be narrower and more streamlined than when the ~~TAM~~APCA is filed in or processed concurrently with a general rate case. In any case, parties to ~~a TAM~~the APCA proceeding should have a full opportunity to review, challenge and litigate issues raised in the case. Parties may address the issue of whether a particular ~~TAM proceeding should have three rounds of testimony or five at the prehearing conference. Parties have not resolved and may address in UE 210, Pacific Power's general rate case, issues including but not limited to whether: (1) changes in methodologies utilized in the calculation of net power costs, such as those used to calculate normalized hydro or forced or planned outage rates or calculation issues resolved by the Commission, will be permitted in stand-alone TAM proceedings; and (2) a stand-alone TAM should include the variable costs of new generation resources if the Company will not recover the fixed costs of the generation resource in the TAM rate effective period.~~ APCA proceeding should have three rounds of testimony or five at the prehearing conference.

Issues related to the prudence of contracts, the appropriate modeling of contracts and known and measurable changes to inputs for existing methodologies are within the proper scope of a stand-alone ~~TAM~~APCA proceeding. Nothing in ~~this agreement~~these guidelines prevents any Party, including the Company, from advocating in a future general rate case or other proceeding other than a stand-alone ~~TAM~~APCA, that the ~~TAM~~APCA should be eliminated or revised.

A. NPC

NPC includes the amounts booked to the following Federal Energy Regulatory Commission (FERC) accounts:

FERC Account	Description

Account 447	Sales for resale, excluding revenues that are not modeled in the NPC forecast
Account 501	Fuel, steam generation; excluding costs that are not modeled in the NPC forecast
Account 503	Steam from other sources
Account 547	Fuel, other generation
Account 555	Purchased power, excluding the Bonneville Power Administration (BPA) residential exchange credit pass-through if applicable
Account 565	Transmission of electricity by others.

~~A.~~B. Initial Filing – Forecast NPC

Each year, on May 15, the Company will make an Initial Filing to ~~forecast net power costs~~recover any variance between the forecast and actual NPC for the previous calendar year, forecast NPC for the following calendar year, and set direct access transition adjustments for the following calendar year. In any future ~~TAM~~APCA filings after UE ~~207~~374, the Initial Filing will be consistent with the following provisions:

1. At least 30 days prior to the ~~initial filing~~Initial Filing, the Company will provide a pre-filing ~~review to Staff, CUB and ICNU~~notice of ~~any proposed~~substantial changes to the ~~net power cost model (e.g., new version of GRID). For this pre-filing review, the~~ methodologies used to forecast NPC. The Company will include in its APCA filing a justification for each substantial change in forecast methodology, calculation of cost elements, or other major data input changes. For each change, where practical, the Company will also provide workpapers that contain a side-by-side comparison~~, where practical, of the prior year net power costs~~ of NPC forecast model results with and without the ~~model changes. In a stand-alone TAM~~proposed change.

2. The Company will include in the NPC forecast the variable costs and dispatch benefits of new resources that are not eligible for inclusion in the Renewable Adjustment Clause in its NPC in stand-alone APCA proceedings, irrespective of whether the fixed capital costs of the new resource are already included in rates, if: (a) the Company acquired the resource prior to May 15th of the year of the stand-alone APCA filing, or (b) the Company built the resource and it was used and useful prior to May 15th of the year of the stand-alone APCA filing~~, the Company agrees not to include model changes in its forthcoming.~~

~~1.~~3. The prudence of the decision to build or acquire the resource may be determined in the stand-alone APCA proceeding prior to including the variable costs and dispatch benefits in rates. The Company will provide notice to the parties if a new resource subject to this section will be included in the APCA filing ~~if Staff, CUB or ICNU~~

~~objects~~by April 15th of the year of the stand-alone APCA filing.

~~2.~~4. The Initial Filing will include updates to all of the ~~net power cost~~NPC components identified in ~~Attachment~~Section A. These costs will be based on the ~~Company's~~Company's most recent official forward price curve, forecast load and allocation factors. In a stand-alone ~~TAM~~APCA filing, the Company will also update ~~the steam~~other revenues ~~associated with Little Mountain steam sales, which~~that are tracked in FERC Account 456 - Other Electric Revenue. When ~~a TAM~~an APCA is filed in or processed concurrently with a general rate case, this element may be included in the ~~TAM~~APCA or the general rate case. ~~Parties have not resolved and may address in PacifiCorp's 2010 TAM, UE 207, whether non-fuel start-up costs may be included in a stand-alone TAM filing.~~Additionally, the APCA forecast will include production tax credits (PTC).

~~1.~~ In the Initial Filing the Company will identify and provide adequate support for all known contracts it expects to be updated or added in the Rebuttal and Final updates. The Company may update or add a contract not identified in the Initial Filing if the Company demonstrates that it has followed the notification procedures in Section A4 of ~~this Agreement~~these guidelines and: (1) the new contract or contract update is based upon new information of which the Company reasonably became aware after the ~~net power cost~~NPC study for the Initial Filing was completed; or

~~3.~~5. (2) the omission resulted from a mistake that occurred despite the ~~Company's~~Company's reasonable diligence in meeting its obligations under this Section. The Company will also identify any contracts modeled in the test period under which the Company has made a liquidated damages claim.

6. ~~In UE 207 and any future TAM~~In the Initial Filing, the Company will reflect forecast changes in Other Revenue for items that have a direct relation to NPC, for which a revenue baseline has been established in rates in Docket UE 375 or subsequent rate case.

~~4.~~7. In any APCA proceeding, the Company has a continuing obligation to provide notice of any correction or omission promptly after the discovery of the error or new information. In addition, the Company will file a summary of all identified corrections or omissions to the components included in the Initial Filing ~~fifteen~~15 business days before Staff and Intervenor Direct Testimony is due.

~~5.~~8. The Company will provide access to the ~~net power cost~~NPC model to Parties when it makes its Initial Filing, provided that the Party has entered into a confidentiality agreement with the Company or is subject to a protective order applicable to the relevant ~~TAM~~APCA or general rate proceeding. The Parties preserve their right to challenge the confidential designation of any documents or data.

~~6.~~9. The Company will provide workpapers and other ~~supp01iing~~supporting documents as specified in Attachment ~~B~~A.

10. The Parties agree to ask the Commission to make the protective order for the next ~~TAM~~APCA an ongoing protective order which will continue to be effective in future ~~TAM~~APCA proceedings.

11. The Company's Initial Filing will include direct testimony covering any unusual expenses incurred over the course of the previous calendar year and identify and discuss any large deviations of actual NPC from forecasted NPC. The Company will also provide with its workpapers a differential worksheet the produces actual minus base power costs for each separate cost category in the recovery of the previous year's NPC on a gross costs and per megawatt-hour (MWh) unit basis.

~~7.~~12. These Guidelines do not limit the ability of other Parties to ~~this Agreement may seek ongoing party status in Pacific Power's TAM proceedings and Pacific Power will support this request.~~propose updates consistent with these Guidelines after the Company's Initial Filing.

~~B.~~C. Rebuttal Update Filing – Forecast NPC

At the time the Company makes its ~~rebuttal filing~~Rebuttal Update Filing, it will include an update to forecast ~~net power costs~~ NPC consistent with the following provisions:

1. The Company will update the following ~~net power cost~~ NPC components, subject to the Guidelines:

   a. Most recent official forward price curve.

   b. New power, fuel and transportation/transmission contracts, both physical and financial, and updates to existing contracts. These contracts include:

      i. wholesale electric sales and purchase contracts that are for long term firm sales and purchases, short term firm sales and purchases, or exchanges and storage with and without energy or capacity prices; ~~(b)~~

      ii. coal and natural gas sales, purchases and transportation contracts; ~~and (c)~~

      iii. wheeling contracts~~.~~; and

      iv. coal contracts for mines directly or indirectly owned by the Company.

These transactions may have fixed prices or prices linked to market indexes. They may require physical deliveries or be settled financially *(e.g.,* swaps). Contracts must be independent and verifiable. ~~For example, this would permit updates to coal costs under Company contracts with third parties, but would not permit updates to coal costs for mines directly or indirectly owned by the Company.~~

2. In its Rebuttal Update filing, the Company may make corrections to or address omissions in the components included in the Initial Filing. The Company may ~~co11'ect~~make corrections or address omissions in the components included in the Rebuttal Update filing within five business days of the date of filing of the Rebuttal Update. The Company agrees to provide notice of any impending correction promptly after the discovery of the error and agrees to correct all errors and omissions within five business days of the initial Rebuttal Update filing.

3. Parties reserve all of their procedural rights, including the right to submit data requests and seek postponement of the hearing, related to the correction of the Rebuttal Update filing.

4. The Company will provide workpapers and the other supporting documents as specified in Attachment ~~B~~A.

~~C.~~D. Final Updates – Forecast NPC

The Company will file ~~final updates~~Final Updates to ~~net power costs~~forecast NPC and calculate transition adjustments as follows, subject to the Guidelines:

1. At least five business days prior to the direct access window, the Company will:

    a. File an update to ~~net power costs~~forecast NPC, incorporating the following:

        i. ~~i.~~ Commission-~~-~~ordered adjustments;

        ii. ~~11.~~ Forward Price Curve from within nine days of the filing date;

        iii. ~~111.~~ New contracts, or updates to existing contracts. These contracts include: (a) wholesale electric sales and purchase contracts that are for long term firm sales and purchases, ~~sh01i~~short term firm sales and purchases, or exchanges and storage with and without energy or capacity prices; and (b) natural gas sales and purchase contracts. These transactions may have fixed prices or prices linked to market indexes. They may require physical deliveries or be settled financially (e.g., swaps);

~~contracts. These transactions may have fixed prices~~

~~or prices linked to market indexes. They may require physical deliveries or be settled financially (e.g., swaps).~~

b. Post indicative transition adjustments for Schedules 294 and 295;

c. Provide indicative supply service ~~net power cost~~NPC rates (to be Schedule 201~~)~~); and

d. Provide an attestation that will confirm that all contracts executed prior to the contract lockdown date have been included in the indicative filing and will identify any exceptions and the reason why such contracts were excluded. The attestation will also include a statement confirming that, for the executed power purchase agreements with new qualifying facilities (QFs) included in the TAM, PacifiCorp has a commercially reasonable good faith belief that these QFs will reach commercial operation during the rate effective period based on the information known to the Company as of the contract lockdown date. This attestation does not require the Company to opine on the commercial viability of any QF.

2. On November 15, in accordance with OAR 860-038-0275(1), the Company will:

a. File an update to ~~net power costs~~NPC incorporating the forward price curve from within seven days of the filing date.

b. Post final transition adjustments for Schedules 294 and 295.

i. Transition Adjustments in Schedules 294 and 295 will be calculated based on the Final Update and consistent with the modification to the calculation described in Section 15 of the Stipulation adopted by the Commission in Order 08-543 in Docket UE-199 and modified so that any remaining monthly thermal generation that is backed down for assumed direct access load will be priced at the simple monthly average of the California-Oregon Border (COB) price, the Mid-Columbia price, and the avoided cost of thermal generation as determined by GRID. The monthly COB and Mid-Columbia prices will be applied to the heavy load hours or light load hours separately. The existing balancing account mechanisms will remain in effect.

ii. Schedule 200 Supply Service rate design will be non-bypassable to direct access customers and will not be subtracted in the calculation of the Transition Adjustment. In addition, the Schedule 201 rate design as proposed by the Company will be allowed to go into effect and will be bypassable to direct access customers. The rate design for proposed Schedule 200 applicable to delivery service Schedules 30, 47, and 48 will be changed from its present energy only cents per kilowatt-hour (kWh) rate design to a two-part rate design which includes a demand charge equal to $1.00 per billing kilowatt (as defined in the respective tariffs) plus a cents per kWh energy charge.

c. Provide supply service ~~net power cost~~ NPC rates (to be Schedule 201)

3. The Company will provide workpapers and other ~~suppo1iing~~supporting documents for both the indicative and final filings as specified in Attachment ~~B~~A.

4. If a Party objects to any aspect of the Final Update, the Party reserves all of its procedural rights to seek review of the ~~controve1ted~~controverted issue.

5. The Parties agree to meet and review whether to recommend to the Commission an extension in length for the ~~shopping~~election window for ~~PacifiCorp's~~PacifiCorp's multi-year direct access option beginning in November 2009.

E. Actual NPC True-Up

The ACPA true-up is calculated on a monthly basis. Actual APCA costs are compared to base APCA cost on a per-unit basis. APCA costs are established in the APCA forecast and include NPC, Other Revenues, and PTCs. Any differences in the system per-unit cost are multiplied by the actual megawatt hours of Oregon retail sales in that month to determine Oregon's share of any differential. The calculation uses the following formula:

$$(APCAC_a \div Load_a) - (APCAC_b \div Load_b) = \text{System APCA Unit Cost Differential}$$

$$\text{System APCA Unit Cost Differential} \times Load_o + (SR_a - SR_b) = \text{APCA Differential}$$

Where:

$APCAC_a$ = Total Company Adjusted Actual NPC (Excluding Situs Resources) plus other costs/benefits reflected in Oregon APCA Forecast

$Load_a$ = Actual System Retail Load

$APCAC_b$ = Total Company Base NPC (Excluding Situs Resources) adjusted for Direct Access plus other costs/benefits reflected in Oregon Forecast

$Load_b$ = Base System Retail Load

$Load_o$ = Actual Oregon Retail Load

SR_a = Actual Situs Resource Value

SR_b = Forecasted Situs Resource Value

~~D.~~F. Rate Design

1. In the ~~Company's~~Company's current general rate case, proposed ~~net power costs~~NPC

are unbundled from other generation costs. All ~~net power costs~~NPC will be collected through a new Schedule 201, ~~Net~~Annual Power ~~Costs - Transition~~Cost Adjustment ~~Mechanism~~, which will be applied as a rider to Schedule 200. Schedule 200 will continue to collect other generation costs.

2. In any future ~~TAM~~APCA filed in or processed concurrently with a general rate case after UE 207, the ~~TAM~~APCA rate design test year will be the general rate case rate design test year. In a stand~~-~~-alone ~~TAM~~APCA, the ~~TAM~~APCA rate design test year will be the forecast test year during which the Schedule 201 rates will be effective.

~~2. If PacifiCorp has not filed a general rate case within four years of the filing of UE 210, and does not plan to file a rate case by March 1, 2014, the Company will convene technical workshops no later than July 1, 2013 to provide the parties to the "Agreement of the Parties on General Guidelines" with relevant information to allow parties to make a preliminary determination if the then-current rate spread for its TAM rates may be unfair, unjust or unreasonable. If one or more parties to the "Agreement of the Parties on General Guidelines" makes a preliminary determination, by September 1, 2013, that the then current rate spread for its TAM rates may be unfair, unjust or unreasonable, PacifiCorp will file its next application as a TAM filed in or processed concurrently with a general rate case.~~

3. In any future ~~TAM~~APCA filed in or processed concurrently with a general rate case after UE ~~207~~374, proposed Schedule 201 revenues by rate schedule will be determined by spreading the total forecast ~~net power costs~~NPC for the test year to the rate schedules in the same manner as the revenues for Schedule 200 are spread to the rate schedules: based on the functionalized revenue requirement as determined by the Commission based upon a Cost of Service study, or by the method proscribed by the Commission in the most recent general rate case or Commission proceeding regarding rate spread and rate design.

In any future stand-alone ~~TAM~~APCA, Proposed Schedule 201 revenues by rate schedule will be determined by spreading the total forecast ~~net power costs~~NPC for the test year to the rate schedules based upon each ~~schedule's~~schedule’s proportion of ~~"~~“Present Schedule 201 revenues~~." "~~.” “Present Schedule 201 revenues~~"~~” for the test year shall reflect the projected test year sales forecasts. Proposed Schedule 201 rate design shall reflect the method prescribed by the Commission in the most recent general rate case or other Commission proceeding regarding rate spread and rate design.

~~E.~~G. ~~TAM~~APCA Filings Made in or Processed Concurrently with a General Rate Case

~~In all future TAM filings after UE 207 in a year in which the~~ If the Company files a general rate case~~, the TAM will be included in or processed concurrently with~~ prior to May 15 in a given year, then the Company may file the ~~general rate case filing. In future filings after UE 207,~~APCA before May 15. If the Company ~~agrees that both filings will be made no later than March 1 to allow for~~chooses not to file a ~~January 1 rate effective date. This commitment will cease if~~APCA prior to May 15, then it must file on May 15. If the ~~TAM is eliminated or there are material changes in these TAM Design Guidelines. If the TAM~~APCA is filed on a stand-alone basis, it will be filed no later than ~~April~~

1. ~~1~~May 15. In order to accommodate the direct access window that begins November 15, the ~~TAM~~APCA may be bifurcated from the full rate case in order to allow for a Commission decision by November 1. Bifurcation of the ~~TAM~~APCA does not alter any provision below.

2. When ~~a TAM~~an APCA is filed in or processed concurrently with a general rate case, the Company or any Party may propose changes to how the Company's Rate Mitigation Adjustment or other rate spread tools should operate in a stand-alone ~~TAM~~APCA filing made before the ~~TAM~~APCA is again filed in or processed concurrently with a general rate case.

3. When ~~a TAM~~an APCA is filed in or processed concurrently with a general rate case, the ~~TAM~~APCA will be subject to rebuttal and final updates ~~identified~~identifies above and ~~to~~ the agreements on workpapers and other supporting documents ~~specified~~specific in Attachment ~~B~~A.

H. Other Provisions

1. These guidelines do not limit the ability of the Company or other Parties to propose changes to these guidelines, including changes to the cost elements that will comprise NPC in stand-alone APCA proceedings or in future general rate cases.

PAC Exhibit PAC/601—Resume

PAC Exhibit PAC/602—Review of PCAM Implementation in Other States

I. INTRODUCTION AND QUALIFICATIONS

Q. Please state your name, position and business address.

A. My name is Frank Graves. I am a Principal at The Brattle Group, located in our headquarters office at One Beacon Street, Suite 2600, Boston, Massachusetts 02108.

Q. Please summarize your education and professional experience.

A. For most of my career spanning over 30 years as a consultant, I have worked in regulatory and financial economics, especially regarding long-range planning for electric and gas utilities, and in litigation matters related to securities litigation and risk management. My education includes an M.S. with a concentration in finance from the M.I.T. Sloan School of Management in 1980, and a B.A. in Mathematics from Indiana University in 1975.

In regard to forecasting, utility resource planning, and cost recovery risks, which are central matters in this case, I have extensive experience in system planning with capacity optimization and production cost models, load forecasting, fuel procurement and risk management, and pollution control compliance. Recently, I have focused on evaluating pathways to deep decarbonization of the energy sector, including the impacts of much greater reliance on renewable generation and distributed energy resources. I have developed, evaluated, or used many power system production and resource planning models as well as utility financial projections for revenue requirements and alternative rate design purposes, and I have evaluated financial risk and cost of capital in a wide variety of settings for energy infrastructure and utility investments. I have given expert testimony on financial and regulatory issues before the Federal Energy Regulatory Commission (FERC), many state regulatory commissions (including Oregon, see below), and state and federal courts. My background and qualifications are described in greater detail in the résumé attached as Exhibit PAC/601.

Q. What testimonies have you previously provided in proceedings before the Public Utility Commission of Oregon (Commission) or in regard to PacifiCorp (PacifiCorp or the Company) in any of its other state jurisdictions?

A. I have provided direct and rebuttal testimony on behalf of companies within PacifiCorp's six-state service territory on several occasions in regard to aspects of fuel and purchased power procurement, forecasting, hedging and cost recovery. Going by state, I testified for PacifiCorp in Utah in 2010 and 2011 in docket 09-035-15 on the need for an Energy Cost Adjustment Mechanism (ECAM) and how that related to risk management practices, and in docket 10-035-124 on the prudence of long-term hedges for natural gas and allowing swap costs in the energy balance account. I testified for PacifiCorp in Wyoming in 2012 (docket 20000-405-ER-11) on utility hedging practices and state practices for cost recovery in rebuttal of suggested 50/50 sharing of gains and losses in those positions, and in 2015 (docket 20000-409-ER-15) regarding a day-ahead versus real-time (DA/RT) adjustment to the net power costs (NPC) in rates to correct for intrinsic under-recovery from short-term transactions in the ECAM. In Oregon that same year, I presented direct and reply testimony in docket UE-296 on the costs of balancing the system and the need for DA/RT adjustments.

Q. What is the scope of your testimony in this proceeding?

A. My testimony discusses the sources of risk and resulting typical under-recovery in the current Power Cost Adjustment Mechanism (PCAM) for PacifiCorp in Oregon to demonstrate how difficult these variances are to forecast or control. I also explain why these difficulties and resulting downward biases in recovered NPC are likely to increase in the coming years, due to increasing reliance on renewable resources and more participation in regional markets. Accordingly, I recommend that the deadbands and profit collars on sharing those NPC variances be eliminated to better align PacifiCorp's financial risks for recovery of NPC with the very limited level of control over the key drivers of the NPC uncertainty. I also discuss the fuel-cost sharing policies of other states, and the ineffectiveness of the sharing rules currently in place (deadbands, profit collars) on NPC variances to create meaningful or useful incentives for PacifiCorp to manage its fuel and purchase power costs differently.

Q. Please summarize your conclusions.

A. A review of the past several years of NPC forecasts and actual costs shows that there has been a systematic under-recovery of those actuals, accumulating to approximately $77 million on an Oregon-allocated basis between 2014 and 2018. The large variances in Oregon have not been passed on in whole or in any part to customers in Oregon because of the wide deadbands and profit collars on PCAM conditions for sharing them, effectively passing the entirety of the NPC shortfall on to PacifiCorp shareholders.

My review shows that the largest and most persistent component of these shortfalls has been the costs of purchases and sales in the wholesale market(s) to balance the system (e.g., when the renewables produce more or less than expected, or load is different than forecast) and to simply trade economically with other utilities that have their own imbalances or less/more cost-effective units available.[1]

Such trading volume is very large—on the order of a quarter of jurisdictional retail sales—and it involves material benefits to PacifiCorp customers from the savings and efficiency gains. On the other hand, it is extremely difficult to forecast when, where, and at what price or cost these numerous short-term transactions will take place. Indeed, it is not likely that modeling improvements could be made to reduce this problem, leading to substantial actual NPC deviations from planned costs that are in rates.

Even more consequential for NPC and the PCAM, these deviations in costs do not tend to balance out over time from a blend of some over- versus some under-forecasting. Instead, it is more likely that both positive and negative deviations from expected volumes will have net costs, for two reasons. First, because the supply curve for available power is usually increasingly upward sloping at higher loads, the positive deviations in load (actuals greater than forecast) will often have greater incremental costs than the comparable incremental savings from the negative deviations (which occur in a lower cost, flatter portion of the supply curve). That is, the extra power needed when the forecast is low will tend to cost more than was

[1] The DA/RT adjustment is designed to capture certain system balancing costs that are otherwise excluded from the NPC forecast by virtue of the nature of the Generation and Regulation Initiative Decision Tools (GRID) model's perfect foresight, among other reasons, as discussed in prior cases and reiterated below. While the DA/RT adjustment has mitigated, to some extent, the under-forecasting bias resulting from system balancing transactions, it remains an imperfect solution, as demonstrated by the under-recovery that has continued in the years subsequent to implementation of the DA/RT adjustment. Nevertheless, the DA/RT adjustment remains necessary because the NPC forecast is more accurate with it than without.

expected if the actual volume had matched expectations, while reduced power needs that do not have to be purchased or generated may not save much relative to the forecast costs. Second, it is possible that lower than expected load volumes will directly involve losses if the planned volumes (of electricity sales or their generation fuel costs) were hedged and those hedges have to be closed out at a lower price than was expected.

Importantly, these under-recovery biases occur in all time frames, e.g., within the day for hourly transactions, even if the day as a whole had actual demands that matched the forecast. This is particularly significant for renewables which can only be forecast for ratemaking on the basis of long-term weather patterns that are not accurate for short-term operations. For instance, if the wind blows more than was expected, and the output is under a long-term contract priced above market energy prices, the excess adds considerable unplanned NPC.

These recurring under-recoveries are not the result of bad forecasting or bad operational management. The planning methods and tools that PacifiCorp uses are consistent with good industry practice, as well as their assumptions and data sources for key inputs. To the contrary, these under-recoveries are a byproduct of the beneficial and cost-saving move to greater reliance on renewables and on market transactions.[2] Because those costs are so difficult to forecast, and they do not occur or arise in the "base case" scenario used to set rates (only in the variances from those projections), they are inadvertently not recognized and are excluded from base rates. A prudently incurred cost is simply missing from the allowed costs in the revenue requirement.

Such difficulties and the associated under-recovery are likely to increase in the future, because of the changes to PacifiCorp's generation portfolio outlined in its 2019 Integrated Resource Plan (IRP), the near-term renewable acquisitions included in the 2019 IRP action plan and because much of the rest of the Western Electricity Coordinating Council (WECC) is similarly transitioning away from coal-fired generation resources towards increased renewable capacity, and the pending move to nodal and state-specific energy pricing by PacifiCorp. These changes will increase forecasting difficulties, will likely make PacifiCorp's supply variances more correlated with other companies across larger areas (hence more impactful on spot energy prices)—at the same time as they will make market participation more beneficial and important.

[2] A significant part of the forecasting problem here is inability to know the short-term deviations from average or typical renewable output. The average (or total output) over moderate time frames, such as a month, can be known in advance with reasonable accuracy, as I show later in Confidential Figure 7. Such average amounts can then be hedged to dampen a material portion of cost risk. However, a year in advance, the rate-setting time in the TAM, it is not possible to have any meaningful insight into intra-month, intra-day or intra-hourly even shorter period renewable output variances, nor into what the corresponding variance and correlation in hourly or shorter term energy prices will be when those wind and solar variances occur. It is possible to do beneficial short-term hedging throughout the year, to further reduce the extent of error exposure, but always subject to volume uncertainty within the hedged period. For instance, it may be that next week's weather forecast features lots of rain, so it is unlikely the solar generation will produce much power. This was not knowable at the beginning of the year, but can be acted upon a week or so in advance to hedge those conditions. Even then, it will not be possible to hedge much or perhaps any of the intra-week variance at that time.

These forecasting and variance-costing problems are widespread throughout the electric industry and so can be considered normal business risk, but what is not normal is for the utility to bear so much and such asymmetric cost-recovery exposure to them. The vast majority of other states have full flow-through cost recovery of NPC-type costs, without deadbands or sharing limitations. This reflects an appreciation that there is no efficiency improvement from putting a utility at risk for largely uncontrollable and unforecastable costs. Therefore, I recommend eliminating the deadbands, sharing bands, and earnings test and allowing full NPC recovery for PacifiCorp, subject to prudence review.

Q. How is your testimony organized?

A. In Section II, I review the terms of the current PCAM established in Oregon, including a summary of the types of costs it includes, how and when the costs are measured, and the risk-sharing between PacifiCorp's ratepayers and shareholders for the deviations between forecast and actual NPC. Then, in Section III, I summarize PacifiCorp's experience in Oregon for the recovery of NPC, and I identify several of the key drivers of the deviations between forecast NPC used to set retail rates versus the actual NPC over the last several years. I explain in Section IV why these cost deviations tend to create under-recovery, rather than to balance out as errors that can go either way. I also explain why they are intrinsically very difficult to capture in forecasts and how they are outside of PacifiCorp's control, together making PCAM variances a poor candidate as an incentive mechanism for improved utility operations. In Section V, I explain the appropriateness of PacifiCorp's proposed modifications to the PCAM approach in Oregon. Finally, in Section VI of my testimony, I provide an overview of how some of the other utility jurisdictions treat similar types of risks associated with cost recovery of NPC-type costs.

II. CURRENT PCAM IN OREGON

Q. What are the components of PCAM costs?

A. As described in Mr. Michael G. Wilding's testimony, the PCAM is a balancing or true-up mechanism with risk-sharing that allows the possibility for PacifiCorp to recover a portion of large differences between the actual PCAM costs incurred to serve its customers and the forecast "base" PCAM costs established during annual transition adjustment mechanism (TAM) filings. The historical PCAM costs include NPC plus other costs/revenues not captured in NPC, such as: ongoing costs associated with PacifiCorp's participation in the Western Energy Imbalance Market (EIM), Production Tax Credits (PTC), and other revenues collected under PacifiCorp's Schedule 205.[3]

Q. How does PacifiCorp estimate the PCAM costs that are reflected in retail rates?

A. The base PCAM costs used to set customer rates in Oregon are estimated in annual TAM filings. PacifiCorp forecasts its system-wide NPC using the GRID model, which simulates the operations of the Company's owned and contracted generators for its entire fleet across all its state jurisdictions, along with market purchases and sales for the future test year based on contracts and expected spot trades for economics and balancing. The NPC is calculated as the sum of fuel costs, wholesale power purchase costs, and wheeling costs, net of wholesale sales revenues. The model results are adjusted to increase the accuracy of system balancing transactions

[3] I understand that the non-NPC EIM costs will be removed from the PCAM process beginning with the 2021 general rate case, and instead will be part of base rates.

(DA/RT adjustment) and to reflect incremental EIM benefits. PTCs and other revenues are estimated outside of the GRID model, included as a part of the TAM filings.

A share of the total Company-wide costs is allocated to Oregon based on Oregon customer's proportion and pattern of the forecast load. Oregon uses a one-year forward projected test year for those calculations (while other PacifiCorp states use somewhat different time frames). The TAM-estimated average cost per kilowatt hour (kWh) for NPC becomes the basis for rates. Any deviation from those forecast prices and the corresponding unit costs in actual NPC (plus a few smaller additional factors, shown below) multiplied by actual retail sales volumes becomes a variance that is subject to possible partial recovery or refund under the risk-sharing terms of the PCAM.

Q. Can you provide a breakdown of the key components of the PCAM costs in recent years?

A. Yes, Figure 1 summarizes the actual and forecast Company-wide PCAM costs that PacifiCorp incurred during 2014-2018, compiled based on the data from Oregon TAM and PCAM filings. As shown, the NPC accounts for the vast majority of the PCAM costs and the resulting unit cost differentials, which will be the focus of my testimony.

Figure 1: Annual Company-Wide PCAM Costs for 2014-2018

	2014	2015	2016	2017	2018
Total Company Adjusted Actual NPC	$1,603	$1,542	$1,447	$1,528	$1,595
Actual Allocated PTC	–	–	–	($89)	($68)
Actual EIM Costs	–	$6	$5	$5	$3
Actual Other Revenues	–	($24)	($16)	($10)	($11)
Total PCAM Adjusted Actual Costs ($million)	**$1,603**	**$1,524**	**$1,437**	**$1,433**	**$1,519**
Actual System Retail Load (MWh)	54,999,277	54,589,759	54,258,193	55,194,054	55,041,477
Actual PCAM Costs ($/MWh)	**$29.15**	**$27.91**	**$26.48**	**$25.97**	**$27.60**
Total Company Adjusted Base NPC	$1,449	$1,466	$1,514	$1,526	$1,474
Base Allocated PTC	–	–	–	($88)	($67)
Base EIM Costs	–	$7	5	$4	$4
Base Other Revenues	–	($24)	(15)	($11)	($12)
Total PCAM Base Costs ($million)	**$1,449**	**$1,448**	**$1,503**	**$1,431**	**$1,400**
Base System Retail Load (MWh)	54,938,054	55,032,984	56,126,562	55,640,607	54,038,127
Base PCAM Costs ($/MWh)	**$26.37**	**$26.32**	**$26.78**	**$25.73**	**$25.90**
System PCAM Unit Cost Differential ($/MWh)	**$2.78**	**$1.59**	**($0.30)**	**$0.25**	**$1.70**
NPC Differential ($/MWh)	*$2.78*	*$1.60*	*($0.30)*	*$0.25*	*$1.71*
Oregon Retail Load (MWh)	12,958,736	12,862,461	12,868,974	13,200,282	12,867,233
Oregon Annual PCAM Differential ($million)	**$36**	**$20**	**($4)**	**$3**	**$22**

Note:
[1] 2016 Adjusted Actual NPC excludes the recovery and abandonment costs for the Joy longwall mining equipment.

In this figure, a positive differential in the shaded row indicates that the actual unit costs of the actual load were greater per megawatt-hour (MWh) than the forecasted unit costs in rates, causing under-recovery. This occurred in every one of the past five years, except a small negative differential in 2016.

Q. How is the difference between the PCAM costs in retail rates and the actual PCAM costs treated for cost recovery under the current PCAM risk-sharing approach?

A. PCAM balances are calculated based on monthly Company-wide per-unit differentials between actual PCAM and base PCAM unit costs, both multiplied by the actual retail load in Oregon. Thus, errors in forecasting volumes do not directly affect the PCAM variances, though those errors may help explain the differences in forecast unit costs that do determine the amount eligible for risk-sharing. Those amounts are subject to four kinds of filters before being recoverable as described in Order 12-493.[4] *First*, for a given year, any difference within an asymmetrical deadband range of -$15 million over-recovery and +$30 million under-recovery are simply absorbed by PacifiCorp, i.e. not shared. *Second*, amounts above or below the deadband limits are eligible to be shared 90 percent by customers and 10 percent kept by PacifiCorp. However, the *third* filter is that this sharing only occurs to the extent that PacifiCorp's return on equity (ROE) without sharing is more than +/-100 basis points (bp) profits collar away from the authorized ROE. If the variance does not pass these thresholds, PacifiCorp gets no recovery from or gives no refund to customers. PacifiCorp may only recover to within 100 bp of its authorized ROE. And *fourth*, the amortization of deferred amounts under the PCAM in a given year is capped at 6 percent of PacifiCorp's revenues for the previous year.

Q. What is your understanding of why these filters have been adopted by the Commission?

A. It is my understanding that these filters have been based on the PCAM adopted for Portland General Electric Company, and they are "designed so that [the utility] will bear normal business risk associated with actual power costs varying from forecast."[5] I would note, however, that the risk-sharing under the PCAM design is quite

[4] *In the matter of PacifiCorp, dba Pacific Power, Request for a General Rate Case*, Docket No. UE 246, Order No. 12-493 (Dec. 20, 2012).
[5] *In the matter of Portland General Electric Co. Request for a General Rate Revision*, Docket No. UE 180, Order No. 07-015 (Jan. 12, 2007).

asymmetric, with much more potential for Company under-recovery from unexpected losses than for over-recovery from unexpected gains. Thus, even if realized costs tended to vary symmetrically around the forecast used to set rates, i.e., even if there was no long term average forecasting error, the Company would usually end up losing money. This problem is made worse by the fact that even a good forecast will tend to omit the balancing costs (as I explain below). Having such a built-in loss expectation is not normal business risk in the utility industry.

Q. Has the implementation of the current PCAM approach so far resulted in PacifiCorp's Oregon customers bearing some of the PCAM cost deviation?

A. No. Since the beginning of the implementation of the current PCAM approach in Oregon, all of the cost deviations have failed to pass the filters and thus have been absorbed by PacifiCorp in all years. Cumulatively, since 2014, these have resulted in approximately $77 million of unrecovered costs in Oregon equivalent to about 65 basis points per year of shortfall in earned ROE. Importantly, this has not been due to one or two occasional bad years with large losses offset by some years with moderate gains or over-recoveries. In fact, and notably, even unusual events that have adversely affected PacifiCorp operations, such as the Enbridge pipeline rupture in October 2018, have not triggered the PCAM, even though allowing adjustments for major unforeseen events was something the PCAM was designed to accomplish.[6] Instead, actual annual PCAM costs have almost always exceeded the PCAM costs

[6] *In the matter of PacifiCorp, dba Pacific Power, Request for a General Rate Revision*, Docket No. UE 246, Order No. 12-493, at 13 (Dec. 20, 2012) ("any adjustment under a PCAM should be limited to unusual events and capture power cost variances that exceed those considered normal business risk for the utility").

recovered in rates in the past several years, except for a small over-recovery in 2016.[7] I explain below why this persistent under-recovery is not a coincidence, nor is it related to bad forecasting or system cost management. It reflects the inherently underestimated costs of using the market to balance the system combined with the biased (asymmetric) design of the PCAM.

III. HISTORICAL NPC UNDER-RECOVERY IN OREGON

Q. Please summarize how PacifiCorp's estimate of system-wide NPC deviated from actual NPCs over the last five years.

A. In the five years spanning 2014-2018, Company-wide actual NPC exceeded the one-year ahead forecast in every year except 2016. My analysis indicates that this is largely due to a downward bias in forecasting NPC unit costs relative to actual unit costs because of modeling and informational limitations, market dynamics (all trading companies tending to have similar, concurrent and even aggravating problems relative to their forecasts), the upward and nonlinear shape of the market supply curve for power, and increasing reliance on renewables, especially wind. There is no reason to expect that these problems are going to abate in the future; to the contrary, they may become worse.

I will focus on the patterns and causes for the Company-wide unitized ($/MWh of retail load) NPC deviation metric for the remainder of my testimony, for the following reason. As noted briefly above, the Company-wide unitized ($/MWh) NPC deviation metric is used in the Oregon PCAM determination as a multiplier to the actual retail load in Oregon. Specifically, the NPC charged to Oregon customers

[7] My understanding is that the small over-recovery in 2016 is after extraordinary costs are adjusted out for the Jim Bridger coal costs. All my analysis includes the 2016 adjusted actual NPC.

in rates is the forecast of Company-wide NPC divided by forecast of Company-wide retail load, while the NPC collected from customers is that forecast and authorized rate multiplied by the actual retail load in Oregon. The actual unitized and Company-wide NPC incurred by PacifiCorp is the actual Company-wide NPC divided by actual Company-wide retail load. Hence, the sign of this unitized NPC deviation metric (forecast for rates minus actual unit costs) for the Company as a whole determines whether PacifiCorp under-recovers NPC. This difference in unit costs is multiplied by the actual retail sales volume to set the amounts eligible for recovery, if they exceed the deadbands and profit collars in Oregon. For this reason, it is more important to examine the factors that influence the unitized NPC deviation metric in $/MWh of retail load.

Q. What have been the key components of NPC deviations as indicated by your analysis?

A. The NPC mainly consists of fuel costs, wheeling costs, and net purchase costs (wholesale market sales minus market purchases). Though all of these can have variances, the net purchase costs are the primary driver of NPC deviations in most of the past five years.

Fuel costs like gas and coal prices to PacifiCorp's own generation can contribute to NPC variances. For instance, the volume of their actual generation could be exactly as was forecasted, but the prices for fuel could have been different than was expected and used to set rates. Alternatively, the forecasted fuel costs could be accurate but the utilization of the plants different than was expected. In that case, depending on load, it is likely that the costs or availability of some other types of supply resources (wind, market purchases) are also different. The third and more likely possibility is that both fuel prices and generation volumes will depart from forecast, and in general this will tend to have partly offsetting influences on NPC for fossil generation.

For instance, if actual gas prices are higher than expected, the usage of the gas units will tend to fall, so the overall gas cost share of NPC will be a variance-dampened blend of higher unit costs but smaller volumes (and vice versa if gas costs are lower than expected). In fact, actual gas prices generally fell below forecasts for most of the past few years, and are recently relatively stable, so they have become less of a driver for NPC under-recovery in recent years. Moreover, gas price can be hedged to help eliminate the unit cost risk. Coal price variances are similarly two-sided with possible increases or decreases in cost pushing volumes burned in the other direction. Additionally, coal prices are generally more stable than gas prices, so coal fuel costs do not contribute significantly to NPC under-recovery either.

In contrast to somewhat predictable generation usage, especially from baseload plants, short-term purchases and sales in the wholesale market(s) can be very unstable. There, deviations in volumes and price do not necessarily have offsetting effects. For instance, if loads are higher than expected, a utility may need to buy more power and buy it at a higher price. For PacifiCorp, adverse price variances (transacting at worse costs than forecast) for net purchases (i.e., as explained below, often for both purchases and sales) have occurred in every one of the past five years.

Market-purchased volumes and the prices at which they occur are also quite sensitive to the time pattern and total quantity of generation from renewable resources, which of course are not controllable or readily predicted, except over moderately long term averages. Thus, even with the annual average performance of these technologies fairly well known and possibly hedged, there is a great deal of volatility and complexity to this component of NPC over shorter time horizons.

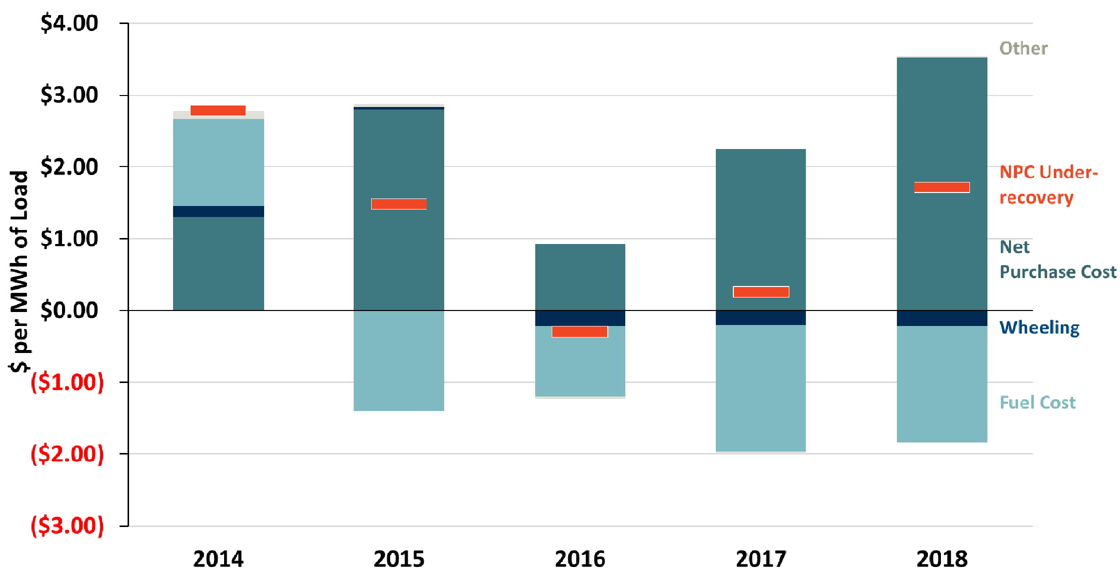
Q. Can you demonstrate these relative shares of influence on NPC variances graphically?

A. Yes, Figure 2 below is a breakdown of the shares of unit cost variance between forecast and actual NPC shown as annual bar charts with stacked layers for the main components. A positive value indicates the actual cost is higher than forecast for that component, thus contributing to the under-recovery in that particular year. Likewise, a component's negative value means that it helps to lower the NPC under-recovery for that year. Of the three main components, net purchase cost was the largest component for 2014-2018, followed by fuel cost and wheeling charges. Fuel cost variance is positive for 2014, though it flipped back to the negative range in the following four years. This is in part driven by large swings in gas prices and gas consumption level during this period. For example, in 2017, both the gas consumption level and the gas prices were lower than forecast, resulting in over-recovery of gas costs.

In addition to being the largest component, net purchase cost remained positive (under-recovered) across the five years in question. As seen in Figure 2, the sign and size of this net purchase cost deficit resulted in an overall shortfall (positive

Net NPC under-recovery), as seen by the red line within the bars, for all years except for 2016, which involved a slight gain.[8] Note however that even when both wheeling and fuel cost deviations were negative in some years, PacifiCorp incurred a NPC under-recovery due to its persistently large positive variance. I decompose this pattern further below to show why it is inherent in NPC.

Figure 2: Composition of NPC Under-recovery for PacifiCorp in Oregon



Notes:
[1] Calculated based on PacifiCorp's PCAM data from 2014 - 2018.
[2] "Other" refers to generating expenses from wind and solar owned by PacifiCorp.

Q. Why do the actual net purchase costs (the subset of NPC shown by the dark teal portions of bars above) exceed the forecasts during all of the years from 2014-2018?

A. Transaction price deviations determine whether actual NPC exceed forecast costs, and the actual volume acts as a multiplier of the difference. Unpredictable natural

[8] The testimony of Mr. Wilding explains why 2016 had a slightly favorable variance, which involved the fact that there were very low gas prices and strong hydro output that year. It is noteworthy that even in a year with such favorable average cost conditions, there was barely any NPC variance (small over-collection), and the under-recovery component from net purchases was still quite positive.

events coupled with complex physical interactions among the participants of the western power grid make it tremendously challenging, if not impossible, for the Company to predict or control the prices at which it buys or sells power other than what is under strict contract. However, as seen in Figure 3, there is naturally a lot of volume of such spot and balancing sales purchases, because of imprecise matching between their supply portfolio and the realized load, similar problems facing other utilities, and the resulting economic opportunities to trade. Note, for instance, that the gross sum (not the net, offsetting sum) of the two is around 25 percent of retail sales. Since each can contribute to NPC, it is this gross sum, not their net, which is most indicative of the scale of the problem. Most of these volumes will be unplanned as to when, where, and at what price they will actually occur at the time of base-rate setting, even if they are fully expected and normal at roughly those levels in the forecast.

Figure 3: PacifiCorp's Short-Term Firm Purchases and Sales

	2014	2015	2016	2017	2018
Short-Term Firm Purchases (MWh)	2,252,456	4,670,988	4,653,654	6,398,082	5,880,090
Percent of Net Retail Load	*4%*	*9%*	*9%*	*12%*	*11%*
Short-Term Firm Sales (MWh)	8,557,501	7,619,541	6,018,797	6,651,663	7,765,501
Percent of Net Retail Load	*16%*	*14%*	*11%*	*12%*	*14%*

For example, if the PacifiCorp service territory experiences an unexpectedly warmer-than-average summer month, demand for electricity will tend to spike upwards for PacifiCorp and for other similarly affected utilities (possibly quite a substantial portion of the WECC). In order to meet this unplanned load increase, PacifiCorp would have to rely on either its more expensive generation assets (the ones not yet being used for planned load levels) or purchase from the market. To the extent that neighboring systems are experiencing similar conditions, market spot prices will be much higher than they would normally be. The supply shortfall may be further exacerbated if other resources that the Company typically relies on generate less than expected—say wind turbines stop operating because of little to no wind (as sometimes happens during heat waves). Consequently, the Company would have to secure even more power than the load increase at a much higher price, which in turn drives up the net purchase costs.

Q. Have you evaluated the key drivers of NPC under-recovery over the last five years to see if a pattern of losses on both under- and over-forecasting (i.e. nearly all unexpected balancing) is evident?

A. Yes, by reviewing the annual and monthly variances in unit costs in relation to net load that is subject to unplanned generation or purchases, I find that the magnitude of the NPC under-recovery has been higher when the actual net load exceeded the forecast, and also when the variances were very small or even negative (actual below forecast)

Net load is a metric designed to identify what supply is needed from dispatchable generation and market purchases (or sales). It is the system load less all wind and hydropower generation on the system. This includes not only resources that PacifiCorp owns, but also all other wind and hydropower resources that it uses that are under long-term contracts, such as qualifying facilities (QF). The net load metric also factors in long-term firm sales and purchases, which are contractual obligations that PacifiCorp has to meet, by subtracting long-term firm purchases and adding long-term firm sales. This definition serves to separate the portion of PacifiCorp's load served by must-take, must-sell, and zero short-run marginal cost (but not necessarily total cost) resources from the remaining load on its more discretionary, dispatchable resources and short-term market purchases, i.e. on the resources that are adjusted to respond to any unplanned requirements (as well as serving a portion of the planned needs).

Additionally, I analyzed how much the forecast for expected net load deviated from the actual net load, both on a monthly and annual basis. If the net load variance is positive for a particular year, the system experiences higher-than-expected net load, resulting in PacifiCorp having to secure more power from dispatchable resources and market purchases than anticipated for that year. As I explained above, power in these instances would have to come from the Company's more expensive generation sources, or from additional purchases.

As seen in Confidential Figure 4, net load variance was positive in 2014, 2015, and 2018, meaning the actual volume exceeded the forecast. Because of the economic dynamics that I explain above, NPC under-recovery was also among the highest for these three years. Vice versa, a negative net load variance indicates that PacifiCorp relied less on its marginal units and market purchases, leading to a lower NPC under-recovery as was the case in 2016 and 2017. In absolute terms, the net load variance is largest in 2016, when forecast net load exceeded the actual by 1.7 million MWh. As a result, 2016 was the only year that PacifiCorp experienced NPC over-recovery.

Confidential Figure 4: Oregon Under-recovery and Related Factors

[redacted]

Notes:
[1] Calculated based on PacifiCorp's PCAM data from 2014 – 2018.
[2] $/MWh values are calculated by dividing under-recovery by total actual retail load of PacifiCorp's system. Retail load is the net system load after taking transmission and distribution losses into account.
[3] Net load variance reflects net system load plus long-term firm sale, subtracting long-term firm purchase and PacifiCorp's own wind and hydro generation. PacifiCorp does not own any solar generation.

The relationship between NPC under-recovery and net load variance is more prominent when shown on a monthly basis. Confidential Figure 5 shows that there is a positive correlation between monthly NPC under-recovery and monthly net load variances for 2014-2018. That is, NPC under-recovery tends to be positive and increasing when actual net load exceeds forecast. Note that the trend line crosses the Y-axis at [redacted], meaning that even when PacifiCorp has accurately forecast its net monthly load, the Company still tends to experience a monthly under-recovery of [redacted].

Confidential Figure 5: 2014-2018 Monthly Average NPC Under-recovery and Company-Wide Net Load Variance

[redacted]

Note:
[1] Calculated based on PacifiCorp's PCAM data from 2014 – 2018.

Q. Why does the magnitude of monthly NPC under-recovery increase at higher levels of net load forecast deviations?

A. Historical data suggests that this is likely due to positive correlation between net load forecast deviations and power price forecast deviations. As shown in Confidential Figure 6 below, actual hub prices at each of the major trading hubs that PacifiCorp uses for purchases and sales tend to exceed forecasts when the actual net load exceed forecast. More specifically, spot prices routinely deviated from the forward market curves at Four Corners, Palo Verde, and Mid-Columbia, three hubs where PacifiCorp historically transacted the most volume. For instance, the difference between actual spot price and forecast price for Mid-Columbia was as high as [redacted] (as in February 2014).

Confidential Figure 6: Monthly Average Hub Price Forecast Variance versus Company-Wide Net Load Variance

[redacted]

Note:
[1] Calculated based on PacifiCorp's electricity hub data from 2014 – 2018. Prices are for flat hours.

This positive correlation means that when PacifiCorp's actual net load exceeds forecast, the Company also tends to experience higher-than-forecast prices for short-term market purchases, increasing the NPC more than proportionally. In contrast, when PacifiCorp's actual net load is less than forecast, actual hub prices do not deviate as much from forecasts. Accordingly, PacifiCorp's sales revenues decrease relative to its forecasts. Therefore, forecast errors in PacifiCorp's net load has an asymmetric impact on NPC deviations as I explain further below.

If the net load volume, which is system load + long term firm sales less (long-term firm purchases + PacifiCorp's wind generation + PacifiCorp's hydro generation), is as forecast, PacifiCorp tends to run its own units at their expected or hedged costs unless the market opportunity to trade is better, which can go both ways.

But if net load volume is higher than forecast for PacifiCorp, it means 1) PacifiCorp has to move further up its own dispatch ladder than was forecast (at higher unit costs per MWh) or purchase more from the market or sell less to the market, and 2) it is likely that the rest of the market is facing similar imbalances, e.g. if it is a hot summer or poor hydro or poor wind conditions. Thus the market price for purchases will also be higher, possibly in a rapidly increasing way as demands push into the high-priced portion of the regional supply curves. Thus, you may have to buy more or sell less at higher prices, for a large adverse NPC variance.

Conversely, if the volume of net load is lower, a utility can move down the supply curve but mostly in the flatter part of the curve (for not much savings compared to moving the other way). If a utility had hedged positions for the expected load, it could sell the excess back to the market, but now likely at a loss to the originally hedged price that was based on higher net demand expectations. Thus a utility is likely to only save a bit or even lose on the adjustment.

Therefore, for both over or under net load forecasts, the error tends to be corrected at a loss.

Q. Does the type of forecasting error and under-recovery that you describe occur at every time scale?

A. Yes. It does occur at every time scale, and sometimes with more variability at shorter intervals, e.g. hourly, where a lot of balancing occurs, and where this is an especially acute issue for wind supply. This component of net load volume can be forecast fairly accurately (or at least usefully) on average over a long time frame (a year or perhaps season), but within those periods may often occur unexpectedly at very different times than planned (e.g., low on-peak day or on-peak hour relative to past patterns of wind), resulting in the same kind of intraday, adverse NPC variances from balancing wind as were shown at the monthly scale for net load. And again, this can occur even if there is no longer-term forecast error for total wind volumes (e.g., over the whole day, month or year).

We can already infer this problem from the above figure by recalling that the fitted trend line crossed the Y-axis at a positive value, i.e. an NPC under-recovery, even though there is no net volume variance at that point. Why is this? It is because the X-axis is measuring average net load error over a whole month. This can be zero, even though there are substantial net load variances (positive and negative) in every day and every hour of that month. Each of those shorter variances will tend to have the same asymmetry of cost as described above, whereby the costs tend to be higher than expected on balancing purchases, and less sensitive (less reduced) on the unforeseen sales or avoided generation.

Q. How does the intermittency of renewable generation influence this shorter term variance problem?

A. It is quite a strong influence. For example, Confidential Figure 7 shows that in 2017 actual hourly wind generation from PacifiCorp's owned and contracted resources deviated from forecast by [redacted] percent (using the absolute hourly deviations), even though on an annual basis, the actual wind generation deviated from forecast by only [redacted] percent. 2018 had similar patterns, with absolute hourly deviations averaging at [redacted] percent versus an annual deviation at only [redacted] percent.[9]

Confidential Figure 7: 2017 Hourly, Monthly, and Annual Wind Generation Deviation

[redacted]

[9] This graphically confirms that the average long-term renewable generation can be meaningfully hedged, but there will be lots of adjustment transactions within the year, some of which can be hedged for blocks of time within the year (though after the TAM forecast) but many not.

Q. Are there other drivers of NPC under-recovery that you have not addressed?

A. Yes. For example in 2014, there were two other adverse surprises in that year that contributed to NPC under-recovery. First, power prices at major trading hubs exceeded the forecasts by about $5/MWh in part due to actual gas prices exceeding forecasts by roughly $1/MMBtu. The higher power prices and gas prices made both the purchases and gas generation more expensive than projections, hence resulting in higher NPC than forecast. Second, PacifiCorp's purchases of third-party wind generation through purchased power agreements (PPAs) from both QFs and non-QFs, exceeded the forecast by about 10 percent. This might seem like good news because it means that fewer market purchases or lower dispatch of higher marginal cost resources are needed. However, the PPA prices of the third-party wind can negate this benefit, if those turn out to be higher than the market energy price at the time of the over-supply variances. This appears to have been the case: The volume-weighted average price paid under these wind PPAs was about $60/MWh, which was roughly double the actual market power prices for energy in that year. Thus PacifiCorp paid more for wind PPAs this year than expected, at costs likely above its own resources' marginal costs or market energy prices.[10] Any such above-market prices for the more-than expected wind output contributed to the NPC under-recovery. (Note that owned wind does not have this problem, because its short-run operating costs are zero, so any increased generation is a source of immediate savings).

[10] This gap is largely because the wind contracts generally recover those resources' fixed costs through variable rates, while the market prices involved in balancing do not generally capture fixed costs from marginal generating facilities.

Q. How does expected wind output enter into the NPC projections that PacifiCorp uses to set rates?

A. It is very difficult if not impossible to forecast when and how much wind will occur, at least not within a forward test year.[11] As a result, PacifiCorp uses a flat average of historical annual wind conditions (at each site) for total output, shaped by the time pattern in the most recent past year of actual output in order to project generation from its wind plants (or it uses the developer's projections if the plant has less than four years of history). This is a reasonable way of projecting those patterns, capturing both the steadiness of the long-term wind patterns and the need to recognize that it typically has a complex (but unstable) seasonal and diurnal pattern. Of course this projection will not match actual realized production patterns, sometimes over-estimating and sometimes under. How that affects NPC depends on whether it occurs for a wind plant owned by PacifiCorp versus under contract for the output at a fixed price per MWh. Positive variances (unexpectedly greater generation) from owned plants will tend to displace fuel use or market purchases, reducing NPC, while such overproduction from a third-party wind resource under a PPA could cause an NPC increase from paying the contract price, if that price is above PacifiCorp's marginal cost.

Note that even if there is exactly the predicted amount of wind over a moderate horizon (a year, or even a day), there can and will be NPC variances arising from what times within that day (or month, etc.) the wind blows and where (because

[11] It is increasingly possible to gain useful, albeit still quite imprecise, forecasts of wind for a day ahead, which helps with unit commitment, but this is not within a horizon that can improve annual forecasting for TAM purposes.

the time of day market prices avoided or incurred are quite volatile). This problem was shown above in Confidential Figure 7 to be extremely common on a daily basis. Thus, wind-based supply, or any intermittent weather-sensitive renewable form of generation, creates an intrinsic NPC variance problem even when it is forecast accurately on average.

This may contribute more NPC variances and under-recovery in the future, as more wind is added to the PacifiCorp fleet and more, older fossil units are retired. Solar power, for which PacifiCorp is planning a significant increase over the next few years, may be slightly more forecast-able, because long-term weather patterns (e.g., annual precipitation) for solar are becoming somewhat predictable by meteorologists albeit still very imprecise. To my knowledge, wind is less amenable to that improvement. The next section describes the increase in planned or required renewables for PacifiCorp and across WECC.

IV. PACIFICORP'S LACK OF CONTROL OVER THE KEY UNCERTAINTIES THAT DRIVE NPC UNDER-RECOVERY

Q. You have explained how forecast errors in either direction induce unplanned net purchases and sales that are likely to create NPC increases. Could PacifiCorp mitigate this problem with better forecasting, or hedging, or changes in operations?

A. No, it is doubtful that much can be done to improve the situation with those adjustments. First, my impression is that the PacifiCorp forecasting methods for these elements of NPC are in keeping with good business practices throughout the industry. While the search for modeling improvements is a good idea, 1) the models and inputs PacifiCorp is using are in keeping with industry standards and are being carefully applied, 2) I am not aware of a model that is capable of capturing the wide variety of unforeseen, stochastic (random) influences that will affect the ultimate NPC, and 3) even if such a model were available, it would not be possible to forecast with any confidence or accuracy the parameters for the random noise from uncontrollable factors that should be overlaid on it to project the coming year. That is, you could perhaps calculate a premium for an assumed level of variance (e.g. based on history), but you would not get a better forecast of what will actually happen.

Likewise, hedging will not help much if at all for the purchased power part of the problem, because the main difficulty is knowing the relevant volumes. Most commercially available hedges are for price protection of a given volume, allowing a utility or producer to hedge specific volumes for specific times. Thus, annual average output can be hedged, but not so much the costs of deviating from that average. The times when there will be an unplanned outage of a generation unit, or there will be more or less wind than in the past from a wind farm, or similar changes on other systems with which PacifiCorp trades, are intrinsically unknowable. Even options, which can be used conditionally, have fixed volumes and periods of allowable exercise. Hedges mostly help the volumes that you can reliably expect. Much of the NPC problem comes from the volumes you cannot plan at least as of the TAM rate-setting time period, except to know in general that they will happen.

Q. Please describe how and why the modeling tools and techniques are limited in ability to work around these problems, such that it would lead you to expect the actual NPC to routinely exceed PacifiCorp's forecasts.

A. Based on my review of the methodology and key assumptions in PacifiCorp's modeling tool GRID to forecast NPC, I conclude that the GRID modeling approach and assumptions include some built-in features (many common to similar models used throughout the industry) that tend to result in under-estimates of the NPC, including the following:

- First, and most insurmountably, system simulation tools like GRID optimize mathematical projections of efficient operations and market transactions under perfect foresight of system conditions and prices, without considering the effects of market uncertainties that create additional unit commitment and dispatch costs, and reduce market participants' ability to find and execute the most profitable transactions. That is not to say that the perfect foresight includes what will actually happen, but as far as the model is concerned, the conditions you project are the only and exact ones that will occur, and then it finds the best way to deal with that. You can run it for different conditions, e.g. higher loads, and perhaps average the two results, but even the alternative scenarios will be perfectly optimized to the parameters of the scenario.
- To be most plausible and useful as an expected cost projection, simulations typically assume "normal" weather, load, hydro generation, without considering the asymmetric impact of deviations from these average conditions. Simulations do not reflect non-standard, challenging and erratic system conditions, such as

transmission outages, fuel supply disruptions (e.g., Aliso Canyon impacts), or extreme weather conditions, such as heat waves, extended droughts, or polar vortexes etc. that can drastically increase power costs and prices. Again, a few such deviant scenarios can be tested, but there are countless perturbations of what they could look like.

- Simulations do not capture inefficiency of fixed-size bilateral trading blocks. Most of PacifiCorp's monthly and day-ahead transactions are executed in blocks (e.g., 16 hour blocks at 25 megawatts (MW) increments), and they are far less flexible and less profitable than the hourly transactions made available in the model.
- Long-term wind and solar forecasts are unable to predict variations within the upcoming year—unlike hydro, which to some degree can be tuned a bit for the coming year because of known and projected weather conditions (like expected snowfall). I am not aware of any such year-to-year conditional shaping of long-term future wind and solar profiles. Thus, they must be simulated as being about like average, all the time (as described above being PacifiCorp's practice), even though after the fact, they never are like average in most days or even for the whole year.[12] This will become more problematic as more renewable resources are added to the PacifiCorp and other WECC members' fleet(s).

[12] There is some net renewable diversity that is gained by relying on a mix of solar and wind, as PacifiCorp is moving towards, but a lot of that benefit is gained at the seasonal and diurnal time frames (spring night-time wind versus summer day-time solar) that can be forecast on average at the beginning of the year, e.g. in the TAM. There may be some additional diversity benefits within shorter time frames, but measuring those would depend on knowing the short-term correlations between solar and wind output (e.g., when the sun goes behind a cloud, does the wind tend to blow more or less?). I am not aware of any utility that has measured or is modeling this level of detail in their renewable resource planning or hedging practices.

- System models do not calculate feedback effects on fuel prices, other suppliers' behavior (such as scarcity bidding), or price-sensitive loads from unforeseen shifts in market conditions.
- Loads depend on circumstances well beyond what a utility considers, especially commercial and industrial loads that can vary with tariffs, competition from other countries, and the price of non-electric commodity inputs to their production.

All of this simply reflects that there is never going to be a forecasting tool for net loads, solar, or wind, or for projecting market balancing operations, that will not have *ex post* errors. Models are intrinsically smoother and nicer than real world conditions, and smoothness typically results in under-estimation. This exposure to errors will persist and will likely grow under the direction the industry is headed. And because the supply curve for the industry is increasingly upward sloping as net demand increases and flatter and more slowly declining when net demand decreases, whatever errors remain will tend to have a positive cost, not wash out. This appears to be a significant cause of the persistent NPC under-recoveries for PacifiCorp.

Q. What are the implication of these key drivers of NPC deviations and under-recovery for the appropriate mechanism to allocate NPC risks between PacifiCorp shareholders and ratepayers?

A. These key drivers of NPC under-recovery (deviations in load, hydro, wind, and market spot power prices) are outside PacifiCorp's control. They may be amenable in principle to better forecasting, though no such mechanism has been identified or approved, or ad hoc adjustments (like including a correction factor based on history as an uplift over forecasted NPC unit costs)—but the difficulties are intrinsic to the fact that this component of NPC arises on the margin in relation to both unforeseen conditions and how those affect the marginal positions of every other power market participant in the WECC that is able to trade with PacifiCorp.

Because these are so uncontrollable (and none of the past variances have been attributed to imprudent or inefficient practices by PacifiCorp) there is no improvement or benefit that can be expected or incentivized by not allowing 100 percent of NPC deviations to pass straight through to customers. Just as one would not be able to do a better job in his or her profession if their bonus was tied to how the weather turned out.

Q. If all of these problems are intrinsic to forecasting and resource planning in the industry, doesn't that just make them a part of normal business risk that the utilities should just incur and internalize, e.g., as part of what their allowed ROE covers?

A. No, they indeed are normal to experience, but it is not normal for them to be systematically under-recovered by virtue of asymmetric risk-sharing and broad exclusions for cost recovery. They reflect prudently incurred costs that are simply extremely difficult to forecast. Thus it is not productive, or equitable, or incentivizing to treat them as just a normal risk that should be absorbed by utility shareholders. In particular, it is not correct to construe them as a risk that is implicitly covered by the allowed ROE. The allowed ROE is predicated on (and will be sufficient to cover comparable financial risks for investors when it is) being added to an allowance for other non-financial costs that is itself unbiased. The intention is to allow a risk-adjusted, time-deferred recovery of prudently incurred costs, including return on and of capital. But that can only occur if indeed <u>all</u> of the prudent costs other than cost of capital are themselves fully in the revenue requirement. [13]

What my analysis demonstrates, and the persistent NPC shortfalls reveal, is that such operating-cost recovery completeness is not the case for PacifiCorp. There is a missing type of cost from the asymmetry of dealing with balancing transactions in a dynamic market. This is a prudent cost, arising because of massive savings that are possible when multiple companies pool and diversify their risks and opportunities in a market. In essence, they are a byproduct of this benefit. It is not reasonable to treat the residual forecasting bias that arises from taking advantage of the market as a cost that should be borne by utility shareholders.

In fact, because it is both normal and prudently incurred, most other states allow their utilities to pass through all of their NPC to their ratepayers without deadbands or earnings tests, as I explain further in Section VI.

Q. Is there any incentive benefit from putting these costs at risk, via the deadbands and profit collars on the current PCAM?

A. No. As noted above, these costs cannot be mitigated by alternative forecasting or hedging, and they are not the result of poor operational decisions. They are prudent, but fundamentally uncontrollable, and therefore should be fully recoverable. Making the utility bear them at risk when they cannot do anything material to reduce or improve them is simply punitive.

---

[13] Even if one thought that this type of non-recovery risk was something that shareholders anticipate and build in a risk premium for it—which I reiterate is not the case—it is unlikely that the measured cost of capital for PacifiCorp would properly capture that premium. This is because, as shown below in my survey of risk sharing by other utilities, almost no states other than the ones where PacifiCorp operates impose such NPC cost-recovery risks on their utilities. Thus the proxy groups for measuring cost of equity almost certainly would not include this problem. By removing this risk-sharing, PacifiCorp would be put on more equal terms with other utilities against which its risk is measured.

In fact, too much risk exposure tends to induce counterproductive behavior to try to avoid the problem. One way (in principle – NOT a recommendation) for PacifiCorp to do that would be to reduce its use of the market for balancing (sticking to the more knowable state of its own generation fleet) and to reduce its reliance on renewable generation. Those are obviously bad ideas, but they illustrate the fact that the NPC sharing rules currently in place punish PacifiCorp for pursuing those benefits, where the NPC under-recovery is simply a byproduct of being in the market with those resources.

V. NEED FOR PACIFICORP'S PROPOSED MODIFICATIONS TO THE PCAM IN OREGON GIVEN FUTURE MARKET TRENDS

Q. You have shown how the PCAM under-recovery variances have arisen in the past. How is the exposure to this problem likely to change in the coming years as PacifiCorp and other WECC utilities adjust their resource mixes?

A. I expect under-recovery variances will become more problematic for PacifiCorp in the future, for several related reasons. First, as seen in Figure 8 many of the states or sometimes just the large cities in the WECC are pursuing public policy goals to try to dramatically decarbonize not just their electric sector but their entire economy, by backing out fossil fuel uses from transportation, heating, and some commercial applications. In particular, 10 states (plus Washington D.C. and Puerto Rico), including California, Washington, Nevada, and New Mexico, have made either 100 percent renewable energy or 100 percent clean energy commitments.[14] Other states have goals to at least significantly reduce fossil fuel use in their electricity

[14] *See 100 percent renewable targets*, ENERGYSAGE, https://news.energysage.com/states-with-100-renewable-targets/.

generation, including Oregon with a 75 percent greenhouse gas reduction target by 2050. On top of that, more than 150 cities have committed to transition to 100 percent renewable energy, including Portland, Boise, and Missoula.[15]

Regardless of such policies, the relative cost of renewables versus fossil generation has shifted, generally shifting towards greater economical roles for renewables under more and more conditions. This makes renewable resources attractive whether they are mandated or not. Several utilities have announced plans to back out existing fossil plants and replace them with a mix of renewables and storage (and sometimes gas peakers) over the next decade, including Public Service Company of New Mexico, Arizona Public Service (APS), Idaho Power, Xcel, among others.[16]

Figure 8: Deep Greenhouse Gas Reduction Targets for U.S. States and Cities

[16] *See Utility Carbon Reduction Tracker*, SMART ELECTRIC POWER ALLIANCE, https://sepapower.org/utility-carbon-reduction-tracker/.

Q. How does PacifiCorp's planned generation resource mix reflect these policy and technology trends for the future?

A. According to the Company's 2019 IRP, PacifiCorp is expecting to substantially increase the share of renewables and energy storage in its resource mix.[17] For instance, the preferred portfolio includes over 6,300 MW of new solar resources and over 4,600 MW of new wind resources over the next 20 years, representing about 100 percent of PacifiCorp's current total fleet capacity. The 2019 IRP's least-cost portfolio also includes about 600 MW of battery storage by 2023 and an additional 2,200 MW by 2038. This is a significant development, given that PacifiCorp does not currently own any solar generation resources or significant battery storage facilities.[18]

Q. Please explain why this shift is likely to exacerbate NPC under-recovery risks.

A. There are two different impacts on NPC from greater use of renewables. The first is to lower the average cost of fuel by virtue of the "free energy" (i.e. zero short run marginal costs, ignoring fixed capital costs) for the new supplies. This will lower the base rates component forecast by the TAM. However, the second impact is more complex, arising because of the difficulty in forecasting the short-term renewable patterns and having to offset deviations from plan in those hours with re-dispatch or market transactions (i.e. the major drivers of the NPC deviations). More specifically:

[17] *See In the matter of PacifiCorp, dba Pacific Power, 2019 Integrated Resource Plan*, Docket No. LC 70, PacifiCorp's 2019 Integrated Resource Plan (Oct. 18, 2019).

[18] Note that battery storage can help with the imbalance problem, by servicing some of the short daily periods when there is less renewable output than expected. However, at the level of roughly 1 MW of storage per 16 MWs of renewables, this will not materially alter the NPC problems described herein. The large increase in renewables will overwhelm the storage offsets.

- In the hours when they do not produce as much as needed or expected, there may be higher than now-typical unit costs from paying fast-response resources or demand-response adjustments to load for absorbing the shortfalls, which can occur on short notice (and will be essentially impossible to forecast over the horizons of annual or longer rate-setting processes). So balancing energy costs may be higher and more volatile than in the past.
- There will tend to be more correlation across the entire power system fleet in output, as PacifiCorp and much of the WECC moves towards more renewables, because they are all responding to shared conditions from the sun or wind. It is of course true that there is geographic diversity across large regions (hundreds of miles or more) for when and where these renewable "fuels" will be active, but it is also true that huge areas (many states at a time) can experience similar weather of being overcast or not windy (or vice versa, very windy). Unlike fossil plants, whose outage characteristics are relatively independent, renewables will tend to face this risk jointly, thus causing much bigger (and perhaps more sudden) shifts over time in what I referred to as net load above.
- As the transportation and heating sectors are decarbonized, there will be more electric load on the system—by some estimates, perhaps doubling (or more) because the majority of greenhouse gases in the economy now stem much more from those sectors than from electricity generation. The apparently most economical way to reduce them is to convert those loads to electricity and

then supply those new needs with lower-emission power.[19] This shift will make weather sensitivity greater for the electric loads served by PacifiCorp and others.

Q. Can you provide some empirical support for these qualitative descriptions of the shift towards renewables?

A. Yes. According to the U.S. Energy Information's Administration (EIA) Annual Energy Outlook 2020, generation from renewables nationally will increase from 18 percent to 38 percent of total generation by 2050, with solar contributing to almost half of that share.[20] In the "West" region, which includes Oregon, Idaho, and Wyoming, EIA projects generation from renewables will double by 2050. Consistent with general market outlook, EIA anticipates that the wave of coal plant retirements will continue. In the last decade, coal plant owners retired (or planned to retire) more than 546 coal plant units, totaling about 102 gigawatts (GW) of generating capacity, or about 1/3 of the total coal fleet relative to 2008.[21] An additional 17 GW of coal capacity is planned to be retired by 2025.

Furthermore, states will need to accelerate their renewable deployment efforts in order to meet the greenhouse gas reduction and/or clean energy targets that I mention above.

[19] It is also possible that biofuels will become available so that those loads do not have to be electrified, but the process of making the clean biofuels may itself involve more electricity production than the end use energy they will serve. So either way, electric demands grow dramatically.

[20] U.S. ENERGY INFORMATION ADMINISTRATION, ANNUAL ENERGY OUTLOOK 2020 – ELECTRICITY, *available at* https://www.eia.gov/outlooks/aeo/pdf/AEO2020%20Electricity.pdf.

[21] U.S. ENERGY INFORMATION ADMINISTRATION, TODAY IN ENERGY (July 26, 2019), *available at* https://www.eia.gov/todayinenergy/detail.php?id=40212.

Q. Please summarize the consequences of this trend for NPC.

A. The main effects are to enlarge the difficulties already experienced. Renewable generation will be more significant but is difficult to forecast, especially far in advance for rate setting. Renewables can also be quite variable over the short run, and will tend to do so en masse rather than independently, creating shared conditions of overall shortfall or excess supply when they vary from expectations, likely pushing replacement market prices far off of their prior expectations as well. And there will be more load exposed to this situation, so the total costs at risk will be larger (offset in part by the expected part of the energy price, when the renewables perform as hoped, lower in cost). Overall, it should be beneficial, but it will make NPC variance due to uncertainty in net load much greater. And as shown above, those variances tend to cause losses on either side, whether positive or negative, because of their correlation with market prices and the asymmetry of prices for unplanned higher demand going up faster than they fall for unplanned softening of demand.

It is also likely that all the utilities in WECC will move to greater and greater reliance on market-mediated coordination as more renewables are used, largely to take advantage of geographic diversity and to share access to non-renewable balancing resources that may be used only occasionally (less often but more acutely) than such plants are now used. This means more of the balancing costs in NPC will depend on actions of other utilities that are not part of the control or forecasts of PacifiCorp.

VI. REVIEW OF PCAM IMPLEMENTATION IN OTHER STATES

Q. Have you reviewed the PCAM implementation in other states?

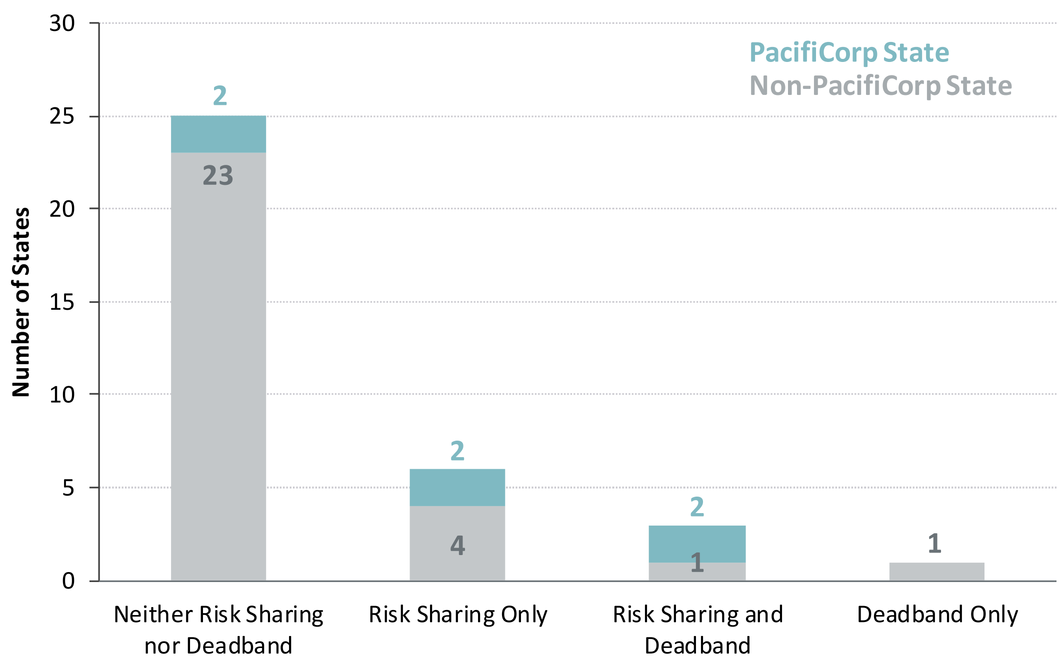
A. Yes. I have compiled state by state profiles of current policies towards PCAM-like cost recovery mechanism for vertically integrated utilities, excluding those that have unbundled generation from delivery services and/or that participate in an independent system operator (ISO) and within have deregulated merchant generation. For instance, this means that Texas utilities in the Electric Reliability Council of Texas are irrelevant, as are the vertically unbundled utilities in PJM, New York, etc.—but the vertically bundled utilities in Midcontinent Independent System Operator (MISO) are relevant. In total, I reviewed the fuel adjustment clauses in force in 2019 across 35 states that have regulated electricity power supply. The results of my survey detailing the structure of each state's enacted adjustment clauses is attached as Exhibit PAC/602.

Q. Based on your review, is the Company's existing PCAM consistent with those of most electric utilities around the country?

A. No. The Company's existing PCAM, which includes risk sharing of 90 percent to customers and 10 percent to stakeholders outside a deadband range of -$15 million to $30 million, and then profit collars on whether the magnitude is material, is inconsistent with prevalent industry practice in two regards. First, of the 35 relevant states, the vast majority do not apply any risk-sharing mechanisms or deadbands, instead passing through all NPC-type costs 100 percent to customers (often subject to an occasional prudence review). A handful apply one or both of risk-sharing or deadbands, but often those are states in which PacifiCorp operates. Thus, PacifiCorp's exposure to this policy is almost unique. Second, the few risk-sharing mechanisms that are applied elsewhere are usually milder and more symmetrical than those facing PacifiCorp.

These findings are summarized in Figure 9 below. For each bar, the teal shading indicates the number of states in which PacifiCorp operates, while the gray shading represents the remaining states in which PacifiCorp does not operate. For example, PacifiCorp states make up two out of the six states with a risk-sharing mechanism only, and two out of three of the states with both a risk-sharing and deadband mechanism. In other words, nearly half of all states with risk sharing are states that lie within PacifiCorp's service territory.

Figure 9: Structure of Fuel Adjustment Clauses in Benchmarked States



Source and Notes:

The Brattle Group interpretation of deadband and risk-sharing mechanisms, based on descriptions of fuel adjustment clauses in SNL Energy Regulatory Research Associates (RRA) summaries and utility filings. PacifiCorp states consist of those in the service territories of Pacific Power (California, Washington, Oregon) or Rocky Mountain Power (Idaho, Utah, and Wyoming).

Digging under the surface of these results, of the three states that have both risk-sharing and deadbands, two are Oregon and Washington where PacifiCorp operates. Of the six other states with just a risk-sharing mechanism, five (Hawaii, Idaho, Missouri, Montana, and Wyoming) generally allow their utilities to recover between 90 percent and 98 percent of cost variations, with the exception of a 70 percent sharing clause for PacifiCorp's PCAM in Wyoming.[22] Thus these other utilities' recovery shares are either consistent with or higher than the one under PacifiCorp's current PCAM in Oregon. Perhaps more importantly, those shared amounts are not subject to asymmetric deadbands or wide profit collars that further skew or restrict cost recovery. Thus they are more amenable to neutral (zero) expected impacts on costs, to the extent that forecasting errors tend to balance out over time.

Q. Is there any important distinction in these patterns when focusing on just vertically integrated utilities in regional-transmission organizations (RTOs) and ISO regions?

A. No. Of the 35 regulated states, 20 operate in RTO/ISO regions.[23] I analyzed the adjustment clauses for their utilities (that participate in these RTO/ISO markets while owning their own generation) and found they almost all have full and unfettered flow-

[22] In Wyoming, Cheyenne Light Fuel & Power can only allocate 85 percent of steam production cost variations to ratepayers, but 95 percent of all other eligible costs, with the latter making up a vast majority of its power costs. The fifth state with a risk sharing mechanism, but no deadband, Arizona, has eliminated the 90/10 cost-sharing mechanism that was in place in 2012, but maintains a $0.004/kWh annual cap on increases or decreases to the adjustment clause. If a true-up stays in keeping with this cap, APS can recover its full fuel and purchased power costs.

[23] The 20 states I reviewed (Arkansas, California, Indiana, Iowa, Kansas, Kentucky, Louisiana, Minnesota, Mississippi, Missouri, Montana, New Mexico, North Carolina, North Dakota, Oklahoma, South Dakota, Vermont, Virginia, West Virginia, and Wisconsin) participate in California Independent System Operator, Independent System Operator of New England, MISO, PJM, and Southwest Power Pool.

through of NPC-type costs. Only two (Vermont and Wisconsin) have fuel and purchased power adjustment clauses with deadbands. But in both cases, these deadbands are narrower than the current one in place for PacifiCorp's PCAM in Oregon, and they are completely symmetric, while the deadbands for Oregon are skewed to impose a larger share of losses for utilities than they allow retention of gains.[24] Similarly, only three states (Vermont, Missouri, Montana) incorporate a risk-sharing mechanism for recovery of fuel and purchased power costs.

VII. CONCLUSIONS

Q. Please summarize your conclusions.

A. Due to Oregon's wide and asymmetric deadbands and profit collars on NPC risk-sharing, PacifiCorp has experienced systematic NPC under-recovery in the past several years, which has accumulated to approximately $77 million of losses since 2014. These shortfalls are not arising because of occasional bad luck in the market, or bad forecasting, or improper or inefficient operations, but because of a flawed design for the PCAM mechanism itself.

As constructed, the PCAM does not accommodate the fact that due to more reliance on renewables and market participation (both beneficial on average), there is more irreducible forecast error in the projected NPCs. Worse, the error is not just noise but a downward bias, whereby the costs of balancing the system are intrinsically missed and omitted from the requested total costs. As a result, realized NPC tend to be higher than were forecast in rates, and there is persistent under-

[24] Wisconsin has a deadband of +/- 2 percent, and Vermont has a deadband of +/- $0.3 million per year. In contrast, the current deadband for PacifiCorp in Oregon is -$15 million over-recovery and +$30 million under-recovery, representing about 4-8 percent of the actual NPC in Oregon. That is, the Company needs a very large (8 percent) under-recovery of its Oregon NPC before it can even qualify for partial sharing.

recovery. Balancing transactions are not forecast precisely because they arise from realized conditions not being like the forecast. Perhaps surprisingly, when they occur, they tend to involve losses whether purchases or sales. This is because if more supply is needed than was expected, it will tend to have to be purchased in a tight market in which others are often experiencing similar shortages (or it must be supplied from the highest part of the dispatch supply curve that was not planned to be used). On the other side, when realized demand is below forecast, sales of unneeded power or fuel will tend to be dumped into a soft market with less than full recovery of whatever covering transactions or expenses were normally expected to have been needed.

These difficulties are normal for utility planning, but it is not normal for a utility to have to absorb most of such variances from forecast costs. It would be one thing to put the variances at risk or disallow the variances if the unrecovered costs stemmed from factors that PacifiCorp could control. Here, that is not the case, so there is no efficiency or incentive benefit to imposing risk-sharing on NPC. As I have demonstrated, the large volume of purchases and sales for system balancing in the wholesale markets are the main drivers. It is intuitive that these transactions occur due to many factors that are beyond PacifiCorp's control or prediction, because the Company would have to not only accurately forecast the conditions of its system (e.g. all the short-term weather) throughout the test year but also to correctly anticipate the needs, surprises, and (re)actions of other market participants throughout the market region(s). This is clearly impossible. Indeed, best-practices market modeling tools do not even support simulating most of those elements.

PacifiCorp's increasing use of renewables and broader participation in regional power markets is a good thing, surely reducing NPC on average. But doing so comes with a side-effect of more exposure to short-term, uncontrollable, difficult to forecast, and only partially hedge-able transactions that tend to have a persistent net cost. This net cost is inadvertently excluded from the base rates. All utilities face this problem, and since it is uncontrollable and not able to be fixed with better forecasting, the vast majority of their state regulators allow full cost recovery of NPC with no risk sharing. Only a handful impose any risk-sharing or deadband conditions, and those are 1) mostly the PacifiCorp states and 2) they mostly have milder and more symmetric risk sharing than Oregon. Thus, it is not normal business risk in the industry to face losses from these prudent costs.

A better solution, which would put PacifiCorp in risk-exposure parity with other investor-owned utilities, would be to go to full cost flow-through of NPC to customers, subject to a prudence review of actual operations. This would be a more relevant form of oversight than the current arrangement, which tends to confound intrinsic forecasting difficulties with business operations. Making this improvement in regulatory practice likely to become even more important in the future, due to the strong shift towards more renewable generation in the PacifiCorp fleet (and throughout much of the WECC).

Q. Does this conclude your direct testimony?

A. Yes it does.

Docket No. UE 374
Exhibit PAC/601
Witness: Frank Graves

BEFORE THE PUBLIC UTILITY COMMISSION

OF OREGON

PACIFICORP

Exhibit Accompanying Direct Testimony of Frank Graves

Resume

February 2020

FRANK C. GRAVES

Principal

Boston, MA | +1.617.864.7900 | Frank.Graves@brattle.com

Mr. Frank C. Graves is a Principal of The Brattle Group who specializes in regulatory and financial economics, especially for electric and gas utilities, and in litigation matters related to securities litigation, damages from breached energy contracts, and risk management.

He has over 35 years of experience assisting utilities in forecasting, valuation, and risk analysis of many kinds of long range planning and service design decisions, such as generation and network capacity expansion, fuel and gas supply procurement and hedging, pricing and cost recovery mechanisms, cost and performance benchmarking, renewable asset selection and contracting, and new business models for distributed energy technologies. He has testified before many state regulatory commissions and the FERC as well as in state and federal courts and arbitration proceedings on such matters as integrated resource planning (IRPs), energy contract disputes, the prudence of investment and contracting decisions, risk management, costs and benefits of new services, policy options for industry restructuring, adequacy of market competition, and competitive implications of proposed mergers and acquisitions.

In the area of financial economics, he has assisted and testified in civil cases in regard to contract damages estimation, securities litigation suits, special purpose audits, tax disputes, risk management, and cost of capital estimation, and he has testified in criminal cases regarding corporate executives' culpability for securities fraud.

He received an M.S. with a concentration in finance from the M.I.T. Sloan School of Management in 1980, and a B.A. in Mathematics from Indiana University in 1975.

Recent Activities

Client Engagements

- Uncertainty over the pace and extent of potential distributed energy resources (DERs) adoption by customers makes load forecasting and system planning much more complex, possibly involving future "tipping points" when DER use could accelerate rapidly. However, statistical histories on these improving technologies are not yet very informative as to when or why such a shift might occur. Mr. Graves has assisted several distribution utilities with a new, behavior-based modeling technique for long range system planning that simulates possible paths to DER adoption, utilizing system dynamics methods that recognize the feedbacks between offered electricity prices, customers' propensities to use DERs, declining technology costs, cost shifting to non-users, and other interdependencies.
- With improvements in performance and cost of microgeneration, many hospitals, universities, and similar campuses are considering combined heat and power supply as an alternative to utility energy services. Mr. Graves has helped several such entities evaluate potential benefits of CHP, including choosing the preferred size and mix of technology and risk analysis of terms in financial and operating contracts for the CHP systems.
- Several states and cities have set goals of deep decarbonization of their local economies, often dubbed "80 by 50" if they aspire to 80% reductions in GHG emissions by 2050. Achieving this will involve radical change in the economy of those regions, potentially with dramatic load growth due to electrification and massive investment in new infrastructure for end-use and power supply and delivery. Mr. Graves has built models that show what types and degree of change could arise, and what they might cost depending on how such transformations are incentivized or enforced.
- Wildfires in California have become catastrophic in the past few years, creating both financial turmoil for the utilities and controversy over how to insure and manage this problem. Mr. Graves has been extensively involved in estimating the expected, growing cost of this problem and the design of mechanisms to insure it and compensate investors for the likelihood of uncompensated costs from fire damages.

Testimony

On behalf of Public Service Company of New Mexico, presented testimony before the New Mexico Public Regulation Commission on the merits of replacing the San Juan Generating Station coal units with a fleet of renewables, storage and gas-fired peakers, and on the reasons for appropriateness of allowing full recovery of sunk costs despite early retirement. Case No. 19-00018-UT, November 15, 2019.

On behalf of both Southern California Edison and Pacific Gas & Electric Company, presented direct and rebuttal testimony co-authored with Robert Mudge in regard to cost of wildfire risk under AB 1054, a state policy to create a fire insurance mechanism. Applications 19-04-014 and 19-04-015, September 4, 2019.

For Nicor Gas, a natural gas distribution company, Mr. Graves co-authored testimony on the cost of equity capital utilizing a broad spectrum of risk-pricing methods and explaining how financial leverage affects it. Testimony was filed with the Illinois Commerce Commission, Docket 18-xxxx, November 9, 2018.

For the electric transmission division of Pacific Gas & Electric, Mr. Graves presented testimony and co-authored an accompanying report on the cost of capital impacts from the extreme risks arising from potential liability for damages caused by large wildfires in California. Testimony before the FERC, Docket ER19- ___ - 000, Exhibit PGE-0019, October 1, 2018.

For the Government of Colombia, written and oral testimony in regard to apparent misrepresentations of coal mine development costs and expected profitability by Glencore Corporation that adversely affected royalty payments for Colombia. Heard in the International Court of Arbitration, ICSID Case No ARB/16/6, Washington DC, June 2018.

REPRESENTATIVE ENGAGEMENTS

Utility Planning and Operations

- Uncertainty over the pace and extent of potential distributed energy resources (DERs) adoption by customers makes load forecasting and system planning much more complex, possibly involving future "tipping points" when DER use could accelerate rapidly. However, statistical histories on these improving technologies are not yet very informative as to when or why such a shift might occur. Mr. Graves has assisted several distribution utilities with a new, behavior-based modeling technique for long range system planning that simulates possible paths to DER adoption, utilizing system dynamics methods that recognize the feedbacks between offered electricity prices, customers' propensities to use DERs, declining technology costs, cost shifting to non-users, and other interdependencies.
- Many large high-tech firms are selling power supply services relying entirely on renewable resources. This can only be done for average or cumulative power needs, but the resulting green energy production will not match the time pattern of those firms' demand. Mr. Graves lead a team evaluating how much risk is borne by a utility from offering such service over many years, when it will have to balance a significant green supply (such as rooftop and utility-scale solar) against its own load and the regional market.
- With improvements in performance and cost of microgeneration, many hospitals, universities, and similar campuses are considering combined heat and power supply as an alternative to utility energy services. Mr. Graves has helped several such entities evaluate potential benefits of CHP, including choosing the preferred size and mix of technology and risk analysis of terms in financial and operating contracts for the CHP systems.
- Many utilities are facing a concern through the expected useful lives of their coal plants are being shortened by low gas prices and increased use of renewables. Mr. Graves helped a utility justify early retirement of a coal plant with full recovery of its stranded costs, when that plan could be replaced more economically with new wind plants while the tax incentives for their development were still in effect.
- Mr. Graves developed a valuation and risk analysis model showing that a utility's RFP for new generation could be better served by deferring new plant construction for a few years via a less costly and less risky transitional market-based power supply contract with price and quantity terms shaped to match the shifting needs over time until supply shortfalls were large enough to justify the investment in a new power plant at efficient scale. The parties negotiated a multi-year contract along these lines in lieu of pursuing the construction alternative that initially came out of the RFP selection.

- In Maryland the electric distribution companies administer SOS (Standard Offer Service) supply procurement and accounting to backup customers who do not use a competitive retail power supplier. The utilities are authorized to recover both the direct and financing costs of that service plus a return on equity. Mr. Graves developed a method for sizing an appropriate equity return for the SOS risks and administrative services based on analogies to various intermediation businesses on the internet, such as EBay, PayPal, and others—in which, like SOS intermediation, the businesses do not take ownership for the products conveyed. Testimony was provided.
- Mr. Graves co-lead a team of Brattle analysts to assess the relative influence of different factors that were affected by the "Polar Vortex" cold snap of early 2014 that caused dramatic spikes in local power and gas prices in parts of the mid-Atlantic and northeastern US. The risks of similar recurring events were assessed in light of pending expansions of the electric and gas transmission grids, as well as likely coal plant retirements.
- For the Board of Directors or executive management teams of several utilities, Mr. Graves has lead strategic retreats on disruptive issues facing the electric industry in the future and how a utility should choose which risks and opportunities to embrace vs. avoid.
- Air quality and other power plant environmental regulations are being tightened considerably in the period from about 2014-2018. Mr. Graves has co-developed a market and financial model for determining what power plants are most likely to retire vs. retrofit with new environmental controls, and how much this may alter their profitability. This has been used to help several power market participants assess future capacity needs, as well as to adjust their price forecasts for the coming decade.
- Successful merchant power plant development and financing depends in part on obtaining a long term power purchase agreement. Mr. Graves directed a study of what pricing points and risk-sharing terms should be attractive to potential buyers of long-term power supply contracts from a large baseload facility.
- Many utilities are pursuing smart meters and time-of-use pricing to increase customer ability to consume electricity economically. Mr. Graves has led a study of the costs and benefits of different scales and timing of installation of such meters, to determine the appropriate pace. He has also evaluated how various customer incentives to increase conservation and demand response might be provided over the internet, and how much they might increase the participation rates in smart meter programs.
- Wind resources are a critical part of the generation expansion plans and contracting interests of many utilities, in order to satisfy renewable portfolio standards and to reduce long run exposure to carbon prices and fuel cost uncertainty. Mr. Graves has applied Brattle's risk modeling capabilities to simulate the impacts of on- and off-shore wind resources on the potential range of costs for portfolios of wholesale power contracts designed to serve retail electricity loads. These impacts were compared to gas CCs and CTs and to simply buying more from the wholesale market to identify the most economical supply strategy.

- For a municipal utility with an opportunity to invest in a nuclear power plant expansion, Mr. Graves lead an analysis of how the proposed plant fit the needs of the company, what market and regulatory (environmental) conditions would be required for the plant to be more economical than conventional fossil-fired generation, and how the development risks could be shared among co-owners to better match their needs and risk tolerances. He also assessed the market for potential off-take contracts to recover some of the costs and capacity that would be available for a few years, ahead of the needs of the municipal utility.
- The potential introduction of environmental restrictions or fees for CO2 emissions has made generation expansion decisions much more complex and risky. He helped one utility assess these risks in regard to a planned baseload coal plant, finding that the value of flexibility in other technologies was high enough to prefer not building a conventional coal plant.
- Mr. Graves helped design, implement, and gain regulatory approvals for a natural gas procurement hedging program for a western U.S. gas and electric utility. A model of how gas forward prices evolve over time was estimated and combined with a statistical model of the term structure of gas volatility to simulate the uncertainty in the annual cost of gas at various times during its procurement, and the resulting impact on the range of potential customer costs.
- Generation planning for utilities has become very complex and risky due to high natural gas prices and potential CO2 restrictions of emission allowances. Some of the scenarios that must be considered would radically alter system operations relative to current patterns of use. Mr. Graves has assisted utilities with long range planning for how to measure and cope with these risks, including how to build and value contingency plans in their resource selection criteria, and what kinds of regulatory communications to pursue to manage expectations in this difficult environment.
- For a Midwestern utility proposing to divest a nuclear plant, Mr. Graves analyzed the reasonableness of the proposed power buyback agreement and the effects on risks to utility customers from continued ownership vs. divestiture. The decommissioning funds were also assessed as to whether their transfer altered the appropriate purchase price.
- Several utilities with coal-fired power plants have faced allegations from the U.S. EPA that they have conducted past maintenance on these plants which should be deemed "major modifications", thereby triggering New Source Review standards for air quality controls. Mr. Graves has helped one such utility assess limitations on the way in which GADS data can be used retrospectively to quantify comparisons between past actual and projected future emissions. For another utility, Mr. Graves developed retrospective estimates of changes in emissions before and after repairs using production costing simulations. In a third, he reviewed contemporaneous corporate planning documents to show that no increase in emissions would have been expected from the repairs, due to projected reductions in future use of the plant as well as higher efficiency. In all three cases, testimony was presented.

- The U.S. Government is contractually obligated to dispose of spent nuclear fuel at commercial reactors after January 1998, but it has not fulfilled this duty. As a result, nuclear facilities that are shutdown or facing full spent fuel pools are facing burdensome costs and risks. Mr. Graves prepared developed an economic model of the performance that could have reasonably been expected of the government, had it not breached its contract to remove the spent fuel.
- Capturing the full value of hydroelectric generation assets in a competitive power market is heavily dependent on operating practices that astutely shift between real power and ancillary services markets, while still observing a host of non-electric hydrological constraints. Mr. Graves led studies for several major hydro generation owners in regard to forecasting of market conditions and corresponding hydro schedule optimization. He has also designed transfer pricing procedures that create an internal market for diverting hydro assets from real power to system support services firms that do not yet have explicit, observable market prices.
- Mr. Graves led a gas distribution company in the development of an incentive ratemaking system to replace all aspects of its traditional cost of service regulation. The base rates (for non-fuel operating and capital costs) were indexed on a price-cap basis (RPI-X), while the gas and upstream transportation costs allowances were tied to optimal average annual usage of a reference portfolio of supply and transportation contracts. The gas program also included numerous adjustments to the gas company's rate design, such as designing new standby rates so that customer choice will not be distorted by pricing inefficiencies.
- An electric utility with several out-of-market independent power contracts wanted to determine the value of making those plants dispatchable and to devise a negotiating strategy for restructuring the IPP agreements. Mr. Graves developed a range of forecasts for the delivered price of natural gas to this area of the country. Alternative ways of sharing the potential dispatch savings were proposed as incentives for the IPPs to renegotiate their utility contracts.
- For an electric utility considering the conversion of some large oil-fired units to natural gas, Mr. Graves conducted a study of the advantages of alternative means of obtaining gas supplies and gas transportation services. A combination of monthly and daily spot gas supplies, interruptible pipeline transportation over several routes, gas storage services, and "swing" (contingent) supply contracts with gas marketers was shown to be attractive. Testimony was presented on why the additional services of a local distribution company would be unneeded and uneconomic.
- A power engineering firm entered into a contract to provide operations and maintenance services for a cogenerator, with incentives fees tied to the unit's availability and operating cost. When the fees increased due to changes in the electric utility tariff to which they were tied, a dispute arose. Mr. Graves provided analysis and testimony on the avoided costs associated with improved cogeneration performance under a variety of economic scenarios and under several alternative utility tariffs.

- Mr. Graves has helped several pipelines design incentive pricing mechanisms for recovering their expected costs and reducing their regulatory burdens. Among these have been Automatic Rate Adjustment Mechanisms (ARAMs) for indexation of operations and maintenance expenses, construction-cost variance-sharing for routine capital expenditures that included a procedure for eliciting unbiased estimates of future costs, and market-based prices capped at replacement costs when near-term future expansion was an uncertain but probable need.
- For a major industrial gas user, he prepared a critique of the transportation balancing charges proposed by the local gas distribution company. Those charges were shown to be arbitrarily sensitive to the measurement period as well as to inconsistent attribution of storage versus replacement supply costs to imbalance volumes. Alternative balancing valuation and accounting methods were shown to be cheaper, more efficient, and simpler to administer. This analysis helped the parties reach a settlement based on a cash-in/cash-out design.
- The Clean Air Act Amendments authorized electric utilities to trade emission allowances (EAs) as part of their approach to complying with SO2 emissions reductions targets. For the Electric Power Research Institute (EPRI), Mr. Graves developed multi-stage planning models to illustrate how the considerable uncertainty surrounding future EA prices justifies waiting to invest in irreversible control technologies, such as scrubbers or SCRs, until the present value cost of such investments is significantly below that projected from relying on EAs.
- For an electric utility with a troubled nuclear plant, Mr. Graves presented testimony on the economic benefits likely to ensue from a major reorganization. The plant was to be spun off to a jointly-owned subsidiary that would sell available energy back to the original owner under a contract indexed to industry unit cost experience. This proposal afforded a considerable reduction of risk to ratepayers in exchange for a reasonable, but highly uncertain prospect of profits for new investors. Testimony compared the incentive benefits and potential conflicts under this arrangement to the outcomes foreseeable from more conventional incentive ratemaking arrangements.
- Mr. Graves helped design Gas Inventory Charge (GIC) tariffs for interstate pipelines seeking to reduce their risks of not recovering the full costs of multi-year gas supply contracts. The costs of holding supplies in anticipation of future, uncertain demand were evaluated with models of the pipeline's supply portfolio that reveal how many non-production costs (demand charges, take-or-pay penalties, reservation fees, or remarketing costs for released gas) would accrue under a range of demand scenarios. The expected present value of these costs provided a basis for the GIC tariff.
- Mr. Graves performed a review and critique of a state energy commission's assessment of regional natural gas and electric power markets in order to determine what kinds of pipeline expansion into the area was economic. A proposed facility under review for regulatory approval was found to depend strongly on uneconomic bypass of existing

pipelines and LDCs. In testimony, modular expansion of existing pipelines was shown to have significantly lower costs and risks.

- For several electric utilities with generation capacity in excess of target reserve margins, Mr. Graves designed and supervised market analyses to identify resale opportunities by comparing the marginal operating costs of all this company’s power plants not needed to meet target reserves to the marginal costs for almost 100 neighboring utilities. These cost curves were then overlaid on the corresponding curve for the client utility to identify which neighbors were competitors and which were potential customers. The strength of their relative threat or attractiveness could be quantified by the present value of the product of the amount, duration, and differential cost of capacity that was displaceable by the client utility.
- Mr. Graves specified algorithms for the enhancement of the EPRI EGEAS generation expansion optimization model, to capture the first-order effects of financial and regulatory constraints on the preferred generation mix.
- For a major electric power wholesaler, Mr. Graves developed a framework for estimating how pricing policies affect the relative attractiveness of capacity expansion alternatives. Traditional cost-recovery pricing rules can significantly distort the choice between two otherwise equivalent capacity plans, if one includes a severe “front end load” while the other does not. Price-demand feedback loops in simulation models and quantification of consumer satisfaction measures were used to appraise the problem. This “value of service” framework was generalized for the Electric Power Research Institute.
- For a large gas and electric utility, Mr. Graves participated in coordinating and evaluating the design of a strategic and operational planning system. This included computer models of all aspects of utility operations, from demand forecasting through generation planning to financing and rate design. Efforts were split between technical contributions to model design and attention to organizational priorities and behavioral norms with which the system had to be compatible.
- For an oil and gas exploration and production firm, Mr. Graves developed a framework for identifying what industry groups were most likely to be interested in natural gas supply contracts featuring atypical risk-sharing provisions. These provisions, such as price indexing or performance requirements contingent on market conditions, are a form of product differentiation for the producer, allowing it to obtain a price premium for the insurance-like services.
- For a natural gas distribution company, Mr. Graves established procedures for redefining customer classes and for repricing gas services according to customers' similarities in load shape, access to alternative gas supplies, expected growth, and need for reliability. In this manner, natural gas service was effectively differentiated into several products, each with price and risk appropriate to a specific market. Planning tools were developed for balancing gas portfolios to customer group demands.

- For a Midwestern electric utility, Mr. Graves extended a regulatory pro forma financial model to capture the contractual and tax implications of canceling and writing off a nuclear power plant in mid-construction. This possibility was then appraised relative to completion or substitution alternatives from the viewpoints of shareholders (market value of common equity) and ratepayers (present value of revenue requirements).
- For a corporate venture capital group, Mr. Graves conducted a market-risk assessment of investing in a gas exploration and production company with contracts to an interstate pipeline. The pipeline's market growth, competitive strength, alternative suppliers, and regulatory exposure were appraised to determine whether its future would support the purchase volumes needed to make the venture attractive.
- For a natural gas production and distribution company, he developed a strategic plan to integrate the company's functional policies and to reposition its operations for the next five years. Decision analysis concepts were combined with marginal cost estimation and financial pro forma simulation to identify attractive and resilient alternatives. Recommendations included target markets, supply sources, capital budget constraints, rate design, and a planning system. A two-day planning conference was conducted with the client's executives to refine and internalize the strategy.
- For the New Mexico Public Service Commission, he analyzed the merits of a corporate reorganization of the major New Mexico gas production and distribution company. State ownership of the company as a large public utility was considered but rejected on concerns over efficiency and the burdening of performance risks onto state and local taxpayers.

Regulated Industry Policy and Restructuring

- Several states and cities have set goals of deep decarbonization of their local economies, often dubbed “80 by 50” if they aspire to 80% reductions in GHG emissions by 2050. Achieving this will involve radical change in the economy of those regions, potentially with dramatic load growth due to electrification and massive investment in new infrastructure for end-use and power supply and delivery. Mr. Graves has built models that show what types and degree of change could arise, and what they might cost depending on how such transformations are incentivized or enforced.
- As wholesale power and natural gas prices have fallen, interest in “retail choice” for energy supply has increased. At the same time, some state regulatory agencies have become concerned that misleading marketing and non-competitive pricing are too common in the mass market, especially afflicting low income and senior residential customers. Mr. Graves lead a review of such concerns that compared practices and market performance in several states to identify what could be done to improve such services.
- For a group of utilities responding to a state mandate to consider means of encouraging distributed technologies to be assessed and incentivized in parity with central station generation, Mr. Graves and others at Brattle prepared alternative means of incorporating

marginal cost and externality value considerations into new cost/benefit assessment tools, procurement mechanisms, and supply contracting.

- For a mid-Atlantic gas distribution utility, Mr. Graves assessed mark to market losses that had occurred from gas supply hedges entered before spot prices declined precipitously. Concerns were voice that this outcome indicated the company's hedging practices were no longer attune to market conditions, so Mr. Graves developed and lead workshop between the company, intervener groups, and state commission staff to define new appropriate goals, mechanisms and review standards for revised risk management approach.
- For a major participant in the Japanese power industry contemplating reorganization of that country's electric sector following Fukushima, Mr. Graves lead a research project on the performance of alternative market designs around the US and around the world for vertical unbundling, RTO design, and retail choice.
- For several utilities facing the end of transitional "provider of last resort" (or POLR) prices, Mr. Graves developed forecasts and risk analyses of alternative procurement mechanisms for follow-on POLR contracts. He compared portfolio risk management approaches to full requirements outsourcing under various terms and conditions.
- For a large municipal electric and gas company considering whether to opt-in to state retail access programs, Mr. Graves lead an analysis of what changes in the level and volatility of customer rates would likely occur, what transition mechanisms would be required, and what impacts this would have on city revenues earned as a portion of local electric and gas service charges.
- Many utilities experienced significant "rate shock" when they ended "rate freeze" transition periods that had been implemented with earlier retail restructuring. The adverse customer and political reactions have led to proposals to annual procurement auctions and to return to utility-owned or managed supply portfolios. Mr. Graves has assisted utilities and wholesale gencos with analyses of whether alternative supply procurement arrangements could be beneficial.
- The impacts of transmission open access and wholesale competition on electric generators risks and financial health are well documented. In addition, there are substantial impacts on fuel suppliers, due to revised dispatch, repowerings and retirements, changes in expansion mix, altered load shapes and load growth under more competitive pricing. For EPRI, Mr. Graves co-authored a study that projected changes in fuel use within and between ten large power market regions spanning the country under different scenarios for the pace and success of restructuring.
- As a result of vertical unbundling, many utilities must procure a substantial portion of their power from resources they do not own or operate. Market prices for such supplies are quite volatile. In addition, utilities may face future customer switching to or from their supply service, especially if they are acting as provider of last resort (POLR). This problem is a blending of risk management with the traditional least-cost Integrated Resource Planning (IRP). Regulatory standards for findings of prudence in such a hybrid environment are

often not well understood or articulated, leaving utilities at risk for cost disallowances that can jeopardize their credit-worthiness. Mr. Graves has assisted several utilities in devising updated procurement mechanisms, hedging strategies, and associated regulatory guidelines that clarify the conditions for approval and cost recovery of resource plans, in order to make possible the expedited procurement of power from wholesale market suppliers.

- Public power authorities and cooperatives face risks from wholesale restructuring if their sales-for-resale customers are free to switch to or from supply contracting with other wholesale suppliers. Such switching can create difficulties in servicing the significant debt capitalization of these public power entities, as well as equitable problems with respect to non-switching customers. Mr. Graves has lead analyses of this problem, and has designed alternative product pricing, switching terms and conditions, and debt capitalization policies to cope with the risks.
- As a means of unbundling to retain ownership but not control of generation, some utilities turned to divesting output contracts. Mr. Graves was involved in the design and approval of such agreements for a utility's fleet of generation. The work entailed estimating and projecting cost functions that were likely to track the future marginal and total costs of the units and analysis of the financial risks the plant operator would bear from the output pricing formula. Testimony on risks under this form of restructuring was presented.
- Mr. Graves contributed to the design and pricing of unbundled services on several natural gas pipelines. To identify attractive alternatives, the marginal costs of possible changes in a pipeline's service mix were quantified by simulating the least-cost operating practices subject to the network's physical and contractual constraints. Such analysis helped one pipeline to justify a zone-based rate design for its firm transportation service. Another pipeline used this technique to demonstrate that unintended degradations of system performance and increased costs could ensue from certain proposed unbundling designs that were insensitive to system operations.
- For several natural gas pipeline companies, Mr. Graves evaluated the cost of equity capital in light of the requirements of FERC Order 636 to unbundle and reprice pipeline services. In addition to traditional DCF and risk positioning studies, the risk implications of different degrees of financial leverage (debt capitalization) were modeled and quantified. Aspects of rate design and cost allocation between services that also affect pipeline risk were considered.
- Mr. Graves assisted several utilities in forecasting market prices, revenues, and risks for generation assets being shifted from regulated cost recovery to competitive, deregulated wholesale power markets. Such studies have facilitated planning decisions, such as whether to divest generation or retain it, and they have been used as the basis for quantifying stranded costs associated with restructuring in regulatory hearings. Mr. Graves has assisted a leasing company with analyses of the tax-legitimacy of complex leasing transactions by reviewing the extent and quality of due diligence pursued by the lessor, the adequacy of pre-tax returns, the character, time pattern, and degree of risk borne by the

buyer (lessor), the extent of defeasance, and compliance with prevailing guidelines for true-lease status.

Financial Analysis and Commercial Litigation

- Wildfires in California have become catastrophic in the past 5 years, creating both financial turmoil for the utilities and controversy over how to insure and manage this problem. Mr. Graves has been extensively involved in estimating the expected, growing cost of this problem and the design of mechanisms to insure it and compensate investors for the likelihood of uncompensated costs from fire damages.
- Despite well settled financial economics, there is great regulatory controversy surrounding how or whether to make adjustments in cost of capital measurements for differences in leverage between the proxy firms used to estimate the rate and the capital structure of the target utility. Mr. Graves has lead analyses of how to demonstrate the need for this adjustment, with testimony given to explain the foundations.
- For the government of Colombia, Mr. Graves testified in arbitration about misrepresentations that occurred in the negotiation of royalties over coal mining production. Those negotiations resulted in a royalty scheme that was much more favorable to the coal company than would have been acceptable to Colombia had more realistic representations occurred. He showed that the mining companies own studies projected much higher value and more favorable operating conditions for the facility, and that alternative schedules for running the mine would have produced more value than was asserted possible by its owners.
- For the co-owners of the SONGS nuclear power plant that had become inoperable due to failed and irreparable steam generators, Mr. Graves provided written and oral testimony in arbitration over what damages had been incurred by the utilities from having to replace the nuclear plant with new generation, purchased power, and transmission upgrades, as well as accelerated decommissioning liabilities. His report evaluated the impacts of the lost plant on the entire western power market, including how it would change the needs and costs for emission allowances in the California GHG market. He estimated that damages were nearly $7 billion dollars.
- For an international energy company seeking to expand its operations in the US, Mr. Graves lead an assessment of the market performance risks facing a possible acquisition target, in order to determine what contingencies or market shifts were critical to it being an attractive target. Uncertain long run wholesale energy conditions, tightening environmental regulations, and disruptive technology development prospects were considered.

- For an international technology firm that had experienced a recent bankruptcy, Mr. Graves assisted in the design of a study of how the remaining valuable assets could be deemed assignable to disparate country-specific claims. Company operating practices for research and development risk and profit sharing were evaluated to identify an equitable approach.
- For a merchant power company with a prematurely terminated development contract, Mr. Graves co-lead a team to value the lost contract. The contract included several different kinds of revenue streams of different risks, for which Brattle developed different discount rates and debt carrying-capacity assessments. The case was settled with a very large award consistent with the Brattle valuations.
- Holding company utilities with many subsidiaries in different states face differing kinds of regulatory allowances, balancing accounts with differing lags and allowed returns for cost recovery, possibly different capital structures, as well as different (and varying) operating conditions. Given such heterogeneity, it can be difficult to determine which subsidiaries are performing well vs. poorly relative to their regulatory and operational challenges. Mr. Graves developed a set of financial reporting normalization adjustments to isolate how much of each subsidiary's profitability was due to financial, vs. managerial, vs. non-recurring operational conditions, so that meaningful performance appraisal was possible.
- Many banks, insurance firms and capital management subsidiaries of large multinational corporations have entered into long term, cross border leases of properties under sale and leaseback or lease in, lease out terms. These have been deemed to be unacceptable tax shelters by the IRS, but that is an appealable claim. Mr. Graves has assisted several companies in evaluating whether their cross border leases had legitimate business purpose and economic substance, above and beyond their tax benefits, due to likelihood of potentially facing a role as equity holder with ownership risks and rewards. He has shown that this is a case-specific matter, not per se determined by the general character of these transactions.
- For a private energy hedge fund providing risk management contracts to industrial energy users, a breach of contract from one industrial customer was disputed as supposedly involving little or no loss because the fund had not been forced to liquidate positions at a loss that corresponded precisely to the abruptly terminated contract. Mr. Graves provided analysis demonstrating how the portfolio loss was borne, but other fund management metrics used to control positions, and other unrelated hedging positions, also changed roughly concurrently in a manner that disguised the way the economic damage was realized over time. The case was settled on favorable terms for Mr. Graves' client.
- Many utilities have regulated and unregulated subsidiaries, which face different types and degrees of risk. Mr. Graves lead a study of the appropriate adjustments to corporate hurdle rates for the various lines of business of a utility with many types of operations.
- A company that incurred Windfall Tax liabilities in the U.K. regarded those taxes as creditable against U.S. income taxes, but this was disputed by the IRS. Mr. Graves lead a team that prepared reports and testimony on why the Windfall Tax had the character of a

typical excess profits tax, and so should be deemed creditable in the U.S. The tax courts concurred with this opinion and allowed the claimed tax deductions in full.

- For a defendant in a sentencing hearing for securities' fraud, Mr. Graves prepared an analysis of how the defendant's role in the corporate crisis was confounded by other concurrent events and disclosures that made loss calculations unreliable. At trial, the Government stipulated that it agreed with Mr. Graves' analysis.
- For the U.S. Department of Justice, Mr. Graves prepared an event study quantifying bounds on the economic harm to shareholders that had likely ensued from revelations that Dynegy Corporation's "Project Alpha" had been improperly represented as a source of operating income rather than as a financing. The event study was presented in the re-sentencing hearing of Mr. Jamie Olis, the primary architect of Project Alpha.
- Mr. Graves has assisted leasing companies with analyses of the tax-legitimacy of complex leasing transactions. These analyses involved reviewing the extent and quality of due diligence pursued by the lessor, the adequacy of pre-tax returns, the character, time pattern, and degree of risk borne by the buyer (lessor), the extent, purpose and cost of defeasance, and compliance with prevailing guidelines for true-lease status.
- For a utility facing significant financial losses from likely future costs of its Provider of Last Resort (POLR) obligations, Mr. Graves prepared an analysis of how optimal hindsight coverage of the liability would have compared in costs to a proposed restructuring of the obligation. He also reviewed the prudence of prior, actual coverage of the obligation in light of conventional risk management practices and prevailing market conditions of credit constraints and low long-term liquidity.
- Several banks were accused of aiding and abetting Enron's fraudulent schemes and were sued for damages. Mr. Graves analyzed how the stock market had reacted to one bank's equity analyst's reports endorsing Enron as a "buy," to determine if those reports induced statistically significant positive abnormal returns. He showed that individually and collectively they did not have such an effect.
- Mr. Graves lead an analysis of whether a corporate subsidiary had been effectively under the strategic and operational control of its parent, to such an extent that it was appropriate to "pierce the corporate veil" of limited liability. The analysis investigated the presence of untenable debt capitalization in the subsidiary, overlapping management staff, the adherence to normal corporate governance protocols, and other kinds of evidence of excessive parental control.
- As a tax-revenue enhancement measure, the IRS was considering a plan to recapture deferred taxes associated with generation assets that were divested or reorganized during state restructurings for retail access. Mr. Graves prepared a white paper demonstrating the unfairness and adverse consequences of such a plan, which was instrumental in eliminating the proposal.

- For a major electronics and semiconductor firm, Mr. Graves critiqued and refined a proposed procedure for ranking the attractiveness of research and development projects. Aspects of risk peculiar to research projects were emphasized over the standards used for budgeting an already proven commercial venture.
- In a dispute over damages from a prematurely terminated long-term power tolling contract, Mr. Graves presented evidence on why calculating the present value of those damages required the use of two distinct discount rates: one (a low rate) for the revenues lost under the low-risk terminated contract and another, much higher rate, for the valuation of the replacement revenues in the risky, short-term wholesale power markets. The amount of damages was dramatically larger under a two-discount rate calculation, which was the position adopted by the court.
- The energy and telecom industries, especially in the late 1990s and early 2000s, were plagued by allegations regarding trading and accounting misrepresentations, such as wash trades, manipulations of mark-to-market valuations, premature recognition of revenues, and improper use of off-balance sheet entities. In many cases, this conduct has preceded financial collapse and subsequent shareholder suits. Mr. Graves lead research on accounting and financial evidence, including event studies of the stock price movements around the time of the contested practices, and reconstruction of accounting and economic justifications for the way asset values and revenues were recorded.
- Dramatic natural gas price increases in the U.S. have put several natural gas and electric utilities in the position of having to counter claims that they should have hedged more of their fuel supplies at times in the past. Mr. Graves developed testimony to rebut this hindsight criticism and risk management techniques for fuel (and power) procurement for utilities to apply in the future to avoid prudence challenges.
- As a means of calculating its stranded costs, a utility used a partial spin-off of its generation assets to a company that had a minority ownership from public shareholders. A dispute arose as to whether this minority ownership might be depressing the stock price, if a "control premium" was being implicitly deducted from its value. Using event studies and structural analyses, Mr. Graves identified the key drivers of value for this partially spun-off subsidiary, and he showed that value was not being impaired by the operating, financial and strategic restrictions on the company. He also reviewed the financial economics literature on empirical evidence for control premiums, which he showed reinforced the view that no control premium de-valuation was likely to be affecting the stock.
- A large public power agency was concerned about its debt capacity in light of increasing competitive pressures to allow its resale customers to use alternative suppliers. Mr. Graves lead a team that developed an Economic Balance Sheet representation of the agency's electric assets and liabilities in market value terms, which was analyzed across several scenarios to determine safe levels of debt financing. In addition, new service pricing and upstream supply contracting arrangements were identified to help reduce risks.

- Wholesale generating companies intuitively realize that there are considerable differences in the financial risk of different kinds of power plant projects, depending on fuel type, length and duration of power purchase agreements, and tightness of local markets. However, they often are unaware of how if at all to adjust the hurdle rates applied to valuation and development decisions. Mr. Graves lead a Brattle analysis of risk-adjusted discount rates for generation; very substantial adjustments were found to be necessary.
- A major telecommunications firm was concerned about when and how to reenter the Pacific Rim for wireless ventures following the economic collapse of that region in 1997-99. Mr. Graves lead an engagement to identify prospective local partners with a governance structure that made it unlikely for them to divert capital from the venture if markets went soft. He also helped specify contracting and financing structures that create incentives for the venture to remain together should it face financial distress, while offering strong returns under good performance.
- There are many risks associated with operations in a foreign country, related to the stability of its currency, its macro economy, its foreign investment policies, and even its political system. Mr. Graves has assisted firms facing these new dimensions to assess the risks, identify strategic advantages, and choose an appropriate, risk-adjusted hurdle rate for the market conditions and contracting terms they will face.
- The glut of generation capacity that helped usher in electric industry restructuring in the US led to asset devaluations in many places, even where no retail access was allowed. In some cases, this has led to bankruptcy, especially of a few large rural electric cooperatives. Mr. Graves assisted one such coop with its long term financial modeling and rate design under its plan of reorganization, which was approved. Testimony was provided on cost-of-service justifications for the new generation and transmission prices, as well as on risks to the plan from potential environmental liabilities.
- Power plants often provide a significant contribution to the property tax revenues of the townships where they are located. A common valuation policy for such assets has been that they are worth at least their book value, because that is the foundation for their cost recovery under cost-of-service utility ratemaking. However, restructuring throws away that guarantee, requiring reappraisal of these assets. Traditional valuation methods, e.g., based on the replacement costs of comparable assets, can be misleading because they do not consider market conditions. Mr. Graves testified on such matters on behalf of the owners of a small, out-of-market coal unit in Massachusetts.
- Stranded costs and out-of-market contracts from restructuring can affect municipalities and cooperatives as well as investor-owned utilities. Mr. Graves assisted one debt-financed utility in an evaluation of its possibilities for reorganization, refinancing, and re-engineering to improve financial health and to lower rates. Sale and leaseback of generation, fuel contract renegotiation, targeted downsizing, spin-off of transmission, and new marketing programs were among the many components of the proposed new business plan.

- As a means of reducing supply commitment risk, some utilities have solicited offers for power contracts that grant the right but not the obligation to take power at some future date at a predetermined price, in exchange for an initial option premium payment. Mr. Graves assisted several of these utilities in the development of valuation models for comparing the asking prices to fair market values for option contracts. In addition, he has helped these clients develop estimates of the critical option valuation parameters, such as trend, volatility, and correlations of the future prices of electric power and the various fuel indexes proposed for pricing the optional power.
- For the World Bank and several investor-owned electric utilities, Mr. Graves presented tutorial seminars on applying methods of financial economics to the evaluation of power production investments. Techniques for using option pricing to appraise the value of flexibility (such as arises from fuel switching capability or small plant size) were emphasized. He has applied these methods in estimating the value of contingent contract terms in fuel contracts (such as price caps and floors) for natural gas pipelines.
- Mr. Graves prepared a review of empirical evidence regarding the stock market's reaction to alternative dividend, stock repurchase, and stock dividend policies for a major electric utility. Tax effects, clientele shifting, signaling, and ability to sustain any new policies into the future were evaluated. A one-time stock repurchase, with careful announcement wording, was recommended.
- For a division of a large telecommunications firm, Mr. Graves assisted in a cost benchmarking study, in which the costs and management processes for billing, service order and inventory, and software development were compared to the practices of other affiliates and competitors. Unit costs were developed at a level far more detailed than the company normally tracked, and numerical measures of drivers that explained the structural and efficiency causes of variation in cost performance were identified. Potential costs savings of 10-50 percent were estimated, and procedures for better identification of inefficiencies were suggested.
- For an electric utility seeking to improve its plant maintenance program, Mr. Graves directed a study on the incremental value of a percentage point decrease in the expected forced outage rate at each plant owned and operated by the company. This defined an economic priority ladder for efforts to reduce outage that could be used in lieu of engineering standards for each plant's availability. The potential savings were compared to the costs of alternative schedules and contracting policies for preventive and reactive maintenance, in order to specify a cost reduction program.
- Mr. Graves conducted a study on the risk-adjusted discount rate appropriate to a publicly-owned electric utility's capacity planning. Since revenue requirements (the amounts being discounted) include operating costs in addition to capital recovery costs, the weighted average cost of capital for a comparable utility with traded securities may not be the correct rate for every alternative or scenario. The risks implicit in the utility's expansion alternatives were broken into component sources and phases, weighted, and compared to

the risks of bonds and stocks to estimate project-specific discount rates and their probable bounds.

Market Competition

- Mr. Graves assisted a nuclear plant owner with an assessment of whether a proposed merger of a company in whom it had a partial investment interest would alter the co-owner's incentives to manage the plant for maximum stand-alone value of the asset. Structural and behavioral models of the relevant market were developed to determine that there would be no material changes in incentive or ability to affect the value of the asset.
- Mr. Graves has testified on the quality of retail competition in Pennsylvania and on whether various proposals for altering Default Service might create more robust competition.
- Regulatory and legal approvals of utility mergers require evidence that the combined entity will not have undue market power. Mr. Graves assisted several utilities in evaluating the competitive impacts of potential mergers and acquisitions. He has identified ways in which transmission constraints reduce the number and type of suppliers, along with mechanisms for incorporating physical flow limits in FERC's Delivered Price Test (DPT) for mergers. He has also assessed the adequacy of mitigation measures (divestitures and conduct restrictions) under the DPT, Market-Based Rates, and other tests of potential market power arising from proposed mergers.
- A major concern associated with electric utility industry restructuring is whether or not generation markets are adequately competitive. Because of the state-dependent nature of transmission transfer capability between regions, itself a function of generation use, the quality of competition in the wholesale generation markets can vary significantly and may be susceptible to market power abuse by dominant suppliers. Mr. Graves helped one of the largest ISOs in the U.S. develop market monitoring procedures to detect and discourage market manipulations that would impair competition.
- Vertical market power arises when sufficient control of an upstream market creates a competitive advantage in a downstream market. It is possible for this problem to arise in power supply, in settings where the likely marginal generation is dependent on very few fuel suppliers who also have economic interests in the local generation market. Mr. Graves analyzed this problem in the context of the California gas and electric markets and filed testimony to explain the magnitude and manifestations of the problem.
- The increased use of transmission congestion pricing has created interest in merchant transmission facilities. Mr. Graves assisted a developer with testimony on the potential impacts of a proposed line on market competition for transmission services and adjacent generation markets. He also assisted in the design of the process for soliciting and ranking bids to buy tranches of capacity over the line.
- Many regions have misgivings about whether the preconditions for retail electric access are truly in place. In one such region, Mr. Graves assisted a group of industrial customers with a critique of retail restructuring proposals to demonstrate that the locally weak

transmission grid made adequate competition among numerous generation suppliers very implausible.

- Mr. Graves assisted one of the early ISOs with its initial market performance assessment and its design of market monitoring tests for diagnosing the quality of prevailing competition.

Electric and Gas Transmission

- Substantial fleets of wind-based generation can impose significant integration costs on power systems. Mr. Graves assisted in assessing what additional amounts and costs for ancillary services would be needed for a Western utility with a large renewable fleet. The approach included a statistical analysis of how wind output was correlated with demand, and how much forecasting error in wind output was likely to be faced over different scheduling horizons. Benefits of geographic diversity of the wind fleet were also assessed.
- For a utility seeking FERC approval for the purchase of an affiliate's generating facility, Mr. Graves analyzed how transmission constraints affecting alternative supply resources altered their usefulness to the buyer.
- As part of a generation capacity planning study, he lead an analysis of how congestion premiums and discounts relative to locational marginal prices (LMPs) at load centers affected the attractiveness of different potential locations for new generation. At issue was whether the prevailing LMP differences would be stable over time, as new transmission facilities were completed, and whether new plants could exacerbate existing differentials and lead to degraded market value at other plants.
- Mr. Graves assisted a genco with its involvement in the negotiation and settlement of "regional through and out rates" (RTOR) that were to be abolished when MISO joined PJM. His team analyzed the distribution of cost impacts from several competing proposals, and they commented on administrative difficulties or advantages associated with each.
- For the electric utility regulatory commission of Colombia, S.A., Mr. Graves led a study to assess the inadequacies in the physical capabilities and economic incentives to manage voltages at adequate levels. The Brattle team developed minimum reactive power support obligations and supplement reactive power acquisition mechanisms for generators, transmission companies, and distribution companies.
- Mr. Graves conducted a cost-of-service analysis for the pricing of ancillary services provided by the New York Power Authority.
- On behalf of the Electric Power Research Institute (EPRI), Mr. Graves wrote a primer on how to define and measure the cost of electric utility transmission services for better planning, pricing, and regulatory policies. The text covers the basic electrical engineering of power circuits, utility practices to exploit transmission economies of scale, means of assuring system stability, economic dispatch subject to transmission constraints, and the

estimation of marginal costs of transmission. The implications for a variety of policy issues are also discussed.

- The natural gas pipeline industry is wedged between competitive gas production and competitive resale of gas delivered to end users. In principle, the resulting basis differentials between locations around the pipeline ought to provide efficient usage and expansion signals, but traditional pricing rules prevent the pipeline companies from participating in the marginal value of their own services. Mr. Graves worked to develop alternative pricing mechanisms and service mixes for pipelines that would provide more dynamically efficient signals and incentives.
- Mr. Graves analyzed the spatial and temporal patterns of marginal costs on gas and electric utility transmission networks using optimization models of production costs and network flows. These results were used by one natural gas transmission company to design receipt-point-based transmission service tariffs, and by another to demonstrate the incremental costs and uneven distribution of impacts on customers that would result from a proposed unbundling of services.

TESTIMONY

On behalf of Public Service Company of New Mexico, presented testimony before the New Mexico Public Regulation Commission on the merits of replacing the San Juan Generating Station coal units with a fleet of renewables, storage and gas-fired peakers, and on the reasons for appropriateness of allowing full recovery of sunk costs despite early retirement. Case No. 19-00018-UT, November 15, 2019.

On behalf of both Southern California Edison and Pacific Gas & Electric Company, presented direct and rebuttal testimony co-authored with Robert Mudge in regard to cost of wildfire risk under AB 1054, a state policy to create a fire insurance mechanism. Applications 19-04-014 and 19-04-015, September 4, 2019.

For Nicor Gas, a natural gas distribution company, Mr. Graves co-authored testimony on the cost of equity capital utilizing a broad spectrum of risk-pricing methods and explaining how financial leverage affects it. Testimony was filed with the Illinois Commerce Commission, Docket 18-xxxx, November 9, 2018.

For the electric transmission division of Pacific Gas & Electric, Mr. Graves presented testimony and co-authored an accompanying report on the cost of capital impacts from the extreme risks arising from potential liability for damages caused by large wildfires in California. Testimony before the FERC, Docket ER19- ___ - 000, Exhibit PGE-0019, October 1, 2018.

For the Government of Colombia, written and oral testimony in regard to apparent misrepresentations of coal mine development costs and expected profitability by Glencore Corporation that adversely affected royalty payments for Colombia. Heard in the International Court of Arbitration, ICSID Case No ARB/16/6, Washington DC, June 2018.

Before the Pennsylvania Public Utility Commission, written direct testimony for Philadelphia Gas Works, Docket No. R-2017-2586783, June 2017, regarding financial benchmarking of the company vs. investor owned and public agency peers, and the need for a rate increase to maintain financial metrics and cover future costs.

Direct testimony in regard to a claim for a share of lime consumption reduction costs obtained by Plum Point as one of SMEPA's power plant operator/suppliers, on behalf of SMEPA, before the American Arbitration Association in the matter of Southwest Mississippi Electric Power Association vs. Plum Point Energy Associates, Case No. 01-15-0002-6062, September 2016.

Direct, Rebuttal and Supplementary Rebuttal reports regarding damages from loss of a nuclear generation facility, on behalf of Southern California Edison Company, Edison Material Supply LLC., San Diego Gas and Electric Company and City of Riverside before the International Chamber of Commerce in the matter of Southern California Edison v. Mitsubishi Nuclear Energy Systems, Inc. and Mitsubishi Heavy Industries, Ltd., Case No. 19784/AGF/RD, July 27, 2015 (direct), January 19, 2016 (rebuttal) and March 14, 2016 (supplemental).

Direct report re determination of an appropriate level of return needed for Standard Offer Service (SOS), on behalf of Delmarva Power & Light Company and Potomac Electric Power Company before the Maryland Public Service, Case Nos. 9226 and 9232, July 24, 2015.

Direct testimony in regard to the prudence of its gas hedging, on behalf of Hope Gas, Inc., before the West Virginia Public Service Commission, Case No. 12-1070-G-30C, June 24, 2013.

Direct testimony on behalf of Public Service Company of New Mexico before the NM Public Regulation Commission re appropriate profit incentives for energy conservation activities, Case No. 12-00317-UT, October 5, 2012.

Rebuttal testimony on behalf of Rocky Mountain Power Company before the Public Service Commission of Utah in regard to hedging practices for natural gas supply, Docket 11-035-200, July 2012.

Rebuttal testimony on behalf of Rocky Mountain Power Company before the Public Service Commission of Wyoming in regard to gas supply hedging and loss-sharing, Docket No. 20000-405-ER-11, June 2012.

Direct testimony on behalf of Ohio Power Company before the PUC of Ohio in regard to performance of PJM capacity markets, in Ohio Power's application for its ESP service charges, Case No. 10-2929-EL-UNC, March 30, 2012.

Expert report and oral testimony on behalf of Pepco Holdings, Inc. before the Maryland Public Service Commission in regard to inadequacies in the MD PSC's RFP for new combined cycle generation development in SWMAAC, Case No. 9214, January 31, 2012.

Direct testimony on behalf of Columbus Southern Power Company and Ohio Power Company before the Public Utilities Commission of Ohio in the Matter of the Commission Review of the Capacity Charges of Ohio Power Company and Columbus Southern Power Company, Case No. 10-2929 -EL-UNC, August 31, 2011.

Rebuttal report on spent nuclear fuel removal on behalf of Yankee Atomic Electric Company, Connecticut Yankee Atomic Power Company, Maine Yankee Atomic Power Company before the United States Court of Federal Claims, Nos. 07-876C, No. 07-875C, No. 07-877C, August 5, 2011.

Direct Testimony on rehearing regarding the allowance of swaps in Rocky Mountain Power's fuel adjustment cost recovery mechanism, on behalf of Rocky Mountain Power before the Public Service Commission of the State of Utah, July 2011.

Comments and Reply Comments on capacity procurement and transmission planning on behalf of New Jersey Electric Distribution Companies before the State of New Jersey Board of Public Utilities in the Matter of the Board's Investigation of Capacity Procurement and Transmission Planning, NJ BPU Docket No. EO11050309, June 17, 2011; July 12, 2011.

Rebuttal testimony regarding Rocky Mountain Power's hedging practices on behalf of Rocky Mountain Power before the Public Service Commission of the State of Utah, Docket No. 10-035-124, June 2011.

Expert and Rebuttal reports regarding contract termination damages, on behalf of Hess Corporation before the United States District Court for the Northern District of New York, Case No. 5:10-cv-587 (NPM/GHL), April 29, 2011, May 13, 2011.

Expert and Rebuttal reports on spent fuel removal at Rancho Seco nuclear power plant, on behalf of Sacramento Municipal Utility District before the U.S. Court of Federal Claims, No. 09-587C, October 2010, July 1, 2011.

Rebuttal testimony on the Impacts of the Merger with First Energy on retail electric competition in Pennsylvania, on behalf of Allegheny Power before the Pennsylvania Public Utility Commission, Docket Nos. A-2010-2176520 and A-2010-2176732, September 13, 2010.

Expert and Rebuttal reports on the interpretation of pricing terms in a long term power purchase agreement, on behalf of Chambers Cogeneration Limited Partnership before the Superior Court of New Jersey, Docket No. L-329-08, August 23, 2010, September 21, 2010.

Expert and Rebuttal reports on spent fuel removal at Trojan nuclear facility, on behalf of Portland General Electric Company, The City of Eugene, Oregon, and PacifiCorp before the United States Court of Federal Claims No. 04-0009C, August 2010, June 29, 2011.

Rebuttal and Rejoinder testimonies on the approval of its Smart Meter Technology Procurement and Installation Plan before the Pennsylvania Public Utility Commission on behalf of West Penn Power Company d/b/a Allegheny Power, Docket No. M-2009-2123951, October 27, 2009, November 6, 2009.

Supplemental Direct testimony on the need for an energy cost adjustment mechanism in Utah to recover the costs of fuel and purchased power, on behalf of Rocky Mountain Power before the Public Service Commission of Utah, Docket No. 09-035-15, August 2009.

Expert and Rebuttal reports on spent nuclear fuel removal on behalf of Yankee Atomic Electric Company, Connecticut Yankee Atomic Power Company, Maine Yankee Atomic Power Company before the United States Court of Federal Claims, Nos. 98-126C, No. 98-154C, No. 98-474C, April 24, 2009, July 20, 2009.

Expert report in regard to opportunistic under-collateralization of affiliated trading companies, on behalf of BJ Energy, LLC, Franklin Power LLC, GLE Trading LLC, Ocean Power LLC, Pillar Fund LLC and Accord Energy, LLC before the United States District Court for the Eastern District of Pennsylvania, No. 09-CV-3649-NS, March 2009.

Rebuttal report in regard to appropriate discount rates for different phases of long-term leveraged leases, on behalf of Wells Fargo & Co. and subsidiaries, Docket No. 06-628T, January 15, 2009.

Oral and written direct testimony regarding resource procurement and portfolio design for Standard Offer Service, on behalf of PEPCo Holdings Inc. in its Response to Maryland Public Service Commission, Case No. 9117, October 1, 2008 and December 15, 2008.

Direct testimony regarding considerations affecting the market price of generation service for Standard Service Offer (SSO) customers, on behalf of Ohio Edison Company, et al., Docket 08-125, July 24, 2008.

Direct testimony in support of Delmarva's "Application for the Approval of Land-Based Wind Contracts as a Supply Source for Standard Offer Service Customers," on behalf of Delmarva Power & Light Company before the Public Service Commission of Delaware, July 24, 2008.

Oral direct testimony in regard to the Government's performance in accepting spent nuclear fuel under contractual obligations established in 1983, on behalf of plaintiff Dairyland Power Cooperative before the United States Court of Federal Claims (No. 04-106C), July 17, 2008.

Direct testimony for Delmarva Power & Light on risk characteristics of a possible managed portfolio for Standard Offer Service, as part of Delmarva's IRP filings (PSC Docket No. 07-20), March 20, 2008 and May 15, 2008.

Oral direct testimony regarding the economic substance of a cross-border lease-to-service contract for a German waste-to-energy plant on behalf of AWG Leasing Trust and KSP Investments, Inc before U. S. District Court, Northern District of Ohio, Eastern Division, Case No. 1:07CV0857, January 2008.

Expert report (October 15, 2007) and oral testimony (September 21 and 22, 2010) in Commonwealth of Pennsylvania Department of Environmental Protection, et al., v. Allegheny Energy Inc, et al. regarding flaws in the plaintiffs' assessment of emissions attributed to repairs at certain power plants, Civil Action No, 2:05ev1885.

Direct testimony regarding portfolio management alternatives for supplying Standard Offer Service, on behalf of Potomac Electric Power Company and Delmarva Power & Light Company before the Public Service Commission of Maryland, Case No. 9117, September 14, 2007.

Direct testimony in regard to preconditions for effective retail electric competition, on behalf of New West Energy Corporation before the Arizona Commerce Commission, Docket No. E-03964A-06-0168, August 31, 2007.

Direct and rebuttal testimonies regarding the application of OG&E for an order of commission granting preapproval to construct Red Rock Generating Facility and authorizing a recovery rider, on behalf of Oklahoma Gas & Electric Company (OG&E) before the Corporation Commission of the State of Oklahoma, Case No. PUD 200700012, January 17, 2007 and June 18, 2007.

Testimony in regard to whether defendant's role in accounting misrepresentations could be reliably associated with losses to shareholders, on behalf of defendant Mark Kaiser before U.S. District Court of New York SI:04Cr733 (TPG).

Rebuttal testimony on proposed benchmarks for evaluating the Illinois retail supply auctions, on behalf of Midwest Generation EME L.L.C. and Edison Mission Marketing and Trading before the Illinois Commerce Commission Docket No. 06-0800, April 6, 2007.

Direct and rebuttal testimonies on the shareholder impacts of Dynegy's Project Alpha for the sentencing of Jamie Olis, on behalf of the U.S. Department of Justice before the United States District Court, Southern District of Texas, Houston Division, Criminal No. H-03-217, September 12, 2006.

Direct and rebuttal testimony on the need for POLR rate cap relief for Metropolitan Edison and Pennsylvania Electric and the prudence of their past supply procurement for those obligations, on behalf of FirstEnergy Corp before the Pennsylvania Public Utility Commission, Docket Nos. R-00061366 and R-00061367, August 24, 2006.

Direct testimony regarding Deutsche Bank Entities' opposition to Enron Corp's amended motion for class certification, on behalf of the Deutsche Bank Entities before the United States District Court, Southern District of Texas, Houston Division, Docket No. H-01-3624, February 2006.

Expert and Rebuttal reports regarding the non-performance of the U.S. Department of Energy in accepting spent nuclear fuel under the terms of its contract, on behalf of Pacific Gas and Electric Company before the United States Court of Federal Claims, Docket No. 04-0074C, into which has been consolidated No. 04-0075C, November 2005.

Direct testimony regarding the appropriate load caps for a POLR auction, on behalf of Midwest Generation EME, LLC before the Illinois Commerce Commission, Docket No. 05-0159, June 8, 2005.

Affidavit regarding unmitigated market power arising from the proposed Exelon—PSEG Merger, on behalf of Dominion Energy, Inc. before the Federal Energy Regulatory Commission, Docket No. EC05-43-000, April 11, 2005.

Expert and rebuttal reports and oral testimonies before the American Arbitration Association on behalf of Liberty Electric Power, LLC, Case No. 70 198 4 00228 04, December 2004, regarding damages under termination of a long-term tolling contract.

Oral direct and rebuttal testimony before the United States Court of Federal Claims on behalf of Connecticut Yankee Atomic Power Company, Docket No. 98-154 C, July 2004 (direct) and August 2004 (rebuttal), regarding non-performance of the U.S. Department of Energy in accepting spent nuclear fuel under the terms of its contract.

Direct, supplemental and rebuttal testimony before the Public Service Commission of Wisconsin, on behalf of Wisconsin Public Service Corporation and Wisconsin Power and Light Company, Docket No. 05-EI-136, February 27, 2004 (direct), May 4, 2004 (supplemental) and May 28, 2004 (rebuttal) in regard to the benefits of the proposed sale of the Kewaunee nuclear power plant.

Testimony before the Public Utility Commission of Texas on behalf of CenterPoint Energy Houston Electric LLC, Reliant Energy Retail Services LLC, and Texas Genco LP, Docket No. 29526, March 2004 (direct) and June 2004 (rebuttal), in regard to the effect of Genco separation agreements and financial practices on stranded costs and on the value of control premiums implicit in Texas Genco Stock price.

Rebuttal and additional testimony before the Illinois Commerce Commission, on behalf of Peoples Gas Light and Coke Company, Docket No. 01-0707, November 2003 (rebuttal) and January 2005 (additional rebuttal), in regard to prudence of gas contracting and hedging practices.

Rebuttal testimony before the State Office of Administrative Hearings on behalf of Texas Genco and CenterPoint Energy, Docket No. 473-02-3473, October 23, 2003, regarding proposed exclusion of part of CenterPoint's purchased power costs on grounds of including "imputed capacity" payments in price.

Rebuttal testimony before the Federal Energy Regulatory Commission (FERC) on behalf of Ameren Energy Generating Company and Union Electric Company, Docket No. EC03-53-000, October 6, 2003, in regard to evaluation of transmission limitations and generator responsiveness in generation procurement.

Rebuttal testimony before the New Jersey Board of Public Utilities on behalf of Jersey Central Power & Light Company, Docket No. ER02080507, March 5, 2003, regarding the prudence of JCP&L's power purchasing strategy to cover its provider-of-last-resort obligation.

Oral testimony (February 17, 2003) and expert report (April 1, 2002) before the United States District Court, Southern District of Ohio, Eastern Division on behalf of Ohio Edison Company and Pennsylvania Power Company, Civil Action No. C2-99-1181, regarding coal plant maintenance projects alleged to trigger New Source Review.

Expert Report before the United States District Court on behalf of Duke Energy Corporation, Docket No. 1:00CV1262, September 16, 2002, regarding forecasting changes in air pollutant emissions following coal plant maintenance projects.

Direct testimony before the Public Utility Commission of Texas on behalf of Reliant Energy, Inc., Docket No. 26195, July 2002, regarding the appropriateness of Reliant HL&P's gas contracting, purchasing and risk management practices, and standards for assessing HL&P's gas purchases.

Direct and rebuttal testimonies before the Public Utilities Commission of the State of California on behalf of Southern California Edison, Application No. R. 01-10-024, May 1, 2002, and June 5, 2002, regarding Edison's proposed power procurement and risk management strategy, and the regulatory guidelines for reviewing its procurement purchases.

Rebuttal testimony before the Texas Public Utility Commission on behalf of Reliant Resources, Inc., Docket No. 24190, October 10, 2001, regarding the good-cause exception to the substantive rules that Reliant Resources, Inc. and the staff of the Public Utility Commission sought in their Provider of Last Resort settlement agreement.

Direct testimony before the Federal Energy Regulatory Commission (FERC) on behalf of Northeast Utilities Service Company, Docket No. ER01-2584-000, July 13, 2001, in regard to competitive impacts of a proposed merchant transmission line from Connecticut to Long Island.

Direct testimony before the Vermont Public Service Board on behalf of Vermont Gas Systems, Inc., Docket No. 6495, April 13, 2001, regarding Vermont Gas System's proposed risk management program and deferred cost recovery account for gas purchases.

Affidavit on behalf of Public Service Company of New Mexico, before the Federal Energy Regulatory Commission (FERC), Docket No. ER96-1551-000, March 26, 2001, to provide an updated application for market based rates.

Affidavit on behalf of the New York State Electric and Gas Corporation, April 19, 2000, before the New York State Public Service Commission, In the Matter of Customer Billing Arrangements, Case 99-M-0631.

Supplemental Direct and Reply Testimonies of Frank C. Graves and A. Lawrence Kolbe (jointly) on behalf of Southern California Edison Company, Docket Nos. ER97-2355-00, ER98-1261-000, ER98-1685-000, November 1, 1999, regarding risks and cost of capital for transmission services.

Expert report before the United States Court of Federal Claims on behalf of Connecticut Yankee Atomic Power Company, Connecticut Yankee Atomic Power Company, Plaintiff v. United States of America, No. 98-154 C, June 30, 1999, regarding non-performance of the U.S. Department of Energy in accepting spent nuclear fuel under the terms of its contract.

Expert report before the United States Court of Federal Claims on behalf of Maine Yankee Atomic Power Company, Maine Yankee Atomic Power Company, Plaintiff v. United States of America, No. 98-474 C, June 30, 1999, regarding the damages from non-performance of the U.S. Department of Energy in accepting spent nuclear fuel and high-level waste under the terms of its contract.

Expert report before the United States Court of Federal Claims on behalf of Yankee Atomic Electric Company, Yankee Atomic Electric Company, Plaintiff v. United States of America, No. 98-126 C, June 30, 1999, regarding the damages from non-performance of the U.S. Department of Energy in accepting spent nuclear fuel and high-level waste under the terms of its contract.

Prepared direct testimony before the Federal Energy Regulatory Commission on behalf of National Rural Utilities Cooperative Finance Corporation, Inc., Cities of Anaheim and Riverside, California v. Deseret Generation & Transmission Cooperative, Docket No. EL97-57-001, March 1999, regarding cost of service for rural cooperatives versus investor-owned utilities, and coal plant valuation.

Expert report and oral examination before the Independent Assessment Team for industry restructuring appointed by the Alberta Energy and Utilities Board on behalf of TransAlta Utilities Corporation, January 1999, regarding the cost of capital for generation under long-term, indexed power purchase agreements.

Oral testimony before the Commonwealth of Massachusetts Appellate Tax Board on behalf of Indeck Energy Services of Turners Falls, Inc., Turners Falls Limited Partnership, Appellant vs. Town of Montague, Board of Assessors, Appellee, Docket Nos. 225191-225192, 233732-233733, 240482-240483, April 1998, regarding market conditions and revenues assessment for property tax basis valuation.

Direct and joint supplemental testimony before the Pennsylvania Public Utility Commission on behalf of Pennsylvania Electric Company and Metropolitan Edison Company, No. R-00974009, et al., December 1997, regarding market clearing prices, inflation, fuel costs, and discount rates.

Direct Testimony before the Pennsylvania Public Utilities Commission on behalf of UGI Utilities, Inc., Docket No. R-00973975, August 1997, regarding forecasted wholesale market energy and capacity prices.

Testimony before the Public Utilities Commission of the State of California on behalf of the Southern California Edison Company, No. 96-10-038, August 1997, regarding anticompetitive implications of the proposed Pacific Enterprises/ENOVA mergers.

Direct and supplemental testimony before the Kentucky Public Service Commission on behalf of Big Rivers Electric Corporation, No. 97-204, June 1997, regarding wholesale generation and transmission rates under the bankruptcy plan of reorganization.

Affidavit before the Federal Energy Regulation Commission on behalf of the Southern California Edison Company in Docket No. EC97-12-000, March 28, 1997, filed as part of motion to intervene and protest the proposed merger of Enova Corporation and Pacific Enterprises.

Direct, rebuttal, and supplemental rebuttal testimony before the State of New Jersey Board of Public Utilities on behalf of GPU Energy, No. EO97070459, February 1997, regarding market clearing prices, inflation, fuel costs, and discount rates.

Oral direct testimony before the State of New York on behalf of Niagara Mohawk Corporation in Philadelphia Corporation, et al. v. Niagara Mohawk, No. 71149, November 1996, regarding interpretation of low-head hydro IPP contract quantity limits.

Oral direct testimony before the State of New York on behalf of Niagara Mohawk Corporation in Black River Limited Partnership v. Niagara Mohawk Power Corporation, No. 94-1125, July 1996, regarding interpretation of IPP contract language specifying estimated energy and capacity purchase quantities.

Oral direct testimony on behalf of Eastern Utilities Associates before the Massachusetts Department of Public Utilities, No. 96-100 and 2320, July 1996, regarding issues in restructuring of Massachusetts electric industry for retail access.

Affidavit before the Kentucky Public Service Commission on behalf of Big Rivers Electric Corporation in PSC Case No. 94-032, June 1995, regarding modifications to an environmental surcharge mechanism.

Rebuttal testimony on behalf of utility in Eastern Energy Corporation v. Commonwealth Electric Company, American Arbitration Association, No. 11 Y 198 00352 04, March 1995, regarding lack of net benefits expected from a terminated independent power project.

Direct testimony before the Pennsylvania Public Utility Commission on behalf of Pennsylvania Power & Light Company in Pennsylvania Public Utility Commission et al. v. UGI Utilities, Inc., Docket No. R-932927, March 1994, regarding inadequacies in the design and pricing of UGI's proposed unbundling of gas transportation services.

Direct testimony before the Pennsylvania Public Utility Commission, on behalf of Interstate Energy Company, Application of Interstate Energy Company for Approval to Offer Services in the Transportation of Natural Gas, Docket No. A-140200, October 1993, and rebuttal testimony, March 1994.

Direct testimony before the Pennsylvania Public Utility Commission, on behalf of Procter & Gamble Paper Products Company, Pennsylvania Public Utility Commission v. Pennsylvania Gas and Water Company, Docket No. R-932655, September 1993, regarding PG&W's proposed charges for transportation balancing.

Oral rebuttal testimony before the American Arbitration Association, on behalf of Babcock and Wilcox, File No. 53-199-00127-92, May 1993, regarding the economics of an incentive clause in a cogeneration operations and maintenance contract.

Answering testimony before the Federal Energy Regulatory Commission, on behalf of CNG Transmission Corporation, Docket No. RP88-211-000, March 1990, regarding network marginal costs associated with the proposed unbundling of CNG.

Direct testimony before the Federal Energy Regulatory Commission, on behalf of Consumers Power Company, et al., concerning the risk reduction for customers and the performance incentive benefits from the creation of Palisades Generating Company, Docket No. ER89-256-000, October 1989, and rebuttal testimony, Docket No. ER90-333-000, November 1990.

Direct testimony before the New York Public Service Commission, on behalf of Consolidated Natural Gas Transmission Corporation, Application of Empire State Pipeline for Certificate of Public Need, Case No. 88-T-132, June 1989, and rebuttal testimony, October, 1989.

Review of PCAM Implementation in Other States

February 2020

Review of PCAM Implementation in Other States

State	Deadband	Risk Sharing	SNL Description of Adjustment Clause
Alabama			Alabama Power, Spire Alabama and Spire Gulf are regulated under Rate Stabilization and Equalization frameworks that adjust base rates periodically (see the Alternative regulation section). The tariffs of the major energy utilities include adjustment provisions to allow for recovery of changes in income taxes and certain general and local taxes. An Energy Cost Recovery, or ECR, mechanism is also in place for Alabama Power. The ECR mechanism is established on the basis of estimates of electric sales, fuel-related costs, and purchased power costs, and reflects accumulated over- or underrecovered amounts.
Alaska			Electric fuel and gas commodity costs are recovered through mechanisms that are separate from base distribution rates. Alaska Electric Light and Power Co. utilizes a power cost adjustment that is updated quarterly. ENSTAR Natural Gas Co.'s gas cost adjustment is updated annually; both are subject to true-up.
Arizona		Yes. **APS'** PSA is subject to a $0.004/kWh annual cap on rate increases or decreases, unless the base cost of fuel and purchased power is reset.	Arizona Public Service Co., or APS, utilizes a Power Supply Adjustor, or PSA, a mechanism that permits the deferral and recovery of fuel and purchased power costs, certain production-related variable costs, and certain energy storage costs outside of a rate case. The PSA is subject to a $0.004/kWh annual cap on rate increases or decreases, unless the base cost of fuel and purchased power is reset. The PSA incorporates a forward-looking estimate of fuel and purchased power costs to set a rate that is subsequently reconciled with actual costs. The PSA consists of three components: the "forward component" that recovers or refunds differences between expected fuel and purchased power costs and those reflected in base rates; the "historical component," which tracks the differences between actual costs and those recovered through the combination of base rates and the forward component; and the "transition component," which provides for the recovery or refund of deferred balances stemming from the operation of the old PSA. The PSA also reflects margins from the sale of emissions allowances. Tucson Electric Power Co., or TEP, utilizes a purchased power and fuel adjustment clause, or PPFAC. The PPFAC includes a forward-looking component. A PPFAC is also in place for UNS Electric Inc., or UNS-E.
Arkansas			State statutes permit the electric utilities to request PSC approval of mechanisms that allow the recovery of costs related to fuel and purchased power, energy efficiency, purchased gas and certain other items. Energy cost recovery, or ECR, riders — Electric utilities recover fuel and purchased power costs through an ECR rider. The ECR rider is calculated annually, reflecting the actual cost in the previous calendar year, with an adjustment for projected changes. ECR rate changes are implemented automatically; however, a utility's ECR rider calculation is subject to a 15-day review period. The staff is permitted to audit any utility's ECR rider and can recommend adjustments to the ECR rate filed by the company.
California			The state's major electric utilities utilize a balancing account, the energy resource recovery account, or ERRA, that is designed to track and allow recovery of the difference between electric procurement costs included in rates and actual costs incurred under each utility's procurement plan. The PUC must review the revenues and costs associated with each utility's electricity procurement plan at least annually and adjust retail electricity rates or order refunds as appropriate, typically once a year. In addition, rate changes can be implemented based on the ERRA trigger mechanism, which is effective when aggregate over-collections or undercollections exceed 5% of the utility's prior-year electric generation revenues, excluding amounts collected for the Department of Water Resources. The PUC would make the final determination of an ERRA trigger mechanism rate change.
Colorado			Public Service Company of Colorado's, or PSCO's, fuel and purchased energy costs are recovered through an incentive based electric commodity adjustment, or ECA, that compares actual fuel and purchased power expenses to a formula based benchmark. The ECA also contains certain earnings-sharing provisions related to energy trading activities (see the Alternative Regulation section). PSCO utilizes a purchased capacity cost adjustment clause that allows for recovery of the costs of purchased power not included in base rates or other recovery mechanisms. Black Hills Colorado Electric Utility Company, or BHCE, is subject to an energy cost adjustment mechanism under which all fuel and purchased energy cost differences from the company's base energy cost rate are fully recovered from, or credited to, customers. The impacts of certain incentive mechanisms also flow through the mechanism.

State	Deadband	Risk Sharing	SNL Description of Adjustment Clause
Florida			The fuel cost recovery clause, or FCRC, and the capacity cost recovery clause, or CCRC, provide for recovery of prudently incurred fuel and purchased power costs, respectively. Annual fuel factors are established based upon 12-month projections of fuel costs and energy purchases and sales. Hearings are held each November, during which the PSC sets fuel factors for the next calendar year. Subsequent to the November hearings, utilities may seek or the PSC may require a midterm modification to the factors if updated projected costs for the year vary from updated projected revenues by plus or minus 10%. Interest is accrued on both over- and under-recovered balances. Included in the FCRC is a generating performance incentive factor that provides a financial reward or penalty when a company's base load generating units' availability and heat rate vary from targets approved by the PSC. The reward or penalty is limited to a 25-basis point ROE spread. The PSC generally requires market-based pricing of coal purchased from an affiliate. The FCRC also reflects gains from non-firm energy sales. A three-year moving average based on eligible sales is determined, and 100% of the sales up to this benchmark are credited to ratepayers. For sales above the benchmark, 80% of the gains accrue to ratepayers, with 20% retained by Duke Energy Florida LLC, Tampa Electric Co. Company, or TEC, and Gulf Power Co
Georgia			A non-automatic fuel adjustment mechanism, known as the fuel cost recovery clause, is in place for Georgia Power, or GP. Hearings are required before increases or decreases are implemented. Electric fuel rates are based on estimated sales and fuel costs, and any balance of previously unrecovered/over-recovered fuel costs is considered in setting new rates. The energy portion of purchased power transactions is reflected in the mechanism; the capacity component is recovered through base rates. The cost of GP's natural gas and oil procurement hedging program, including any net gains or losses, are also recovered through the fuel cost recovery clause.
Hawaii		Yes. **Hawaiian Electric Companies** recover 98% of fuel cost fluctuations from customers and incur 2% (with utility exposure capped at $2.5 million)	Fuel adjustment clauses are in place for electric utilities. The clauses are adjusted monthly for changes in fuel costs and the fuel-cost component of purchased energy, and for variations from the forecasted generation mix. Hawaiian Electric Company's, or HECO's, purchased power adjustment clause, or PPAC, is designed to recover purchased power capacity costs and the O&M expense component of purchased power energy costs. Similar mechanisms are in place for Hawaii Electric Light Company, or HELCO, and Maui Electric Company, or MECO. Rates under the PPAC mechanisms are adjusted monthly,
Idaho		Yes. **Avista's** PCA enables the company to defer 90% of net power cost deviations, similar to **PacifiCorp. Idaho Power**'s PCA includes a 95% sharing mechanism	Electric power cost adjustment (PCA) mechanisms are utilized by Avista Corporation, Idaho Power (IP), and PacifiCorp. Semi-automatic purchased gas adjustments are utilized by Avista and Intermountain Gas. Electric and gas utilities may seek PUC approval to issue energy cost recovery (securitization) bonds to moderate the impact of power cost increases on customers (see the Securitization section). Avista's PCA enables the company to defer, in a balancing account, 90% of the difference between actual net power costs and the amount included in retail rates. IP has a similar mechanism in place with a sharing provision under which annual rate adjustments reflect 95% of the cost variations associated with water supply for hydro-electric production, wholesale energy prices, and retail load changes. An energy cost adjustment mechanism is in place for PacifiCorp that allows for the recovery of 90% of the difference between actual power costs and those included in rates.
Indiana			FAC proceedings Electric utilities may adjust rates for changes in fuel and purchased power — energy component only — costs generally every three months, following hearings, through the FAC. The FAC is based on estimated costs of fuel and purchased power for a future three-month period, with an additional factor to account for over- or under recoveries caused by variances between estimated and actual costs in the previous three-month period. No carrying charges accrue on over- or under-recoveries. The adjustment factor may be modified more frequently than every three months under emergency circumstances. By law, the URC may not approve an FAC rate adjustment if it will result in the utility earning a net operating income, or NOI, in excess of that authorized.
Iowa			Energy adjustment clauses, or EACs, are modified monthly based on forecast energy costs and fuel and purchased power for two months. The capacity/demand portions of purchased power are recovered through base rates. Under- and over-recoveries are deferred and respectively charged and credited to customers in the succeeding months. Interstate Power and Light Co., or IP&L, uses an EAC that provides for recovery of fuel and purchased power costs as well as revenues and costs associated with sales or purchases of emission allowances. MidAmerican Energy Co. uses an EAC that excludes chemical-related costs.

State	Deadband	Risk Sharing	SNL Description of Adjustment Clause
Missouri		Yes. **Empire District Electric Co, Kansas City Power and Light,** and **Union Electric** can all recover 95% of fuel and purchased power costs, net emissions allowance costs and OSS revenues that vary from levels included in base rates.	Empire District Electric Co. utilizes an FAC that provides for the company to recover from/flow to ratepayers, on a semi-annual basis over six-month recovery periods, 95% of incremental variations in "prudently incurred" fuel and purchased power costs, net emissions allowance costs and OSS revenues from the levels included in base rates. In a 2015 rate case decision, the PSC required that a portion of the transmission costs Empire incurs related to its participation in the Southwest Power Pool, or SPP, market be excluded from its FAC [...] Union Electric Co., or UE, utilizes an FAC that provides for the company to recover from/flow to ratepayers 95% of incremental variations in prudently incurred fuel and purchased power costs, net emissions allowances and OSS revenues from the levels included in base rates. UE's FAC incorporates three adjustments per year and eight-month-long recovery periods [...] In a 2015 rate case decision, the PSC authorized Kansas City Power and Light Co., or KCP&L, to implement an FAC that provides for the company to recover from/flow to ratepayers 95% of incremental variations in prudently incurred fuel and purchased power costs, net emissions allowances and OSS revenues from the levels included in base rates. KCP&L's FAC incorporates two adjustments per year and 12-month recovery periods.
Montana		Yes. **NorthWestern Energy** and **MDU Resources Group** both have power cost adjustment mechanisms that include a 90% rate payers/10% shareholders cost share	On July 14, 2017, NorthWestern filed its Power Costs and Credits Adjustment Mechanism, or PCCAM, proposal with the commission. The proposed PCCAM provides for annual adjustments based on 12 months of actual data, and provides of a 90%/10% allocation between rate payers and shareholders of the related costs. The PCCAM would temporarily apply to Demand Side Management program costs and certain administrative and general costs until future treatment is determined as part of NorthWestern's next general electric rate case. The commission is expected to hold a hearing on the matter on May 31, 2018. MDU Resources Group utilizes a monthly-adjusted fuel and purchased power cost adjustment mechanism that contains certain incentive provisions, including a 90%/10% sharing of the costs reflected in the mechanism.
Nevada			Electric utilities are subject to a deferred energy cost recognition procedure, under which Commission approval is required prior to implementation of changes in the recovery of fuel and purchased power costs. In accordance with this procedure, Nevada Power Company, or NPC, and Sierra Pacific Power Company, or SPP, file quarterly deferred energy adjustment applications, or DEAAs, proposing to recover or refund the deferred balances, representing the difference between actual fuel and purchased power costs incurred and the amounts currently reflected in rates. Electric utilities must reset, on a quarterly basis, the rate for ongoing fuel and purchased power costs, referred to as the base tariff energy rate, or BTER. The quarterly reset is designed to reflect power costs on a more current basis, thereby eliminating large deferred energy balances. These quarterly BTER adjustments are reviewed annually by the PUC as part of the companies' DEAA filings. Costs eligible for recovery include all prudent expenses incurred to purchase fuel, capacity, and energy, as well as the carrying charges on deferred balances. The burden of proof regarding prudence rests with the utility.
New Mexico			Commission rules provide for automatic fuel adjustment clauses; the fuel and purchased power cost adjustment clause, or FPPCAC, for an electric utility is calculated monthly, but a variance from monthly reporting may be sought. The FPPAC includes a balancing account in which there is approximately a two-month collection lag. A utility is required to reapply for continuation of an FPPCAC every four years, at which time a comprehensive review of the clause is undertaken. In 2008, the PRC authorized Public Service Co. of New Mexico, or PSNM, to establish an emergency FPPCAC. The clause contained several conditions, including that the recoverable costs were subject to a prudence review. PSNM's FPPCAC had been eliminated in 1994, following a stipulation. In 2009, the PRC adopted a rate case settlement that included the reinstatement of the company's FPPCAC on a permanent basis. The fuel factor is adjusted annually. Additionally, the approved settlement contained an SO2 rider through which customers are credited with their share of revenues from allowance sales. El Paso Electric Co., or EPE, may seek approval to adjust its FPPCAC if the company experiences an over- or under-recovery balance of at least $2 million of fuel and purchase power expenses as of Dec. 31 and June 30 of each year. Southwestern Public Service Co., or SWPS, uses an FPPCAC under which it may petition for a change in the fuel factor if the over/under-recovery balance reaches $5 million.
North Carolina			Prudent electric fuel and fuel-related costs are recoverable through a fuel adjustment clause, or FAC. Each utility has an annual hearing to review fuel costs, with a test period determined by the NCUC for each company. The proceedings provide for a true up of any over or undercollections from the previous year, with interest included only for overcollections. The costs of certain reagents used in reducing or treating emissions, as well as certain nonfuel purchased power costs for economic purchases, may be recovered through the FAC. The law limits the annual increase in recoverable costs related to certain purchased power contracts to 2% of a utility's total retail revenues.

State	Deadband	Risk Sharing	SNL Description of Adjustment Clause
North Dakota			Mechanisms that provide for automatic recognition of changes in fuel and the energy portion of purchased power costs are in place for Northern States Power, or NSP, MDU Resources Group and Otter Tail Power, or OTP. Fuel and purchased power cost adjustments are implemented monthly and are based on a rolling four-month history. There is generally a two-month lag for recovery. MDU also recovers capacity costs associated with purchased power through its fuel and purchased power adjustment clause.
Oklahoma			Fully automatic electric FACs are prohibited in Oklahoma. However, semi-automatic FACs are in place. Utilities may propose a change in the current FAC billing factor according to each company's Commission-approved FAC tariff. Once the utility files for a change in its FAC rate, the staff has five days within which to respond. If the staff files objections to the change, a formal investigation is initiated; if the staff files no objections, the proposed rates become effective. The historic costs and revenues included in the FAC are reviewed by the OCC after each calendar year for accuracy and prudence. Oklahoma Gas & Electric Co.'s, or OG&E's, FAC is typically adjusted semi-annually but can be adjusted quarterly if costs have changed and are expected to remain at their current levels for the foreseeable future or if the monthly over or undercollected FAC amounts for a given period are greater than 5% of the company's projected annual Oklahoma-jurisdictional fuel costs. Purchased power and certain cogeneration and capacity payment differentials are reflected in the FAC. OG&E also recovers a portion of the transportation costs associated with gas deliveries to its generating facilities through the FAC. Public Service Co. of Oklahoma's, or PSO's, FAC is adjusted annually, subject to a cap on under and overrecoveries. However, an immediate adjustment may be implemented if the under or overrecovered balance exceeds $50 million. Otherwise, amounts that differ from the levels reflected in base rates are deferred in a balancing account, and the deferrals are recovered over the subsequent 12 months. The FAC also allows for current recovery of line losses above or below the amount recognized in PSO's base rates. Such under or overrecoveries are recovered from, or refunded to, customers during subsequent months. Ratepayers' 90% share of off system sales margins flow through PSO's FAC.
Oregon	Yes, **PGE** and **PacifiCorp** have a -$15 to $30 million deadband, while **Idaho Power's** costs/savings are reduced by a deadband of 250/125 ROE basis points	Yes. PCAMs for **PGE, PacifiCorp,** and **Idaho Power** all recover 90% of cost deviations outside of a deadband	Portland General Electric, or PGE, PacifiCorp, and Idaho Power, or IP are permitted to annually adjust rates to reflect forecasted power costs. PGE's and IP's mechanisms include a component under which a portion of the difference between actual and forecasted power costs is deferred for future recovery or refund. PGE's current power cost recovery framework includes both an annual update, under which rates change each January 1 to reflect updated net variable power costs, or NVPC, and a power cost adjustment mechanism, or PCAM, that is designed to capture a portion of the difference between the NVPC forecast established through the annual update, i.e., baseline NVPC, and the actual NVPC incurred by PGE for that year. The PCAM is subject to a deadband of $15 million below to $30 million above the ultimately established NVPC, a sharing ratio, and an earnings test. PGE absorbs 100% of the costs/benefits within a PUC-determined deadband, and amounts above or below the deadband are allocated 90% to customers and 10% to PGE shareholders. A surcharge or a refund would occur only if PGE's actual ROE is more than 100 basis points below or above PGE's last authorized ROE. PacifiCorp and IP have similar mechanisms.
South Carolina			Nonautomatic electric fuel and purchased gas adjustment clauses are in place for the state's utilities. Each electric utility is required to furnish the PSC an estimate of its fuel costs, including the cost of purchased power, for a prospective 12-month period. The PSC then determines the fuel-related costs to be included in base rates for that period, including adjustments for over or under recovery from the preceding 12-month period. Electric companies are required to account on a monthly basis for the difference between fuel costs recovered through base rates and actual fuel costs by booking the difference to unbilled revenue with a corresponding deferred debit or credit. Emissions allowance costs and the cost of certain materials used in reducing or treating emissions are reflected in the fuel clause.
South Dakota			Automatic fuel, purchased power, and gas cost adjustment clauses are permitted. Through these clauses, the utilities recover actual fuel, purchased power — energy portion only — and purchased gas expenses incurred; carrying costs accrue on unrecovered balances. The fuel clauses of Northern States Power-Minnesota, or NSP-MN, and Black Hills Power, or BHP, and NorthWestern Corp. contain certain incentive provisions.

State	Deadband	Risk Sharing	SNL Description of Adjustment Clause
Tennessee			Automatic purchased power and gas commodity recovery clauses are permitted. The state's gas utilities are allowed to reflect a portion of uncollectible expenses in these clauses. Kingsport Power, or KP, has a fuel and purchased power adjustment rider that reflects any changes in the wholesale costs of the company's power supplier, affiliate Appalachian Power, or APCO, as well as transmission expenses. KP has no generating capacity of its own, and purchases 100% of its power requirements from APCO. Chattanooga Gas, or CG, has a purchased gas adjustment rider in place.
Utah			The PSC may allow electric and gas utilities to implement balancing accounts to recover purchased power and fuel costs. In 2011, PacifiCorp implemented a pilot energy balancing account, or EBA, that was to remain in place through 2016 and contained incentive provisions. However, legislation was enacted on March 29, 2016, that removed the incentive provision of the mechanism and extended the EBA through 2019. Also, PacifiCorp operates under a renewable energy credit mechanism that contains certain incentive provisions.
Vermont	Yes. **Green Mountain Power** can recover or credit costs outside a $0.3 million band	Yes. Through its power supply cost adjustment mechanism, **Green Mountain Power** can annually pass through to ratepayers 90% of the energy costs (or benefits) varying by more than $0.3 million from the energy costs included in rates	Green Mountain Power Corp., or GMP, has a PCA in place that allows the company to recover from, or credit to, customers on an annual basis 90% of the energy costs that are more than $0.3 million higher or lower than the energy costs included in rates through a power supply cost adjustment mechanism. Vermont Gas Systems, or VGS, has a PGA mechanism in place that allows for the recovery of all gas-cost variations on a quarterly basis. The Vermont Supreme Court has prohibited the use of PCA and PGA mechanisms, finding them to be inconsistent with the customer notice requirements under state law. However, these mechanisms are permitted when adopted as part of an alternative regulation plan.
Virginia			Electric fuel adjustment clauses, or FACs provisions are permitted. The SCC's FAC procedure provides for electric rates to be reset annually based on projected usage and costs. The utilities maintain accounts for any over or underaccruals, and these balancing accounts are reconciled through the following year's fuel factor. Purchased power and capacity charges for "economy" purchases are included in the fuel factor calculation. Energy charges associated with reliability purchases may flow through the fuel factor, but capacity charges are recovered through base rates. Appalachian Power Co., or APCO, Virginia Electric and Power Co., or VEPCO, and Kentucky Utilities Co., all use an FAC.
Washington	Yes. **Avista, PSE**, and **PacifiCorp** employ deadbands of respectively ± $4 million, ±$17 million, and ±$4 million respectively	Yes. Under **Avista's** ERM, if costs are $4 million - $10 million lower than those included in base rates, 75% of the energy cost savings flow to customers. Costs between $4 million to $10 million higher are shared equally, while differences above $10 million are allocated 90% to customers and 10% to shareholders. **PSE** and **PacifiCorp** similarly pass costs to customers outside of a deadband based on a	Avista Corporation's Energy Recovery Mechanism, or ERM, allows the company to adjust rates to reflect changes in power supply-related costs, with 75% of any energy cost savings to flow to customers and 25% to the company when actual annual power costs are between $4 million and $10 million lower than those included in base rates. Equal sharing is to occur when actual power costs are between $4 million and $10 million greater than the amount included in base rates. Any differences in excess of $10 million are to be allocated 90% to customers and 10% to shareholders. The ERM contains an adjustment trigger under which a surcharge or rebate occurs when the deferred ERM balance reaches ±$30 million. Puget Sound Energy's, or PSE's, Power Cost Adjustment Mechanism, or PCAM, allows for variations in power costs to be apportioned, on a graduated scale, between the company and customers. Beginning in 2017, to the extent power costs are above/below the PCAM baseline amount, PSE is to absorb/retain the first $17 million above/below the baseline, and 10% of any amount that exceeds $40 million. For costs between $17 million and $40 million above the baseline, PSE is to absorb 50%. For costs between $17 million and $40 million below the baseline, PSE is to retain 35% of the benefits. A PCAM rate surcharge/credit is to be implemented when the deferred power cost balance reaches ±$20 million. Fixed production costs are no longer included in the PCAM. [...] In May 2015, the WUTC adopted a PCAM for PacifiCorp, following a settlement. The PCAM is a first for the company in Washington. The PCAM includes a $4 million dead band for net power cost variances, relative to a benchmark. For net power cost variances between $4 million and $10 million, the PCAM reflects asymmetrical sharing bands in which positive variances are to be allocated 50% to customers and 50% to PacifiCorp, and negative variances are to be allocated 75% to customers and 25% to PacifiCorp. Positive or negative net power cost variances in excess of $10 million are to be allocated 90% to customers and 10% to PacifiCorp.

State	Deadband	Risk Sharing	SNL Description of Adjustment Clause
West Virginia			Electric fuel and/or purchased power costs may be recovered through an ENEC proceeding. In addition to fuel costs, the ENEC reflects the energy portion of purchased power costs, the net benefit associated with affiliated and other wholesale sales, the demand portion of purchased power transactions, transmission costs and credits and any regional transmission organizationrelated costs. ENEC factors are set annually based on projected data for the prospective 12 months. Over- or under-recoveries based on actual data for the prior 12 month period are deferred for reconciliation as part of the next ENEC proceeding, with no carrying charges on the deferred balance. ENEC proceedings are typically completed within four months of filing.
Wisconsin	Yes, recovery for the five largest IOUs is subject to a ±2% deadband		Under the PSC's electric fuel rules, which apply to the state's five largest investor-owned utilities — Northern States Power Co. – WI, Wisconsin Power and Light Co., Madison Gas and Electric Co., Wisconsin Electric Power Co., and Wisconsin Public Service Corp. — each utility forecasts the monthly and annual fuel and purchased power costs on a prospective basis. If a company's actual fuel and purchased power costs are outside a monthly or cumulative monthly variance range around the forecasts and if the utility can demonstrate that these costs will likely be outside the annual range, the PSC may conduct a hearing to establish new rates. Currently, the annual variance range is plus or minus 2%. An electric utility is permitted to defer any fuel costs that are outside of its annual, symmetrical variance range for subsequent recovery or refund. However, the utility is prohibited from recovering deferrals if the company is found to be earning in excess of its authorized equity return.
Wyoming		Yes. **Cheyenne Light, Fuel & Power** can allocate steam production costs 85% to ratepayers and 15% to shareholders, and other eligible costs 95% to customers and 5% to shareholders. **PacifiCorp** similarly has cost-sharing in place, but allocates 70% to ratepayers and 30% to shareholders	Cheyenne Light, Fuel & Power, or CLF&P, operates under a power cost adjustment mechanism through which the company's power costs are classified into two categories. Category 1 costs include steam production costs, while category 2 costs include purchased power and capacity costs, transmission expenses, and certain other costs, and reflect any margins realized from off-system sales. Deviations in Category 1 costs from a base level are allocated 85% to ratepayers and 15% to shareholders. Deviations in Category 2 costs are allocated 95% to customers and 5% to shareholders. PacifiCorp operates under an energy cost adjustment mechanism, or ECAM, that is in place through 2017. Under the ECAM, incremental variations in net power costs that differ from the base level are allocated 70% to ratepayers and 30% to shareholders. In December 2015, the PSC approved the continuation of the current ECAM with certain modifications that allow for the inclusion of reagent chemical costs and start-up fuel costs. In addition, MDU Resources Group collects from/credits to ratepayers variations in fuel and purchased power costs that deviate from an established base level through a power supply cost adjustment mechanism.

I. INTRODUCTION AND QUALIFICATIONS

Q. Please state your name, business address, and position with PacifiCorp.

A. My name is Rick T. Link. My business address is 825 NE Multnomah Street, Suite 600, Portland, Oregon 97232. My position is Vice President, Resource Planning and Acquisitions. I am testifying on behalf of PacifiCorp d/b/a Pacific Power (PacifiCorp or the Company).

Q. Please describe the responsibilities of your current position.

A. I am responsible for PacifiCorp's integrated resource plan (IRP), structured commercial business and valuation activities, and long-term load forecasts. Most relevant to this docket, I am responsible for the economic analysis used to screen system resource investments and for conducting competitive request for proposal (RFP) processes consistent with applicable state procurement rules and guidelines.

Q. Please describe your professional experience and education.

A. I joined PacifiCorp in December 2003 and assumed the responsibilities of my current position in September 2016. Over this time period, I held several analytical and leadership positions responsible for developing long-term commodity price forecasts, pricing structured commercial contract opportunities and developing financial models to evaluate resource investment opportunities, negotiating commercial contract terms, and overseeing development of PacifiCorp's resource plans. I was responsible for delivering PacifiCorp's 2013, 2015, 2017, and 2019 IRPs; have been directly involved in several resource RFP processes; and performed economic analysis supporting a range of resource investment opportunities. Before joining PacifiCorp, I was an energy and environmental economics consultant with ICF Consulting (now

ICF International) from 1999 to 2003, where I performed electric-sector financial modeling of environmental policies and resource investment opportunities for utility clients. I received a Bachelor of Science degree in Environmental Science from the Ohio State University in 1996 and a Masters of Environmental Management from Duke University in 1999.

Q. Have you testified in previous regulatory proceedings?

A. Yes. I have testified in proceedings before the Public Utility Commission of Oregon (Commission), the California Public Utilities Commission (California Commission), the Idaho Public Utilities Commission (Idaho Commission), the Utah Public Service Commission (Utah Commission), the Washington Utilities and Transportation Commission (Washington Commission), and the Wyoming Public Service Commission (Wyoming Commission).

II. PURPOSE AND SUMMARY OF TESTIMONY

Q. What is the purpose of your testimony?

A. I describe how PacifiCorp's Energy Vision 2020 uses opportunities presented by the extension of the federal production tax credit (PTC) to make renewable energy and infrastructure investments that produce net benefits to customers. Energy Vision 2020 consists of two major components: (1) investments in new wind and transmission; and (2) wind repowering. I sponsor the economic analysis demonstrating that PacifiCorp's Energy Vision 2020 wind and transmission investments are reasonable and prudent. I also provide the economic analysis supporting the prudence of the last wind facility PacifiCorp is repowering, Foote Creek I. Through its Renewable Adjustment Clause (RAC) filing in docket UE 352, PacifiCorp previously received approval for cost recovery of nine of its repowered wind facilities,[1] and PacifiCorp's pending RAC filing in docket UE 369 seeks approval of two additional repowered wind facilities.[2]

In addition to Energy Vision 2020, PacifiCorp has acquired another wind resource, the Pryor Mountain Wind Project in Montana, which will achieve commercial operation in 2020. I present and explain the economic analysis that demonstrates that this investment is reasonable and prudent.

I also present economic analysis supporting major resource management decisions for PacifiCorp's coal generation facilities, including the conversion of Naughton Unit 3 to natural gas in 2020, the closure of Cholla Unit 4 in 2020, and the installation of selective catalytic reduction (SCR) emissions control systems at Jim Bridger Units 3 and 4 in 2015-2016.

Finally, I present PacifiCorp's sales and load forecast upon which this rate case filing is based.

Q. How have you organized your testimony?

A. I address PacifiCorp's new wind and transmission investments, collectively referred to as the "Combined Projects" in Section III of my testimony. Section IV of my testimony addresses repowering the Foote Creek I wind facility. I address PacifiCorp's new Pryor Mountain Wind Project in Section V of my testimony. Section VI presents PacifiCorp's resource decisions involving coal generation facilities, and Section VII presents PacifiCorp's sales and load forecast.

---

[1] Docket No. UE 352 included the following wind repowering projects: Glenrock I, Goodnoe Hills, High Plains, Leaning Juniper, Marengo I, Marengo II, McFadden Ridge, Seven Mile Hill I, and Seven Mile Hill II.
[2] Docket No. UE 369 includes the following wind repowering projects: Glenrock III and Dunlap.

III. NEW WIND AND TRANSMISSION

Q. Please describe the new wind and transmission elements of Energy Vision 2020 included in this case.

A. By the end of 2020, PacifiCorp will add 1,150 megawatts (MW) of new wind resources in Wyoming. These resources are comprised of three facilities built by PacifiCorp, the 500 MW TB Flats I and II facilities and the 250 MW Ekola Flats project, and one facility that is a combined build-transfer agreement (BTA) and power purchase agreement (PPA), the 400 MW Cedar Springs facility[3] (collectively, the Energy Vision 2020 Wind Projects). These facilities were carefully selected to maximize value to customers in the 2017R RFP, which was monitored by independent evaluators (IE) from both Oregon and Utah.

Because PacifiCorp's current transmission system in eastern Wyoming is operating at capacity, PacifiCorp is also building a new, 140-mile Gateway West transmission sub-segment—the 500 kilovolt (kV) Aeolus-to-Bridger/Anticline transmission line, plus network upgrades—in Wyoming to enable this generation (collectively, Transmission Projects). As explained by PacifiCorp witness Mr. Richard A. Vail, the line allows PacifiCorp to interconnect up to 1,510 MW of new capacity, relieving existing transmission constraints in southeastern Wyoming. The new line increases transfer capability westbound by approximately 950 MW.

Q. Please summarize your testimony in Section III.

A. PacifiCorp's economic analysis shows that the investments in the Combined Projects are reasonable and prudent. The Energy Vision 2020 Wind Projects, which are

---

[3] The Cedar Springs facility includes Cedar Springs I which is a 200 MW PPA and Cedar Springs II which is a 200 MW BTA.

enabled by the Transmission Projects, will generate PTCs for 10 years; produce zero-fuel-cost energy that will lower net power costs (NPC); generate renewable energy certificates (REC), which can be sold in the market to create additional revenues that would lower net customer costs or be used to comply with state renewable portfolio standard targets; and help decarbonize PacifiCorp's resource portfolio, which will mitigate long-term risk associated with potential future state and federal policies targeting carbon dioxide (CO_2) emissions reductions from the electric sector.

The Transmission Projects will relieve congestion on the current transmission system in eastern Wyoming, enable new wind resource interconnections, provide critical voltage support to the Wyoming transmission network, improve overall reliability of the transmission system, enhance PacifiCorp's ability to comply with mandated reliability and performance standards, and reduce line losses. Moreover, the proposed transmission-system investments create an opportunity for further increases to the transfer capability across the Aeolus-to-Bridger/Anticline line with the construction of additional segments of Energy Gateway.

The Combined Projects will produce customer benefits that significantly outweigh costs. The change in revenue requirement due to the Combined Projects was analyzed using two different IRP modeling tools across nine different scenarios, each with varying natural-gas and CO_2 price assumptions. For each of these scenarios, the present-value revenue requirement differential (PVRR(d)) was calculated from system revenue requirement forecasts through 2050 (through the 30-year life of the Energy Vision 2020 Wind Projects), reflecting nominal capital revenue requirement from the Combined Projects, and from system revenue requirement forecasts over a 20-year period, where capital revenue requirement is levelized.

The Combined Projects show net PVRR(d) benefits of $174 million in the medium case through 2050, and benefits of $338 million in the medium case through 2036. In the 18 scenarios studied (nine each for the 2050 and 2036 analyses), 16 of 18 cases show net customer benefits.

The customer benefits from the Combined Projects increase substantially with higher natural-gas price assumptions and higher CO_2 price assumptions. These benefits conservatively do not assign any value to the RECs that will be generated by the Energy Vision 2020 Wind Projects. For every dollar assigned to the incremental RECs that will be generated by the Wind Projects, present-value benefits would improve for all scenarios by an additional $38 million when calculated from the change in system revenue requirement through 2050. When calculated from the change in system revenue requirement over a 20-year period, each dollar assigned to the incremental RECs from the Energy Vision 2020 Wind Projects would increase PVRR(d) benefits by $31 million.

Sensitivity analysis shows that substantial benefits of the Combined Projects persist when paired with PacifiCorp's wind repowering project, addressed in dockets UE 352 and UE 369, and in Section IV of my testimony.

2017 Integrated Resource Plan

Q. Did PacifiCorp analyze new Wyoming wind resources and the Aeolus-to-Bridger/Anticline Line in its 2017 IRP?

A. Yes. The 2017 IRP preferred portfolio included 1,100 MW of new wind resources located in Wyoming. This wind capacity is enabled by the Aeolus-to-

Bridger/Anticline line, which is also included in the 2017 IRP preferred portfolio. The new wind and Aeolus-to-Bridger/Anticline line are assumed to be placed in service by the end of 2020 so that the new wind resources can qualify for the full value of PTCs.

Q. What led PacifiCorp to include 1,100 MW of new Wyoming wind resources and the Aeolus-to-Bridger Anticline Line in its 2017 IRP preferred portfolio?

A. All the resource portfolios produced during the initial stages of the portfolio-development phase of the 2017 IRP contained new Wyoming wind resources in 2021, which for modeling purposes was used as a proxy on-line date for PTC-eligible wind achieving commercial operation by the end of 2020. These results indicated that PTC-eligible wind resources located in wind-rich areas like Wyoming provide customer benefits.

During the initial stages of portfolio development for the 2017 IRP, the amount of Wyoming wind capacity that routinely appeared in 2021 was limited by transmission congestion on PacifiCorp's existing 230 kV transmission system. This congestion affects energy output from resources in eastern Wyoming where there is substantial potential to develop high-quality, low-cost wind resources. Wyoming resource selections at or near the limitation on Wyoming wind capacity caused by transmission constraints indicated clear potential for incremental customer benefits if incremental transmission is added to accommodate more PTC-eligible wind resources located in Wyoming.

To assess these potential incremental benefits, PacifiCorp reviewed components of its Energy Gateway transmission project to identify specific sub-segments that could access additional new Wyoming wind resources. In performing this review, PacifiCorp looked at the transmission interconnection queue and determined that sub-segment D.2 (the Aeolus-to-Bridger/Anticline Line) of the Energy Gateway transmission project could access a sizable volume of new wind projects being developed in the Aeolus area. PacifiCorp then developed an initial, high-level cost estimate for the Aeolus-to-Bridger/Anticline Line that was used for an initial Aeolus-to-Bridger/Anticline sensitivity assuming 650 MW of incremental transfer capability and 900 MW of new Wyoming wind resources.

Q. Why did PacifiCorp assume new wind resource capacity in excess of the assumed incremental transfer capability of the Aeolus-to-Bridger/Anticline Line in this initial sensitivity?

A. The Aeolus-to-Bridger/Anticline Line can enable new resource interconnections in excess of the transfer capability of the line. PacifiCorp's preliminary sensitivity in the 2017 IRP assumed the Aeolus-to-Bridger/Anticline Line would support at least 900 MW of new resource interconnections. The assumed level of new wind resources is higher than the assumed incremental transfer capability of the transmission line because wind resources do not generate at their full capability in all hours of the year. At times when wind resources in southeastern Wyoming are operating near full output, other resources in the area can be re-dispatched to accommodate PTC-producing wind generation.

Q. What were the results of this initial Aeolus-to-Bridger/Anticline sensitivity?

A. The initial sensitivity indicated that there could be economic benefits from aligning development of the Aeolus-to-Bridger/Anticline Line with new, PTC-eligible

Wyoming wind resources. Based on the promising results from this initial sensitivity, PacifiCorp reviewed its initial, high-level assumptions to determine how refined inputs would affect potential benefits from the incremental new Wyoming wind resources and the Aeolus-to-Bridger/Anticline Line.

PacifiCorp completed power flow and dynamic-stability studies to refine its Aeolus-to-Bridger/Anticline Line assumptions. These studies supported increasing the assumed incremental transfer capability of the new transmission line from 650 MW to 750 MW and suggested that it could enable up to 1,270 MW of new resource interconnections. PacifiCorp also refined its initial, high-level cost assumptions, reducing the estimated capital cost of the project by over $100 million.

In addition, PacifiCorp reviewed its new wind resource cost-and-performance assumptions, initially developed to represent proxy Wyoming wind resources, to focus on specific projects that could be developed in the Aeolus area. Based on this review, PacifiCorp determined that the estimated capital cost for new wind resources could be lowered by 10.7 percent from its initial proxy cost assumptions and that its wind capacity factor assumptions should be reduced from 43 percent to 41.2 percent.

PacifiCorp also reviewed whether additional benefits from the wind enabled by the Aeolus-to-Bridger/Anticline Line could be quantified. PacifiCorp identified and quantified three additional value streams associated with its participation in the Energy Imbalance Market (EIM), improved transmission reliability, and reduced transmission line losses. The results from this additional review and analysis were applied in the final 2017 IRP resource-portfolio screening process, where PacifiCorp conducted additional studies that considered analysis performed in earlier resource-portfolio screening stages.

Q. What type of analysis did PacifiCorp consider from earlier resource-portfolio screening stages?

A. In earlier stages of its resource-portfolio screening process, PacifiCorp developed a wind repowering sensitivity, where certain existing wind resources qualify for an additional 10 years of PTCs after they are upgraded with modern equipment. The wind repowering project, discussed in dockets UE 352 and UE 369 and in Section IV of my testimony, showed significant net customer benefits across a range of assumptions related to forward market prices and federal CO_2 policy based on the Clean Power Plan. Considering the significant customer benefits associated with the wind repowering project, PacifiCorp combined its refined assumptions for incremental new Wyoming wind and the Aeolus-to-Bridger/Anticline Line in a study that included wind repowering.

Q. What were the results of PacifiCorp's final 2017 IRP resource-portfolio screening process that incorporated refined and expanded input assumptions for incremental new Wyoming wind resources and the Aeolus-to-Bridger/Anticline Line?

A. Studies developed for the final 2017 IRP resource-portfolio screening process showed significant net customer benefits relative to other resource-portfolio alternatives. Based on these results, the Aeolus-to-Bridger/Anticline Line and the 1,100 MW of new Wyoming wind resources, both assumed to be placed in service by the end of 2020, were included in the 2017 IRP preferred portfolio.

Q. Did PacifiCorp include an action item for new Wyoming wind resources in its 2017 IRP action plan?

A. Yes. The 2017 IRP action plan, which lists the specific steps PacifiCorp will take over the next two to four years to deliver resources in the preferred portfolio, includes the following action item associated with the new Wyoming wind resources:

> PacifiCorp will issue a wind resource RFP for at least 1,100 MW of Wyoming wind resources that will qualify for federal wind production tax credits and achieve commercial operation by December 31, 2020.
>
> - April 2017, notify the Utah Commission of intent to issue the Wyoming wind resource RFP.
> - May-June, 2017, file a draft Wyoming wind RFP with the Utah Commission and the Washington Commission.
> - May-June, 2017, file to open a Wyoming wind RFP docket with the Commission and initiate the IE RFP.
> - June-July, 2017, file a draft Wyoming wind RFP with the Commission and file a Public Convenience and Necessity (CPCN) application with the Wyoming Commission.
> - By August 2017, obtain approval of the Wyoming wind resource RFP from the Commission, the Utah Commission and the Washington Commission.
> - By August 2017, issue the Wyoming wind RFP to the market.
> - By October 2017, Wyoming wind RFP bids are due.
> - November-December, 2017, complete initial shortlist bid evaluation.
> - By January 2018, complete final shortlist bid evaluation, seek acknowledgment of the final shortlist from the Commission, and seek approval of winning bids from the Utah Commission.
> - By March 2018, receive CPCN approval from the Wyoming Commission.
> - Complete construction of new wind projects by December 31, 2020.

Q. Did PacifiCorp also include an action item for the Aeolus-to-Bridger/Anticline Line in its 2017 IRP action plan?

A. Yes. The 2017 IRP action plan includes the following action item associated with the Aeolus-to-Bridger/Anticline line:

> By December 31, 2020, PacifiCorp will build the 140-mile, 500 kV transmission line running from the Aeolus substation near Medicine Bow, Wyoming, to the Jim Bridger power plant (a sub-segment of the Energy Gateway West transmission project). This includes pursuing regulatory review and approval as necessary.
>
> - June-July 2017, file a CPCN application with the Wyoming Commission.
> - By March 2018, receive conditional CPCN approval from the Wyoming Commission pending acquisition of rights of way.
> - By December 2018, obtain Wyoming Industrial Siting permit and issue engineer, procure, and construct (EPC) limited notice to proceed.
> - Complete construction of the transmission line by December 31, 2020.

Q. Did the Commission acknowledge the Combined Projects in PacifiCorp's 2017 IRP action plan?

A. Yes. The Commission acknowledged the action items containing the Combined Projects, with conditions, at a Special Public Meeting in December 2017, as memorialized in Order 18-138 in docket LC 67.[4]

Q. What conditions did the Commission include with its acknowledgment of these action items?

A. The Commission directed PacifiCorp to provide an updated economic analysis with its request for acknowledgment of the final shortlist for the 2017R RFP, and to update

[4] *In the Matter of PacifiCorp, dba Pacific Power*, Docket LC 67, Order No. 18-138, at 8 (Apr. 27, 2018).

its analysis of these projects as part of its 2017 IRP Update, including any changes resulting from the RFP or changes to critical assumptions.[5] In addition, the Commission requested quarterly updates as the wind projects selected in the RFP process and the transmission project proceed, up through the date the projects go into service.[6]

Q. Has PacifiCorp fulfilled these conditions?

A. Yes. As part of the 2017R RFP process, PacifiCorp conducted economic analysis using the same models as in the 2017 IRP to evaluate bids and develop an RFP shortlist. PacifiCorp reported the results of this updated analysis in its request for acknowledgment of the RFP shortlist in docket UM 1845 in February 2018,[7] and incorporated these results into its 2017 IRP Update filed with the Commission in docket LC 67 in May 2018.[8] PacifiCorp has also since provided six quarterly updates on the status of project permitting and construction to date, with the most recent update filed in October 2019.[9]

Q. Did the Commission provide any other qualifications on acknowledgment of the 2017 IRP action items for the Combined Projects?

A. Yes. In its acknowledgment order, the Commission reserved the right to impose conditions ensuring the benefits of the Combined Projects are not less than IRP projections.[10] Importantly, however, the Commission made clear that it was not

[5] Order No. 18-138 at 8.
[6] *Id*.
[7] *In the Matter of PacifiCorp, dba Pacific Power, 2017R Request for Proposals*, Docket No. UM 1845, PacifiCorp's Corrected Request for Acknowledgment of Final Shortlist of Bidders in 2017R Request for Proposals, at 10-33 (Feb. 23, 2018).
[8] Docket No. LC 67, PacifiCorp's 2017 Integrated Resource Plan Update, at 102-105 (May 1, 2018).
[9] Docket No. LC 67, PacifiCorp's Compliance Filing - New Wind and Transmission Projects Quarterly Update, at 4, 6-7 (Oct. 31, 2019).
[10] Order No. 18-138 at 8, 9.

setting rates or pre-judging ratemaking issues.[11] The Commission issued this IRP order when the projects were still early in development. More than two years later, PacifiCorp is well into implementing the Combined Projects, and during this time it has carefully managed the many different facets of project development risks. As evidenced by the quarterly updates filed in docket LC 67, and as discussed in the testimony of PacifiCorp witness Mr. Chad A. Teply, PacifiCorp is positioned to complete the Combined Projects on time and on budget.

Q. Did PacifiCorp address the Combined Projects in its 2019 IRP?

A. All resource portfolios developed for the 2019 IRP include the Combined Projects, which are under construction. New resource acquisitions were evaluated assuming the Combined Projects will be placed in service by the end of 2020.

2017R RFP

Q. When did PacifiCorp issue the 2017R RFP called for in the 2017 IRP?

A. At the time PacifiCorp issued the 2017R RFP, PacifiCorp was subject to resource procurement requirements in Oregon under the Competitive Bidding Guidelines established by Order 06-446 in docket UM 1182,[12] and in Utah under Utah Code Ann. § 54-17-201 *et. seq.* PacifiCorp issued the 2017R RFP on September 27, 2017, after

[11] *Id.* at 3 ("Our decision to acknowledge or not acknowledge an action item does not constitute ratemaking. The question of whether a specific investment made by a utility in its planning process was prudent will be fairly examined in the subsequent ratemaking."); *see also id.* at 9 (explaining that the Commission "intend[s] to protect customers going forward, while still giving the Company the flexibility to try to capture the significant economic benefits that the Company's planning assumptions show PTC-enabled resources would deliver to customers").

[12] *In the Matter of Public Util. Comm. of Oregon, Investigation Regarding Competitive Bidding*, Docket No. UM 1182, Order No. 06-446, at 15, Appendix A (Aug. 10, 2006). *See also* Docket No. UM 1182, Order No. 14-149, at 18, Appendix A (Apr. 30, 2014) (revising Guidelines). The Commission subsequently adopted competitive bidding rules.

it was approved by the Utah Commission on September 22, 2017,[13] and by this Commission on September 27, 2017.[14]

Q. Please elaborate on the Commission's RFP approval order in docket UM 1845.

A. Under Oregon's Competitive Bidding Guidelines, the Commission focuses on three factors in reviewing a final draft RFP: "(1) the alignment of the utility's RFP with its acknowledged IRP; (2) whether the RFP satisfies the Commission's competitive bidding guidelines; and (3) the overall fairness of the utility's proposed bidding process."[15] As the Commission has explained, "[t]he ultimate goal of the RFP process is the same as the IRP process—to minimize long-term costs and risks[,]" but whereas the IRP process focuses on resource need, "[t]he RFP process focuses on how the utility executes the procurement process[.] . . ."[16]

The Commission initially approved the 2017R RFP at a Special Public Meeting on August 29, 2017, subject to the condition that PacifiCorp subsequently receive acknowledgment of the Combined Projects in its 2017 IRP docket.[17] In so doing, the Commission explained that "unique time constraints" imposed by expiring PTCs justified approving the RFP before IRP acknowledgment.[18] On September 27, 2017, the Commission issued an amended order approving the 2017R RFP as modified to conform with the Utah Commission's approval decision.[19] Among other

[17] Order No. 17-345 at 2. The Commission also conditioned its approval subject to several modifications to RFP terms requested by the IE and other parties. *See id.* at 3-4; Docket No. UM 1845, Order No. 17-367 (Sept. 27, 2017).
[18] Order No. 17-345 at 2.
[19] Order No. 17-367.

changes, the modified 2017R RFP allowed bids from non-Wyoming wind projects.

As with the 2017 IRP acknowledgment order, the Commission emphasized it was not setting rates or pre-judging ratemaking issues.[20] Rather, approval of an RFP, the Commission explained, is "[s]imply a determination on the three criteria set out in the guideline . . . . The approval is simply that: the RFP meets these criteria, does not meet the criteria, or would meet the criteria with certain conditions and modifications."[21]

Q. In response to the Utah Commission's approval order, did PacifiCorp decide to issue a solar RFP to run concurrently with the 2017R RFP?

A. Yes. In its order approving the 2017R RFP, the Utah Commission suggested, but did not require, a modification to expand the 2017R RFP to solicit solar resource bids. To maintain the 2017R RFP schedule while addressing the Utah Commission's suggestion, PacifiCorp issued a separate solicitation process for solar resources, the 2017S RFP, on November 15, 2017. The 2017S RFP allowed the Company to: (1) evaluate how solar resource bids might impact the economic analysis of bids selected to the final shortlist in the 2017R RFP without delaying the schedule for the 2017R RFP; and (2) explore whether new solar resource opportunities might provide all-in economic benefits for customers.

Q. Please describe the key milestones in the 2017R RFP.

A. First, PacifiCorp received initial bids in October 2017. The 2017R RFP was well

---

[20] *Id.* at 2 ("[A] decision to approve an RFP does not constitute any determination on the prudence of the resource acquisition. Any ratemaking determinations would occur at a later time."). *See also id.* at 3 ("If the Company proceeds to rate recovery, we will continue to scrutinize the resource selection, as we recognize that a rushed process makes it harder to comprehensively review the matter before us, and will ultimately be taken into consideration in future proceedings.").
[21] *Id.* at 2.

received by the market, with 5,219 MW of new wind resource capacity bid into the 2017R RFP (4,624 MW of Wyoming wind and 595 MW of non-Wyoming wind).

Second, PacifiCorp evaluated bids and selected the initial shortlist in November 2017. The establishment of the final shortlist was delayed by the need for refreshed bids to account for the enactment of the Tax Cuts and Jobs Act (TCJA) in December 2017.

Third, PacifiCorp announced its final shortlist in January 2018. The final shortlist consisted of four new wind projects located in Wyoming with a total capacity of 1,170 MW, including three of the Company's benchmark facilities (TB Flats I and II, now combined as a single 500 MW project, and the 109 MW McFadden Ridge II project), and two new facilities: Uinta, a BTA totaling 161 MW, and Cedar Springs, one-half BTA and one-half PPA, for a total of 400 MW.

Fourth, PacifiCorp updated the final shortlist in February 2018 after completing its interconnection-restudy process. PacifiCorp initially developed the final shortlist based on economic analysis of the bids without consideration of interconnection queue position, specifically at the request of IEs and comments in the RFP process.[22] Based on the results of the interconnection restudies, PacifiCorp removed the McFadden Ridge II benchmark because it could not be interconnected with just the addition of the Aeolus-to-Bridger/Anticline transmission line. The updated final shortlist added the Ekola Flats benchmark bid and increased the total capacity in the updated final shortlist to 1,311 MW. In its restudy process, PacifiCorp

[22] Docket No. UM 1845, PacifiCorp's Reply Comments, at 14-15 (Mar. 29, 2018) ("RFP Reply Comments"); Docket No. UM 1845, PacifiCorp's Comments on Staff's Report, at 4 (Apr. 19, 2018) ("RFP Comments on Staff Report").

confirmed the Aeolus-to-Bridger/Anticline Line will enable interconnection of up to 1,510 MW of new wind capacity within the constrained area of PacifiCorp's transmission.

Q. Please summarize the role of the IEs who monitored the 2017R RFP.

A. The 2017R RFP was overseen by two IEs—one appointed by the Commission and retained by PacifiCorp, and one appointed and retained by the Utah Commission. In accordance with the applicable statutes, rules, and policies in Oregon and Utah, the IE is an independent expert appointed and managed by the respective state commissions (not PacifiCorp) to ensure an RFP process is conducted in a fair and unbiased manner and the final shortlist projects are reasonable and consistent with the modeling results used to evaluate bids.[23]

In the 2017R RFP, both IEs were involved from the beginning—providing feedback and recommendations regarding the design and content of the 2017R RFP and actively participating in every stage of the RFP. For its part, PacifiCorp ensured the IEs had complete and unrestricted access to all information related to the 2017R RFP and kept both IEs informed of developments as they occurred.

Q. Did the IEs provide an assessment of PacifiCorp's benchmark resources bid into the 2017R RFP (*i.e.*, TB Flats I and II, Ekola Flats, and McFadden Ridge II)?

A. Yes. Because the 2017R RFP included benchmark resources, both IEs provided detailed assessments of the benchmark bids to ensure they were reasonable and would not bias the solicitation in favor of utility-owned resources. The benchmark review process occurred before any other bids were received to provide additional assurance

[23] OAR 860-089-0200, 860-089-0450; Order No. 14-149, Appendix A, at 2 (Guideline #5); Utah Code § 54-17-203; Utah Admin. Code R746-420-1 - R746-420-6.

that the benchmarks were not provided an unfair advantage.

Q. Did the IEs confirm the reasonableness of the benchmark bids?

A. Yes. The Oregon IE conducted a thorough assessment of the benchmarks, noting that when "assessing a utility's own bids in response to the RFP, our greatest concern is that the utility will incorporate cost estimates that have been aggressively estimated and do not characterize the costs of the project accurately."[24] To make its assessment, the Oregon IE "looked at a detailed breakdown of each of the benchmarks costs to determine if any items have been improperly omitted from the cost calculation, and at overall capital cost levels by comparing them to publicly-available data on recent wind generation capital costs."[25] This "comparison provided a measure of the overall reasonableness of the Benchmark capital costs and capacity factors."[26] The Oregon IE ultimately found that the benchmarks were acceptable based on three items:

- First, the benchmarks were not deliberately under-priced through omission of any capital cost components.
- Second, the benchmark capital and operating costs appeared reasonable when compared with public data on U.S. wind projects.
- Third, the capacity factors of the benchmarks were reasonable when compared with public data and were supported by credible third-party analysis.[27]

The Utah IE similarly concluded that: (1) PacifiCorp provided detailed information related to the benchmarks that exceeded industry standards; (2) cost estimates were reasonable; and (3) the review, assessment, and scoring of the benchmark resources was conducted in a fair and equitable manner with no outward

[24] Docket No. UM 1845, Revised Independent Evaluator's Final Report on PacifiCorp's 2017R Request for Proposals, at 10 (Feb. 20, 2018) ("Oregon IE Report").

[26] *Id.*
[27] *Id. at 10-11.*

perception of bias.[28]

Q. Please describe Oregon's RFP shortlist acknowledgment process.

A. Under the Competitive Bidding Guidelines, in addition to seeking Commission approval of the RFP prior to commencement of bidding, a utility must subsequently request acknowledgment of its selection of the final shortlist of RFP resources coming out of that bidding process.[29] Acknowledgment "means only that the [shortlist] seems reasonable to the Commission at the time the acknowledgment is given."[30] In a subsequent cost recovery proceeding, acknowledgment of an RFP shortlist has the same effect as IRP acknowledgment.[31] In other words, the decision whether to acknowledge a utility's shortlist "does not constitute ratemaking[,]" and "[t]he question of whether a specific investment made by a utility in its planning process is prudent will be fairly examined in the subsequent rate proceeding."[32]

Q. Did the Oregon IE recommend acknowledgment of the 2017R RFP Shortlist?

A. Yes. The Oregon IE recommended the Commission approve PacifiCorp's final shortlist based on the following conclusions:

- The selected bids represent the top offers that are viable under current transmission planning assumptions and provide the greatest benefits to ratepayers.
- The selected bids represent the best viable options from a competitive perspective, based on the 59 bid options presented.

[28] Docket No. 17-035-23, Redacted Final Report of the Independent Evaluator Merrimack Energy Group, Inc., at 44-45 (Feb. 27, 2018) ("Utah IE Report").
[29] Order No. 14-149, Appendix A at 5 (Guideline #13).
[30] *In The Matter Of The Investigation Into Least-cost Planning In Oregon*, Docket No. UM 180, Order No. 89-507, 102 PUR4th 301 (Apr. 20, 1989); Order No. 14-149, Appendix A, at 5 (explaining that with respect to an RFP shortlist, "[a]cknowledgment has the same meaning as assigned to that term in Commission Order No. 89-507.").
[31] Order No. 14-149, Appendix A at 5 (Guideline #13).
[32] Order No. 18-138 at 3 (discussing the IRP acknowledgement process).

- The IE's analysis confirmed that the selected bids were reasonably priced and, while not the lowest-cost offers, were the lowest-cost offers that were viable under current transmission planning assumptions. The IE's analysis included its own cost models for each bid option and a review of PacifiCorp's models.
- The IE took special care to confirm the selection of PacifiCorp's benchmark resources. The IE confirmed the accuracy of the benchmark costs and scoring. The IE noted that the benchmark bids were disciplined by the fact that a third-party bidder submitted a competing offer for a BTA for benchmark projects.
- The IE confirmed that the 2017R RFP aligns with the acknowledged 2017 IRP and that the shortlist was developed using IRP assumptions and models.[33]

Q. How did the Commission proceed with PacifiCorp's RFP shortlist?

A. In May 2018, the Commission issued a decision declining to acknowledge PacifiCorp's shortlist, based in large part on concerns about how transmission interconnection constraints imposed by the Federal Energy Regulatory Commission (FERC) narrowed the shortlist of eligible projects.[34]

Q. Please describe the interconnection constraints.

A. Under PacifiCorp's open access transmission tariff (OATT) and the policies and precedent established by FERC, PacifiCorp transmission must process and study projects for interconnection in serial order, based on the date the generator requests interconnection.[35] Federal interconnection requirements therefore limited the number of projects bidding into the RFP process that would be eligible to interconnect and achieve commercial operation prior to the impending PTC deadline.[36]

Q. How did the interconnection constraint affect the RFP shortlist?

A. PacifiCorp's interconnection restudy process resulted in displacing one of the

---

[33] Oregon IE Report at 2-3; Order No. 18-178 at 4.
[34] Order No. 18-178 at 9.

[36] RFP Reply Comments at 9-11.

benchmark projects (McFadden Ridge II) with another benchmark project (Ekola Flats).[37] The interconnection restudy process did not replace any third-party projects with benchmark projects.

Q. Did the IEs address the interconnection queue issue?

A. Yes. Both IEs agreed with PacifiCorp's assessment that projects with interconnection queue numbers greater than Q0712 were non-viable. Although both IEs expressed some frustration about the limitations imposed by these issues, both concluded that the process was nonetheless fair, transparent, and unbiased.

The Oregon IE explained that PacifiCorp's "transmission arm, which assesses interconnection costs, must, by law, assume that each queue project is interconnected in order received so each project assumes that all projects ahead of it in the queue are interconnected."[38] Thus, "[a]s more projects in the Wyoming area are interconnected it puts more strain on the transmission system until eventually major upgrades such as the Gateway West and South projects are needed."[39] In this case, the major upgrades were required for all projects with queue numbers greater than Q0712. The Oregon IE concluded that it "understand[s] and appreciate[s] PacifiCorp's position and do[es] not disagree with their transmission department's findings (beyond noting the obvious fact that many projects will likely drop out of the queue and that actual interconnection costs will differ from projected)."[40] According to the IE, "[t]o go forward with projects that cannot meet the proposed online date without major accelerated transmission investment would not seem to be the wisest course of

[37] *Id.* at 13-14; RFP Comments on Staff Report at 3-4.
[38] Oregon IE Report at 32.
[39] *Id.*
[40] *Id.* at 35.

action."[41]

The Utah IE found that the final shortlist of projects "was a reasonable selection based on the constraints identified."[42]

Q. Order 18-178 on the final shortlist was issued less than a month after Order 18-138 acknowledging the 2017 IRP. Did the Commission provide any context for the interplay between these two orders?

A. Yes. The Commission was careful to qualify that its decision with respect to the RFP shortlist "does not diminish [the] earlier acknowledgment of PacifiCorp's proposal to acquire renewable resources[]" in the IRP docket.[43]

The Commission emphasized that it did not conclude PacifiCorp "acted inappropriately" in conducting the RFP or in managing its transmission queue.[44] Rather, the Commission recognized the time constraints imposed by expiring PTCs led to the unusual circumstances at issue in the RFP docket:

> We believe that accommodating PacifiCorp's request for an out-of-order RFP process, in which we were asked to approve PacifiCorp's RFP well before we concluded our review of the IRP, combined with an expedited schedule, is the primary factor that resulted in a RFP design, process and, ultimately, shortlist that did not meet our expectations . . . .[45]

Notwithstanding concerns about the impact transmission requirements had on the shortlisted projects, the Commission clarified that going forward, it is "committed to give fair regulatory treatment to resource decisions that PacifiCorp ultimately makes."[46]

---

[41] *Id.*

[43] Order No. 18-178 at 9.
[44] *Id.* at 13.
[45] *Id.*
[46] *Id.* at 14.

Q. Did the Utah IE provide any overall conclusions related to the 2017R RFP?

A. Yes. The Utah IE supported the final shortlist projects based on the following conclusions:

- The 2017R RFP was fair, reasonable, and generally in the public interest.[47]
- The bid evaluation and selection processes were designed to lead to the acquisition of wind-generated electricity at the lowest reasonable cost based on the detailed state-of-the-art portfolio evaluation methodology used, the steps taken to achieve comparability between utility cost-of-service resources and third-party firm priced bids, the flexibility afforded bidders via a range of eligible resource alternatives, and the attempt to allow for equal terms for PPA and BTA resources.[48]
- PacifiCorp's modeling demonstrates that the Combined Projects "should result in significant savings for customers."[49] Further, because PTCs will flow through to customers in the first 10 years, the "near-term benefits to customers should be significant."[50]

Energy Vision 2020 CPCN/Pre-Approval Filings

Q. Did PacifiCorp seek a CPCN for the Combined Projects from the Wyoming Commission?

A. Yes. Because the Combined Projects are being constructed in Wyoming, PacifiCorp filed an application for a CPCN at the Wyoming Commission in June 2017.

Q. Did the Wyoming Commission approve PacifiCorp's CPCN application?

A. Yes. In April 2018, the Wyoming Commission approved the CPCN based on a stipulation among several parties. In the stipulation, PacifiCorp agreed to remove the 161 MW Uinta facility from the final shortlist. This reduced the total capacity of the Wind Projects from 1,311 MW to 1,150 MW. PacifiCorp updated its February 2018 economic analysis to reflect this change.

[49] *Id.*
[50] *Id.* at 83.

Q. Did PacifiCorp request and receive approval for the Combined Projects in other states?

A. Yes. PacifiCorp filed for a CPCN in Idaho. In Utah, PacifiCorp requested approval under Utah Code Ann. § 54-17-302 for the Company's "significant energy resource decision" to acquire the Wind Projects; it also requested approval under Utah Code Ann. § 54-17-402 for its "resource decision" to construct the Transmission Projects. The Company updated both applications to remove the Uinta facility based on the stipulation in Wyoming. The Utah and Idaho Commissions granted the applications in June and July 2018, respectively.

Modeling Methodology

Q. Please describe the chronology of PacifiCorp's analyses of the Combined Projects.

A. PacifiCorp's initial economic analysis of the Combined Projects was in the 2017 IRP. The Company updated this analysis in June 2017 when it filed for CPCNs and pre-approval in Wyoming, Utah, and Idaho. After the initial final shortlist was selected, PacifiCorp updated its analysis in January 2018 to reflect the winning bids, which at the time included McFadden Ridge II. Following the completion of the interconnection restudies, in February 2018, PacifiCorp updated its economic analysis to replace McFadden Ridge II with Ekola Flats. After the stipulation removing Uinta from the Combined Projects, PacifiCorp adjusted its February 2018 analysis to reflect this change.

Q. What economic analysis did PacifiCorp rely upon in deciding to move forward with its investment in the Combined Projects?

A. PacifiCorp relied upon its economic analysis from February 2018, adjusted to remove the Uinta facility, to make its decision to move forward with the Combined Projects.

System Modeling Methodology

Q. Please summarize the methodology PacifiCorp used in its system analysis of the Combined Projects.

A. PacifiCorp relied upon the same modeling tools used to develop resource portfolios in its 2017 IRP to refine its analysis of the Combined Projects. These IRP modeling tools, described further below, calculate system present value revenue-requirement (PVRR) by identifying least-cost resource portfolios and dispatching system resources over a 20-year forecast period (2017–2036). Net customer benefits are calculated as the PVRR(d) between two simulations of PacifiCorp's system. One simulation includes the Combined Projects, and the other simulation excludes the Combined Projects. Customers are expected to realize net benefits when the system PVRR with the Combined Projects is lower than the system PVRR without the Combined Projects. Conversely, customers would experience increased costs if the system PVRR with the Combined Projects were higher than the system PVRR without the Combined Projects.

Q. What modeling tools did PacifiCorp use to perform its economic analysis of the Combined Projects?

A. PacifiCorp used the System Optimizer (SO) model and the Planning and Risk model (PaR) to develop resource portfolios and to forecast dispatch of system resources in simulations with and without the Combined Projects.

Q. Please describe the SO and PaR models.

A. The SO model is used to develop resource portfolios with sufficient capacity to achieve a target planning-reserve margin. The SO model selects a portfolio of resources from a broad range of resource alternatives by minimizing the system PVRR. In selecting the least-cost resource portfolio for a given set of input assumptions, the SO model performs time-of-day, least-cost dispatch for existing resources and prospective new resource alternatives, while considering the cost-and-performance characteristics of existing contracts and prospective demand-side management (DSM) resources—all within or connected to PacifiCorp's system. The system PVRR from the SO model reflects the cost of existing contracts, wholesale-market purchases and sales, the cost of new and existing generating resources (fuel, fixed and variable operations and maintenance, and emissions, as applicable), the cost of new DSM resources, and levelized revenue requirement of capital additions for existing coal resources and potential new generating resources.

PaR is used to develop a chronological unit commitment and dispatch forecast of the resource portfolio generated by the SO model, accounting for operating reserves, volatility and uncertainty in key system variables. PaR captures volatility and uncertainty in its unit commitment and dispatch forecast by using Monte Carlo sampling of stochastic variables, which include load, wholesale electricity and natural-gas prices, hydro generation, and thermal unit outages. PaR uses the same common input assumptions that are used in the SO model, with resource-portfolio data provided by the SO model results. The PVRR from PaR reflects a distribution of system variable costs, including variable costs associated with existing contracts, wholesale-market purchases and sales, fuel costs, variable operations and maintenance (O&M) costs, emissions costs, as applicable, and costs associated with energy or reserve deficiencies. Fixed costs that do not change with system dispatch, including the cost of DSM resources, fixed O&M costs, and the levelized revenue requirement of capital additions for existing coal resources and potential new generating resources, are based on the fixed costs from the SO model, which are combined with the distribution of PaR variable costs to establish a distribution of system PVRR for each simulation.

Q. How has PacifiCorp historically used the SO and PaR models?

A. PacifiCorp uses the SO model and PaR to produce and evaluate resource portfolios in its IRP and to evaluate bids in its RFPs. PacifiCorp also uses these models to analyze resource-acquisition opportunities, resource retirements, resource capital investments, and system transmission projects.

Q. Are the SO and PaR models the appropriate tools for analyzing the Combined Projects opportunity?

A. Yes. The SO model and PaR are the appropriate modeling tools when evaluating significant capital investments that influence PacifiCorp's resource mix and affect least-cost dispatch of system resources. The SO model simultaneously and endogenously evaluates capacity and energy trade-offs associated with resource capital projects and is needed to understand how the type, timing, and location of future resources might be affected by the Combined Projects. PaR provides additional granularity on how the Combined Projects are projected to affect system operations, recognizing that key system conditions are volatile and uncertain. Together, the SO model and PaR are best suited to perform a net-benefit analysis for the Combined Projects opportunity that is consistent with long-standing risk-adjusted, least-cost planning principles applied in PacifiCorp's IRP.

Q. How did PacifiCorp use PaR to assess stochastic system cost risk associated with the Combined Projects?

A. Just as it evaluates resource-portfolio alternatives in the IRP, PacifiCorp uses the stochastic-mean PVRR and risk-adjusted PVRR, calculated from PaR study results, to assess the stochastic system-cost risk of the Combined Projects. With Monte Carlo sampling of stochastic variables, PaR produces a distribution of system variable costs. The stochastic-mean PVRR is the average of net variable operating costs from the distribution of system variable costs, combined with system fixed costs from the SO model. PacifiCorp uses a risk-adjusted PVRR to evaluate stochastic system cost risk. The risk-adjusted PVRR incorporates the expected value of low-probability, high-cost outcomes. The risk-adjusted PVRR is calculated by adding five percent of system variable costs, from the 95th percentile of the distribution of system variable costs, to the stochastic-mean PVRR.

When applied to the Combined Projects analysis, the stochastic-mean PVRR represents the expected level of system costs from cases with and without the Combined Projects. The risk-adjusted PVRR is used to assess whether the Combined Projects cause a disproportionate increase to system variable costs under low-probability, high-cost system conditions.

Q. Please describe how the effective combined federal and state income tax rate assumption is applied in the SO model and the PaR in the economic analysis.

A. The effective combined federal and state income tax rate affects PacifiCorp's post-tax weighted average cost of capital, which is used as the discount rate in the SO model and PaR. Accounting for recent changes in tax law, the discount rate used in the economic analysis is 6.91 percent.

The income tax rate also affects the capital revenue requirement for all new resource options available for selection in the SO model. Capital revenue requirement is levelized in the SO and PaR models to avoid potential distortions in the economic analysis of capital-intensive assets that have different lives and in-service dates. This is achieved through annual capital recovery factors, which are expressed as a percentage of the initial capital investment for any given resource alternative in any given year. Capital recovery factors, which are based on the revenue requirement for specific types of assets, are differentiated by each asset's assumed life, book-depreciation rates, and tax-depreciation rates. Because capital revenue requirement accounts for the impact of income taxes on rate-based assets, the capital recovery factors applied to new resource costs in the SO model were reflected for each system simulation.

Finally, the income tax rate affects the tax gross-up of all PTC-eligible resources. At the time, federal PTCs were $24/megawatt-hour (MWh), which equates to a $31.82/MWh reduction in revenue requirement assuming an effective combined federal and state income tax rate of 24.587 percent. The impact of the income tax rate assumptions were applied to all PTC-eligible resource alternatives available in the SO model.

Q. What assumptions did PacifiCorp use in its economic analysis of the Combined Projects in February 2018?

A. The models reflect: (1) cost-and-performance assumptions for the Wind Projects consistent with the winning bids selected to the 2017R RFP final shortlist; (2) the latest load-forecast projections; (3) the latest price-policy scenario assumptions; and (4) changes in federal tax rate for corporations under the TCJA.

Q. Please describe the cost-and-performance estimates for the Energy Vision 2020 Wind Projects in the February 2018 economic analysis.

A. The February 2018 economic analysis includes the capital costs associated with the winning bids, the costs associated with the Cedar Springs PPA, and updated net capacity factors. This economic analysis also captures terminal-value benefits from BTA and EPC-benchmark bids, where the Company retains control of the site at the end of the asset life. These benefits were considered in the 2017R RFP bid-selection process, consistent with the bid-evaluation methodology described in the RFP, and therefore, they are applied in the economic analysis.

Q. Please describe the load forecast included in the February 2018 economic analysis.

A. The economic analysis uses PacifiCorp's load forecast completed in the summer of 2017.

Q. Please explain how PacifiCorp used price-policy scenarios to analyze the Combined Projects.

A. In addition to assessing stochastic system cost risk, PacifiCorp analyzed the

Combined Projects under a range of price-policy assumptions regarding wholesale market prices and CO_2 policy. Wholesale-power prices, often set by natural-gas prices, and the system cost impacts of potential CO_2 policies influence the forecast of net system benefits from the Combined Projects. Wholesale-power prices and CO_2 policy outcomes affect the value of system energy, the dispatch of system resources, and PacifiCorp's resource mix. Consequently, wholesale-power prices and CO_2 policy assumptions affect NPC benefits, non-NPC variable cost benefits, and system fixed-cost benefits of the Combined Projects. Because wholesale-power prices and CO_2 policy outcomes are both uncertain and important drivers to the analysis, PacifiCorp studied the economics of the Combined Projects under a range of different price-policy scenarios.

Q. What price-policy assumptions did PacifiCorp use in its February 2018 Combined Projects analysis?

A. PacifiCorp developed three wholesale-power price scenarios (low, medium, and high), and similarly developed three CO_2 policy scenarios (zero, medium, and high). The nine price-policy scenarios developed for the analysis reflect different combinations of these scenario assumptions.

Considering that there is a high level of correlation between wholesale-power prices and natural-gas prices, the wholesale-power price scenarios were based on a range of natural-gas price assumptions. This ensures consistency between power price and natural-gas price assumptions for each scenario. PacifiCorp implemented its CO_2 policy assumptions through a CO_2 price, expressed in dollars-per-ton recognizing that it is possible that future CO_2 policies targeting electric-sector emissions could be adopted and impose incremental costs to drive emission reductions. CO_2 price assumptions used in the price-policy scenarios are not intended to mimic a specific type of policy mechanism (*i.e.*, a tax or an allowance price under a cap-and-trade program), but are intended to recognize that there might be future CO_2 policies that impose a cost to reduce emissions.

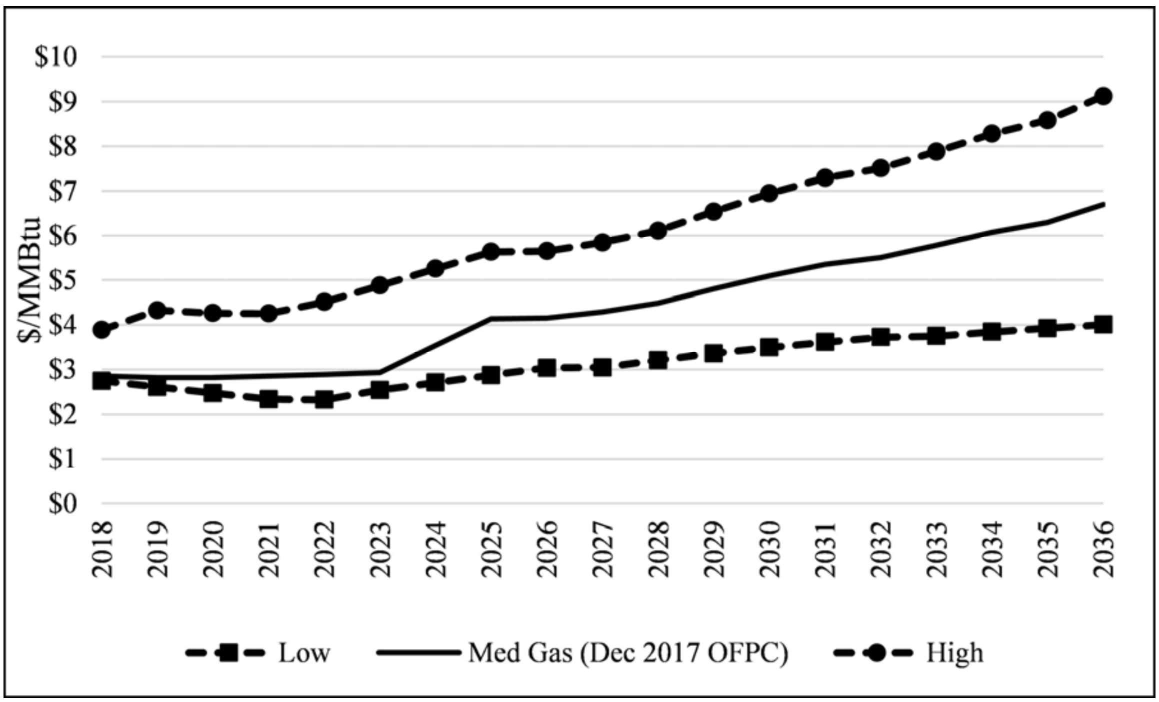
Q. Please describe the natural-gas price assumptions used in the February 2018 price-policy scenarios.

A. The medium-natural-gas price assumptions that are paired with zero CO_2 prices reflect natural-gas prices from PacifiCorp's official forward price curve (OFPC) dated December 29, 2017. This OFPC uses observed forward market prices as of December 29, 2017, for 72 months, followed by a 12-month transition to natural-gas prices based on a forecast developed by a third-party forecasting service. The medium-, low-, and high-natural-gas price assumptions used for all other scenarios were chosen after reviewing a range of credible third-party forecasts. Confidential Exhibit PAC/701 shows the range in natural-gas price assumptions from these third-party forecasts relative to those adopted for the price-policy scenarios to evaluate the Combined Projects.

The low-natural-gas price assumption was also derived from a low-price scenario developed by a third-party forecasting service. The medium-natural-gas price assumption, which is used beyond month 84 in the December 2017 OFPC, and in all months when medium-natural-gas prices are paired with medium or low CO_2 price assumptions, is based on a base-case forecast from [redacted] that is reasonably aligned with other base-case forecasts. The high-natural-gas price assumption was based on a high-price scenario from [redacted] that is characterized by exaggerated boom-bust cycles (cyclical periods of high prices and low prices). PacifiCorp smoothed the boom-bust cycle in this third party's high-price scenario because the specific timing of these cycles is extremely difficult to project with reasonable accuracy.

Figure 1 shows Henry Hub natural-gas price assumptions from the December 2017 OFPC, low-, and high-natural-gas price scenarios.

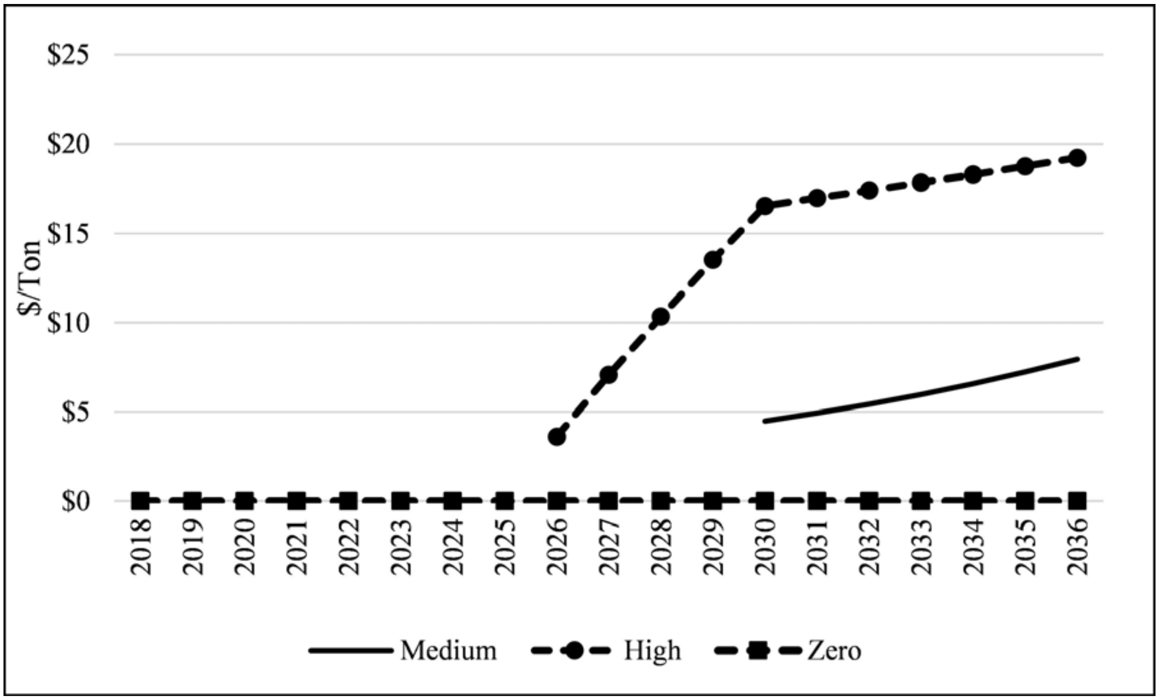
Figure 1. Nominal Natural-Gas Price Scenarios in the February 2018 Analysis



Q. **Please describe the CO_2 price assumptions used in the February 2018 price-policy scenarios.**

A. As with natural-gas prices, the medium and high CO_2 price assumptions are based on third-party projections from [redacted]. To bracket the low end of potential policy outcomes, PacifiCorp assumes there are no future policies adopted that would require incremental costs to achieve emissions reductions in the electric sector. In this scenario, the assumed CO_2 price is zero. Figure 2 shows the CO_2 price assumptions used to analyze the Combined Projects.

Figure 2. Nominal CO_2 Price Assumptions in the February 2018 Analysis



Q. How did PacifiCorp apply federal PTC benefits in its system modeling using the SO model and PaR configured to forecast system costs through 2036?

A. The February 2018 economic analysis through 2036 models the Combined Projects using nominal PTC benefits. When establishing the 2017R RFP final shortlist, PacifiCorp applied PTC benefits for applicable bids (BTAs and benchmark-EPC bids) on a nominal basis rather than on a levelized basis because this better reflects how the federal PTC benefits for these bids will flow through to customers. It also aligns the treatment of federal PTC benefits in the system modeling results extending out through 2036 with the nominal revenue requirement results extending out through 2050. This approach ensures the 2017R RFP bid selections from the SO model more accurately reflect the difference in how BTA and benchmark-EPC bids are expected to impact customer rates.

Q. Did PacifiCorp apply the revenue requirement associated with capital costs on a levelized basis in its system modeling using the SO model and PaR configured to forecast system costs through 2036?

A. Yes. When setting rates, revenue requirement from capital costs is depreciated over the book life of the asset, effectively spreading the cost of capital investments over the life of the asset. Because revenue requirement from capital projects is spread over the life of the asset in rates, these costs continue to be treated as a levelized cost in the SO model and PaR simulations. Levelization of capital revenue requirement is necessary in these models to avoid potential distortions in the economic analysis of capital-intensive assets that have different lives and in-service dates. Without levelization, this potential distortion is driven by how capital costs are included in rate base over time. Capital revenue requirement is generally highest in the first year an asset is placed in service and declines over time as the asset depreciates.

Q. Does PacifiCorp assume that all the up-front capital costs of the Transmission Projects will be paid by its retail customers?

A. No. While the up-front capital cost of the Transmission Projects will contribute to retail-customer rate base, the revenue requirement for these investments will be partially offset by incremental revenue from other transmission customers. The up-front transmission costs will flow into PacifiCorp's formula transmission rate under its OATT and generate revenue credits that offset a portion of these costs for retail customers.

PacifiCorp uses its transmission system to serve retail-customer load and to manage retail-customer NPC through off-system market sales and purchases and is the largest user of its transmission system. However, other transmission customers pay OATT-based transmission rates that generate revenue credits and offset the cost of PacifiCorp's transmission revenue requirement. As discussed in Mr. Vail's testimony, the Transmission Projects are considered network transmission assets under PacifiCorp's OATT and therefore will be included in PacifiCorp's transmission formula rate. Based on recent history, PacifiCorp assumed that these revenue credits will account for approximately 12 percent of PacifiCorp's transmission revenue requirement. Consequently, PacifiCorp's analysis assumes its retail customers pay 88 percent of the revenue requirement from the up-front capital cost for the Transmission Projects after accounting for an assumed 12 percent revenue credit from other transmission customers.

Q. How did PacifiCorp model de-rates to its Wyoming 230 kV transmission system when evaluating the Combined Projects?

A. In its final 2017 IRP resource-portfolio screening process, PacifiCorp identified and quantified reliability benefits associated with the Aeolus-to-Bridger/Anticline Line. This new transmission project will eliminate de-rates caused by outages on 230 kV transmission-system elements. Historical outages on this part of PacifiCorp's transmission system indicate an average de-rate of 146 MW over approximately 88 outage days per year, which equates to approximately one 146-MW, 24 hour outage every four days. Without knowing when these events might occur, de-rates on the existing 230 kV transmission system were captured in the SO model and PaR as a 36.5 MW reduction in the transfer capability from eastern Wyoming to the Aeolus area. In simulations that include the Combined Projects, this de-rate assumption was eliminated when the new transmission assets are placed in service at the end of October 2020.

Q. How did PacifiCorp model line-loss benefits associated with the Transmission Projects when performing its economic analysis of the Combined Projects?

A. Line-loss benefits are only applicable in those simulations where the Transmission Projects are built and therefore were only considered in the simulations that include the Combined Projects. When the Aeolus-to-Bridger/Anticline Line is added in parallel to the existing transmission lines, resistance is reduced, which lowers line losses. With reduced line losses, an incremental 11.6 average MW (aMW) of energy, which equates to approximately 102 gigawatt-hours (GWh), will be able to flow out of eastern Wyoming each year. The line-loss benefit was reflected in the SO model and PaR by reducing northeast Wyoming load by approximately 11.6 aMW each year.

Q. Did PacifiCorp analyze potential EIM benefits in its economic analysis of the Combined Projects?

A. Yes. In its final 2017 IRP resource-portfolio screening process, PacifiCorp described how the EIM can provide potential benefits when incremental energy is added to transmission-constrained areas of Wyoming. Unscheduled or unused transmission from participating EIM entities enables more efficient power flows within the hour. With increasing participation in the EIM, there will be increasing opportunities to move incremental energy from Wyoming to offset higher-priced generation in the PacifiCorp system or other EIM participants' systems. The more efficient use of transmission that is expected with growing participation in the EIM was captured in the economic analysis of the Combined Projects by increasing the transfer capability between the east and west sides of PacifiCorp's system by 300 MW (from the Jim Bridger plant to south-central Oregon). The ability to use intra-hour transmission from a growing list of EIM participants more efficiently is not driven by the Combined Projects; however, this increased connectivity provides the opportunity to move low-cost incremental energy out of transmission-constrained areas of Wyoming.

Q. Did PacifiCorp conduct additional sensitivity studies to assess the Combined Projects?

A. Yes. PacifiCorp completed sensitivity studies to assess how certain factors affect the net benefits of the Combined Projects. The first sensitivity compares the Combined Projects to potential solar resources, based on bids received in the 2017S RFP. The second sensitivity quantifies how the net benefits of the Combined Projects are affected when paired with the wind repowering project.

Annual Revenue Requirement Modeling Methodology

Q. In addition to the system modeling used to calculate present-value net benefits over a 20-year planning period, has PacifiCorp forecasted the change in nominal revenue requirement due to the Combined Projects?

A. Yes. The system PVRR from the SO model and PaR was calculated from an annual stream of forecasted revenue requirement over a 20-year time frame, consistent with the planning period in the IRP. The annual stream of forecasted revenue requirement captures nominal revenue requirement for non-capital items (*i.e.*, PTCs, NPC, fixed O&M, etc.) and levelized revenue requirement for capital expenditures. To estimate the annual revenue-requirement impacts of the Combined Projects, capital costs for the Wind Projects and the Transmission Projects need to be considered in nominal terms (*i.e.*, not levelized).

Q. How did PacifiCorp forecast the annual revenue-requirement impacts of the Combined Projects?

A. In the simulations that include the Combined Projects, the annual stream of costs for the Wind Projects, including levelized capital and PTCs, and the Transmission Projects are temporarily removed from the annual stream of costs used to calculate the stochastic-mean PVRR. The differential in the remaining stream of annual costs, which includes all system costs except for those associated with the Combined Projects, represents the net system benefit caused by the Combined Projects.

These data are disaggregated to isolate the estimated annual NPC benefits, other non-NPC variable-cost benefits (*i.e.*, variable O&M and emissions costs for those scenarios that include a CO_2 price assumption), and fixed-cost benefits. To complete the annual revenue-requirement forecast, the change in costs for the Combined Projects, including nominal capital revenue requirement and PTCs, are added back in with the annual system net benefits caused by the Combined Projects.

Q. Over what time frame did PacifiCorp estimate the change in annual revenue requirement due to the Combined Projects?

A. The change in annual revenue requirement was estimated through 2050. This captures the full 30-year life of the Wind Projects.

Q. What is the assumed life of the Transmission Projects?

A. PacifiCorp assumed a 62-year life for the Transmission Projects. The Transmission

Projects will continue to provide system benefits well beyond 2050 when the Wind Projects are fully depreciated. These additional benefits are not reflected in PacifiCorp's economic analysis.

Q. How did PacifiCorp calculate the annual net benefits caused by the Combined Projects beyond the 20-year forecast period used in PaR?

A. The PaR forecast period runs from 2017 through 2036. The change in net system benefits caused by the Combined Projects over the 2028-through-2036 time frame, expressed in dollars-per-MWh of incremental energy output from the Combined Projects, were used to estimate the change in system net benefits from 2037 through 2050. This calculation was performed in several steps.

First, the net system benefits caused by the Combined Projects were divided by the change in incremental energy expected from the Combined Projects, as modeled in PaR over the 2028-through-2036 time frame. Next, the net system benefits per MWh of incremental energy from the Combined Projects over the 2028-through-2036 time frame were levelized. These levelized results were extended out through 2050 at inflation. The levelized net system benefits per MWh of incremental energy output from the Combined Projects over the 2037-through-2050 time frame were then multiplied by the change in incremental energy output from the Combined Projects over the same period.

Q. Why did PacifiCorp use PaR results from the 2028-through-2036 time frame to extend system cost impacts out through 2050?

A. Consistent with the 2017 IRP, PacifiCorp's economic analysis of the Combined Projects assumes the Dave Johnston coal plant, located in eastern Wyoming, retires at the end of 2027. When this plant is assumed to retire, transmission congestion affecting energy output from resources in eastern Wyoming, where many repowered wind resources are located, is reduced. The incremental energy output from the Combined Projects provides more system benefits when not constrained by transmission limitations. Consequently, the net system benefits caused by the Combined Projects over the 2028-through-2036 time frame, after Dave Johnston is assumed to retire, is representative of net system benefits that could be expected beyond 2036.

Q. Did PacifiCorp calculate a PVRR(d) for the Combined Projects using its estimate of annual revenue requirement impacts projected out through 2050?

A. Yes.

System Modeling Price-Policy Results

Q. Please summarize the PVRR(d) results calculated in February 2018 from the SO model and PaR through 2036.

A. Table 1 summarizes the PVRR(d) results for each price-policy scenario. The PVRR(d) between cases with and without the Combined Projects, reflecting the updated final shortlist from the 2017R RFP, are shown for the SO model and for PaR, which was used to calculate both the stochastic-mean PVRR(d) and the risk-adjusted PVRR(d). The data used to calculate the updated SO Model PVRR(d) and PaR Stochastic Mean PVRR(d) results shown in the table are provided as Exhibit PAC/702.

Table 1. February 2018 SO Model and PaR PVRR(d) (Benefit)/Cost of the Combined Projects ($ million)

Price-Policy Scenario	Updated Final Shortlist		
	SO Model PVRR(d)	PaR Stochastic Mean PVRR(d)	PaR Risk-Adjusted PVRR(d)
Low Gas, Zero CO_2	($185)	($150)	($156)
Low Gas, Medium CO_2	($208)	($179)	($188)
Low Gas, High CO_2	($370)	($337)	($355)
Medium Gas, Zero CO_2	($377)	($319)	($334)
Medium Gas, Medium CO_2	($405)	($357)	($386)
Medium Gas, High CO_2	($489)	$(448)	($469)
High Gas, Zero CO_2	($699)	($568)	($596)
High Gas, Medium CO_2	($716)	($603)	($633)
High Gas, High CO_2	($781)	($694)	($728)

Over a 20-year period, the Combined Projects reduce customer costs in all nine price-policy scenarios. This outcome is consistent in both the SO model and PaR results. Under the central price-policy scenario, when applying medium natural gas, medium CO_2 price-policy assumptions, the PVRR(d) net benefits range between $357 million, when derived from PaR stochastic-mean results, and $405 million, when derived from SO model results.

Q. What is the potential upside to these PVRR(d) results associated with REC value?

A. The PVRR(d) results presented in Table 1 do not reflect the potential value of RECs generated by the incremental energy output from the updated final shortlist projects. Accounting for the performance estimates from the updated final shortlist projects, customer benefits for all price-policy scenarios would improve by approximately $34 million for every dollar assigned to the incremental RECs that will be generated from the winning bids through 2036. Quantifying the potential upside associated with incremental REC values is simply intended to communicate that the net benefits from the winning bids could improve if the incremental RECs can be monetized in the market or otherwise used to offset higher cost purchases required to meet state renewable portfolio standard targets.

Q. Did you calculate the potential upside to these PVRR(d) results associated with reduced O&M costs?

A. Yes. Projects with large wind turbines are expected to require less O&M costs because there are fewer turbines on a given site. The default O&M assumptions applied to BTA and benchmark-EPC bids in the economic analysis are based on PacifiCorp's experience in operating and maintaining the existing fleet of owned-wind facilities, and do not reflect expected cost savings associated with operating and maintaining wind facilities proposing to use larger wind turbines. If the O&M cost elements applicable to the larger-turbine equipment are reduced by 42 percent, which is equivalent to an approximately 18-percent reduction in total O&M costs, beyond the proposed O&M agreement period, customer benefits calculated through 2036 for all price-policy scenarios would improve by approximately $19 million.

Q. Is there additional upside to the net benefits shown in Table 1?

A. Yes. PacifiCorp's analysis conservatively calculates net benefits by comparing a case with the Combined Projects against a case without the Combined Projects. As discussed by Mr. Vail, the Aeolus-to-Bridger/Anticline Line has been an integral component of PacifiCorp's long-term transmission plan for some time and it is unlikely that this investment would never be needed. The economic benefits would increase substantially if the case with the Combined Projects were compared to a case where the Aeolus-to-Bridger/Anticline line were added to the system at a later date. Further, the CO_2 price assumptions used in the updated economic analysis were inadvertently modeled in 2012 real dollars instead of nominal dollars. Consequently, the PVRR(d) net benefits in the six price-policy scenarios that use medium and high CO_2 price assumptions are conservative.

Revenue Requirement Modeling Price-Policy Results

Q. Please summarize the February 2018 PVRR(d) results calculated from the change in annual revenue requirement through 2050.

A. Table 2 summarizes the updated PVRR(d) results for each price-policy scenario calculated from the change in annual nominal revenue requirement through 2050. The annual data over the period 2017 through 2050 that was used to calculate the updated PVRR(d) results shown in the table are provided as Exhibit PAC/703.

Table 2. February 2018 Nominal Revenue Requirement PVRR(d) (Benefit)/Cost of the Combined Projects ($ million)

Price-Policy Scenario	Updated Final Shortlist
Low Gas, Zero CO_2	$184
Low Gas, Medium CO_2	$127
Low Gas, High CO_2	($147)
Medium Gas, Zero CO_2	($92)
Medium Gas, Medium CO_2	($167)
Medium Gas, High CO_2	($304)
High Gas, Zero CO_2	($448)
High Gas, Medium CO_2	($499)
High Gas, High CO_2	($635)

When system costs and benefits from the Combined Projects are extended out through 2050, covering the full depreciable life of the owned-wind projects included in the updated 2017R RFP final shortlist, the Combined Projects reduce customer costs in seven out of nine price-policy scenarios. Customer net benefits range from \$92 million in the medium natural-gas, zero CO_2 price-policy scenario to \$635 million in the high natural gas, high CO_2 price-policy scenario. Under the central price-policy scenario, when applying medium natural gas, medium CO_2 price-policy assumptions, the PVRR(d) benefits of the Combined Projects are \$167 million. The Combined Projects provide significant customer benefits in all price-policy scenarios, and the net benefits are unfavorable only when low natural-gas prices are paired with zero or medium CO_2 prices. These results show that upside benefits far outweigh downside risks.

Q. Is there additional potential upside to these PVRR(d) results associated with REC value?

A. Yes. The PVRR(d) results presented in Table 2 do not reflect the potential value of RECs generated by the incremental energy output from the Energy Vision 2020 Wind Projects. Accounting for the performance estimates from the updated final shortlist projects, customer benefits for all price-policy scenarios would improve by approximately \$43 million for every dollar assigned to the incremental RECs that will be generated from the winning bids through 2050.

Q. Is there additional potential upside to these PVRR(d) results associated with reduced O&M costs?

A. Yes. As discussed above, PacifiCorp anticipates O&M costs for those projects that will install larger-turbine equipment to be lower than what has been reflected in the updated economic analysis. Accounting for these cost savings, customer benefits for all price-policy scenarios would improve by approximately $31 million when calculated from projected operating costs through 2050.

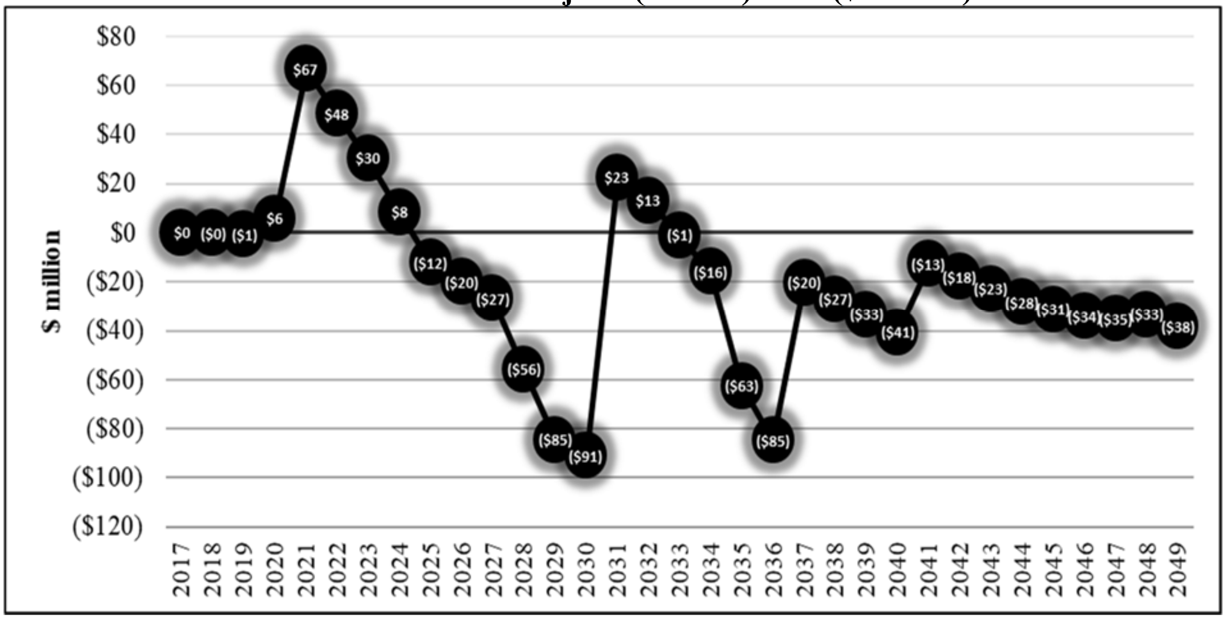
Q. Is there additional potential upside to these PVRR(d) results shown in Table 2?

A. Yes. As noted earlier, the economic benefits would increase substantially if the case with the Combined Projects were compared to a case where the Aeolus-to-Bridger/Anticline line were added to the system at a later date. Moreover, the updated CO_2 price assumptions used in the updated economic analysis were inadvertently modeled in 2012 real dollars instead of nominal dollars. Consequently, the PVRR(d) net benefits in the six price-policy scenarios that use medium and high CO_2 price assumptions are conservative.

Q. Please describe the change in annual nominal revenue requirement from the Combined Projects.

A. Figure 3 shows the change in nominal revenue requirement due to the Combined Projects for the medium natural gas, medium CO_2 price-policy scenario on a total-system basis. The change in nominal revenue requirement shown in the figure reflects February 2018 costs, including capital revenue requirement (*i.e.*, depreciation, return, income taxes, and property taxes), O&M expenses, the Wyoming wind-production tax, and PTCs. The project costs are netted against system impacts from the Combined Projects, reflecting the change in NPC, emissions, non-NPC variable costs, and system fixed costs that are affected by, but not directly associated with, the Combined Projects.

Figure 3. February 2018 Total-System Annual Revenue Requirement With the Combined Projects (Benefit)/Cost ($ million)



The Combined Projects produce net benefits in 23 years out of the 30 years that the proposed owned-wind resources selected to the 2017R RFP final shortlist are assumed to operate. The year-on-year reduction in net benefits from 2036 to 2037 is driven by the Company's conservative approach to extrapolate benefits from 2037 through 2050 based on modeled results from the 2028-through-2036 time frame. This leads to an abrupt reduction in the benefits in 2037, and a subsequent year-on-year reduction to net benefits, which breaks from the trend observed in the model results over the 2035-to-2036 time frame. This extrapolation methodology is conservative because it results in project benefits not matching the levels observed in the model results for 2036 until 2047.

Solar Sensitivity

Q. Did PacifiCorp include a solar sensitivity in its February 2018 analysis?

A. Yes. The solar sensitivity analysis reflects the updated final shortlist from the 2017R RFP and best-and-final pricing supplied by bidders participating in the 2017S RFP on February 1, 2018.

Q. Please describe the sensitivity studies that analyzed the impact of the solar bids received in the 2017S RFP on the economics of the Combined Projects.

A. The Company's solar sensitivity analysis used the SO model and PaR simulations to determine the PVRR(d) based on two model runs—one with solar PPA bids and the Combined Projects and one with solar PPA bids but without the Combined Projects.

Q. What were the results of the solar sensitivity where solar PPA bids are assumed to be pursued in lieu of the Combined Projects?

A. Table 3 summarizes PVRR(d) results for the solar sensitivity where solar PPA bids are assumed to be pursued without any investments in the Combined Projects. This sensitivity was developed using SO model and PaR simulations through 2036 for the medium natural gas, medium CO_2 and the low natural gas, zero CO_2 price-policy scenarios. The results are shown alongside the benchmark study in which the Combined Projects were evaluated without solar PPA bids.

Table 3. February 2018 Solar Sensitivity with Solar PPAs Included in lieu of the Combined Projects (Benefit)/Cost ($ million)

	Sensitivity PVRR(d)	Benchmark PVRR(d)	Change in PVRR(d)
Medium Gas, Medium CO2			
SO Model	($343)	($405)	$61
PaR Stochastic Mean	($228)	($357)	$129
PaR Risk Adjusted	($237)	($386)	$149
Low Gas, Zero CO2			
SO Model	($196)	($185)	($11)
PaR Stochastic Mean	($139)	($150)	$11
PaR Risk Adjusted	($145)	($156)	$11

In this sensitivity, the SO model selects 1,122 MW of solar PPA bids in the low natural gas, zero CO_2 price-policy scenario and 1,419 MW of solar PPA bids in the medium natural gas, medium CO_2 price-policy scenario. All the selected solar PPA bids are for projects located in Utah.

In the medium natural gas, medium CO_2 price-policy scenario, a portfolio with the Combined Projects delivers greater customer benefits relative to a portfolio that adds solar PPA bids without the Combined Projects. Customer benefits are greater when the resource portfolio includes the Combined Projects without solar PPA bids by $149 million in the medium natural gas, medium CO_2 price-policy scenario based on the risk-adjusted PaR results. In the low natural gas, zero CO_2 price-policy scenario, the portfolio with the Combined Projects delivers slightly greater customer benefits relative to a portfolio that adds solar PPA bids without the Combined Projects when modeled in PaR, and slightly lower customer benefits when analyzed with the SO model. The decrease in net benefits in the solar PPA portfolio is $11 million based on the risk-adjusted PaR results.

When analyzed without the Combined Projects, the solar PPA bids produce net customer benefits that are lower than the benefits expected from the Combined Projects in the medium natural gas, medium CO_2 price-policy scenario. While the sensitivity with a portfolio containing solar PPAs without the Combined Projects produces PVRR(d) results that are similar to the PVRR(d) results with only the Combined Projects in the low natural-gas, zero CO_2 price-policy scenario, both portfolios deliver customer benefits. This sensitivity did not support an alternative resource procurement strategy to pursue solar PPA bids in lieu of the Combined Projects. This would leave the significant benefits from the Combined Projects, which include building a much-needed transmission line, on the table.

Q. What were the results of the solar sensitivity where solar PPA bids are pursued with the Combined Projects?

A. Table 4 summarizes PVRR(d) results for the solar sensitivity where solar PPA bids are assumed to be pursued along with the proposed investments in the Combined Projects. This sensitivity was developed using SO model and PaR simulations through 2036 for the medium natural gas, medium CO_2 and the low natural gas, zero CO_2 price-policy scenarios. The results are shown alongside the benchmark study in which the Combined Projects were evaluated without solar PPA bids.

Table 4. February 2018 Solar Sensitivity with Solar PPAs Included With the Combined Projects (Benefit)/Cost ($ million)

	Sensitivity PVRR(d)	Benchmark PVRR(d)	Change in PVRR(d)
Medium Gas, Medium CO2			
SO Model	($647)	($405)	($242)
PaR Stochastic Mean	($519)	($357)	($163)
PaR Risk Adjusted	($543)	($386)	($157)
Low Gas, Zero CO2			
SO Model	($312)	($185)	($127)
PaR Stochastic Mean	($250)	($150)	($100)
PaR Risk Adjusted	($259)	($156)	($103)

In this sensitivity, the SO model continues to choose the winning bids included in the updated 2017R RFP final shortlist as part of the least-cost bid portfolio. In addition to these wind resource selections, the SO model selects 1,042 MW of solar PPA bids in the low natural gas, zero CO_2 price-policy scenario and 1,419 MW of solar PPA bids in the medium natural gas, medium CO_2 price-policy scenario. Again, all the selected solar PPA bids are for projects located in Utah.

When the solar PPAs are assumed to be pursued in addition to the Combined Projects, total net customer benefits increase. This result is consistent with PacifiCorp's expectation that cost-effective solar opportunities would not displace the Combined Projects but would only potentially add to incremental resource procurement opportunities that might provide net customer benefits.

Wind-Repowering Sensitivity

Q. Please explain PacifiCorp's February 2018 sensitivity analysis related to the wind repowering project.

A. The wind repowering sensitivity reflects the updated final shortlist and cost-and performance estimates for the wind repowering project as of February 2018. Table 5 summarizes PVRR(d) results for this wind-repowering sensitivity. This sensitivity was developed using SO model and PaR simulations through 2036 for the medium natural-gas, medium CO_2 and the low natural-gas, zero CO_2 price-policy scenarios. The results are shown alongside the benchmark study in which the Combined Projects were evaluated without wind repowering.

Table 5. Wind-Repowering Sensitivity (Benefit)/Cost ($ million)

	Sensitivity PVRR(d)	Benchmark PVRR(d)	Change in PVRR(d)
Medium Gas, Medium CO2			
SO Model	($608)	($405)	($204)
PaR Stochastic Mean	($541)	($357)	($184)
PaR Risk Adjusted	($567)	($386)	($181)
Low Gas, Zero CO2			
SO Model	($334)	($185)	($149)
PaR Stochastic Mean	($281)	($150)	($131)
PaR Risk Adjusted	($295)	($156)	($138)

In the February 2018 wind-repowering sensitivity, customer benefits increase significantly when the wind repowering project is implemented with the Combined Projects in both the medium natural-gas, medium CO_2, and the low natural-gas, zero CO_2 price-policy scenarios. These results demonstrate that customer benefits not only persist, but also increase, if both the wind-repowering project and the Combined Projects are completed.

Adjusted Economic Analysis Without Uinta Facility

Q. Please summarize the cost-and-performance attributes of the Wind Projects without Uinta.

A. With removal of the Uinta project, the total in-service capital cost for the remaining Energy Vision 2020 Wind Projects is approximately $[redacted], with a per-unit capital cost of $[redacted]/kilowatt (kW). In aggregate, the Energy Vision 2020 Wind Projects are expected to operate at a capacity-weighted average annual capacity factor of [redacted] percent.

Q. What is the nominal value of PTCs relative to the in-service capital cost of the Energy Vision 2020 Wind Projects without Uinta?

A. Over the first 10 years of operation, the Energy Vision 2020 Wind Projects that will be owned by PacifiCorp will generate over $1.2 billion in PTC benefits, which is nearly 103 percent of the in-service capital for these wind facilities.

Q. Did PacifiCorp update the February 2018 economic analysis of the Combined Projects based on the removal of the Uinta project?

A. Yes. First, PacifiCorp performed a spreadsheet analysis to estimate the high-level economic impact of removing the Uinta project. This spreadsheet analysis was performed for all nine price-policy scenarios previously described in my testimony. Consistent with the Company's previous economic analysis, these results are based on the methodology used in the Company's IRP through 2036 and using nominal revenue requirement projections through 2050.

Q. Please describe how you performed the high-level spreadsheet analysis.

A. Using data from the February 2018 economic analysis, I calculated the system benefits, including the Uinta Project, on a dollar-per-MWh basis for each price-policy scenario. I then multiplied these results by the expected generation from the Uinta project to estimate the annual system benefits associated with the Uinta project in total dollars. These system-benefit estimates were then netted against the same project-specific costs for the Uinta facility that were used in the February 2018 economic analysis. This calculation results in an estimate of the marginal net benefit or cost of removing the Uinta project for each price-policy scenario.

Q. Did you also update the February 2018 economic analysis using PacifiCorp's models?

A. Yes. I also re-ran PacifiCorp's IRP models to remove Uinta under the medium natural gas, medium CO_2 and low natural gas, zero CO_2 price-policy scenarios.

Q. Did you update any of the other inputs used in the analysis?

A. No. Other than removing Uinta, all the other inputs used in the economic analysis are the same as the inputs used in the February 2018 analysis.

Q. What is the high-level estimate of the economic impact of removing Uinta based on results through 2036?

A. Table 6 reports the high-level estimate of the economic impact of removing Uinta based on the results through 2036. These PVRR(d) results are shown alongside the results summarized in my February 2018 economic analysis. The difference between the original results that include Uinta and the high-level estimates without Uinta are an indicator of the marginal net benefit or cost of the Uinta project.

Table 6. Estimated Impact of Removing Uinta
PaR Stochastic Mean PVRR(d) (Benefit)/Cost ($ million) through 2036

Price-Policy Scenario	February 2018 (With Uinta)	High-Level Estimate (Without Uinta)	Marginal (Benefit)/Cost of Uinta
Low Gas, Zero CO_2	($150)	($146)	($4)
Low Gas, Medium CO_2	($179)	($172)	($7)
Low Gas, High CO_2	($337)	($312)	($25)
Medium Gas, Zero CO_2	($319)	($296)	($23)
Medium Gas, Medium CO_2	($357)	($330)	($27)
Medium Gas, High CO_2	($448)	($410)	($38)
High Gas, Zero CO_2	($568)	($517)	($51)
High Gas, Medium CO_2	($603)	($548)	($55)
High Gas, High CO_2	($694)	($629)	($66)

Q. What conclusions can you draw from the results provided in Table 6?

A. The high-level estimate based on results through 2036 shows that net benefits of the Combined Projects (without Uinta) are reduced by between $4 million and $66 million. In the medium natural gas, medium CO_2 price-policy scenario, net benefits are reduced by $27 million. Considering that results from the IRP models were used to select winning bids in the 2017R RFP, these findings confirm that it was reasonable to include Uinta in the 2017R RFP final shortlist. Importantly, these results also show that the Combined Projects will continue to deliver substantial net customer benefits with removal of the Uinta project. With Uinta removed, the net benefits from the Combined Projects range between $146 million and $629 million. In the medium natural gas, medium CO_2 price-policy scenario, the net benefits are estimated to be $330 million.

Q. What is the high-level estimate of the economic impact of removing Uinta based on nominal revenue requirement results through 2050?

A. Table 7 reports the high-level estimate of the economic impact of removing Uinta based on the nominal revenue requirement results through 2050. These PVRR(d) results are shown alongside the February 2018 economic analysis. Like Table 6 above, the difference between the original results that include Uinta and the high-level estimates without Uinta are an indicator of the marginal net benefit or cost of the Uinta project.

Table 7. Estimated Impact of Removing Uinta
Nominal PVRR(d) (Benefit)/Cost ($ million) through 2050

Price-Policy Scenario	February 2018 (With Uinta)	High-Level Estimate (Without Uinta)	Marginal (Benefit)/Cost of Uinta
Low Gas, Zero CO_2	$184	$146	$38
Low Gas, Medium CO_2	$127	$97	$31
Low Gas, High CO_2	($147)	($145)	($2)
Medium Gas, Zero CO_2	($92)	($97)	$5
Medium Gas, Medium CO_2	($167)	($162)	($4)
Medium Gas, High CO_2	($304)	($283)	($20)
High Gas, Zero CO_2	($448)	($411)	($37)
High Gas, Medium CO_2	($499)	($456)	($43)
High Gas, High CO_2	($635)	($576)	($59)

Q. What conclusions can you draw from Table 7?

A. The high-level estimate based on nominal revenue requirement results through 2050 shows that removal of Uinta reduces the net cost of the Combined Projects in three of the nine price-policy scenarios, and that the net benefits of the Combined Projects are reduced in six of the nine price-policy scenarios. In the medium natural gas, medium CO_2 price-policy scenario, net benefits are reduced by $4 million. Importantly, when the impact of net benefits are based on nominal revenue requirement results through 2050, these results show that the Combined Projects will continue to deliver substantial net customer benefits with removal of the Uinta project. With Uinta removed, the net benefits from the Combined Projects in the scenarios where they occur range between \$97 million and \$576 million. In the medium natural gas, medium CO_2 price-policy scenario, the net benefits are estimated to be \$162 million.

Q. What is the economic impact of removing Uinta based on updated results from the IRP model runs?

A. Table 8 reports the high-level estimate of the economic impact of removing Uinta alongside the updated modeled results using the 2036 and 2050 calculation methodologies. These results are presented for both the low natural gas, zero CO_2 and the medium natural gas, medium CO_2 price-policy scenarios. The table also shows the difference between the high-level estimate and the modeled results.

Table 8. Estimated Impact of Removing Uinta
Nominal PVRR(d) (Benefit)/Cost (\$ million) through 2050

PaR Stochastic Mean PVRR(d) (Benefit)/Cost (\$ million) through 2036			
Price-Policy Scenario	**High-Level Estimate**	**Modeled Result**	**Variance from**
Low Gas, Zero CO_2	(\$146)	(\$143)	(\$3)
Medium Gas, Medium CO_2	(\$330)	(\$338)	\$8
Nominal PVRR(d) (Benefit)/Cost (\$ million) through 2050			
Price-Policy Scenario	**High-Level Estimate**	**Modeled Result**	**Variance from**
Low Gas, Zero CO_2	\$146	\$154	(\$8)
Medium Gas, Medium CO_2	(\$162)	(\$174)	\$12

Q. What conclusions can you draw from Table 8?

A. First, the modeled results are similar to the high-level estimates described above, and consequently, the high-level estimates provide a reasonable representation of the impact of removing Uinta.

Second, under the medium natural gas, medium CO_2 price-policy scenario, the Combined Projects still provide net customer benefits when Uinta is removed. When calculated from IRP model results through 2036, customer net benefits are \$338 million (down by \$19 million from \$357 million in the February 2018 analysis).

When calculated from the nominal revenue requirement results through 2050, customer net benefits are $174 million (up by $7 million from the $167 million in the February 2018 analysis).

Third, under the low natural gas, zero CO_2 price-policy scenario, the Combined Projects still provide net customer benefits with Uinta removed when the PVRR(d) is calculated from IRP model results through 2036. Based on this methodology, customer net benefits are $143 million (down by $7 million from the $150 million benefit in the February 2018 analysis). When calculated from the nominal revenue requirement results through 2050, net costs are $154 million (down by $30 million from the $184 million in the February 2018 economic analysis).

Q. Have you calculated the change in capital costs that would have to occur to eliminate net benefits in the medium natural gas, medium CO_2 price-policy scenario?

A. Yes. Removal of the Uinta project reduces capital costs for the Combined Projects to [redacted]. In-service capital costs would have to increase by approximately 11.1 percent (or [redacted]) to eliminate net benefits in the medium natural gas, medium CO_2 price-policy scenario.

Q. Do the Combined Projects without Uinta still provide overall customer net benefits?

A. Yes. As set forth above, when using the IRP modeling, the Combined Projects still provide robust customer net benefits under all nine price-policy scenarios. Although the benefits have decreased slightly, they remain substantial. In addition, under the nominal revenue requirement view, the net benefits remained fairly consistent, increasing in some price-policy scenarios and decreasing in others. Although neither view is dispositive, each of these views provides important insight into how the Combined Projects are expected to impact the Company's revenue requirement. Taken together, each of these views indicate that the removal of Uinta does not adversely impact the customer benefits, and the acquisition of the Combined Projects remains in the public interest.

IV. WIND REPOWERING OF FOOTE CREEK I

Q. Please briefly describe what repowering a wind facility entails.

A. Repowering a wind facility involves upgrading an existing, operating wind facility with longer blades and new technology to generate more energy in a wider range of conditions.

Q. Please describe the scope of PacifiCorp's full repowering project.

A. The full wind repowering project includes 13 wind facilities, representing approximately 1,040 MW of installed wind capacity. PacifiCorp's underlying economic analysis described in my direct testimony in dockets UE 352 and UE 369 covers 12 of the 13 wind facilities, totaling approximately 999.1 MW—Glenrock I, Glenrock III, Rolling Hills,[51] Seven Mile Hill I, Seven Mile Hill II, High Plains, McFadden Ridge, and Dunlap in Wyoming; Marengo I, Marengo II and Goodnoe

[51] Rolling Hills is not included in Oregon rates. *See In the Matter of PacifiCorp, dba Pacific Power, 2009 Renewable Adjustment Clause Schedule 202*, Docket No. UE 200, Order No. 08-548, at 20 (Nov. 14, 2008).

Hills in Washington; and Leaning Juniper in Oregon.[52] This filing includes the 13th facility, Foote Creek I in Wyoming, which presents similar economic benefits, as described further below.

Q. Is PacifiCorp seeking recovery for the full scope of its repowering project in this general rate case (GRC)?

A. No. In docket UE 352, the Commission approved a stipulation providing recovery through the RAC for most of the repowered wind facilities—Glenrock I, Goodnoe Hills, High Plains, Leaning Juniper, Marengo I, Marengo II, McFadden Ridge, Seven Mile Hill I, and Seven Mile Hill II.[53] PacifiCorp is separately seeking approval for Glenrock III and Dunlap in its 2020 RAC filing in docket UE 369, with requested rate effective dates of April 1, 2020, and October 15, 2020, respectively, for those facilities.[54] Therefore, PacifiCorp only seeks rate recovery in this general rate case for the single remaining wind facility, Foote Creek I, expected to be in service in late 2020. Table 9 depicts the full scope of PacifiCorp's repowering project, organized by the mechanism through which PacifiCorp has sought cost recovery approval.

Table 9. Repowered Wind Facilities, by Cost Recovery Mechanism

Cost Recovery Mechanism:	Wind Facility	Online Date	Location	Installed Capacity (MW)
2019 RAC	Glenrock I	Online	WY	99.0
	Seven Mile Hill I	Online	WY	99.0
	Seven Mile Hill II	Online	WY	19.5
	High Plains	Online	WY	99.0
	McFadden Ridge	Online	WY	28.5
	Marengo I	Online	WA	140.4
	Marengo II	Online	WA	70.2
	Goodnoe Hills	Online	WA	94.0
	Leaning Juniper	Online	OR	100.5
2020 RAC	Glenrock III	Online	WY	39.0
	Dunlap	Mid-2020	WY	111.0
2021 GRC	Foote Creek I	Late 2020	WY	31
n/a[55]	Rolling Hills	Online	WY	99.0

Q. What are the general benefits of the repowering project?

A. Repowering upgrades will increase output of the wind facilities included in Oregon rates by 28.1 percent on average, extend the operating lives of the facilities, and allow the facilities to requalify for federal PTCs for 10 additional years.

Q. What were the results of PacifiCorp's underlying economic analysis for the full repowering project?

A. PacifiCorp developed economic analysis in February 2018, updated in August 2018, which demonstrated significant customer benefits across a range of assumptions related to forward market prices and possible federal CO_2 policy.[56]

Q. Did PacifiCorp analyze repowering in its 2017 IRP?

A. Yes. The preferred portfolio in the 2017 IRP, representing PacifiCorp's risk-adjusted, least-cost plan to meet customer demand reliably over a 20-year planning period,

[55] As noted above, Rolling Hills is not included in Oregon rates.
[56] Docket No. UE 369, PAC/300, Link/30-56; Docket No. UE 352, PAC/300, Link/29-55.

includes repowering 905 MW of existing wind resource capacity located in Oregon, Washington, and Wyoming. PacifiCorp later expanded the scope of the wind repowering project to include its Goodnoe Hills and Foote Creek I wind facilities, both of which PacifiCorp determined could be economically repowered similar to the facilities evaluated in the 2017 IRP. This increased the wind repowering project to approximately 1,040 MW of existing wind capacity.

Q. Did the Commission acknowledge repowering action items in PacifiCorp's 2017 IRP?

A. Yes. In Order 18-138, the Commission acknowledged the 2017 IRP, including the action items related to PacifiCorp's Energy Vision 2020 projects (which includes repowering along with the Combined Projects discussed above), with conditions.[57]

Q. Please describe the repowering of the Foote Creek I facility.

A. As discussed in PacifiCorp witness Mr. Timothy J. Hemstreet's testimony, the Foote Creek I wind facility was originally developed more than 20 years ago. Because of its age and design, repowering of Foote Creek I involves the removal of all existing wind turbine equipment, including towers, foundations, and energy collection systems, and replacement with new equipment and energy collector circuits appropriately sized for the new equipment. This is different from repowering the rest of PacifiCorp's wind fleet, where the existing towers, foundations, and energy collection systems remained in place and were able to accommodate more modern wind-turbine-generator equipment.

Repowering at the Foote Creek I facility will result in the replacement of

[57] Order No. 18-138 at 7-8.

68 existing small-capacity wind turbines with 13 modern wind turbines, representing approximately 46 MW of wind resource nameplate capacity.

Q. Why wasn't Foote Creek I included in your main economic analysis?

A. As discussed above, the scope of repowering the Foote Creek I facility is notably different than the other wind facilities. Moreover, unlike the other 12 wind facilities within the scope of the wind repowering project, PacifiCorp shared ownership of Foote Creek I with Eugene Water & Electric Board (EWEB). Further differentiating Foote Creek I from the other 12 wind facilities within the scope of the wind repowering project, Bonneville Power Administration (BPA) was purchasing 37 percent of the output from Foote Creek I via a PPA that was to terminate in April 2024. Taken together, it took additional time to engage in discussions with EWEB and BPA to determine whether the ownership structure and PPA could be modified to facilitate repowering the Foote Creek I wind facility. Ultimately, as Mr. Hemstreet describes in his testimony, PacifiCorp was able to clear the way for repowering by acquiring EWEB's ownership interest, terminating the PPA with BPA, and acquiring the master wind energy lease rights associated with the Foote Creek I site.

Q. When did PacifiCorp make the decision to repower Foote Creek I?

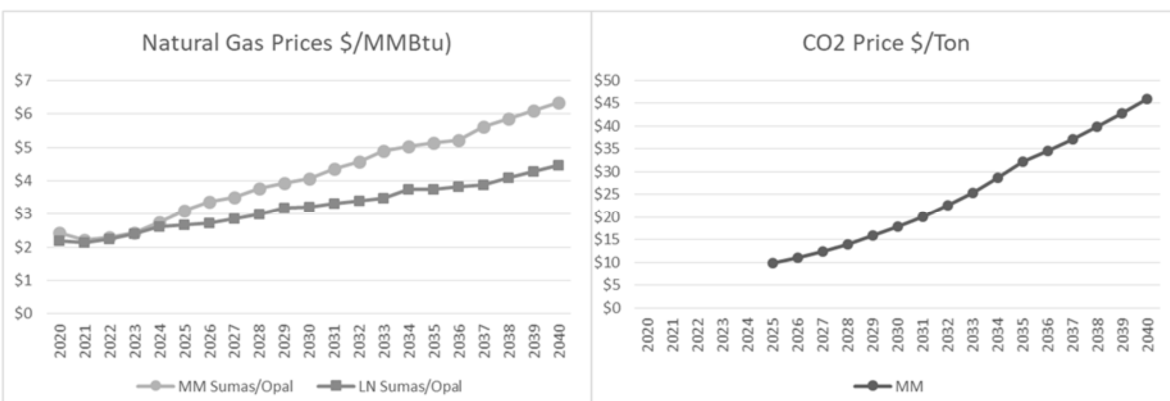
A. PacifiCorp made the decision to repower Foote Creek I in June 2019.

Q. Please summarize the economic analysis that supports the prudence of this decision.

A. PacifiCorp originally approved repowering Foote Creek I based on a June 11, 2019, economic analysis indicating that repowering would produce present-value net customer benefits ranging between $3 million and $46 million. This analysis included acquisition of EWEB's 21.21 percent ownership interest and termination of the PPA with BPA. This analysis did not include acquisition of the master wind energy lease rights associated with the Foote Creek I site.

The economic analysis was updated July 16, 2019, to reflect the acquisition of the master wind energy lease rights associated with the Foote Creek I site. This analysis used two price-policy scenarios, representing low and medium natural gas prices and zero and medium CO_2 price scenarios. The price-policy scenario that pairs medium natural gas prices with medium CO_2 prices is referred to as the "MM" scenario and the price-policy scenario that pairs low natural gas prices with a zero CO_2 price is referred to as the "LN" scenario. The natural gas and CO_2 price assumptions are summarized in Figure 4.

Figure 4. Price-Policy Assumptions used in the Economic Analysis of Foote Creek I Repowering.



My analysis shows that Foote Creek I will deliver net customer benefits in both price-policy scenarios through 2050, producing present-value net customer benefits ranging between $6 million and $48 million.

Q. Please explain how you conducted your analysis.

A. The methodology is consistent with the approach used to perform the economic analysis of the other 12 facilities within the scope of the wind repowering project and the Combined Projects described in Section III of my testimony. The system value of incremental wind energy in eastern Wyoming is calculated from two PaR simulations for a given price-policy scenario—one simulation with incremental wind energy and one simulation without incremental wind energy. I then converted the system value of incremental wind energy to a dollar-per-megawatt-hour value by dividing the change in annual system costs by the change in incremental wind energy for both price-policy scenarios through 2038. The value of wind energy is extended out through 2050 by extrapolating the system values calculated from modeled data over the 2030-to-2038 time frame. The assumed system value, expressed in dollars per megawatt-hour, is applied to the incremental energy output associated with Foote Creek I wind repowering.

Q. Please provide the results of your analysis.

A. Foote Creek I repowering is forecasted to provide significant net benefits for customers. Table 10 summarizes the benefits calculated from changes in system costs through 2050, inclusive of the cost of repowering. This table also presents the same information on a levelized dollar-per-megawatt-hour basis. Under the medium and low price-policy scenarios, nominal levelized net benefits are $29/MWh and $3/MWh, respectively. These results are consistent with the range of the net benefits associated with other wind repowering facilities presented in my direct testimony in PacifiCorp's RAC filings in dockets UE 352 and UE 369.[58]

[58] Docket No. UE 352, PAC/300, Link/34, 54 (Tables 5 and 16); Docket No. UE 369, PAC/300, Link/35, 55 (Tables 5 and 16).

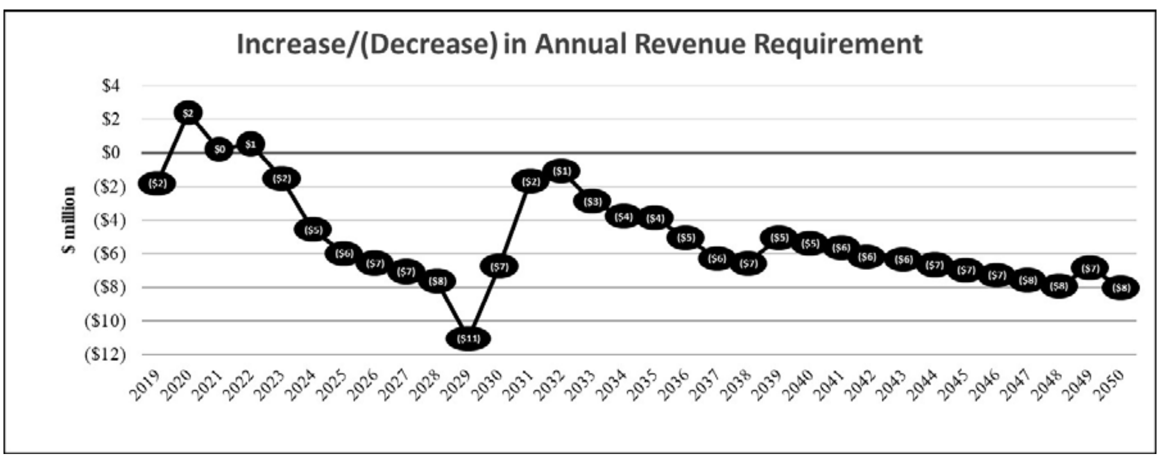
Table 10. Net Benefits from Foote Creek I Repowering

	PVRR(d) Net (Benefit)/Cost ($ million)	Nom. Lev. Net Benefit ($/MWh of Incremental Energy)
Medium Natural Gas, Medium CO_2	($48.2)	$29/MWh
Low Natural Gas, No CO_2	($5.6)	$3/MWh

Q. Have you demonstrated the estimated change in nominal annual revenue requirement from Foote Creek I repowering for the medium price-policy scenario?

A. Yes. Figure 5 reflects the change in nominal revenue requirement associated with project costs, including capital revenue requirement (*i.e.*, depreciation, return, income taxes, and property taxes), O&M expenses, the Wyoming wind-production tax, and PTCs. The project costs are netted against system benefits as described above. Foote Creek I repowering reduces nominal revenue requirement in all but the first three years of its depreciable life.

Figure 5. (Reduction)/Increase in Total-System Annual Revenue Requirement from Foote Creek I Repowering



V. PRYOR MOUNTAIN WIND PROJECT

Q. Did you conduct the economic analysis supporting acquisition of the Pryor Mountain Wind Project?

A. Yes. I prepared the economic analysis for the 240 MW Pryor Mountain Wind Project, which supports PacifiCorp's decision to move forward with the project as a resource decision that is least-cost and least-risk for customers. I completed this analysis in September 2019.

Q. Please provide background on the Pryor Mountain Wind Project.

A. In May 2019, PacifiCorp executed an agreement for the development rights associated with the Pryor Mountain Wind Project, located in Montana. In June 2019, PacifiCorp and Vitesse, LLC (Vitesse) (a wholly-owned subsidiary of Facebook, Inc.) executed an agreement for the purchase of all RECs generated by Pryor Mountain over a 25-year period under PacifiCorp's Oregon Schedule 272 – Renewable Energy Rider Optional Bulk Purchase Option. In September 2019, PacifiCorp executed the EPC and wind turbine supplier agreements for the project. Mr. Teply provides additional information about this project in his testimony.

Q. Was the Pryor Mountain Wind Project the result of an RFP issued by PacifiCorp?

A. No. PacifiCorp pursued the Pryor Mountain Wind Project outside of an RFP because it was a unique, time sensitive opportunity to provide significant value to customers. The opportunity evolved over a very compressed timeline, beginning in October 2018, with final terms on all material agreements completed before September 30, 2019. Therefore, consistent with the Commission's rules governing resource procurement for electric companies, PacifiCorp filed a report on September 27, 2019, explaining the relevant circumstances leading to the acquisition of this resource and the value this resource provides to customers.[59]

Q. Did Staff provide comments on this report?

A. Yes. Staff filed response comments in docket LC 70 on October 25, 2019.[60] Staff raised several high-level concerns, which it asked PacifiCorp to address in seeking rate recovery for this facility.

Q. Can you address Staff's concern regarding whether this facility is a time-limited opportunity of unique value based on the project economics provided in PacifiCorp's report?

A. Yes. In response to Staff's general concern that it could not assess the project's economics without an opportunity to evaluate PacifiCorp's economic modeling inputs and workpapers, my testimony and exhibits provide the information necessary for Staff's evaluation. Staff also raised one specific concern regarding the project's economics, which relates to the benefits modeled in 2050, the final year of the analysis. Staff expressed concern that these 2050 benefits could be an "un-realistic end effect in PacifiCorp's modeling" which skews the outcome.[61] Staff claims that, in the low natural gas price and no CO_2 price assumption (the "LN" price-policy scenario), elimination of the benefits modeled in 2050 could turn any expected benefits into net costs.[62]

[59] OAR 860-089-0100(3)(b), (4); *In the Matter of PacifiCorp, dba Pacific Power, 2019 Integrated Resource Plan*, Docket No. LC 70, PacifiCorp's Notice of Exception Under OAR 860-089-0100 (Sept. 27, 2019).
[60] Docket No. LC 70, Comments on PacifiCorp's September 27, 2019 Notice of Exception to the Competitive Bidding Rules (Oct. 25, 2019) ("Staff Exception Response Comments").
[61] *Id.* at p. 3.
[62] *Id.* at p. 3.

Q. Please explain the benefits modeled in 2050.

A. The modeling reflects a terminal value benefit because PacifiCorp retains control of the site at the end of the asset life. The terminal value benefit recognizes the fact that at end of a utility-owned resource's life, there is residual value that accrues to customers. For a PPA, the terminal value accrues to the project owner, not customers. That terminal value includes the facilities supporting the resources, like transmission facilities, that have longer useful lives and, in the case of generation tied to natural resources such as wind resources, there is inherent value in the site itself—particularly resources located in high-capacity-factor geographic areas like Montana. High-value, renewable-resource locations are often scarce or unique in their suitability for generation permitting and construction, as well as proximity to transmission.

Q. Has the Commission previously acknowledged that utilities generally include terminal value in their bids for benchmark resource in an RFP?

A. Yes, that is my understanding.[63]

Q. Staff suggests that the inclusion of the 2050 benefit is substantial enough to change the results of the economic analysis.[64] Please respond.

A. Contrary to Staff's claim, the analysis does not rely heavily on 2050 results to demonstrate a positive net benefit. Even if the terminal value were completely eliminated, which would not be appropriate, project customer net benefits under medium natural gas and CO_2 price-policy assumptions would range between

[63] *In the Matter of Public Utility Commission of Oregon Investigation Regarding Competitive Bidding,* Docket No. UM 1182, Order No. 14-149 (April 30, 2014).
[64] Staff Exception Response Comments at p. 3.

$57 million and $70 million.

Q. Staff also raised concerns about the need to protect customers against risks regarding possible construction delays and PTC ineligibility, lower-than-expected capacity factors, and the potential for PTC renewal making this opportunity relatively less valuable compared to potential future wind resources.[65] Please respond.

A. None of the potential risk factors Staff identifies detract from the customer benefits of the Pryor Mountain Wind Project. First, as Mr. Teply describes, the Pryor Mountain Wind Project is on schedule to be in service by December 31, 2020, and meets all other requirements for 100 percent PTC benefits. Second, as evident in PacifiCorp's net power cost model sponsored by Mr. David G. Webb in the concurrently filed Transition Adjustment Mechanism, PacifiCorp has modeled the Pryor Mountain Wind Project in rates using the same capacity factor I have used in my economic analysis—ensuring that customers will receive PTC and net power cost benefits based on the projected capacity factor. Third, the 100 percent PTC has not been renewed at this time, nor is there any certainty that it will be in the future. This is evident in the significant wind development now ongoing in the industry to meet the 2020 PTC deadline.

Q. Staff also raised a concern about the use of Schedule 272 in connection with the Pryor Mountain Wind Project.[66] Please respond.

A. The Schedule 272 Agreement represents a unique opportunity to leverage Vitesse's desire to purchase RECs from a specified resource while providing a cost-effective

[65] *Id.* at p. 4.
[66] *Id.* at p. 5.

energy resource to serve PacifiCorp's customers. The Company estimates that the present-value cost reduction resulting from Vitesse's purchase of all RECs generated by the project is $[redacted], which will mitigate risks under the various price-policy assumptions.

Q. Finally, Staff suggested that customers like Vitesse should be made aware of other voluntary green products as an alternative to Schedule 272.[67] How do you respond?

A. PacifiCorp offers voluntary REC purchase options through its Blue Sky program, including the bulk REC purchase option authorized by Schedule 272. Staff suggests that community solar is a voluntary product available to PacifiCorp customers. While this is true, I note that a program like community solar, on its own, is unlikely to meet the needs of a customer like Vitesse that is seeking to "green" a significant quantity of energy consumption. PacifiCorp is not aware of any barriers to accessing information regarding any of PacifiCorp's voluntary product options, particularly for large, sophisticated customers like Vitesse.

Q. Please describe your economic analysis of the Pryor Mountain Wind Project.

A. The methodology I used to perform the economic analysis of the Pryor Mountain Wind Project is the same I used to perform the economic analysis of the other resources addressed in my testimony. I relied on PaR runs with a simulation period covering the 2019-to-2038 time frame. System benefits from the development of the Pryor Mountain Wind Project, which includes sale of the associated RECs in accordance with the Schedule 272 Agreement, are based on two PaR simulations—

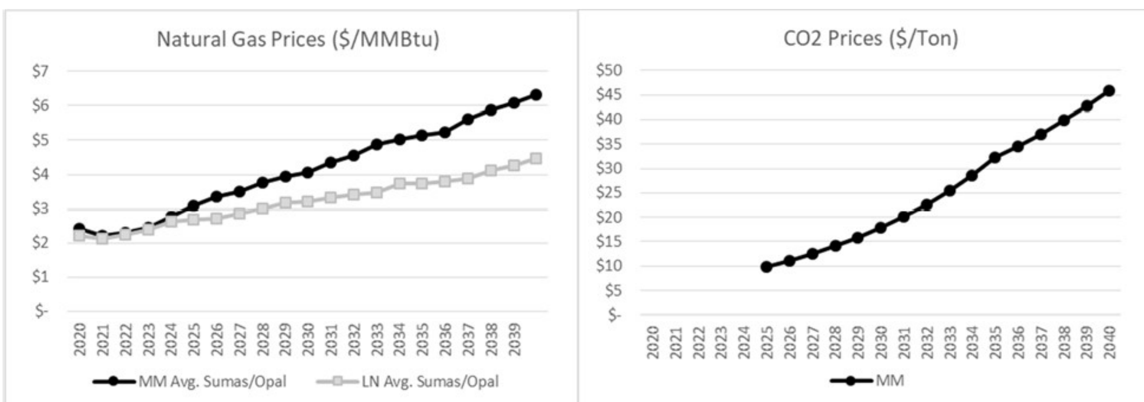
[67] *Id.* at p. 5.

one with incremental generation from the project and one without incremental generation from the project.

Q. What price-policy scenarios did you use in your economic analysis?

A. I used the same two price-policy scenarios as in PacifiCorp's project-by-project wind repowering analysis and for Foote Creek I—one assuming medium natural gas price and medium CO_2 price assumptions (the "MM" price-policy scenario) and one assuming low natural gas price and no CO2 price assumptions (the "LN" price-policy scenario). These assumptions are summarized in Figure 6.

Figure 6. Price-Policy Assumptions in the Economic Analysis of the Pryor Mountain Wind Project



Q. Over what period did you analyze the costs and benefits of the Pryor Mountain Wind Project?

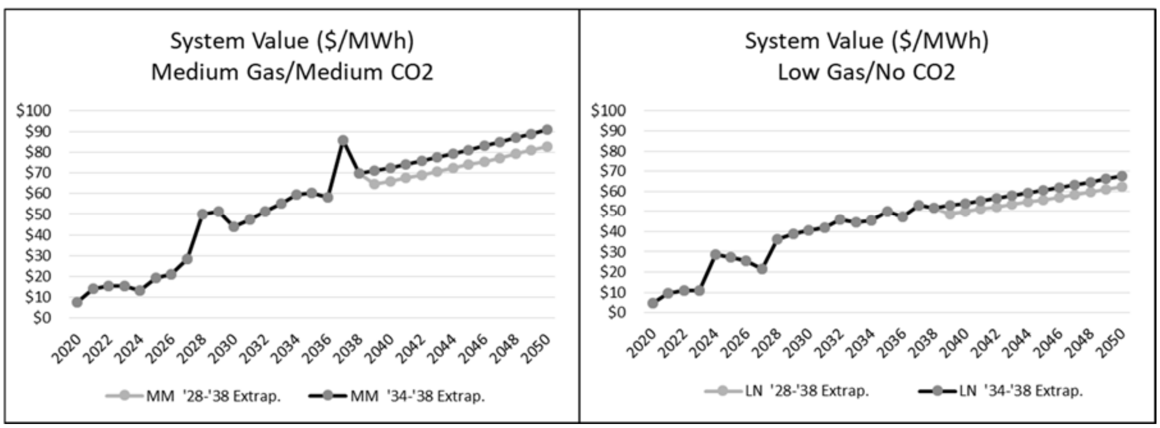
A. My analysis covers the 30-year life of the asset—from 2020 through 2050.

Q. Please explain how you developed a forecast of the project's benefits beyond the 2038 time frame.

A. As with my economic analysis of the Combined Projects and Foote Creek I, the system value of incremental energy is converted to a dollar-per-MWh value by dividing the reduction in annual system costs associated with the Pryor Mountain

Wind Project by the change in incremental energy from the Pryor Mountain Wind Project. This analysis was performed for the MM and LN price-policy scenarios through 2038. The value of energy is extended out through 2050 by extrapolating the system values calculated from modeled data over two different time frames—2028-to-2038, and 2024-to-2038. The assumed system value, expressed in dollars-per-megawatt-hour, is applied to the incremental energy output from Pryor Mountain Wind Project. The system value of the Pryor Mountain Wind Project is summarized for both price-policy scenarios in Figure 7.

Figure 7. System Value Used in the Economic Analysis of Pryor Mountain Wind Project



Q. Please provide the results of your economic analysis.

A. The Pryor Mountain Wind Project is expected to provide significant net benefits for customers. Table 11 summarizes the PVRR(d) benefits calculated from changes in system costs through 2050.[68] This table also presents the same information on a levelized dollar-per-megawatt-hour basis. Under the MM price-policy scenario, net benefits range between $69 million and $82 million. Under the LN price-policy

[68] Due to a minor error discovered in the original analysis, these results differ slightly from those in the September 2019 report.

scenario, the PVRR(d) benefits range between a $7 million benefit and a $1 million cost, depending upon the period used to extrapolate benefits beyond 2038. The execution of the Schedule 272 agreement with Vitesse was a necessary milestone to ensure the Pryor Mountain Wind Project could move forward and mitigates the risk of deteriorating value under a variety of price and policy scenarios, including the most conservative LN price policy scenario. Additionally, while not explicitly analyzed, customer benefits would increase significantly with high natural-gas price and/or high CO_2 price assumptions.

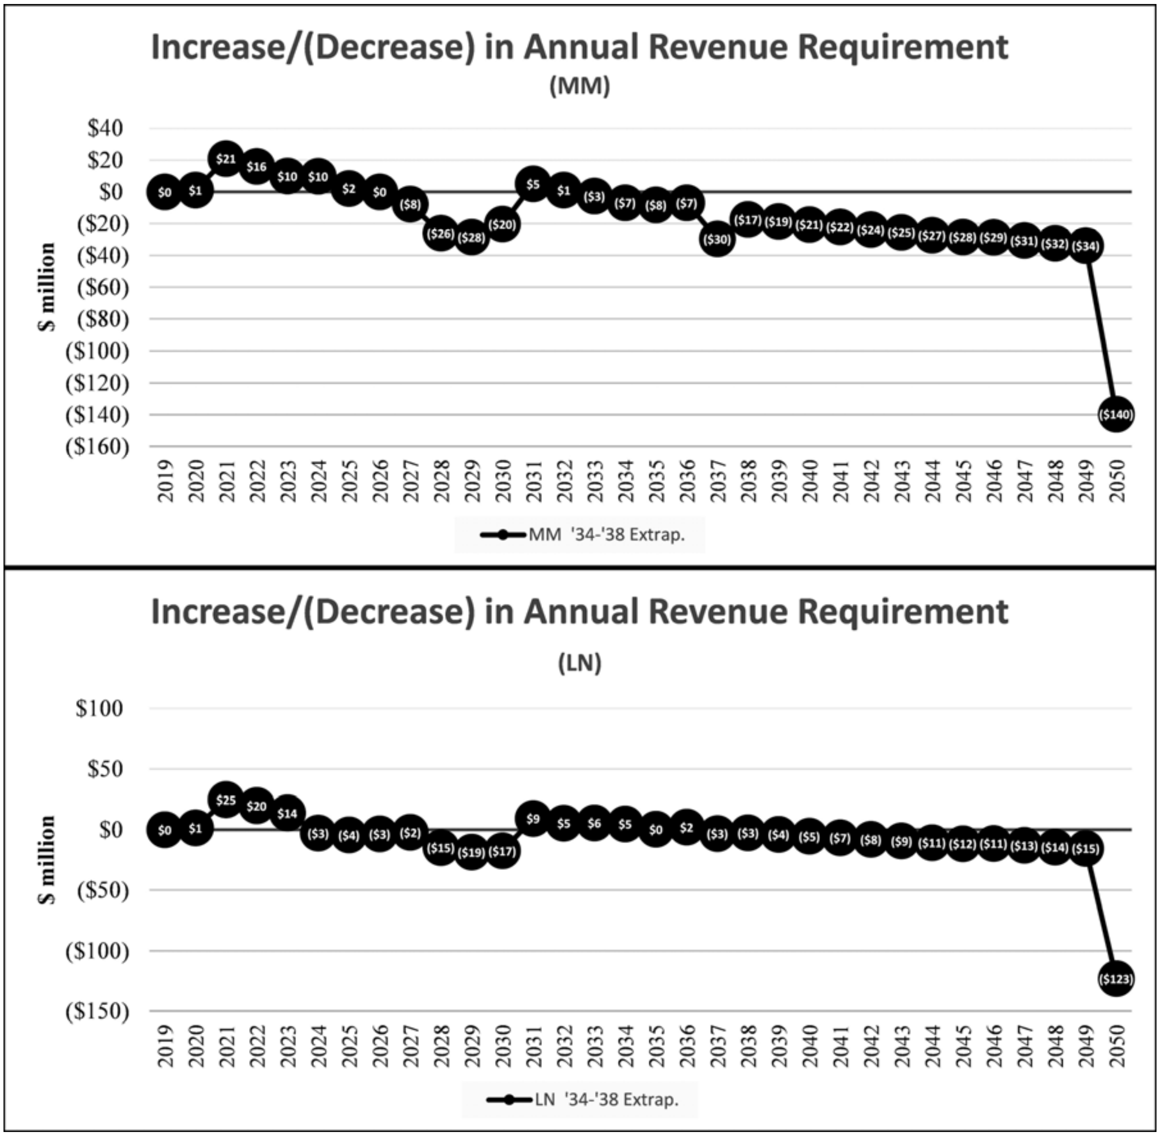
Table 11. Net Benefits from the Pryor Mountain Wind Project

Price-Policy Scenario (Extrapolation Method)	PVRR(d) Net (Benefit)/Cost ($ million)	Nom. Lev. Benefit ($/MWh of Incremental Energy)
MM ('28-'38 Extrapolation)	($69)	($7.22)
MM ('34-'38 Extrapolation)	($82)	($8.56)
LN ('28-'38 Extrapolation)	$1	$0.12
LN ('34-'38 Extrapolation)	($7)	($0.72)

Q. Have you analyzed the change in annual revenue requirement associated with the Pryor Mountain Wind Project?

A. Yes. Figure 8 shows the estimated change in nominal annual revenue requirement due to the Pryor Mountain Wind Project for the MM and LN price-policy scenarios with extrapolated benefits derived from modeled results over the period 2034-2038. This figure reflects the change in nominal revenue requirement associated with Pryor Mountain Wind Project netted against system benefits, which were calculated as described above. Considering both the MM and LN cases illustrated below, the Pryor Mountain Wind Project reduces nominal revenue requirement during a majority of its depreciable life.

Figure 8. (Reduction)/Increase in Total-System Annual Revenue Requirement from the Pryor Mountain Wind Project



VI. RESOURCE DECISIONS FOR COAL GENERATION UNITS

Q. Have you prepared economic analysis supporting major resource management decisions for coal generation units included in this case?

A. Yes. I present economic analysis supporting the conversion of Naughton Unit 3 to natural gas in 2020, the closure of Cholla Unit 4 in 2020, and the installation of SCR emissions control systems at Jim Bridger Units 3 and 4 in 2015-2016.

Naughton Unit 3 Natural Gas Conversion

Q. Please provide background on Naughton Unit 3.

A. The Naughton plant is located near Kemmerer, Wyoming. For several years PacifiCorp has been considering the conversion of Naughton Unit 3, a 280 MW resource, to a natural gas facility for environmental compliance purposes. The most recent permit from the Wyoming Air Quality Division requires Naughton Unit 3 to cease coal firing by January 30, 2019, and that gas conversion be completed by June 24, 2021.

Q. Did PacifiCorp end coal generation at Naughton Unit 3 in 2019?

A. Yes. Coal generation from Naughton Unit 3 ended on January 30, 2019.

Q. Does the 2019 IRP's preferred portfolio reflect the conversion of Naughton Unit 3 to a natural gas facility in 2020?

A. Yes. In the 2019 IRP preferred portfolio, Naughton Unit 3 is converted to natural gas in 2020, providing a low-cost reliable resource for meeting load and reliability requirements. The 2019 IRP action plan provides that PacifiCorp will complete the gas conversion of Naughton Unit 3, including completion of all required regulatory notices and filings, in 2020. The conversion will retrofit the unit to a natural gas fueled, slow start peaking unit at 75 percent maximum continuous rating, with expected generation of 247 MW. In his testimony, Mr. Teply describes the history and status of this conversion project, which is expected to be completed by mid-2020.

Q. In the 2019 IRP, how long does PacifiCorp assume Naughton Unit 3 will operate as a natural gas facility?

A. The 2019 IRP assumes Naughton 3 will operate as a natural gas facility through 2029.

Q. Does the conversion of Naughton 3 to natural gas benefit customers over other alternatives?

A. Yes. The cost of natural gas conversion is approximately $3 million, which equates to $12/kW. A new frame simple cycle combustion turbine located near the Naughton facility is estimated to cost $745/kW (2018 dollars). While the assumed design life of a new gas peaking asset is longer than the assumed life of Naughton Unit 3 once it is converted to a gas-fueled generating unit, the upfront capital required to convert natural gas is significantly less than the initial capital of new gas-fired generating unit. The gas conversion of Naughton Unit 3 represents an opportunity to maintain system capacity at a very low cost over a period in time where there are resource adequacy concerns in the region. PacifiCorp's analysis in the 2019 IRP demonstrates that, compared to early retirement of Naughton Unit 3, natural gas conversion has a PVRR(d) customer benefit ranging between $62 million and $121 million. The range of benefits is dependent upon the timing and magnitude of early coal unit retirement assumptions.

Q. Please explain the methods and assumptions used for the economic analysis in the 2019 IRP.

A. Informed by the 2019 IRP public-input process and results from coal studies that informed the 2019 IRP, initial portfolio development cases explored, among other things, alternative coal unit retirement assumptions. These cases also evaluated how system costs would be impacted if Naughton Unit 3 were converted to natural gas in 2020.

Case P-09 from the 2019 IRP is a variant of case P-03 that isolates the impact of converting Naughton Unit 3 to a 247 MW gas-fired facility in 2020. Both cases assume less accelerated coal retirements relative to the 2019 IRP preferred portfolio.[69] Through the end of 2024, the total coal capacity assumed to retire in cases P-09 and P-03 is 280 MW, which represents Naughton Unit 3 ending coal-fired operations in 2019. Through the end of 2027, the total coal capacity assumed to retire in cases P-09 and P-03 is 1,734 MW. The PVRR of system costs in case P-09, where Naughton Unit 3 is assumed to convert to a 247 MW gas-fired facility in 2020, is $62 million lower than in case P-03.

Similarly, Case P-10 from the 2019 IRP is a variant of case P-04 that isolates the impact of converting Naughton Unit 3 to a 247 MW gas-fired facility in 2020. Cases P-10 and P-04 assume more accelerated coal retirements relative to the 2019 IRP preferred portfolio. Through the end of 2024, the total coal capacity assumed to retire in cases P-10 and P-04 is 1,730 MW. Through the end of 2027, the total coal capacity assumed to retire in these cases is 2,568 MW. The PVRR of total system costs in case P-10, where Naughton Unit 3 is assumed to convert to a 247 MW gas-fired facility in 2020, is $121 million lower than P-04. As compared to the PVRR(d) between cases P-09 and P-03, customer benefits are higher with the increase in accelerated coal retirements assumed in cases P-10 and P-04.

As noted above, cases developed in the initial portfolio development phase of the 2019 IRP were developed on the basis of outcomes of modeled results and stakeholder feedback. Subsequent cases produced during the initial portfolio development phase of the 2019 IRP were designed to evaluate cost and risk impacts

[69] The 2019 IRP preferred portfolio assumes 1,018 MW and 2,441 MW of early coal unit retirements through the end of 2024 and 2027, respectively.

of other variables (*i.e.*, further analysis of coal unit retirement timing and price-policy assumptions). Based on the findings described above, subsequent cases produced in the 2019 IRP—including the case that was ultimately identified as the preferred portfolio—retained the assumption that Naughton Unit 3 is converted to a 247 MW gas-fired facility in 2020.

Retirement of Cholla Unit 4 in 2020

Q. Please provide background on PacifiCorp's Cholla Unit 4.

A. PacifiCorp owns 100 percent of Cholla Unit 4 which was commissioned in 1981 and has a generating capability of 395 MW. Arizona Public Service owns Cholla Units 1 and 3 (Unit 2 was retired in October 2015) and operates the entire Cholla facility. PacifiCorp owns approximately 37 percent of the plant's common facilities.

Q. For environmental compliance reasons, is PacifiCorp required to cease operations at Cholla Unit 4 or convert it to natural gas by April 30, 2025?

A. Yes.

Q. Does PacifiCorp's 2019 IRP preferred portfolio include early retirement of Cholla Unit 4?

A. Yes. PacifiCorp's 2019 IRP preferred portfolio reflects customer benefits associated with Cholla Unit 4's retirement as early as 2020. Given the unique ownership structure at the Cholla plant, PacifiCorp's action plan commits PacifiCorp to initiating the process of retiring Cholla Unit 4 and removing it from service no later than January 2023 and earlier if possible.

Q. Does PacifiCorp currently plan to retire Cholla 4 by year-end 2020?

A. Yes. PacifiCorp has initiated the process of retiring Unit 4 and anticipates being able to achieve retirement by year-end 2020, earlier than the January 2023 timeframe initially set forth in the 2019 IRP action plan

Q. Did PacifiCorp conduct additional economic analysis on the retirement of Cholla Unit 4 in 2020?

A. Yes. Further economic analysis building on the IRP studies confirm that early closure at the end of 2020 is expected to generate more present-value customer benefits relative to the plant continuing operation through April 2025.

Q. Please describe your economic analysis.

A. The economic analysis relies on an assessment of system value which compares the outcomes of the IRP's PaR scenarios with a simulation period covering the 2019-2025 timeframes. Consistent with the 2019 IRP preferred portfolio, the simulations use a range of natural gas price and carbon policy scenarios which incorporate a CO_2 price beginning in 2025 (medium natural gas price and medium CO_2 price assumptions (the "MM" price-policy scenario); low natural gas price and no CO_2 price assumptions (the "LN" price-policy scenario), and high natural gas price and no CO_2 price assumptions (the "HN" price-policy scenario)).[70]

Each price-policy scenario was run twice—one to update the 2019 preferred portfolio where Cholla Unit 4 is assumed to retire at the end of December 2020, and the other assuming Cholla Unit 4 continues operation through the April 2025 time frame. Each price-policy scenario showed an increase in net system costs when it

[70] For both PaR runs produced under the MM price-policy scenario, price assumptions were developed from PacifiCorp's September 2019 official forward price curve. LN and HN price-policy scenarios are derived from third-party sources. Natural gas prices in the LN price-policy scenario do not drop below prices in the MM scenario until 2026-beyond the early retirement study period. Consequently, the primary difference between the MM and LN price-policy scenario is the absence of a CO_2 price in 2025 in the LN scenario.

was assumed that Cholla Unit 4 operates as a coal-fired facility through April 30, 2025.

The updated economic analysis confirms PacifiCorp's ongoing IRP analyses and demonstrates that retirement of Unit 4 by year-end 2020 will produce net customer benefits relative to a case where Unit 4 continues operating through April 2025. This outcome is consistent across a range of price-policy scenarios. This holds true even with incremental costs, such as the closure-related costs, in part because PacifiCorp will no longer incur the operating costs associated with running Unit 4.

Q. Please provide the specific results of your economic analysis.

A. Early closure at the end of 2020 is expected to generate between $96 million and $123 million in present-value customer benefits relative to an alternative where the unit continues to operate through April 2025. All three price-policy scenarios report an increase in net system costs when it is assumed that Cholla Unit 4 operates as a coal-fired facility through April 30, 2025 relative to the case where it is assumed to retire at the end of 2020.

As shown in Table 12, the year-end 2020 retirement case under the MM price-policy scenario shows $121 million in present-value customer benefits. In the HN and LN price-policy scenarios, the year-end 2020 retirement case produce present-value customer benefits of $96 million and $123 million, respectively. In each price-policy scenario, the cost to replace system capacity and energy in the early retirement case are lower than the ongoing costs of maintaining operations through April 2025.

Table 12 - PVRR(d) Net (Benefit)/Cost of Year-End 2020 Retirement

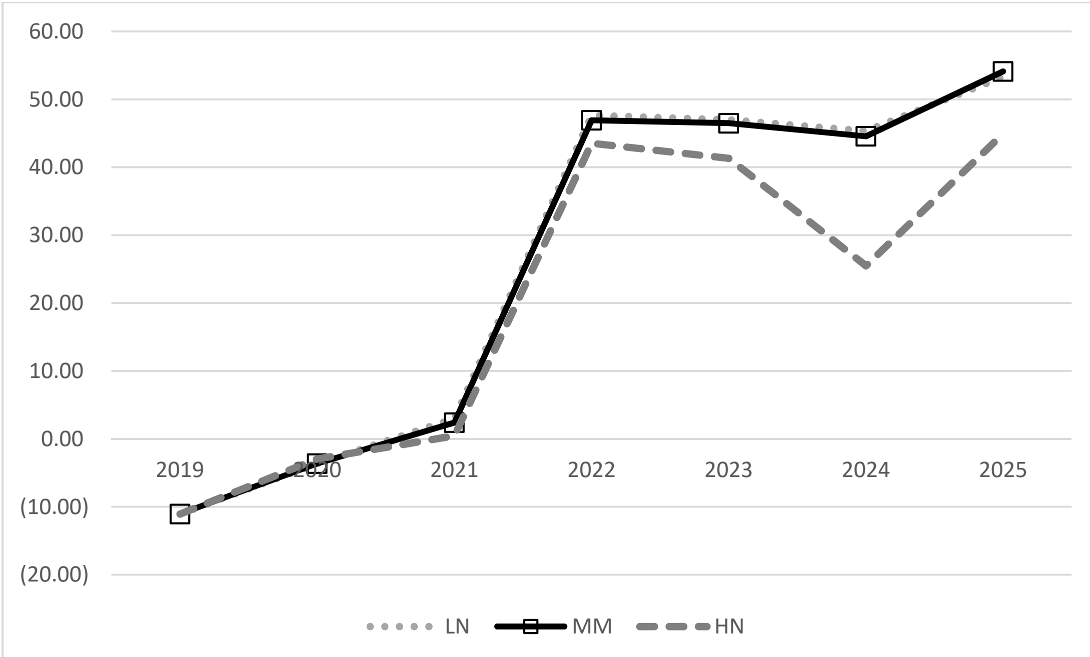
Price Policy Scenario	PVRR(d) Net (Benefit)/Cost of a Year-End 2020 Retirement ($ million)
Medium Gas, Medium CO_2	($121)
Low Gas, No CO_2	($123)
High Gas, No CO_2	($96)

Q. Please explain these results in more detail.

A. In each price-policy scenario, when Cholla Unit 4 operates through April 2025, fuel expenses (ranging from $53 million to $73 million on a present-value basis) and run-rate fixed costs ($122 million on a present-value basis) exceed the net value of system balancing market transactions (ranging from $28 million to $31 million on a present-value basis). While continued operation of Cholla Unit 4 through 2025 reduces the cost of liquidated damages associated with the coal supply-agreement, these savings do not offset the ongoing operating cost of the unit.

The customer benefits in the MM and LN price-policy scenarios are similar. Annual cost differences in the system simulation between these two scenarios are very small, and consequently, present-value customer benefits in both scenarios are nearly identical. In the HN price-policy scenario, the high price of natural gas leads to a modest increase in generation, and consequently, fuel costs, from Cholla Unit 4. However, the relative reduction in other system variable costs (i.e., fuel costs from other generators and system-balancing market transactions) is greater in the HN price-policy scenario, which reduces present-value customer benefits of the year-end 2020 early retirement case relative to the MM price-policy. Figure 9 illustrates the cost differentials for each price-policy scenario on an annual basis.

Figure 9 – Nominal Net System (Benefit)/Cost of Year-End 2020 Retirement ($ million)

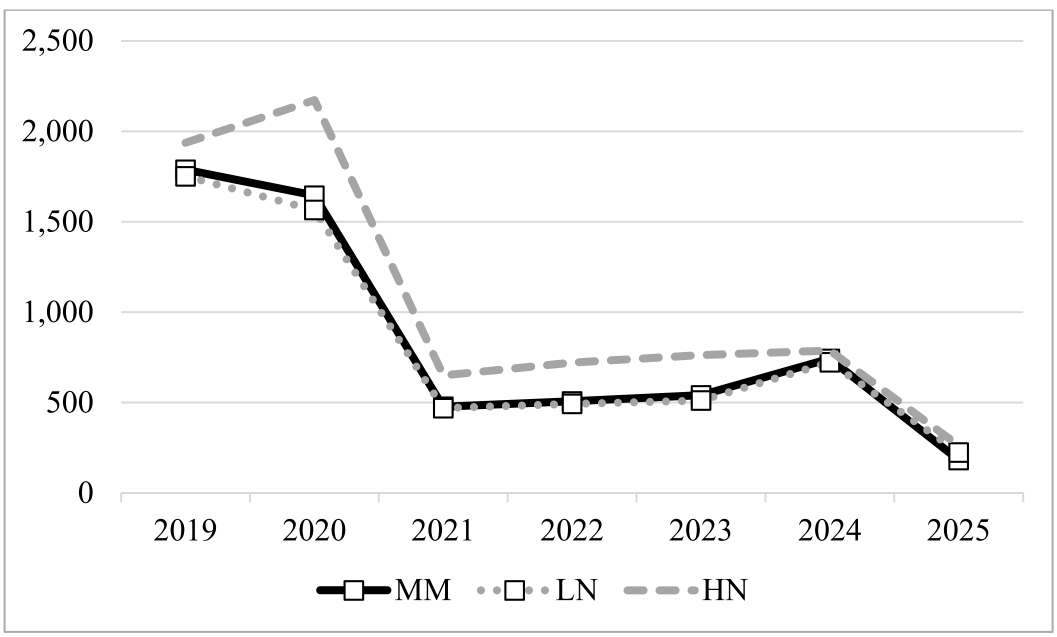


Q. Does the year-end 2020 early retirement of Cholla Unit 4 increase costs in 2020, followed by decreased costs between 2021-2025?

A. Yes. Increases in 2020 costs are primarily associated with an estimated $3.3 million of safe harbor lease early termination payments. PacifiCorp's acquisition of Cholla Unit 4 was subject to a pre-existing safe harbor lease, for federal income tax purposes, between Arizona Public Service (APS), as property owner, and General Electric Company as tax lessor. PacifiCorp assumed certain rights and obligations of APS under the safe harbor lease with respect to Cholla Unit 4. Under the early retirement case, a casualty payment is assumed to be paid to General Electric Company for its loss of tax benefits ($2.9 million cost on a present-value basis), and the amortization of pre-paid availability and transmission charges related to the Mead-Phoenix line. When PacifiCorp acquired Cholla Unit 4, the company paid APS a prepaid availability and transmission charge in April 1994 and April 1996. The charges are related to the construction of transmission facilities that enable an additional 150 MW of northbound firm transmission capability on the Phoenix-Mead transmission line. The prepaid transmission service cost began being amortized over a 50-year life in May 1997 as PacifiCorp began receiving transmission credits on its bill from APS. Under the early retirement case, it is assumed the unamortized balance would be written off, which is estimated to have an unamortized balance of $9.2 million in 2020 and $6.7 million in 2025 ($3.9 million cost on a present-value basis).

Beyond 2020, the 2020 year-end early retirement of Cholla Unit 4 reduces net system costs through the assumed April 2025 retirement date. Over this period, projected generation from Cholla Unit 4 declines, and the value of energy net of fuel costs is insufficient to offset annual fixed operating costs. Annual generation levels for Cholla Unit 4 are summarized in Figure 10.

Figure 10 – Cholla Generation by Price-Policy Scenario (GWh)



Jim Bridger Units 3 and 4 SCR Emissions Control Systems

Q. Has PacifiCorp included the costs of the SCR emissions control systems at Jim Bridger Units 3 and 4 in this case?

A. Yes. While the decision to invest in the SCR systems was made many years ago, this is the first GRC PacifiCorp has filed since these systems were installed.

Q. Please summarize your testimony on the Jim Bridger SCR emissions control systems.

A. PacifiCorp's economic analysis of SCR emission control systems at Jim Bridger Units 3 and 4 demonstrate that these systems were expected to provide net customer benefits relative to alternatives that included conversion to natural gas and early retirement. Specifically, my testimony on the SCR systems at Jim Bridger Units 3 and 4 presents the following:

- A description of the methodology used to analyze the SCR systems required to continue operating Jim Bridger Units 3 and 4 as coal-fueled facilities.
- A base case economic analysis showing $183 million in total company present-value customer benefits from the SCR systems that are necessary to continue operating Jim Bridger Units 3 and 4 as coal-fueled assets.
- Natural-gas price and CO_2 price scenario assumptions and results showing a range of economic outcomes that support the SCR systems in six of the nine scenarios studied.
- A description of an additional sensitivity showing that the Jim Bridger Units 3 and 4 SCR systems are favorable to both gas conversion and early retirement alternatives.

Q. Have circumstances changed since PacifiCorp made the decision to install SCR emission control systems at Jim Bridger Units 3 and 4?

A. Yes. PacifiCorp conducted its economic analysis as part of its 2013 IRP.[71]

[71] *See*, Docket No. LC 57, PacifiCorp's 2013 IRP Submittal (April 30, 2013).

PacifiCorp decided in May 2013 to move forward with SCR emission control systems for Jim Bridger Units 3 and 4 based on this analysis. This timeline was designed to comply with environmental regulations requiring action by the end of 2015 for Unit 3 and by the end of 2016 for Unit 4.[72]

Since then, PacifiCorp has continued to evaluate its coal fleet as part of the biennial IRP process as economic conditions have evolved. In PacifiCorp's 2019 IRP, the risk-adjusted, least-cost portfolio for the first time includes retirement of Jim Bridger Units 3 and 4 in 2037.[73] In addition, Oregon's laws governing resource emissions have changed and now prohibit coal generation in rates after 2030.

This information was not available to PacifiCorp at the time it made the decision to install SCRs, and prudence of this investment must be measured based on what was known at the time a decision was made, without reliance on hindsight. In the intervening years since the SCR emission control systems were installed (in late 2015 and late 2016 for Units 3 and 4, respectively),[74] customers have received and will continue to receive the benefits of this low-cost resource.

Q. Did the Commission decline to acknowledge the SCR emission control systems at Jim Bridger Units 3 and 4 in the 2013 IRP?

A. Yes. The Commission stated that it did not have enough information to resolve the issues brought up by other parties. Instead the Commission indicated that it would "undertake a thorough and fair review of the prudence of PacifiCorp's decision in a future rate case proceeding."[75] In my testimony and exhibits, I provide the

[75] *In the Matter of PacifiCorp, dba Pacific Power*, LC 57, Order No. 14-252, at 19 (July 8, 2014).

information necessary to demonstrate that PacifiCorp was prudent in making this investment.

Methodology

Q. What model was used to evaluate the SCR emission control systems for Jim Bridger Units 3 and 4?

A. PacifiCorp used its SO model to perform a PVRR(d) economic analysis of the SCR emission control systems at Jim Bridger Units 3 and 4. This same analysis was presented in PacifiCorp's 2013 IRP and 2013 IRP Update, and in the Wyoming CPCN process for the SCR systems at Jim Bridger Units 3 and 4 described in the testimony of Mr. Teply.

Q. Is this the same SO model used to analyze the Energy Vision 2020 projects described above?

A. Yes.

Q. Why is the SO model an appropriate tool for analyzing incremental emission control equipment installations required on coal resources?

A. The SO model is the appropriate modeling tool when evaluating capital investment decisions and alternatives to those investments that might include early retirement and replacement or conversion of assets to natural gas. The SO model is capable of simultaneously and endogenously evaluating capacity and energy trade-offs between emission control systems required to meet environmental regulations and a broad range of alternatives, including fuel conversion, early retirement and replacement with greenfield resources, market purchases, demand-side management resources, and/or renewable resources. In this way, the SO model captures the cost implications of prospective emission control installation decisions by evaluating NPC impacts along with the impacts those decisions might have on future resource acquisition needs. This is particularly important when resource retirement and replacement is an environmental compliance alternative.

Q. How was the SO model used to analyze the PVRR(d) of the SCR systems required for Jim Bridger Units 3 and 4?

A. For a range of market price scenarios, which I describe later in my testimony, two SO model simulations were completed—an optimized simulation and a change-case simulation. In the optimized simulation, the SO model determined whether continued operation of Jim Bridger Units 3 and 4 inclusive of incremental SCR systems and other planned costs required to achieve compliance with environmental regulations was a lower cost solution than avoiding those expenses through early retirement and resource replacement or through conversion to natural gas. In the change-case simulation, the SO model was forced to produce a suboptimal decision by not allowing it to make the preferred decision that was made in the optimized simulation.

When the optimized simulation selected continued operations with incremental SCR emission control systems and other planned costs, then the change case was created by removing the SCR emission control systems as an alternative, allowing the SO model to select either an early retirement or gas-conversion alternative. In each of these change-case simulations, the SO model selected natural-gas conversion as a lower-cost alternative to early retirement. In scenarios where the optimized simulation selected conversion to natural gas, then the change case forced continued operations with incremental SCR emission control systems and other planned costs. The difference in total-company costs, inclusive of differences in NPC, operating costs and capital costs, between the two simulations for any given market-price scenario represents the PVRR(d), which establishes how favorable or unfavorable the incremental environmental capital investments planned for Jim Bridger Units 3 and 4 are in relation to the next best alternative.

Q. What incremental environmental investment costs were assumed for Jim Bridger Units 3 and 4?

A. Incremental environmental investment costs applied in the SO model include the cost of the SCR emission control systems required for Jim Bridger Units 3 and 4, along with projected costs required to achieve compliance with an array of known and emerging environmental regulations. This included costs to achieve compliance with the U.S. Environmental Protection Agency's mercury and air toxics standard, and costs to achieve compliance with prospective rules on coal-combustion residuals and cooling water intake structures. The incremental investment costs assumed in the SO model for Jim Bridger Units 3 and 4 along with other coal resources in PacifiCorp's fleet are summarized in Confidential Exhibit PAC/704.

Q. What resource-replacement alternatives were made available to the SO model in the event SCR emission control systems were not installed on Jim Bridger Units 3 and 4?

A. In addition to brownfield natural-gas conversion of Jim Bridger Units 3 and 4, the SO model was configured with a range of resource-replacement alternatives, which included:

- greenfield natural-gas resources;
- firm market purchases;

- demand-side management; and
- incremental wind resources.

Since the installation of SCR systems was required by December 31, 2015, for Jim Bridger Unit 3 and by December 31, 2016, for Jim Bridger Unit 4, resource retirement and replacement alternatives were assumed to be available beginning January 2016 and January 2017, respectively. Natural-gas conversion alternatives were made available beginning March 2016 for Jim Bridger Unit 3 and March 2017 for Jim Bridger Unit 4, assuming coal-fueled operation would continue as long as possible and the work to complete the gas conversion could be accomplished over a two-month period.

Q. Did PacifiCorp's economic analysis consider how the power requirements from the SCR emission control systems might affect the net capacity of Jim Bridger Units 3 and 4?

A. Yes. The SCR emission control systems, once installed and operational, were assumed to reduce PacifiCorp's share of capacity of both Jim Bridger Unit 3 and Unit 4 by approximately 3.5 MW.

Q. Did your analysis account for changes in the fueling plan at the Jim Bridger plant between the SCR and natural-gas conversion or early-retirement scenarios?

A. Yes. If Jim Bridger Units 3 and 4 were to convert to natural gas or retire early, the coal fueling needs at the four-unit Jim Bridger plant would be reduced, which in turn, would influence mine plans and reclamation plans. Cash coal cost assumptions used in the SO model were based on non-capital-related costs to fuel the Jim Bridger plant, which included then-current third party coal prices and transportation costs from

Black Butte coal as well as then-current cash operating cost forecasts for Bridger Coal Company (BCC) inclusive of final reclamation trust contributions. Under a two-unit coal operating plan, cash costs assumed closure of the Bridger Coal surface mine. Under a four-unit coal operating plan, cash costs assumed a two dragline operation at the surface mine. Cash coal cost assumptions for both the two-unit and four-unit coal operating plans used in the economic analysis are provided in Confidential Exhibit PAC/705.

Q. Please describe mine reclamation costs considered in PacifiCorp's economic analysis.

A. In 1989, the BCC owners established a final reclamation trust to fund actual final reclamation work. A sinking fund calculation is used to determine the appropriate final reclamation trust contribution rate and ensure sufficient funds exist in the trust to support final reclamation work once coal production ceases. Contributions to the final reclamation trust were included as part of the Jim Bridger plant cash coal costs through 2030, the study horizon used for the SO model analysis. Considering that reclamation costs continue beyond the 2030 study horizon, reclamation costs from 2031 through 2037 were included in the PVRR(d) calculations to capture differences in reclamation costs beyond the SO model study period. Confidential Exhibit PAC/706 summarizes reclamation costs for both the two-unit and four-unit coal operating plans used in the economic analysis.

Q. Did PacifiCorp consider differences in incremental mine capital costs between the two-unit and four-unit coal operating plans?

A. Yes. Over the period 2013 through 2030, average annual mine capital cost assumptions for a four-unit coal operating plan are higher than those in a two-unit coal operating plan. Confidential Exhibit PAC/707 shows annual mine capital cost assumptions used in the economic analysis for both the two-unit and four-unit coal operating plans.

Natural-Gas and CO_2 Price Scenarios

Q. Please explain why natural-gas and CO_2 price assumptions were important when analyzing the SCR emission control systems at Jim Bridger Units 3 and 4.

A. PacifiCorp evaluated early retirement and resource replacement or conversion of Jim Bridger Unit 3 and Unit 4 to natural gas as alternatives to SCR emission control systems. The assumed price for natural gas directly affects the cost for gas-fueled replacement resources in the case of an early retirement alternative or the fuel cost and replacement energy in the case of a gas conversion alternative. The price for natural gas is also a key factor in setting wholesale power prices. In this way, natural-gas prices disproportionately affect the value of energy net of operating costs from Jim Bridger Units 3 and 4 when operating as a coal-fueled resource versus the value of energy net of operating costs from a natural gas-fueled resource replacement alternative. Similarly, because of the relatively high level of carbon content in coal as compared to natural gas, higher CO_2 prices disproportionately affect the prospective cost of emissions between coal resources and natural gas as an alternative to the incremental investments required to continue operating Jim Bridger Units 3 and 4 as coal-fueled assets.

Q. Did PacifiCorp evaluate different assumptions for natural-gas prices and CO_2 prices in its analysis of the Jim Bridger Units 3 and 4 SCR systems?

A. Yes. PacifiCorp conducted a robust examination of alternative courses of action over a wide range of scenarios and input assumptions. In total, eight different combinations of natural-gas and CO_2 price assumptions were analyzed as variations to the base case, which was tied to the September 2012 OFPC. Table 13 summarizes the directional changes to base case assumptions among the eight scenarios. Two scenarios assume low and high natural-gas prices with base case CO_2 assumptions held constant; two scenarios assume low and high CO_2 price assumptions with the underlying base case natural-gas prices held constant; and four scenarios pair different combinations of natural-gas price and CO_2 price assumptions. In any scenario where the CO_2 assumption varies from that used in the base case, the underlying natural-gas price assumption was adjusted to account for an assumed natural-gas price response from changes in electric sector natural-gas demand.

Table 13. Natural-Gas and CO_2 Price Scenarios

Description	Natural-Gas Prices	CO_2 Prices
Base Case	September 2012 OFPC	\$16/ton in 2022 rising to \$23/ton by 2030
Low Gas, Base CO_2	Low	\$16/ton in 2022 rising to \$23/ton by 2030
High Gas, Base CO_2	High	\$16/ton in 2022 rising to \$23/ton by 2030
Base Gas, \$0 CO_2	Base case adjusted for price response	No CO_2 costs
Base Gas, High CO_2	Base case adjusted for price response	\$14/ton in 2020 rising to \$65/ton by 2030
Low Gas, High CO_2	Low case adjusted for price response	\$14/ton in 2020 rising to \$65/ton by 2030
High Gas, \$0 CO_2	High case adjusted for price response	No CO_2 costs
Low Gas, \$0 CO_2	Low case adjusted for price response	No CO_2 costs
High Gas, High CO_2	High case adjusted for price response	\$14/ton in 2020 rising to \$65/ton by 2030

Q. Why were natural-gas price assumptions adjusted in those scenarios where CO_2 price assumptions vary from the base case?

A. As I stated earlier, CO_2 prices disproportionately affect the prospective cost of emissions between coal resources and natural-gas alternatives. This is primarily driven by the relatively high level of carbon content in coal as compared to natural gas. With rising CO_2 prices, generating resources with lower CO_2 emissions, such as natural gas-fueled resources, can begin to displace coal-fueled generation, thereby increasing the demand for natural gas within the electric sector of the U.S. economy. Displacement of coal generation can also be influenced by low- or zero-emitting renewable generation sources; however, it was assumed that these low- or zero-emitting renewable resources would not entirely offset increased natural-gas demand. Conversely, with falling CO_2 prices (or a market that is absent CO_2 prices), there is no incremental emissions-based cost advantage for natural gas or renewable generation as compared to coal, and demand for natural gas in the electric sector of the U.S. economy could be slightly lower. It is assumed that any change in natural-gas demand must be balanced with a change in supply such that higher natural-gas demand yields an upward movement in price and lower natural-gas demand yields a downward movement in price.

Q. Did PacifiCorp only apply upward adjustments to natural-gas prices in response to changes in CO_2 price level?

A. No. The assumed interaction between natural-gas prices and CO_2 prices was applied on a bi-directional basis. That is, PacifiCorp not only assumed natural-gas prices rise in the presence of a CO_2 price (or with increased CO_2 price levels), but also incorporated downward natural-gas price pressures when CO_2 prices were removed or lowered.

Q. How did PacifiCorp choose its natural-gas and CO_2 price assumptions as used in the eight market price scenarios?

A. The range of low- and high-price assumptions were based upon the range of then current third-party expert forecasts and government agency price projections. Confidential Exhibit PAC/708 shows how the low and high price assumptions that were used in PacifiCorp's economic analysis compare to these third-party forecasts.

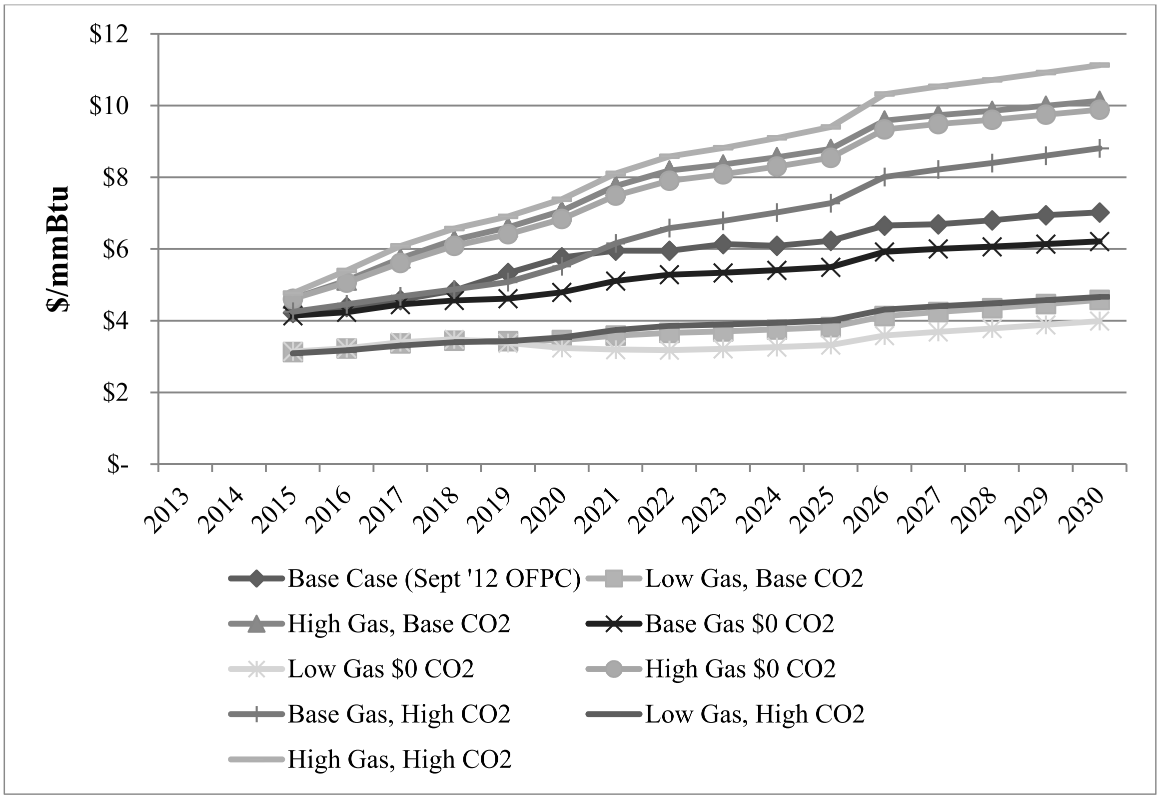
Low natural-gas price assumptions were derived from a third-party, low price scenario, which was characterized by strong and price-resilient shale gas supply growth and stagnant exports of liquefied natural gas out of the U.S. natural-gas market. The high natural-gas price assumptions were based on a blend of two, third-party price scenarios. This blending approach recognized that the most extreme high natural-gas price forecast was a strong outlier relative to price projections from other forecasters, and would have resulted in a high-price scenario that exceeds the highest of 47 natural-gas price forecasts in the U.S. Energy Information Administration's 2011 Annual Energy Outlook.[76]

Fundamental drivers to a high price scenario included constraints or disappointments in shale gas production, linkage to rising oil prices through substantial new demand in the transportation sector, and/or significant increases in liquefied natural-gas exports out of the U.S. natural-gas market. Figure 11 shows the

[76] The U.S. Energy Information Administration is the statistical and analytical agency within the U.S. Department of Energy. The highest natural-gas price forecast in the 2011 Annual Energy Outlook assumed that total unproved technically recoverable shale gas resources are reduced by 49 percent and that the estimated ultimate recovery per shale gas well is 50 percent lower than what was in their reference case.

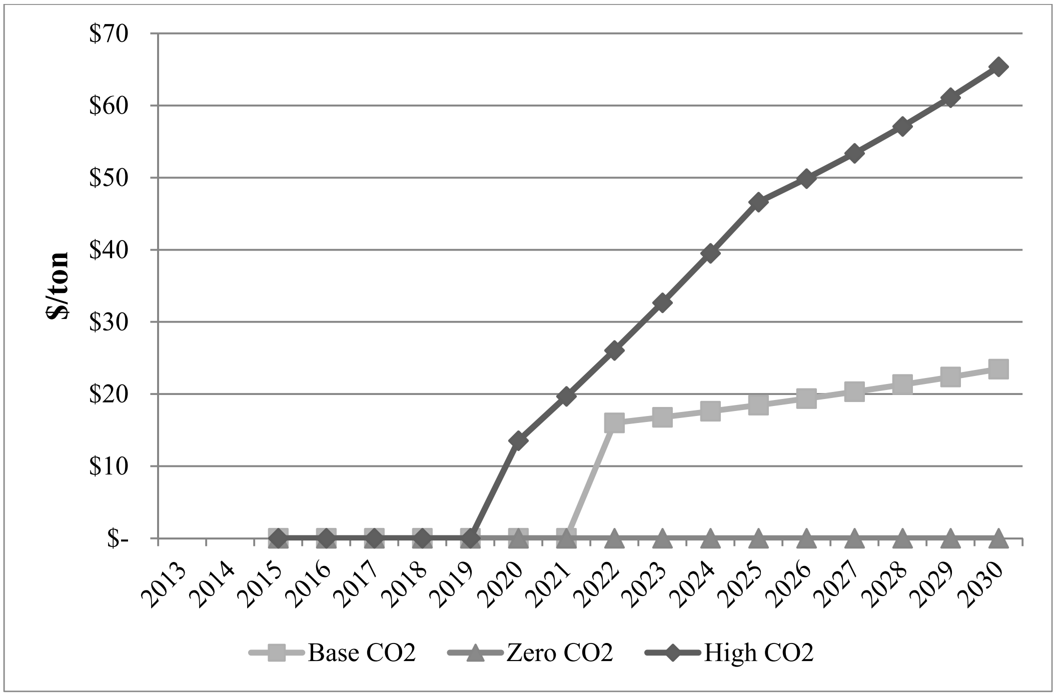
Henry Hub natural-gas price forecast among all market price scenarios considered in the economic analysis of the SCR emission control systems at Jim Bridger Units 3 and 4.

Figure 11. Henry Hub Natural-Gas Prices among All Scenarios



PacifiCorp assumed a zero CO_2 price for the low scenario, recognizing that there had been limited activity in the CO_2 policy arena. For the high CO_2 price scenario, prices were assumed to begin in 2020, escalate rapidly through 2025 and reach $65/ton by 2030. The high CO_2 price scenario aligns with the then-current high CO_2 price forecast from a third-party source. Figure 12 shows the three CO_2 price assumptions used in the market-price scenarios supporting the economic analysis.

Figure 12. CO_2 Prices among All Scenarios



Base-Case Results

Q. Please describe the base-case results.

A. The optimized base-case simulation selected the SCR emission control systems at Jim Bridger Unit 3 and Jim Bridger Unit 4. The change-case simulation in which Jim Bridger Units 3 and 4 were not allowed to select SCR emission control systems showed that gas conversion was the next best, albeit higher cost, alternative to the installation of these SCR systems. The PVRR(d), as summarized in Exhibit PAC/709, shows that installation of SCR systems is $183 million lower cost than gas conversion.

Q. How were system costs impacted between the base-case simulation, where SCRs were installed on Jim Bridger Units 3 and 4, and the change-case simulation, where both units were converted to natural gas?

A. When SCR emission control systems were installed on Jim Bridger Units 3 and 4, total-company fuel costs are lower and net system balancing revenues are higher relative to a natural-gas conversion alternative that would significantly reduce generation levels from the two units. These total-company benefits more than offset the increased fixed costs associated with the capital for the SCR emission control systems, which were assumed to be approximately $372/ kW higher than gas conversion capital costs, and levelized annual operating and run-rate capital costs, which were assumed to be approximately $52/kW higher than projected gas conversion costs. On a total-company basis, the PVRR(d) of system variable costs was $775 million favorable to the SCR systems compliance alternative, which more than offset the $592 million increase to total-company fixed costs.[77]

Natural-Gas and CO_2 Price Scenario Results

Q. Please describe the results from the natural-gas and CO_2 price scenarios.

A. The natural-gas and CO_2 price scenario results showed that the investment in SCR emission control systems at Jim Bridger Unit 3 and Jim Bridger Unit 4 remained favorable to the next best, albeit higher cost natural-gas conversion alternative under all base and high natural-gas price scenarios at all assumed CO_2 price levels. In these scenarios, the PVRR(d) ranges between $51 million favorable for the SCR systems (base gas, high CO_2) and $997 million favorable for the SCR systems (high gas, zero CO_2). The PVRR(d) results were unfavorable for the SCR systems only in those scenarios where then-current low natural-gas prices were assumed.

When low natural-gas price assumptions were paired with base CO_2 price

[77] System variable costs include fuel, net system balancing revenue, variable O&M expenses, and CO_2 emissions expenses, as applicable. System fixed costs include incremental environmental controls costs, fixed O&M and run-rate capital expenses for existing and new resources, and changes to system demand-side management costs.

assumptions, the nominal levelized price of natural gas at Opal[78] over the period 2016 to 2030 is \$3.70 per million British thermal units (MMBtu) and the PVRR(d) is \$285 million unfavorable for the SCR emission control systems required at Jim Bridger Units 3 and 4. In the low natural-gas, zero CO_2 price-policy scenario, the nominal levelized price of natural gas at Opal is \$3.41 per MMBtu over the 2016-to-2030 time frame, and the PVRR(d) is \$224 million unfavorable for the SCR emission control systems. When low natural-gas prices are paired with high CO_2 price assumptions, the nominal levelized price at Opal over the period 2016 to 2030 is \$3.78 per MMBtu, and the PVRR(d) is \$378 million unfavorable for the SCR emission control systems. The PVRR(d) results from the natural-gas and CO_2 price scenarios are summarized alongside the base case results in Exhibit PAC/709.

Q. How did the PVRR(d) results trend among the different updated natural-gas price assumptions?

A. The scenario results show that there is a strong trend between natural-gas price assumptions and the PVRR(d) benefit/cost associated with the SCRs required for continued operation of Jim Bridger Units 3 and 4 as coal-fueled assets. With higher natural-gas price assumptions, the SCR emission control systems are more favorable as compared to the Jim Bridger Unit 3 and Unit 4 gas conversion alternative. Conversely, lower natural-gas prices improve the PVRR(d) results in favor of the gas conversion alternative. Lower natural-gas prices reduce the fuel cost of the gas conversion alternative, reduce the fuel cost of the other natural gas-fueled system resources that partially offset the generation lost from the coal-fueled Jim Bridger

[78] Opal is a natural-gas market hub located in Lincoln County, Wyoming.

units, and reduce the opportunity cost of reduced off-system sales when Jim Bridger Units 3 and 4 operate as a gas-fueled generation assets.

Q. Could you infer from this trend how far natural-gas prices would have had to fall for gas conversion to have been favorable to installation of SCR systems at Jim Bridger Units 3 and 4?

A. Yes. Confidential Exhibit PAC/710 graphically displays the relationship between the nominal levelized natural-gas price at Opal over the period 2016 through 2030 and the PVRR(d) benefit/cost of continued coal operation of Jim Bridger Units 3 and 4 with installation of SCR emission control systems. To isolate the effects of CO_2 prices, which as I described earlier were assumed to elicit a natural-gas price response due to changes in demand for natural gas in the electric sector, the natural-gas price relationship with PVRR(d) results is shown for the natural-gas price scenarios in which the base case CO_2 price assumption was used. Based on this trend, levelized natural-gas prices over the period 2016 through 2030 would have to decrease by 15 percent, from $5.72 per MMBtu to $4.86 per MMBtu, to achieve a breakeven PVRR(d). This is referred to as the "breakeven analysis" for changes in natural-gas prices.

Q. How did the PVRR(d) results trend among the different CO_2 price assumptions?

A. Higher CO_2 price assumptions improve the PVRR(d) in favor of the gas conversion alternative, and lower CO_2 prices improve the economics of the SCR emission control systems. As with the trend described in the relationship between natural-gas prices and the PVRR(d) results, the relationship between CO_2 prices and the PVRR(d) benefit/cost of the SCR systems required at Jim Bridger Units 3 and 4 is intuitive.

Because the CO_2 content of coal is nearly double the CO_2 content of natural gas, higher CO_2 prices lead to relatively lower cost of emissions for the gas conversion alternative and offset the costs related to any generation lost from the coal-fueled Jim Bridger Units 3 and 4 assets.

Q. What CO_2 price would be required to change the PVRR(d) results in favor of converting Jim Bridger Units 3 and 4 to natural gas?

A. Confidential Exhibit PAC/711 includes a graphical representation of the relationship between the nominal levelized CO_2 price over the period 2016 to 2030 and the PVRR(d) benefit/cost of installing the SCR emission control systems. To isolate the effects of fundamental shifts in the natural-gas price assumptions, the CO_2 price relationship with the PVRR(d) results is shown for the two CO_2 price scenarios that were paired with the same underlying base case natural-gas price assumption. Based upon the trend between PVRR(d) and nominal levelized CO_2 price assumptions, the levelized CO_2 prices over the period 2016 through 2030 would need to exceed $30 per ton, more than three times the base case nominal levelized CO_2 price assumption, to achieve a breakeven PVRR(d) for the Jim Bridger Unit 3 and Unit 4 SCR emission control systems.

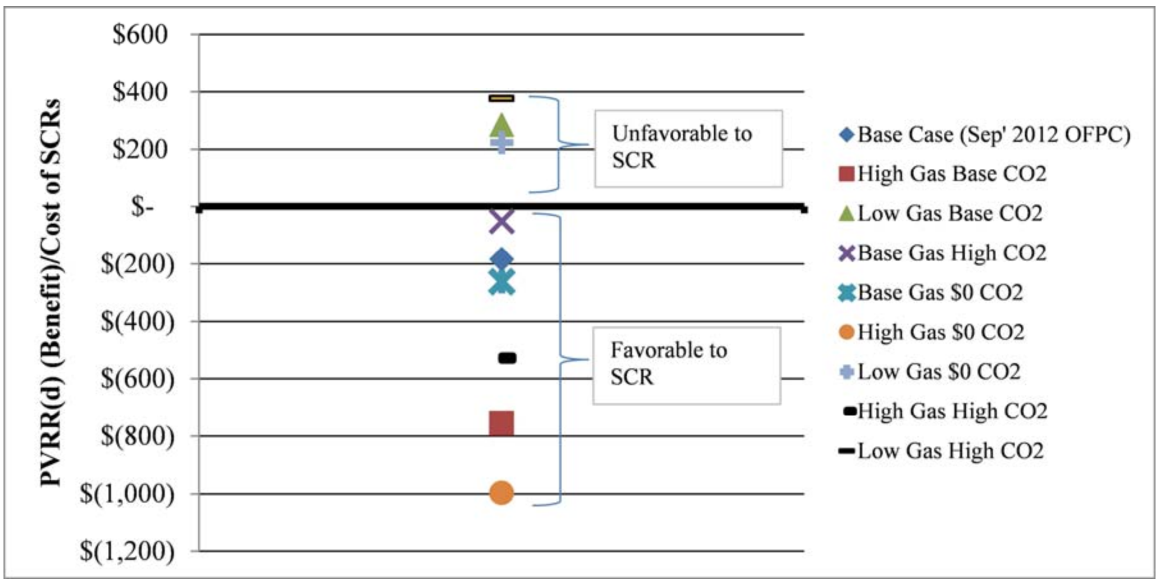
Q. How did PacifiCorp use the natural-gas and CO_2 price scenario results to inform its decision to install the Jim Bridger Unit 3 and Unit 4 SCR emission control systems?

A. PacifiCorp first reviewed the magnitude of the PVRR(d) results from the base case, which is defined by assumptions representing the Company's best estimate of forward-looking assumptions at the time the analysis was completed. The base-case results provided an initial look at how favorable or unfavorable the SCR systems are in relation to the next best alternative and provided context when reviewing scenario results. The base case results summarized earlier in my testimony yield a PVRR(d) showing that the Jim Bridger Unit 3 and Unit 4 SCR systems would be $183 million lower cost than the natural-gas conversion alternative. This outcome also shows that when PacifiCorp's best estimate of forward-looking assumptions were used, there was a reasonably sized "cushion" in the PVRR(d) results allowing for some erosion of the favorable economics should long-term natural-gas prices or CO_2 prices change from what was assumed in the base case analysis. The natural-gas and CO_2 price scenarios were then used to quantify how sensitive the PVRR(d) results are to these key assumptions and provided a foundation for judging risk.

Q. Can you describe how PacifiCorp evaluated risk in the context of the results from the natural-gas and CO_2 price scenarios?

A. Yes. Figure 13 shows the distribution of PVRR(d) results for the base case and the eight natural-gas and CO_2 price scenarios. The figure shows that of the nine cases analyzed, six scenarios produce a PVRR(d) favorable to the SCR systems and the three scenarios with low gas price assumptions produce a PVRR(d) that was unfavorable to the SCR systems. The figure further illustrates the range of potential PVRR(d) outcomes among the scenarios analyzed. At one end of the spectrum, the PVRR(d) for the high gas, zero CO_2 scenario is $997 million favorable to the SCR systems. On the other end of the spectrum, the PVRR(d) for the low gas high CO_2 scenario is $378 million unfavorable to the Jim Bridger Unit 3 and Unit 4 SCR systems. Among the scenarios analyzed, the distribution of PVRR(d) outcomes indicate a disproportionate risk profile. While there is a possibility that the evolution of future natural-gas prices could have rendered the decision to invest in SCR systems to be higher cost than a gas conversion alternative, the cost impacts to customers of such an outcome were projected to be higher under a gas conversion alternative should future natural-gas prices rise relative to the base case.

Figure 13. Distribution of Scenario PVRR(d) Results

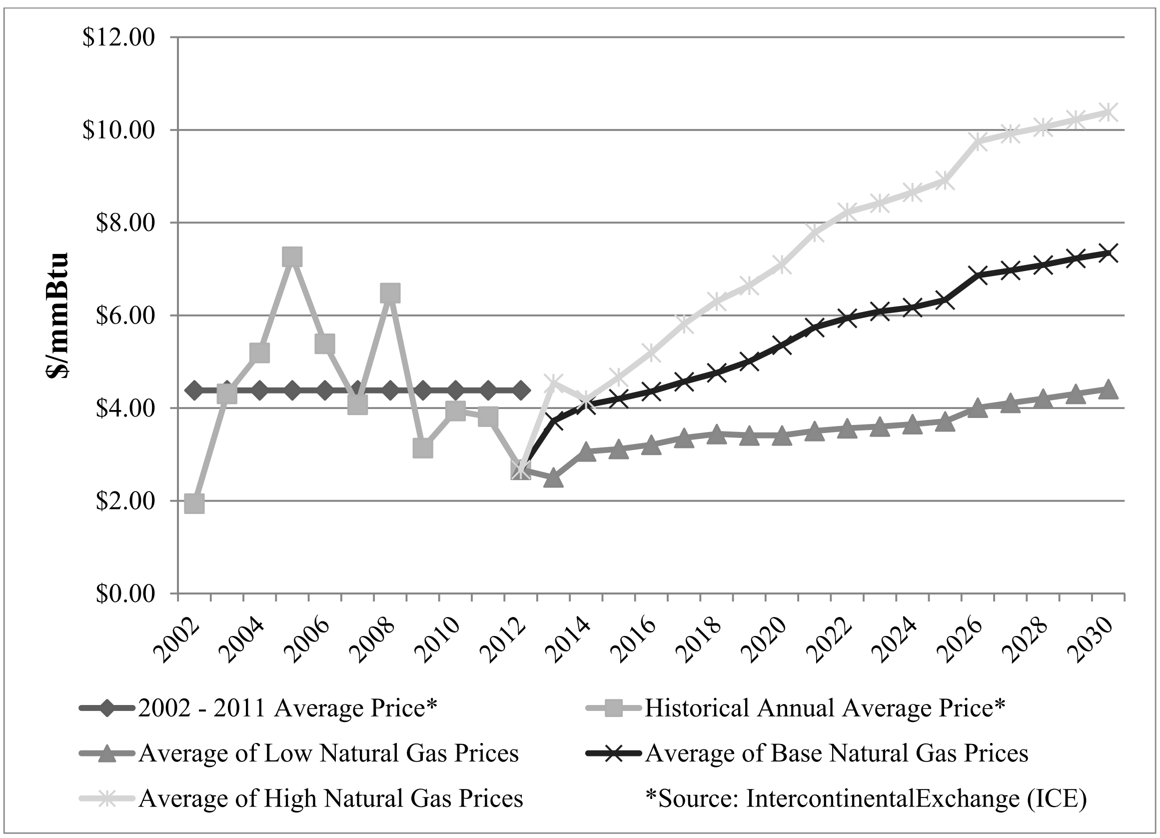


Q. Given the impact of low gas prices on the PVRR(d) results, how did you analyze the uncertainty around future natural-gas prices?

A. I compared the potential range of future natural-gas price scenarios in the context of historical natural-gas price levels. Figure 14 plots historical natural-gas prices alongside the average annual natural-gas price at Opal among the three low natural-gas price scenarios, the three base natural-gas price scenarios, and the three high natural-gas price scenarios.

Opal natural-gas prices in the low natural-gas price scenarios never reach 2002 to 2012 historical average prices over the course of the next 18 years. Among the low natural-gas price scenarios, the average annual price for natural gas at Opal over the period 2013 through 2030 is $3.59 per MMBtu, which is 18 percent below 2002–2012 historical price levels. Among the base natural-gas price scenarios, which are representative of the best estimate of forward-looking assumptions available at the time, the average annual price for Opal natural gas was $5.66 per MMBtu, or 29 percent above 2002–2012 historical price levels. Among the high natural-gas price scenarios, Opal natural-gas prices averaged $7.60 per MMBtu, representing a 73-percent increase relative to 2002-2012 historical prices.

Figure 14. Average Annual Natural-Gas Prices at Opal



Q. Did PacifiCorp consider the impact of changing market conditions on its Jim Bridger SCR analysis before issuing a full notice to proceed (FNTP) in December 2013?

A. Yes. As discussed above, the Company produced natural-gas price sensitivities that show a strong linear relationship between natural-gas price inputs and the PVRR(d) between the SCR and natural-gas-conversion compliance alternatives, which is displayed in Confidential Exhibit PAC/710. Given the significance of this relationship, PacifiCorp developed the breakeven analysis to allow for rapid re-assessment of the PVRR(d) between the SCR and natural-gas conversion compliance alternatives. This analytical tool allowed the Company to monitor changing market conditions affecting the financial viability of the investment at significant project milestones without having to recreate the more time-intensive economic analysis to account for changes in forward gas prices. The breakeven analysis specifically complemented flexibility provisions negotiated in the EPC contract, which is described further in Mr. Teply's testimony. PacifiCorp used this breakeven analysis before selecting installation of SCR emission control systems as the best compliance alternative in May 2013. Between May and December 2013, management personnel were in frequent contact and regularly monitoring the economics of the SCR investment. Before issuing the FNTP on December 1, 2013, PacifiCorp once again evaluated natural-gas prices relative to the breakeven price point to assess how changes in market conditions affected customer benefits.

Q. What were forward natural-gas prices at the time PacifiCorp committed to installing SCR systems at Jim Bridger Units 3 and 4?

A. PacifiCorp's economic analysis of the Jim Bridger SCRs used base-case natural-gas prices from the Company's September 2012 OFPC, which yielded a nominal levelized price at Opal over the 2016-through-2030 time frame of $5.72 per mmBtu. Before issuing the FNTP on December 1, 2013, PacifiCorp reviewed the most recent OFPC from September 2013, which yielded a nominal levelized price at Opal of $5.35 per mmBtu over the 2016-through-2030 time frame. This was well above the break-even levelized Opal natural-gas price for the SCRs at $4.86/mmBtu. Based upon the breakeven relationship described above, PacifiCorp determined that the SCR emission control systems remained the most economical environmental compliance option for Jim Bridger Units 3 and 4, benefiting customers by approximately $130 million more than the gas-conversion alternative.[79]

When evaluating natural-gas prices before issuing the FNTP, PacifiCorp also considered that there is uncertainty in long-term natural-gas price forecasts, that natural-gas prices cannot trend downward indefinitely, and that there was a reasonable possibility that actual natural-gas prices could be higher than then-current base-case projections.

[79] Furthermore, after September 2013, there were no indications that prices had fallen below the breakeven point. In late October 2013, PacifiCorp received price forecasts from third-party consultants indicating no major changes from their prior forecasts. In fact, two of PacifiCorp's three third-party forecasts increased after September 2013. And the only consultant forecast that was less than the break-even point showed a decline of less than one percent relative to the same consultant's August forecast. Although the company does not make long-term resource decisions based on isolated forecasts and short-term market forwards, these data demonstrated it was reasonable to continue to rely on the September 2013 OFPC.

Q. Please explain how PacifiCorp considered the impact of reduced EPC contract costs on the SCR benefits before issuing the FNTP.

A. Before issuing the FNTP PacifiCorp was aware that EPC costs for the Jim Bridger SCR emission control systems had been reduced by [redacted]. The reduced EPC cost contributes approximately [redacted] in additional benefits to the SCR compliance alternative. These incremental benefits, tied to fixed costs for the SCR systems, are easily calculated, and no model runs are required to understand how reduced EPC costs improve benefits for the SCR compliance alternative. Before issuing the FNTP, PacifiCorp knew that these EPC cost reductions would only add to the already substantial benefits of the SCR compliance alternative even after accounting for reduced base-case natural-gas price assumptions. Moreover there would have been increased costs and risks of natural-gas conversion under a hypothetical post-FNTP cancellation.

Q. Based on all the analysis described above, was it in customers' best interest to pursue the installation of SCR emission control systems at Jim Bridger Units 3 and 4?

A. Yes. The economic analysis conducted by PacifiCorp clearly showed that installation of the SCR emission control systems was the least-cost, least-risk alternative. While some changes to inputs and assumptions occurred during this period, there were no red flags that indicated that the substantial SCR benefits had eroded or that natural gas conversion had become the more economical compliance alternative.

Early Retirement Sensitivity Analysis

Q. Did PacifiCorp's base case and scenario analyses allow for early retirement as an alternative to the SCR emission control systems?

A. Yes. PacifiCorp conducted a sensitivity analysis of early retirement, one of the alternatives to the SCR emission control systems, as part of its in-depth evaluation to stress test the viability of this investment. The PVRR(d) was calculated by taking the difference in system costs between two SO model simulations. One simulation assumed the SCR emission control systems would be installed and Jim Bridger Unit 3 and Unit 4 would continue operating as coal-fueled assets. The second simulation forced Jim Bridger Unit 3 and Unit 4 to stop operating as coal-fueled assets, allowing the model to choose among the most economical alternative, which includes gas conversion and early retirement. In all the simulations forcing Jim Bridger Unit 3 and Unit 4 to stop operating as coal-fueled assets, the SO model chose gas conversion over early retirement when it is was assumed that the SCR emission control systems would not be installed.

Q. Did PacifiCorp perform an additional sensitivity that showed gas conversion would be a lower cost alternative to the SCR emission control systems than an early-retirement alternative?

A. Yes. For this sensitivity, in the case where Jim Bridger Unit 3 and Unit 4 were assumed to stop operating as coal-fueled assets, each unit was forced to retire (not allowing it to choose gas conversion) for purposes of calculating the PVRR(d).

Q. What are the results of this sensitivity analysis?

A. When Jim Bridger Unit 3 and Unit 4 were forced to retire early, the SO model added a 597 MW combined-cycle unit located in southern Utah in 2017.[80] As compared to an early retirement alternative, the PVRR(d) is $588 million in favor of the Jim Bridger Unit 3 and Unit 4 SCR emission control systems. The sensitivity also shows that gas conversion, while unfavorable to the SCR systems, has a PVRR(d) that is $405 million favorable to early retirement.

VII. SALES AND LOAD FORECAST

Q. Please summarize your testimony on PacifiCorp's sales and load forecast.

A. I provide PacifiCorp's forecasts of the number of customers, kWh sales at the meter (sales), system loads and system peak loads at the system input level (loads), and number of bills by rate schedule for the 12-month period ending December 31, 2021. PacifiCorp's load forecast has been updated with the most recent information available and includes certain changes in methodology to more accurately forecast load.

Q. When did PacifiCorp prepare the sales and load forecast used in this filing?

A. PacifiCorp completed the sales and load forecast used in this filing in June 2019. This is PacifiCorp's most recent forecast of sales and loads.

Q. How did PacifiCorp use the June 2019 sales and load forecast in this filing and in the concurrent 2021 Transition Adjustment Mechanism (2021 TAM) filing?

A. Ms. Shelley E. McCoy used the sales and load forecast to calculate inter-jurisdictional allocation factors. The sales forecast by rate schedule was used by Mr. Robert M. Meredith to allocate costs between customer classes and to design rates that correctly

---

[80] Incremental front office transactions are also included in the portfolio when Jim Bridger Unit 3 and 4 are forced to retire early.

reflect the cost of service. The load forecast was also used by Mr. Webb to calculate net power costs in the 2021 TAM filing.

Q. Have there been any updates to the forecast methodology since the forecast prepared for PacifiCorp's last Oregon rate case, docket UE 263 (2013 Rate Case), and the 2014 TAM, docket UE 264?

A. Yes. As discussed below, PacifiCorp updated its commercial sales model, residential customer model, transportation electrification, and the street lighting sales model.

Q. Please provide a general overview of PacifiCorp's sales and load forecast methodology.

A. PacifiCorp first develops a forecast of monthly sales by customer class and monthly peak load by state. This sales forecast becomes the basis of the load forecast by adding line losses, meaning kWh sales levels are grossed-up to a generation or "input" level. The monthly loads are then spread to each hour based on the peak load forecast and typical hourly load patterns to produce the hourly load forecast.

Q. Please provide a summary of the forecasted energy sales for 2021.

A. Table 14 provides the forecasted energy sales for the 12-month period ending December 31, 2021.

Table 14 – Test Period Sales Forecast (MWh)

	2020 GRC (CY 2021)	
	Total Company	**Oregon**
Residential	**16,314,413**	**5,671,134**
Commercial	**19,256,803**	**5,996,343**
Industrial	**19,176,292**	**1,682,735**
Irrigation	**1,469,416**	**333,381**
Lighting	**99,688**	**32,935**
Total	**56,316,612**	**13,716,528**

Comparisons to Past Sales Forecasts

Q. How does the total-company sales forecast for 2021 compare to the sales forecast used in the 2013 Rate Case?

A. As shown in Table 15, total-company 2021 forecast sales are 2.9 percent higher than 2014 forecast sales used in the 2013 Rate Case. The difference in the forecasts is attributable to an increase in commercial, residential and irrigation load. The growth in the commercial class is related to data centers and reclassification of public authority sales as commercial sales. The industrial class decrease in the forecast is attributable to a decline in commodity prices over the 2014-to-2015 time frame.

Table 15 – Total Company Sales Comparison (MWh)

	Previous GRC CY 2014	Current GRC CY 2021	Percentage Change
Residential	15,912,619	16,314,413	2.5%
Commercial	17,321,091	19,256,803	11.2%
Industrial	19,825,363	19,176,292	-3.3%
Irrigation	1,245,400	1,469,416	18.0%
Public Authority	276,500	-	-100.0%
Lighting	141,650	99,688	-29.6%
Total	54,722,623	56,316,612	2.9%

Q. How does the Oregon sales forecast for 2021 compare to the sales forecast used in the 2013 GRC?

A. As shown in Table 16, the 2021 Oregon sales forecast has increased by approximately 4.2 percent from the 2014 sales forecast used in the 2013 Rate Case. On an Oregon basis, the commercial class increase reflects the continuing expansion of data centers in Oregon. The increase in residential class sales is driven by customer growth offset by a decline in use-per-customer. The decline in the industrial load reflects the loss of a large Oregon industrial customer.

Table 16 - Oregon Sales Comparison (MWh)

	Previous GRC CY 2014	Current GRC CY 2021	Percentage Change
Residential	**5,381,873**	**5,671,134**	**5.4%**
Commercial	**5,378,807**	**5,996,343**	**11.5%**
Industrial	**2,133,140**	**1,682,735**	**-21.1%**
Irrigation	**238,210**	**333,381**	**40.0%**
Lighting	**36,940**	**32,935**	**-10.8%**
Total	**13,168,971**	**13,716,528**	**4.2%**

Forecast Methodology

Q. Please summarize major updates used to produce the 2021 forecast as compared to the forecast used in the 2013 Rate Case.

A. PacifiCorp updated many of its data inputs and assumptions using the most recent information available, including updates to the historical data periods for sales, monthly forecasts, line losses, normal weather, and temperature splines; market drivers; customer usage; and the residential use-per-customer model with appliance saturation and efficiency results.

Q. Please describe the changes in the load forecast methodology since the 2013 Rate Case.

A. To increase accuracy, PacifiCorp changed the commercial forecast methodology from a use-per-customer model to a total usage model, similar to that used for the industrial class forecast. This update was first incorporated into the load forecast used for the 2015 TAM in docket UE 287.

PacifiCorp also updated its residential customer forecasting methodology by adopting a differenced model approach in the development of the forecast of residential customers. Rather than directly forecasting the number of customers, the differenced model predicts the monthly change in number of customers, which produces a more accurate customer forecast. This methodology update was first incorporated into the load forecast used for the 2020 TAM forecast in docket UE 356.

There are two updates new to this filing. First, PacifiCorp developed a transportation electrification projection based on current and expected electric-vehicle adoption trends. This projection was incorporated as a post-model adjustment to the residential and commercial sales forecasts. Second, PacifiCorp incorporated a light emitting diode (LED) lighting adoption curve for its street lighting forecast. The adoption curve was developed to predict how the conversion to this more efficient technology is impacting sales.

Monthly Sales Forecast Methodology

Q. How are the forecasts for number of customers developed?

A. For the residential class, PacifiCorp forecasts the number of customers using IHS Markit's forecast of number of households or population as the major driver. For the commercial class, PacifiCorp forecasts the number of customers using the forecasted number of residential customers as the major economic driver. For the industrial, irrigation and street lighting classes, the customer forecasts are fairly static and developed using time series or regression models without any economic drivers.

Q. What methodology does PacifiCorp use to forecast the residential class sales?

A. PacifiCorp develops the residential sales forecasts as a product of two separate forecasts: (1) the number of customers—as described above; and (2) sales per customer. PacifiCorp models sales-per-customer for the residential class through a Statistically Adjusted End-Use model, which combines the end-use modeling concepts with traditional regression analysis techniques.

Q. What methodology does the Company use to forecast the commercial class sales?

A. For the commercial class, PacifiCorp forecasts sales using regression analysis techniques with non-manufacturing employment or non-farm employment, as the economic drivers, in addition to weather-related variables. Also, similar to how the PacifiCorp forecasts its largest industrial customers, data center forecasts are based on input from the Company's regional business managers (RBMs).

Q. How does PacifiCorp forecast sales for the industrial customer class?

A. The majority of industrial customers are modeled using regression analysis with trend and economic variables. Manufacturing employment is used as the major economic driver. For a small number of industrial customers (the largest customers on the system), PacifiCorp individually prepares forecasts based on input from the customer and the RBMs.

Q. What methodology does PacifiCorp use for the irrigation and lighting sales forecasts?

A. For the irrigation class, PacifiCorp forecasts sales using regression analysis techniques based on historical sales volumes and weather-related variables. Monthly sales for lighting are forecast using regression analysis techniques based on historical sales volumes and a LED lighting adoption curve.

Hourly Load Forecast

Q. Please outline how the hourly load forecast is developed.

A. After PacifiCorp develops the forecasts of monthly energy sales by customer class, a forecast of hourly loads is developed in two steps. First, monthly peak forecasts are developed for each state. The monthly peak model uses historical peak-producing weather for each state, and incorporates the impact of weather on peak loads through several weather variables that drive heating and cooling usage. This forecast is based on average monthly historical peak-producing weather for the 20-year period 1999 through 2018.

Second, hourly load forecasts are developed for each state using hourly load models that include state-specific hourly load data, daily weather variables, the 20-year average temperatures identified above, a typical annual weather pattern, and day-type variables such as weekends and holidays as inputs to the model. The hourly loads are adjusted to match the monthly peaks from the first step above. Also, the hourly loads are adjusted so the monthly sum of hourly loads equals monthly sales plus line losses.

Q. How are monthly system coincident peaks derived?

A. After the hourly load forecasts are developed for each state, hourly loads are aggregated to the total system level. The system coincident peaks can then be identified, as well as the contribution of each jurisdiction to those monthly peaks.

Forecasts by Rate Schedule

Q. Were any additional forecasts created for these proceedings?

A. Yes. As mentioned earlier, Mr. Meredith requires two additional forecasts that are based on the kWh sales forecast and the number of customers forecast. Once the kWh sales forecast is complete, it must be applied to individual rate schedules to forecast kWh sales by rate schedule. In addition, the forecast of number of customers by rate schedule must be expressed in number of bills.

Q. How are rate schedule level forecasts produced?

A. PacifiCorp develops this forecast in two steps: (1) it forecasts test year sales by rate schedule; and (2) it proportionally adjusts the rate schedule sales forecasts so that the total matches the customer class forecast.

Q. Finally, how does PacifiCorp forecast the number of bills for each rate schedule?

A. The forecast of the number of bills for each rate schedule follows the same process as the sales forecast for each rate schedule. First, PacifiCorp forecasts the number of bills by class and by rate schedule. Then, PacifiCorp proportionally adjusts the forecasted number of bills by rate schedule so that the total number of bills matches the customer class forecasted number of bills.

VIII. CONCLUSION

Q. Based on your testimony, what do you recommend to the Commission?

A. I recommend that the Commission conclude that PacifiCorp's EV 2020 Wind Projects and Transmission Projects, Foote Creek I repowered wind facility and the Pryor Mountain Wind Project are reasonable and prudent. I also recommend that the Commission approve the costs of the major resource management decisions PacifiCorp has made with respect to its coal generation units.

Q. Does this conclude your direct testimony?

A. Yes.

I. INTRODUCTION AND QUALIFICATIONS

Q. Please state your name, business address, and present position with PacifiCorp.

A. My name is Chad A. Teply and my business address is 1407 West North Temple, Suite 310, Salt Lake City, Utah 84116. I am currently employed as Senior Vice President of Business Policy and Development. I am testifying for PacifiCorp d/b/a Pacific Power (PacifiCorp or the Company).

Q. Please describe your education and professional experience.

A. I have a Bachelor of Science Degree in Mechanical Engineering from South Dakota State University. I joined MidAmerican Energy Company in November 1999, and held positions of increasing responsibility within the generation organization, including serving as project manager for development and construction of a new 780 megawatt (MW) supercritical coal-fueled generation resource placed in service in 2007. In April 2008, I moved to Northern Natural Gas Company as Senior Director of Engineering. I joined PacifiCorp in February 2009. My current responsibilities encompass strategic planning, stakeholder engagement, regulatory support, and development and execution of major generation resource additions, major transmission projects, and major environmental compliance projects.

II. PURPOSE OF TESTIMONY

Q. What is the purpose of your testimony in this case?

A. The purpose of my testimony is to address the new wind projects that are included in Energy Vision 2020, the Pryor Mountain Wind Project, certain major emissions control retrofit projects, and the natural gas conversion of Naughton Unit 3.

First, as explained by Mr. Stefan A. Bird, PacifiCorp developed an energy resource strategy, Energy Vision 2020, comprised of two components: repowering existing wind resources and implementation of new wind and transmission projects. Energy Vision 2020 was assessed in the Company's 2017 Integrated Resource Plan (IRP) preferred portfolio, which identified a time-limited opportunity to procure approximately 1,100 MW of cost-effective Wyoming wind facilities and construct transmission facilities to relieve existing congestion and allow interconnection of those new wind facilities, while providing all-in customer savings. In my testimony and exhibits, I discuss and support the Energy Vision 2020 new wind projects and demonstrate the reasonableness of their costs. Mr. Richard A. Vail's testimony provides the same for the related transmission projects, Mr. Timothy J. Hemstreet's testimony supports PacifiCorp's Foote Creek I wind repowering project, and Mr. Rick T. Link provides the economic analysis demonstrating the net benefits associated with PacifiCorp's Energy Vision 2020 projects.

Second, I explain and support the Company's development and implementation of the Pryor Mountain Wind Project and show that the costs are reasonable. The Pryor Mountain Wind Project, located in Carbon County, Montana, was identified as an opportunity to acquire and implement a late-stage renewables development project to capture 100 percent federal production tax credits (PTC) if acted on expeditiously to deliver the project by year-end 2020. In addition to providing PTCs and net power cost benefits, the project also allows the Company to meet a customer need for incremental renewable energy certificates (RECs), the purchase of which under PacifiCorp's Oregon Schedule 272 - Renewable Energy

Rider Optional Bulk Purchase Option (Schedule 272), further improves the project's economics and associated customer benefits.

Third, my testimony supports the prudence of major emissions control retrofit projects included in this case and placed in service during major maintenance overhauls at Jim Bridger Units 3-4 in November 2015 and November 2016, respectively, Hunter Unit 1 in May 2014, Craig Unit 2 in December 2017, and Hayden Units 1-2 in May 2015 and August 2016, respectively, all of which were installed in accordance with state and federal environmental compliance requirements for the individual units. More specifically, my testimony supports the prudence of the installation of selective catalytic reduction (SCR) systems on Jim Bridger Units 3-4, Craig Unit 2, and Hayden Units 1-2, and the installation of low nitrogen oxides (NO_X) burners and a baghouse on Hunter Unit 1. Each of those projects were installed to ensure environmental compliance for the respective units, as well as continued safe, reliable, and cost-effective operation of the facilities. The impact on Oregon revenue requirement for the projects is reflected in the testimony of Ms. Shelley E. McCoy, and Mr. Link provides the economic analysis demonstrating the customer benefit of the projects.

Finally, I explain the natural gas conversion of Naughton Unit 3 following its removal from coal-fired operation on January 30, 2019, to maintain compliance with certain environmental regulations. Conversion of Naughton Unit 3 to a natural gas fueled resource is facilitated by the design of the unit which already incorporates natural gas fueling infrastructure for start-up. This underlying infrastructure can be readily and economically modified to facilitate generation up to 247 MW of capacity from the unit within applicable environmental permit limits for periods of peak loads across PacifiCorp's system to benefit our customers.

Q. Please summarize your direct testimony.

A. My testimony demonstrates that:

- the acquisition and construction of TB Flats I and II, Cedar Springs II, and Ekola Flats (collectively referred to as the Energy Vision 2020 Wind Projects or individually as an Energy Vision 2020 Wind Project) and the associated transmission facilities described in the testimony of Mr. Vail that form Energy Vision 2020 (collectively, the Combined Projects) are prudent and in the public interest. The Combined Projects will provide substantial customer benefits after they achieve commercial operation by the end of 2020. My testimony explains how the Company has developed, procured, and implemented the Energy Vision 2020 Wind Projects to deliver this outcome.

- the acquisition and construction of the Pryor Mountain Wind Project is prudent and in the public interest. As with the Energy Vision 2020 Wind Projects, the Pryor Mountain Wind Project has been acquired, developed, procured, and implemented to achieve commercial operation by the end of 2020 to deliver significant PTC benefits, as well as incremental customer benefits derived from the associated Schedule 272 REC sale.

- the installation of major emissions control retrofits for Hunter Unit 1, Jim Bridger Units 3-4, Craig Unit 2, and Hayden Units 1-2 are prudent and in the public interest. The emissions control retrofit projects included in this case and described further in testimony below were required to comply with environmental laws, namely the Clean Air Act Regional Haze Rules, established by the U.S. Environmental Protection Agency (EPA) and administered by the respective state agencies in which the units reside.

- completion of natural gas conversion of Naughton Unit 3 is prudent and in the public interest. The natural gas conversion project included in this case and described further in testimony below is *de minimis* in scope and facilitates operation of a significant generation resource during periods of peak loads across PacifiCorp's system for the benefit of customers.

III. ENERGY VISION 2020 OVERVIEW

Q. Please provide an overview of the Combined Projects as identified and presented in the 2017 IRP.

A. To support its participation in the 2017 Renewables Request for Proposals (2017R RFP) included in the 2017 IRP Action Plan, PacifiCorp secured development and implementation rights for the 250 MW Ekola Flats wind project and the 500 MW TB Flats I and II wind project, which were ultimately selected from competitive market respondents as successful final shortlist projects in the 2017R RFP. In addition, the 2017R RFP final shortlist resulted in PacifiCorp executing a power purchase agreement (PPA) for the third-party delivered 200 MW Cedar Springs I wind project and a build-transfer agreement (BTA) for procurement of the third-party delivered 200 MW Cedar Springs II wind project. The competitive market solicitation conducted through the 2017R RFP confirmed the economics and deliverability of these specific wind facilities, which are now under construction and on schedule to be delivered before year-end 2020.

The Energy Vision 2020 Wind Projects rely upon the construction of the Aeolus to Bridger/Anticline transmission line and associated network upgrades, which will relieve existing congestion and allow interconnection of the Energy Vision 2020 Wind Projects. In turn, the benefits generated by the Energy Vision Wind Projects—zero-fuel-cost generation that lowers net power costs and provide 10 years of federal PTCs—support cost-effective development of the transmission projects. Together, the Combined Projects provide significant savings to customers over the lives of the resources. As further detailed in the testimony of Mr. Vail, the transmission facilities are also currently under construction and on schedule for delivery before year-end 2020.

Q. Why is the Company implementing acquisition and construction of the Combined Projects?

A. As further described in the testimony of Mr. Link, the Company is implementing the acquisition and construction of the Combined Projects to deliver a time-sensitive opportunity for customers that was identified in the Company's 2017 IRP preferred portfolio (*i.e.*, addition of approximately 1,100 MW of new wind resources and the associated new transmission infrastructure by 2020). Following competitive market engagement in the 2017R RFP, the Company has executed the necessary agreements to ensure that the Energy Vision 2020 Wind Projects have effective implementation plans and are positioned to support the associated transmission facilities.

Q. Before proceeding, did PacifiCorp obtain the required state regulatory approvals for the Combined Projects?

A. Yes. To capture the substantial customer benefits resulting from this time-limited opportunity and in accordance with applicable state regulatory statutes, PacifiCorp received approval of Certificates of Public Convenience and Necessity (CPCN) from the Wyoming Public Service Commission (Wyoming CPCN) and the Idaho Public Utilities Commission (Idaho CPCN) for the Combined Projects. PacifiCorp also received approval orders from the Utah Public Service Commission approving the "significant energy resource decision" for the construction or acquisition of the new wind facilities and "voluntary procurement preapproval" for the construction of the associated transmission facilities (Utah Preapproval).

IV. GENERAL DESCRIPTION OF THE ENERGY VISION 2020 WIND PROJECTS

Q. Please describe the Energy Vision 2020 Wind Projects.

A. The Energy Vision 2020 Wind Projects information incorporated into this general rate case filing is intended to allow the Public Utility Commission of Oregon (Commission) to review the prudence and customer benefits of the Energy Vision 2020 Wind Projects as validated through the 2017R RFP. As outlined above, the Energy Vision 2020 Wind Projects include: (1) the 250 MW Ekola Flats facility; (2) the 500 MW TB Flats I and II facility; (3) the nominal 200 MW Cedar Springs II facility; and (4) the 200 MW Cedar Springs I facility that will provide energy to PacifiCorp's system through a PPA. My testimony focuses on the facilities that will ultimately be owned and operated by PacifiCorp, which excludes the Cedar Springs I PPA.

Each wind facility will consist of a number of 2.0 MW to 4.3 MW wind turbine generators (WTG) to achieve the facility's respective nameplate capacity, an electrical collection system, 34.5 kilovolt (kV) to 230 kV collector substation(s), a 230 kV tie-line between the wind project and the point of interconnection substation, meteorological towers, access roads, an operations and maintenance (O&M) building and required communication and control facilities (*e.g.*, metering, hardware, software, and associated communication circuits and related equipment).

The cost for the Energy Vision 2020 Wind Projects included in this case are approximately $1.23 billion.

Q. Please provide a summary of the capital expenditures required to construct the Energy Vision 2020 Wind Projects.

A. Confidential Exhibit PAC/801 to my testimony includes the summary.

Q. Please describe the time-sensitive nature of the Combined Projects.

A. The time-sensitive nature of the Combined Projects is primarily driven by the pending phase-out of federal PTCs for new wind resources and the time period involved to construct a major transmission line. In Internal Revenue Code section 45, the Internal Revenue Service (IRS) provides for PTCs at the 2017 full rate of 2.4 cents per kilowatt-hour of electrical energy production by a wind facility. The PTCs are available for a 10-year period that begins when the facility is placed in service. The Protecting Americans from Tax Hikes Act of 2015 (the PATH Act) extended the availability of the PTCs for wind facilities under construction before January 1, 2020. The PATH Act extension, however, also provides for a phase-out of the PTCs. Wind facilities that began construction before January 1, 2017, per IRS rules, will realize the full PTC credit, which is the case for the Energy Vision 2020 Wind Projects. If a wind facility begins construction in 2017, the PTCs are reduced by 20 percent. The PTCs are reduced by 40 percent if construction begins in 2018, and by 60 percent if construction begins in 2019. PTCs are not available for wind facilities that begin construction after December 31, 2019.

To receive "safe-harbor" PTCs, the facilities must be placed into commercial operation by the end of the fourth calendar year following the year in which construction began (the start-of-construction standard) or otherwise meet specific IRS requirements for demonstrating the "continuity requirement" throughout the implementation timeline. To ensure customers receive the full benefit of safe-harbor PTCs the Combined Projects (and other wind facilities selected in the 2017R RFP) must have begun construction before January 1, 2017, and must be placed in service by year-end 2020. The Company's acquisition and implementation plan is designed to meet this schedule and provide customers the full economic benefit of the PTCs.

Q. Do the Energy Vision 2020 Wind Projects meet the IRS's start-of-construction criteria?

A. Yes. Each of the Energy Vision 2020 Wind Projects will use WTG equipment acquired before December 31, 2016. These transactions satisfy the safe-harbor requirements under the PTC guidance issued by the IRS.

Q. Did the Company's submittal of benchmark resources in the 2017R RFP preclude other competitive market proposals from being selected for implementation?

A. No. As explained in the testimony of Mr. Link, the Company's benchmark resources (Ekola Flats and TB Flats I and II) represent only a portion of the competitive market wind facilities that were determined to be viable in the 2017R RFP considering interconnection, permitting, construction, performance, and implementation. PacifiCorp received a robust competitive market response to the 2017R RFP, with the Company's benchmark resources ultimately being successful in that process, in addition to the third-party Cedar Springs projects described above.

Q. What is the current construction status of the Energy Vision 2020 Wind Projects?

A. For TB Flats I and II, 116 of 132 WTG foundations have been constructed; WTG access roads are complete; foundations for both collector substations are complete; structural steel erection is approximately 40 percent and 68 percent complete at the TB Flats I and TB Flats II collector substations, respectively; underground collector cable installation is approximately 86 percent and 27 percent complete at the TB Flats I and TB Flats II areas, respectively; manufacturing, testing, and delivery of five main power transformers are on schedule to support spring 2020 delivery to the site; and manufacturing of follow-on WTGs continues in support of component delivery to the site beginning in April 2020.[1]

For Ekola Flats, 20 of 63 WTG foundations have been constructed; WTG access roads are complete; foundations at the collector substation are complete; certain directional borings have been completed in support of underground collector cable installation; manufacturing, testing, and delivery of two main power transformers are on schedule to support spring 2020 delivery to the site; and manufacturing of the follow-on WTGs continues in support of component delivery to the site beginning in June 2020.

For the Cedar Springs II BTA project, the project achieved the contractual Firm Date on November 7, 2019, which is a pre-closing date indicative of completion and transition from project development activities to field construction; detailed

[1] Follow-on WTGs are the non-safe harbor WTG components, and the safe harbor WTG components are currently located in storage offsite.

engineering work continues (including WTG layout adjustments in support of U.S Fish and Wildlife avian mitigation guidance), site rough grading of the collector substation has commenced, and work has begun on the transmission tie-line between the Cedar Springs II and the Cedar Springs I (NextEra PPA) collector substations.

Q. What is the status of the WTG agreements for the Energy Vision 2020 Wind Projects?

A. With respect to WTG supply agreements, Vestas - American Wind Technology, Inc. (Vestas) was originally competitively selected in the third quarter of 2017 as the follow-on WTG supplier for the Ekola Flats and TB Flats projects. On November 14, 2018, PacifiCorp received a letter from Vestas communicating that it was unable to hold pricing for the WTGs due to: (1) steel pricing risk; (2) tariffs on Chinese goods; and (3) increased transportation costs. In response, PacifiCorp investigated the conditions associated with the Vestas letter and consequently initiated a competitive market request for proposal (RFP) update exercise with all originally shortlisted WTG suppliers beginning on November 15, 2018. The shortlisted suppliers from this update were asked to confirm their positions on pricing and availability in conformity with permit conditions and constraints. Final firm price proposals were received on January 21, 2019. PacifiCorp completed an assessment of life cycle costs associated with the updated proposals. Both 2.* MW and 4.* MW[2] WTG platform options from multiple WTG suppliers were compared. Ultimately, the assessment concluded that the Ekola Flats and TB Flats project initial capital cost estimates for WTG supply

[2] The asterisk used in 2.* MW and 4.* MW is a common industry wildcard designation when referring to a range of available WTGs capacities within turbine design platforms of various original equipment manufacturers.

would exceed the estimates included in PacifiCorp's original CPCN filings. As I discuss in more detail below, however, when considered in conjunction with updated run rate O&M cost reductions included in the new proposals and remaining Combined Projects contingencies, the increased costs were effectively offset and not assessed as creating a material challenge to the overall benefit and ultimate deliverability of the Combined Projects.

WTG component deliveries for all of the Energy Vision 2020 Wind Projects will begin in spring 2020.

Q. Has the Company performed preliminary evaluations of the wind potential at each Energy Vision 2020 Wind Project site?

A. Yes. Wind potential studies for each of the Energy Vision 2020 Wind Projects were completed by the individual project developers and were also validated with a third-party wind resource evaluation firm as part of the 2017R RFP process. As reflected in Confidential Table 1, wind assessments for each of the Energy Vision 2020 Wind Projects indicate that the sites have favorable wind regimes suitable for high performance wind energy generation. Pertinent wind potential assessments including expected capacity factors are included in Exhibits PAC/802, PAC/808, and PAC/814.

Confidential Table 1: Energy Vision 2020 Wind Project Capacity Factor Estimates

EV 2020 Net Capacity Factors (P50 Assessment)		
Project Name	Project Size (Nameplate MWs)	Project Net Capacity Factor
Ekola Flats	250.9	[redacted]
TB Flats I and II	503.2	
Cedar Springs II BTA	199.8	

The 2017R RFP evaluation team also reviewed the wind resource assessments for each project and independently determined whether the wind data for each project supported the proposed capacity factors or whether adjustments to the proposed capacity factor for a project were warranted when assessing project benefits.

Q. Is the Company collaborating with the U.S. Fish and Wildlife Service in developing and implementing the Energy Vision 2020 Wind Projects?

A. Yes. The Company has engaged the U.S. Fish and Wildlife Service regarding developing and implementing the Energy Vision 2020 Wind Projects. The Company, or with respect to the Cedar Springs projects, the third-party developer, has begun pre-construction usage surveys for various avian, bat, and wildlife species utilizing recommendations from applicable state and federal guideline documents, including the 2012 Land Based Wind Energy Guidelines. The Company will continue to coordinate with county, state, and federal agencies that have jurisdiction over development, permitting, and operations to ensure appropriate environmental and safety measures are implemented throughout the life of the Energy Vision 2020 Wind Projects. The Company is committed to maintaining development and implementation schedules and protocols that recognize potential environmental impacts and strive to mitigate them.

Q. How did the Company generate the cost information for construction, operation, and maintenance of the individual wind facilities through their useful life?

A. The Company assessed life cycle costs for the Energy Vision 2020 Wind Projects using information submitted by the various project proponents in the 2017R RFP and validated against a variety of sources. For example, initial installation costs and run rate O&M cost projections were incorporated into the respective facility's 2017R RFP proposals. Transmission interconnection costs were confirmed against the respective wind facility's transmission interconnection studies. PacifiCorp's internal project management and administrative costs were estimated based on the Company's experience with construction of past wind facilities and other recent generation resource additions.

The Company also applied contingencies to the Ekola Flats and TB Flats I and II self-build projects to account for project uncertainties. The third-party developer of the Cedar Springs II project is responsible for the contingencies included to deliver that project. O&M cost estimates were developed based on the Company's experience with currently operating wind facility O&M budgets and third-party contracts for the Company's existing wind facilities. Ongoing capital costs were estimated based on the Company's experience and indicative costs provided by WTG suppliers for critical capital components.

Q. In terms of managing implementation of the Combined Projects to meet the December 31, 2020 PTC deadline, what were the critical path items?

A. The critical path items were obtaining the CPCNs and pre-approvals necessary to allow PacifiCorp to begin work on the Aeolus to Bridger/Anticline transmission line. To meet the December 31, 2020 deadline for the Combined Projects, PacifiCorp had to have these regulatory approvals and make its investment decision before the summer of 2018, to allow sufficient time to obtain rights of way and permits for the Aeolus to Bridger/Anticline transmission line. PacifiCorp received the Wyoming CPCN in April 2018 and Utah Preapproval in June 2018, and made the decision to proceed with the Combined Projects shortly thereafter (the Idaho CPCN was issued slightly later, in July 2018). PacifiCorp's decision to invest in the Combined Projects was based on the Company's February 2018 economic analysis, adjusted in April 2018 to remove the Uinta project.

Q. Have there been any material changes to the scope or overall economics of the Combined Projects since PacifiCorp began work on the Aeolus to Bridger/Anticline transmission line in the summer of 2018?

A. No. Project permitting and rights of way acquisition proceeded as planned for the Ekola Flats and TB Flats projects and the associated 500 kV transmission facilities. As noted above, an issue did arise related to U.S. tariff impacts and other unfavorable market conditions, which negatively impacted previously established WTG equipment supply pricing and competitive market costs for the 230 kV transmission facilities.

The increased costs for the 230 kV transmission facilities were absorbed in project contingencies carried in the 500 kV transmission facilities and therefore had no negative impact on originally assessed customer benefits for the Energy Vision 2020 projects.

The U.S. tariff impacts on Ekola Flats and TB Flats WTG equipment required PacifiCorp to re-engage the originally shortlisted WTG suppliers for the Ekola Flats and TB Flats projects to submit updated WTG capital costs, run rate O&M costs, and equipment performance information. In Table 2 below, the Company compared the updated information to the originally assessed life-cycle cost and benefit information. This analysis demonstrated that the competitive market update and reassessment resulted in a slight increase in customer benefits when compared to the Company's February 2018 economic analysis, as adjusted to remove the Uinta project:

Table 2: Annual Revenue Requirement Present-Value Revenue Requirement Differential (PVRR(d)) through 2050 (Benefit) / Cost of the Projects ($ millions)

Price-Policy Scenario	Updated Annual Revenue Requirement PVRR(d)	Original Annual Revenue Requirement PVRR(d)
Low Gas, Zero CO_2	152	154
Medium Gas, Medium CO_2	(176)	(174)

Q. What is the expected operational life of the Energy Vision 2020 Wind Projects?

A. The anticipated operational life of the Energy Vision 2020 Wind Projects has been assessed at 30 years, which aligns with the Company's currently approved depreciable life for wind resources.

Q. When did construction of the Energy Vision 2020 Wind Projects begin?

A. Site construction of the Energy Vision 2020 Wind Projects began in mid-2019 following receipt of all necessary regulatory approvals and applicable permits and authorizations from other local, state, tribal or federal governmental agencies that have jurisdiction over the construction or operation of the Energy Vision 2020 Wind Projects, including approval from the Wyoming Industrial Siting Council. The Company anticipates that substantial completion, under normal construction circumstances, weather conditions, labor availability and materials delivery, will be achieved by November 15, 2020, for the Ekola Flats and TB Flats projects and by December 31, 2020, for Cedar Springs II.

Q. Please explain why the Energy Vision 2020 Wind Projects are prudent and in the public interest.

A. The information and analysis in the Company's 2017 IRP and in this case demonstrate that the Energy Vision 2020 Wind Projects are prudent and in the public interest. The Energy Vision 2020 Wind Projects provide a range of benefits to PacifiCorp's Oregon customers, including PTCs, net power cost savings, RECs that may be sold or used for Renewable Portfolio Standard compliance, reduced emissions, and generation diversification. The Energy Vision 2020 Wind Projects will become an essential element of the Company's diversified resource portfolio that is needed to serve customers, and as described more fully in the testimony of Mr. Link and Mr. Vail, the Energy Vision 2020 Wind Projects and associated transmission projects will provide net benefits to all customers.

Q. Please describe your exhibits for the 250 MW Ekola Flats facility.

A. Information for the 250 MW Ekola Flats facility is identified as follows:

- Exhibit PAC/802—Site Plan Ekola Flats
- Confidential Exhibit PAC/803—Ekola Flats Assessment and Wind Resource and Energy Production Estimate
- Confidential Exhibit PAC/804— Ekola Flats Project Schedule
- Exhibit PAC/805— Large Generator Interconnection Agreement Ekola Flats
- Confidential Exhibit PAC/806— Ekola Flats Easements
- Exhibit PAC/807— Permit Status Record Ekola Fats

Q. Please describe the exhibits to your testimony for the 500 MW TB Flats wind facility.

A. Information for the 500 MW TB Flats wind facility is identified as follows:

- Exhibit PAC/808— Site Plan TB Flats
- Confidential Exhibit PAC/809— TB Flats Assessment, Wind Resource and Energy Production Estimate, and Wind Resource Assessment Review
- Confidential Exhibit PAC/810— TB Flats Project Schedule
- Exhibit PAC/811— Large Generator Interconnection Agreement TB Flats
- Confidential Exhibit PAC/812— TB Flats Easements
- Exhibit PAC/813— TB Flats Permit Status Record

Q. Please describe the exhibits for the 200 MW Cedar Springs II wind facility.

A. Information for the 200 MW Cedar Springs II wind facility is identified as follows:

- Exhibit PAC/814— Site Plan Cedar Springs
- Confidential Exhibit PAC/815— Cedar Springs Assessment and Wind Energy Analysis
- Confidential Exhibit PAC/816— Cedar Springs Project Schedule
- Exhibit PAC/817— Large Generator Interconnection Agreement Cedar Springs
- Confidential Exhibit PAC/818— Cedar Springs Rights of Way
- Exhibit PAC/819— Permit Status Record Cedar Springs

V. PRYOR MOUNTAIN WIND PROJECT

Q. Please provide an overview of the Pryor Mountain Wind Project.

A. The Pryor Mountain Wind Project will have a nameplate capacity of 240 MW. The facility will be located on a site in Carbon County, Montana, approximately 60 miles south of Billings, Montana. The project consists of 57 Vestas Model 110-2.0 MW safe harbor, 21 Vestas Model 110-2.2 MW safe harbor, four General Electric Model 116-2.3 MW safe harbor, and 32 Vestas model 110-2.2 MW follow-on WTGs. In addition to the wind turbines there will be a 34.5 kV collector system, a collector substation with two 34.5 kV to 230 kV step-up transformers, an O&M building, and site access roads. A new point of interconnection substation located on the project site in Montana will also be constructed. The planned in-service date for the project is December 2020. Based on current regulatory practice, the project has been assessed using a depreciable life of 30 years.

Q. Please provide background on PacifiCorp's development of the Pryor Mountain Wind Project.

A. The opportunity to capture customer benefits resulting from the acquisition, development, and implementation of the Pryor Mountain Wind Project was identified and evolved over a compressed timeline beginning in October 2018 and ending with final terms on all material agreements (*i.e.*, the engineer, procure, and construct (EPC) contract and WTG supply agreements) completed by September 30, 2019. In parallel, negotiation of a Schedule 272 REC purchase agreement for the sale of all RECs associated with the output of the Pryor Mountain Wind Project to Vitesse, LLC (Vitesse) began in December 2018 and final terms were reached in late June 2019. The process from initial discussions to negotiation of final terms of the Schedule 272 REC purchase agreement occurred in under six months.

The Pryor Mountain wind project costs included in this case are approximately [redacted].

Q. Please provide a summary of the capital expenditures required to construct the Pryor Mountain wind project.

A. Confidential Exhibit PAC/820 includes the summary.

Q. Please describe the time-sensitive nature of the federal PTCs as it pertains to the Pryor Mountain Wind Project.

A. Similar to the Energy Vision 2020 Wind Projects, the time-sensitive nature of the Pryor Mountain Wind Project is primarily driven by the pending phase-out of the federal PTCs for new wind resources. With an in-service date before the end of 2020, the Pryor Mountain Wind Project will be eligible for the full rate (100 percent) of the PTCs as described earlier in my testimony. The Pryor Mountain Wind Project will deploy safe harbor WTG equipment to achieve eligibility. The Company's acquisition and implementation plan for the Pryor Mountain Wind Project is designed to meet the year-end 2020 in-service schedule and provide customers the full economic benefit of the project.

Q. Does the Pryor Mountain Wind Project meet the IRS's start-of-construction criteria as described earlier in your testimony?

A. Yes. The Pryor Mountain Wind Project will utilize WTG equipment acquired before December 31, 2016. The WTG equipment acquisitions satisfy the safe-harbor requirements under the PTC guidance issued by the IRS.

Q. What approach was taken to secure late-stage development safe harbor wind turbine generator equipment and follow-on WTG equipment for the Pryor Mountain Wind Project?

A. The Vestas safe harbor WTG equipment identified above was sourced and will be acquired and transferred under an affiliate transaction with Berkshire Hathaway Energy Renewables (BHER). The four General Electric safe harbor WTG's described above were directly procured by the Company in 2016. PacifiCorp completed a competitive market solicitation for the follow-on WTG equipment required to complete the nominal 240 MW Pryor Mountain Wind Project. The combination of utilizing PacifiCorp's safe harbor equipment, the transferred BHER safe harbor equipment, and competitive market engagement for follow-on WTG equipment limited exposure to competitive market constraints and pricing volatility for 2020 delivery of 100 percent PTC projects with the safe harbor equipment already manufactured and awaiting delivery.

Q. What is the current construction status of the Pryor Mountain Wind Project?

A. The Pryor Mountain Wind Project will primarily be constructed in 2020, although in 2019 site activities began with completion of geotechnical borings and surveys, other site surveys and detailed engineering, construction of a material laydown area, and installation of approximately five percent of WTG access roads. A ramp up of site construction activities will occur in spring 2020 as winter weather in Montana improves.

Q. Has the Company performed preliminary evaluations of the wind potential at the Pryor Mountain Wind Project site?

A. Yes. A wind potential study for the Pryor Mountain Wind Project was completed by a third-party wind resource evaluation firm. The wind potential assessments for Pryor Mountain indicates that the site has a favorable wind regime suitable for high performance wind energy generation. The expected capacity factor for the project is described in the exhibits to my testimony, but for ease of reference is provided here as [redacted] and aligns with the assumptions made in support of the economics evaluation of the project.

Q. Is the Company collaborating with the U.S. Fish and Wildlife Service in developing and implementing the Pryor Mountain Wind Project?

A. Yes. The Company has engaged the U.S. Fish and Wildlife Service regarding developing and implementing the Pryor Mountain Wind Project. The Company and the project's previous owner and developers began pre-construction usage surveys for various avian, bat, and wildlife species utilizing recommendations from applicable state and federal guideline documents, including the 2012 Land Based Wind Energy Guidelines. The Company will continue to coordinate with county, state, and federal agencies that have jurisdiction over development, permitting, and operations to ensure appropriate environmental and safety measures are implemented throughout the life of the Pryor Mountain Wind Project. The Company is committed to maintaining development and implementation schedules and protocols that recognize potential environmental impacts and strive to mitigate them.

Q. How did the Company assess the customer benefits provided by the Pryor Mountain Wind Project?

A. Mr. Link provides a detailed description of the Company's customer benefits assessment in his testimony. In general terms, the methodology used to perform the economic analysis of the Pryor Mountain Wind Project is consistent with the methodology used to perform the economic analysis of bids submitted into the Company's 2017R RFP, which ultimately resulted in selection of the Energy Vision 2020 Wind Projects. PacifiCorp's economic analysis reflects the significant benefits from the sale of RECs associated with the Pryor Mountain Wind Project.

Q. How did the Company generate the cost information for construction, operation, and maintenance of the Pryor Mountain Wind Project through its useful life?

A. Consistent with the Energy Vision 2020 Wind Projects, the Company assessed life cycle costs for the Pryor Mountain Wind Project using information from a variety of sources. For example, initial installation costs and run rate O&M cost projections were developed through competitive market engagements for project construction and WTG supply and long-term O&M contracts. Transmission interconnection costs were confirmed against the Pryor Mountain Wind Project's transmission interconnection studies. PacifiCorp's internal project management and administrative costs were estimated based on the Company's experience with construction of past and current wind facilities and other recent generation resource additions. The Company also applied limited contingencies to the Pryor Mountain Wind Project to account for project uncertainties. O&M cost estimates were developed based on the Company's experience with currently operating wind facility O&M budgets and third-party contracts for the Company's existing wind facilities. Ongoing capital costs were estimated based upon the Company's experience and indicative costs provided by WTG suppliers for critical capital components.

Q. Please describe the exhibits for the 240 MW Pryor Mountain Wind Project.

A. Information for the 240 MW Pryor Mountain Wind Project is identified as follows:

- Exhibit PAC/821—Site Plan Pryor Mountain
- Confidential Exhibit PAC/822—Wind Potential Assessment Pryor Mountain
- Confidential Exhibit PAC/823—Project Schedule Pryor Mountain
- Exhibit PAC/824—Large Generator Interconnection Agreement Pryor Mountain

- Confidential Exhibit PAC/825—Pryor Mountain Rights of Way
- Exhibit PAC/826—Permit Status Record Pryor Mountain

VI. EMISSIONS CONTROL RETROFIT PROJECTS

Q. Please provide a summary of the Company's cost to complete the emissions control retrofit projects included in this proceeding.

A. The cost of the Jim Bridger Unit 3 SCR project included in this proceeding is [redacted] on a total-company basis, or approximately [redacted] on an Oregon-allocated basis, and the cost of the Jim Bridger Unit 4 SCR project included in this proceeding is [redacted] on a total-company basis, or approximately [redacted] on an Oregon-allocated basis. The cost of the Hunter Unit 1 low NO_X burners and baghouse projects included in this proceeding is [redacted] on a total-company basis, or approximately [redacted] on an Oregon-allocated basis. The cost of the Craig Unit 2 SCR system included in this proceeding is [redacted] on a total-company basis, or approximately [redacted] on an Oregon-allocated basis. The cost of the Hayden Unit 1 SCR system included in this proceeding is [redacted] on a total-company basis, or approximately [redacted] on an Oregon-allocated basis, and the cost of the Hayden Unit 2 SCR system included in this proceeding is [redacted] on a total-company basis, or approximately [redacted] on an Oregon-allocated basis.

Q. Which other Company witnesses in this proceeding provide testimony regarding the prudence of the emissions control retrofit projects included in this case?

A. Mr. Link provides testimony explaining the economic analysis used by the Company to support its decision to proceed with installation of the emissions control retrofit project included in this proceeding. These capital additions are included in the existing rate base reflected in the revenue requirement incorporated in the exhibits of Ms. McCoy.

Jim Bridger Units 3-4 SCRs

Q. Describe the Jim Bridger plant and the operating features of Units 3-4.

A. The Jim Bridger facility is a 2,123 MW, four-unit mine-mouth coal-fired electrical generating facility located in Sweetwater County, Wyoming, which is two-thirds co-owned by PacifiCorp and one-third co-owned by the Idaho Power Company. The plant is maintained and operated by PacifiCorp. Water for operation is conveyed approximately 40 miles through a pipeline originating at a diversion from the Green River. Unit 3 began commercial operation in 1976 and Unit 4 followed in 1979. Unit 3 and Unit 4 have nominal net (or "net reliable") generation capacities of 523 and 530 MW, respectively, of which the corresponding PacifiCorp two-thirds share is 349 and 353 MW. Both units are configured with Alstom (formerly Combustion Engineering) controlled circulation, tangentially fired, pulverized coal boilers and General Electric steam turbine-generators. Both units are configured with closed loop circulating water cooling systems that include mechanical draft cooling towers and electrostatic precipitators. Unit 4 was originally equipped with a sodium-based wet flue gas desulfurization (FGD) system, and Unit 3 was retrofitted in 1985 with a sodium-based wet FGD system.

The Jim Bridger substation is contiguous to the plant and connects six transmission lines: Populus #1 at 345 kV, Populus #2 at 345 kV, Threemile Knoll at 345 kV, Rock Springs at 230 kV, Point of Rocks at 230 kV and Mustang at 230 kV.

An additional 345 kV line connecting to the Energy Vision 2020 Aeolus – Anticline 500 kV transmission line is currently under construction.

The plant is adjacent to PacifiCorp's and Idaho Power Company's co-owned Bridger mine, which supplies sub-bituminous coal to the plant along a 2.4-mile long, 42-inch wide overland belt conveyor. Additional sub-bituminous coal is delivered to the plant from other mines in southwestern Wyoming via rail or truck. Coal combustion residuals (CCR) are disposed of on plant property in a solid waste landfill and a FGD waste surface impoundment.

Q. Please provide a general description of the Jim Bridger Units 3-4 SCR systems.

A. The Jim Bridger Units 3-4 SCR systems and associated ancillary equipment for each unit serve to control oxides of nitrogen emissions. Each SCR system is comprised of two separate reactors, with multiple catalyst levels; inlet and outlet ductwork; a shared ammonia reagent system; an economizer upgrade; structural reinforcement of the boiler, air preheater, and flue gas path ductwork and equipment; power distribution and electrical infrastructure installation and integration with the existing plant; and an extension of the existing plant-wide distributed control system. An induced draft fan upgrade and a corresponding auxiliary power system variable frequency drive insertion was also required for Unit 4 only.

Q. What was the required timeline for the Company to install the SCR systems at Jim Bridger Units 3-4?

A. The Clean Air Act Regional Haze Rules, the Jim Bridger facility Best Available Retrofit Technology (BART) permit issued by the state of Wyoming, a BART appeal settlement agreement with the state of Wyoming, and the Wyoming Regional Haze

State Implementation Plan (SIP) required the installation of the SCR systems on Unit 3 by the end of 2015, and on Unit 4 by the end of 2016.

Q. Did EPA approve the state of Wyoming's Regional Haze SIP compliance requirements for Jim Bridger Units 3-4?

A. Yes. EPA approved these requirements in its final Regional Haze Federal Implementation Plan (FIP) for Wyoming published in the *Federal Register* on June 4, 2012. EPA subsequently reiterated its approval of these requirements in its updated Regional Haze FIP for Wyoming published in the *Federal Register* on January 30, 2014. EPA's final approval made these emissions reduction compliance requirements at Jim Bridger Units 3-4 federally enforceable, in addition to being enforceable under state law.

Q. How did the Company assess the benefits associated with the Jim Bridger SCR projects described?

A. The Company began its detailed economic assessment of the projects in 2012 to support its Wyoming CPCN filing (Wyoming SCR CPCN) and its Utah Voluntary Resource Procurement Decision filings for the projects. The Company used the same analysis methodology and results to support its 2013 IRP filings and updates across its service territory states. The proceedings associated with these various filings provided stakeholders an opportunity for rigorous review of the projects prior to their implementation in the 2013 through 2016 timeframe, as facilitated by the statutes available and procedural schedules used by the public utility commissions in each state. The Company's economic analyses are detailed in the testimony of Mr. Link.

The economic analyses completed demonstrate that both of these projects were prudent, necessary, and in the best interests of our customers.

Q. Do the SCR systems at Jim Bridger Units 3-4 have the same general purpose and scope?

A. Yes. For this reason, my testimony references the SCR systems at both Jim Bridger Units 3-4.

Q. Did the Company file an application for a CPCN for the Jim Bridger Units 3-4 SCR systems in the state of Wyoming, where the projects are constructed?

A. Yes. On August 7, 2012, the Company filed its application requesting a CPCN[3] with the Wyoming Public Service Commission, in compliance with the Stipulation and Agreement (2010 Wyoming Stipulation) approved in Wyoming docket 20000-384-ER-10 (2010 Wyoming Rate Case), to construct two major environmental projects as provided in paragraph 13.b. of the 2010 Wyoming Stipulation. The projects entailed the addition of SCR systems to Units 3-4 of the Jim Bridger electric generating plant located in Sweetwater County, Wyoming.

Q. Did the Company file a Voluntary Request for Approval of Resource Decision to Construct the Jim Bridger Units 3-4 SCR systems in the state of Utah?

A. Yes. On August 24, 2012, the Company filed its application requesting the Public Service Commission of Utah review and approve in advance of construction the Jim Bridger SCR projects.[4]

---

[3] *In the matter of the Application of Rocky Mountain Power for Approval of a Certificate of Public Convenience and Necessity to Construct Selective Catalytic Reduction Systems on Jim Bridger Units 3 and 4 Located Near Point of Rocks, Wyoming,* Docket No. 20000-418-EA-12, Order No. 21555 (May 29, 2013).
[4] *In the Matter of the Voluntary Request of Rocky Mountain Power for Approval of Resource Decision to Construct Selective Catalytic Reduction Systems on Jim Bridger Units 3 and 4,* Docket No. 12-035-92. Order (May 10, 2013), Order of Clarification (May 30, 2013).

Q. Did the Company include analysis of the Jim Bridger Units 3-4 SCR systems in the Company's 2013 IRP filings?

A. Yes. The Company filed Confidential Volume III of the 2013 IRP on April 30, 2013.[5] Confidential Volume III included detailed analysis of the Jim Bridger Units 3-4 SCR systems. Regarding the 2013 IRP, in Order No. 14-252, it is my understanding that the Commission did not acknowledge the action item related to the installation of SCRs at Jim Bridger Units 3-4 noting that it would review a number of issues including prudence in a future rate case proceeding.[6]

Q. How was the Jim Bridger Units 3-4 SCR systems project cost information incorporated into the Company's Wyoming SCR CPCN and Utah Resource Decision applications compare to the Company's 2013 IRP analysis of the project?

A. The Company used the same project cost information as the baseline for the Wyoming SCR CPCN and Utah Resource Decision applications, as well as for the Company's 2013 IRP filings.

---

[5] Confidential Volume III of the 2013 IRP was filed in Idaho, Oregon, Utah, Washington, and Wyoming. For Oregon, *see In the Matter of PacifiCorp, d/b/a Pacific Power 2013 Integrated Resource Plan,* Docket No. LC 57, PacifiCorp's 2013 Integrated Resource Plan, Vol. III (Apr. 30, 2013).
[6] *In the Matter of PacifiCorp, d/b/a Pacific Power, 2013 Integrated Resource Plan*, Docket No. LC 57, Order No. 14-252, 8-9 (Jul. 8, 2014).

Q. Did the Public Service Commission of Utah approve the Company's request for a Resource Decision?

A. Yes. On May 10, 2013, the Public Service Commission of Utah approved the Company's request for a Resource Decision to add SCR systems on Jim Bridger Units 3-4.[7]

Q. Did the Wyoming Public Service Commission approve the Company's request for a CPCN?

A. Yes. On May 29, 2013, the Wyoming Public Service Commission approved the Company's request for a CPCN to add SCR systems on Jim Bridger Units 3-4.[8]

Q. Before executing the EPC contract, did the Company engage in a multi-year process to develop, study, review, and obtain initial regulatory approvals for the Bridger SCRs?

A. Yes. This process began with the issuance of Wyoming's SIP in 2008, which led to a lengthy environmental permitting process. In August 2012, the Company initiated a CPCN proceeding in Wyoming and a pre-approval proceeding in Utah, resulting in highly scrutinized and publicized regulatory reviews that lasted until May 2013. In April 2013, the Company completed its 2013 IRP, which contained a comprehensive review of the Bridger SCRs.

[7] *In the Matter of the Voluntary Request of Rocky Mountain Power for Approval of Resource Decision to Construct Selective Catalytic Reduction Systems on Jim Bridger Units 3 and 4,* Docket No. 12-035-92. Order, 34 (May 10, 2013).
[8] *In the matter of the Application of Rocky Mountain Power for Approval of a Certificate of Public Convenience and Necessity to Construct Selective Catalytic Reduction Systems on Jim Bridger Units 3 and 4 Located Near Point of Rocks, Wyoming,* Docket No. 20000-418-EA-12, Order No. 21555, 17-18 (May 29, 2013).

Q. Did the detailed evaluation of the Bridger SCRs that occurred as part of this multi-year process inform the Company's decision to move forward with this investment?

A. Yes. The Bridger SCRs were fully vetted in numerous different processes, helping to confirm that they were the best compliance option for customers.

Q. Have you prepared a timeline of the Bridger SCR projects from the draft Wyoming SIP to the final completion date?

A. Yes. Figure 1 contains a list of the major milestones for the Bridger SCR projects.

Figure 1—Bridger SCRs Timeline

Date	Milestone
May 22, 2008	Wyoming Regional Haze SIP (revised)
December 31, 2009	Jim Bridger BART Permit
February 26, 2010	PacifiCorp Appeal of BART Permit
November 2, 2010	Wyoming BART Appeal Settlement (Bridger SCR Requirement)
December 23, 2010	Jim Bridger BART Permit Amendment
January 7, 2011	Wyoming Regional Haze SIP (revised)
June 4, 2012	EPA Wyoming FIP Proposal
August 7, 2012	Wyoming CPCN Application
August 24, 2012	Utah Pre-approval Application
February 11, 2013	Utah Pre-approval Rebuttal
March 4, 2013	Wyoming CPCN Rebuttal
April 30, 2013	PacifiCorp 2013 IRP Confidential Volume III Filed
May 10, 2013	Utah Pre-approval Order
May 30, 2013	Wyoming CPCN Approval Order
May 31, 2013	EPC Limited Notice to Proceed
June 28, 2013	Idaho Power Company's Wyoming CPCN Application
December 1, 2013	EPC Final Notice to Proceed
December 2, 2013	Idaho Power Company's Wyoming CPCN Approval Order
January 30, 2014	EPA Wyoming FIP Final Action
March 31, 2014	PacifiCorp 2013 IRP Update Confidential Exhibit F Filed
November 2015	Jim Bridger 3 SCR in service
December 30, 2015	Wyoming GRC Order
December 31, 2015	Jim Bridger 3 SCR Compliance Deadline
November 2016	Jim Bridger 4 SCR in service
December 31, 2016	Jim Bridger 4 SCR Compliance Deadline

Q. When was the EPC contract executed and the contractor released to begin work?

A. The Jim Bridger Units 3-4 SCR EPC contract was executed by the parties on May 31, 2013. The EPC contract included a limited notice to proceed (LNTP) provision that initially released the selected EPC contractor to begin scheduled critical activities only for a period of time while parallel path permitting and regulatory proceedings (e.g., environmental agency Regional Haze activities and IRP reviews) continued. The Company gave full notice to proceed (FNTP) to the EPC contractor effective on December 1, 2013, under negotiated EPC contract provisions that were established to maintain project cost and schedule certainty. The EPC contractor's construction site mobilization began in December 2013.

Q. Did the Company update its original Confidential Volume III analysis of the Jim Bridger Units 3-4 SCR systems?

A. Yes. The Company included its updated analysis of the Jim Bridger Units 3-4 SCR projects in Confidential Appendix F in its 2013 IRP Update completed on March 31, 2014, which specifically addressed potential changes in carbon regulation and natural gas market cost impacts.

Q. Did the Company's updated review of potential carbon regulation and natural gas forward price curves in its March 31, 2014 IRP Update filing result in changes to its earlier economic analysis of the Jim Bridger Units 3-4 SCR systems?

A. No. The forecast proxy costs for carbon regulations and natural gas included in the 2013 IRP Update remained within the ranges initially assessed.

Q. What was the Company's cost to complete the Jim Bridger Unit 3 SCR system?

A. The cost of the Jim Bridger Unit 3 SCR system included in this proceeding is [redacted] on a total-company basis, or approximately [redacted] on an Oregon-allocated basis. The total-company cost to complete the Jim Bridger Unit 3

SCR system was approximately [redacted] less than the corresponding cost originally assessed in the Wyoming CPCN and Utah Resource Decision applications, as well as in the 2013 IRP. A cost comparison is shown in Confidential Exhibit PAC/827.

Q. Did the Company prudently manage the implementation of the Jim Bridger Unit 3 SCR system?

A. Yes. Beyond management of project costs as mentioned above, the Company's project team prudently implemented and maintained an appropriate procurement strategy, project controls, and status reporting to ensure compliance with contract safety program implementation, technical specification requirements, scope of work definition, critical path schedules, quality assurance, commissioning plans, and turnover to operations plans, among other things.

Q. What is the major maintenance overhaul cycle interval for Jim Bridger Units 3-4?

A. Jim Bridger Units 3-4 are maintained on a four-year maintenance outage cycle based on the Company's operating experience with the Jim Bridger units. The outage cycle has been established to optimize unit reliability and availability, while maintaining an appropriate balance of major maintenance outage scope and costs. The implementation schedules of the Jim Bridger SCR projects were aligned with the established major maintenance overhaul cycles for the individual units.

Q. What is the current status of the Jim Bridger Unit 3 SCR system?

A. The Jim Bridger Unit 3 SCR system was placed in service in November 2015, following the planned major maintenance overhaul for Unit 3. The Company's environmental compliance deadline as established by the governing permits, implementation plans, and agreements described earlier in this testimony was December 31, 2015, for Unit 3. Completion of the Jim Bridger Unit 3 SCR system satisfied the compliance deadlines established for the unit, as well as the prescribed emissions reductions.

Q. Please confirm that the drivers, general description, and rationale for the Jim Bridger Unit 4 SCR system was consistent with that provided above for the Jim Bridger Unit 3 SCR system.

A. The drivers, general description, and rationale for the Jim Bridger Unit 4 SCR system all mirror the information provided above for the Jim Bridger Unit 3 SCR system.

Q. When was the Unit 4 EPC contract executed and the contractor released to begin work?

A. A single EPC contract was executed for the Jim Bridger Units 3-4 SCR systems, the timeline of which is described above.

Q. What was the Company's cost to complete the Jim Bridger Unit 4 SCR system?

A. The cost of the Jim Bridger Unit 4 SCR system included in this proceeding is [redacted] on a total-company basis, or approximately [redacted] on an Oregon-allocated basis. The Company's total-company cost to complete the Jim Bridger Unit 4 SCR system was approximately [redacted] less than the corresponding cost originally assessed in the Wyoming SCR CPCN and Utah Resource Decision applications, as well as in the 2013 IRP. A cost comparison is shown in Confidential Exhibit PAC/828.

Q. Did the Company prudently manage implementation of the Jim Bridger Unit 4 SCR system?

A. Yes. The testimony I provided above relating to the prudent management of the Jim Bridger Unit 3 SCR system is also applicable to the Jim Bridger Unit 4 SCR system.

Q. What is the current status of the Jim Bridger Unit 4 SCR system?

A. The Jim Bridger Unit 4 SCR system was placed in service in November 2016, following the planned major maintenance overhaul for Unit 4. The Company's environmental compliance deadline as established by the governing permits, implementation plans, and agreements described earlier in this testimony was December 31, 2016, for Unit 4. Completion of the Jim Bridger Unit 4 SCR system satisfied the compliance deadlines established for the unit, as well as the prescribed emissions reductions.

Q. Why did the Company not defer the start of planning for the SCRs until after the EPA's final action in January 2014?

A. The Company was required to comply with the timelines set in Wyoming's SIP. Considering the complexity of the Bridger SCRs and the lengthy project timeline, the Utah Public Service Commission and the Wyoming Public Service Commission found the timing of the Company's investment was appropriate.

Q. Did the Company query the state of Wyoming regarding the enforceability and applicability of its obligations under the SIP?

A. Yes. The state of Wyoming responded that the Company was required to comply with the deadlines set in the Wyoming SIP. The Company's request and the state's response are attached as Exhibit PAC/829 and Exhibit PAC/830, respectively.

Hunter Unit 1 Low NO_X Burners (LNB) and Baghouse

Q. Please describe the Hunter facility and Hunter Unit 1 in particular.

A. The Hunter plant is a three-unit coal-fueled power plant with a net generation capacity of approximately 1,363 MW. The plant is located approximately 158 miles south of Salt Lake City, Utah, near the town of Castle Dale, Utah. Unit 1 is 93.8 percent owned by the Company and 6.2 percent owned by the Utah Municipal Power Agency, with the Company responsible for operation and maintenance of the unit and the Hunter plant as a whole.

Units 1-2 are basically identical units when considering their base design and originally installed boiler and steam turbine generator equipment. Unit 3 is identical in layout to Units 1-2 except the boiler and turbine are from different manufacturers.

Water for plant use is released into the Cottonwood Creek from Joe's Valley and conveyed by a direct pipeline from the Millsite Reservoir to the plant. Potable water is piped from the cities of Castle Dale, Utah or Clawson, Utah. Hunter is a zero-discharge plant. The balance of water is evaporated from a pond or used for irrigation of hay crops on the adjacent research farm. Plant sewage is treated and discharged to the evaporation pond.

Coal is supplied by belt from the nearby fuels preparation facility owned by Wolverine Fuels, LLC, that blends coal to a specified contracted coal quality, allowing for combustion of various coal types.

Q. Please describe the Hunter Unit 1 baghouse conversion project and associated equipment.

A. The Hunter Unit 1 baghouse conversion project replaced the originally installed particulate matter (PM) control equipment (electrostatic precipitator) on the unit with a best available retrofit technology baghouse to meet the Company's emissions compliance obligations required by the Regional Haze Rules and incorporated into the state of Utah's Regional Haze SIP and associated permits to be installed by spring 2014. The baghouse captures PM and mercury from the flue gas stream as it passes through the equipment. Capturing mercury in the baghouse allows the unit to comply with the EPA's Mercury and Air Toxics Standards (MATS) requirements for mercury capture by the prescribed deadline of April 16, 2015, without installing incremental stand-alone mercury emissions control equipment. The dry particulate waste stream captured in the baghouse is transported to an on-site landfill for disposal.

An additional emissions control benefit that the baghouse brings to Unit 1 is the ability to close the scrubber bypass currently installed on the unit, which when considered in conjunction with the Hunter Unit 1 scrubber, reagent preparation, and waste handling projects completed on the unit in 2012 allows the unit to meet a reduced sulfur dioxide (SO_2) emissions limit required by the state of Utah Regional Haze SIP and associated permits.

Other equipment installed as part of the baghouse project included upgraded booster fans, boiler reinforcement, new ductwork, modifications to the existing chimney, relocation of the stack opacity monitors, electrical infrastructure, controls, and other miscellaneous appurtenances and support systems.

The Company's share of the capital investment for the baghouse conversion project included in this proceeding is [redacted] on a total-company basis. Construction of the project was completed and placed in service following a planned major maintenance outage on the unit in May 2014. The final project cost was approximately [redacted] less than the cost initially assessed during the economic analysis and authorization for expenditure stage of the project.

Q. Please describe the Hunter Unit 1 LNB installation project.

A. The LNB installation project on Hunter Unit 1 includes the installation of NO_X combustion controls that replace originally installed equipment. The new burners utilize improved combustion characteristics and a separated over-fire air supply to the boiler to reduce NO_X emissions.

The Company's share of the capital investment for the project included in this proceeding is [redacted] on a total-company basis. The project was completed and placed in service following the same major maintenance outage on the unit referenced above. The final project cost was approximately [redacted] less than the cost initially assessed during the economic analysis and authorization for expenditure stage of the project.

Q. Have Hunter Units 2 and 3 been equipped with LNB and baghouse retrofit technologies that provide emissions reductions consistent with those being installed on Hunter Unit 1?

A. Yes. Pursuant to Utah Regional Haze SIP requirements, Unit 2 was equipped in 2011 with the same LNB and baghouse retrofit technologies contemplated in this docket for Hunter Unit 1. The same post-retrofit emissions limits for NO_X (0.26 pounds per million British thermal unit (Btu)) and PM (0.015 pounds per million Btu) are required for each unit. The Commission reviewed the Unit 2 emissions control equipment investments for ratemaking purposes in a past general rate case docket. The Unit 2 equipment is included in the Company's rate base.

Unit 3 was equipped with a fabric filter baghouse (1983) when the unit was originally constructed and was retrofitted with LNB technology in 2007. The Unit 3 LNB investment was included in the Company's approved rate base in docket UE 210. The Unit 3 LNB equipment is included in the Company's rate base.

All three Hunter units are equipped with wet lime scrubbers to control sulfur dioxide emissions to a rate of 0.12 pounds per million Btu.

Hunter Unit 1 Projects Drivers and Alternatives Assessments

Q. What were the key permits and/or regulations requiring the Hunter Unit 1 baghouse and LNB projects to be installed?

A. To continue compliant operation of Hunter Unit 1, the Company was required to install the projects described herein to control emissions of NO_X, PM, and SO_2 criteria pollutants as required by Regional Haze Rules, the state of Utah's § 309 (g) Implementation Plan, the state of Utah's BART review process, and the state of Utah's Approval Order (DAQE-AN0102370012-08) dated March 2008. Figure 2 below is a general timeline of the significant regulatory actions and regulations.

Figure 2

Date	Milestone
August 8, 2004	Utah SO_2 SIP
June 15, 2005	Regional Haze Rules Finalized
2007	Multiple Hunter Plant Notice of Intent Filed
March 13, 2008	Hunter Plant Approval Order
September 9, 2008	Utah Regional Haze SIP Submittal
May 26, 2011	Regional Haze SIP Update
June 2012	Hunter 1 APR and EPC Contract
December 14, 2012	EPA Approval, Disapproval, Promulgation of 2011 Utah SIP Final
January 2013	Hunter 1 PM/NO_X Construction Start (LNB work)
May 2014	Hunter 1 PM/NO_X Tie-in Outage

The state of Utah Regional Haze SIP and permit requirements for the Hunter Unit 1 projects were finalized in 2008; detailed economic assessment of compliance alternatives and competitive procurement activities were completed in 2012; construction of the project began in 2013; and the baghouse conversion project was placed in service following a planned major maintenance outage on the unit in spring 2014. Additional background regarding the Regional Haze compliance obligations facing Hunter Unit 1 is provided in Exhibit PAC/831.

Q. Did the Company evaluate whether the risk-adjusted, least-cost alternative to comply with environmental requirements was to invest in the emissions control equipment included in this case or to idle Hunter Unit 1?

A. Yes. Before executing the EPC contract for the baghouse project in June 2012, the Company evaluated alternatives to comply with environmental requirements other than to complete the project. The Company used its System Optimizer Model to evaluate multiple alternatives. In brief, the major alternatives reviewed were:

(1) Continue to operate and incur operating expenses and capital revenue requirement expenses inclusive of incremental environmental investments;

(2) Retire Hunter Unit 1 and replace with resource alternatives, or;

(3) Convert to natural gas as a compliance alternative to the incremental environmental investments planned for the unit as a coal-fueled facility.

The comparison of various alternatives resulted in a PVRR(d) of [redacted] favorable to proceeding with the project to the next best alternative as selected by the System Optimizer Model. The next best alternative was to convert Hunter Unit 1 to a natural gas fueled facility. Confidential Exhibit PAC/832 provides detailed discussion of the Company's analyses and results.

Q. Were the methods and tools used to assess the compliance alternatives for Hunter Unit 1 consistent with those utilized to support the Company's 2013 IRP filings,[9] as well as the Company's Jim Bridger Units 3-4 CPCN filing in Wyoming and its Jim Bridger Units 3-4 Voluntary Procurement Pre-approval filing in Utah?

A. Yes. The Company utilized consistent methods and tools (e.g. System Optimizer Model) to assess compliance alternatives for Hunter Unit 1 as was done in the Company's other major filings regarding environmental compliance investments in coal-fueled resources. In fact, the Company included the results of its Hunter Unit 1 analyses in its 2013 IRP Confidential Volume III.

---

[12] Action Item 8B in the Company's 2013 IRP was to complete installation of the baghouse conversion and low NO_X burner compliance projects at Hunter Unit 1 as required by the end of 2014. In Order 14-252, the Commission declined to acknowledge Action Item 8b because the Company did not bring the Commission the Hunter 1 investments in its 2011 IRP and investment decisions were substantially complete at the time of the 2013 IRP. The Commission found that it "... will expect PacifiCorp to provide adequate analysis when it seeks recovery of these projects." *See In the Matter of PacifiCorp d/b/a Pacific Power, 2013 Integrated Resource Plan,* Docket No. LC 57, Order No. 14-252 at 7 (Jul. 8, 2014).

Q. Does the Hunter Unit 1 baghouse conversion project provide emissions compliance benefits beyond those required by the Utah Regional Haze SIP?

A. Yes. The Hunter Unit 1 baghouse conversion project provides emissions compliance benefits associated with the EPA's MATS regulations.

Q. Beyond directly reducing mercury emissions, how is the Hunter Unit 1 baghouse project expected to allow Hunter Unit 1 to meet other EPA's MATS regulations?

A. In addition to specific emissions requirements for mercury, MATS includes requirements for emissions of non-mercury metals. MATS non-mercury metals emissions compliance can be demonstrated via a surrogate PM emissions limit of 0.030 pounds filterable PM per million Btu. The baghouse allows Hunter Unit 1 to comply with that portion of MATS.

With respect to mercury emissions control, the Hunter 1 baghouse allows the unit to comply with MATS mercury emissions limits without the need to install activated carbon injection equipment for mercury removal purposes, avoiding those incremental costs as well.

Craig Unit 2 SCR

Q. Please describe the Craig facility.

A. The Craig facility is a three-unit coal-fired electrical generating facility located in Moffat County, Colorado. Units 1-2 (837 MW), are jointly owned by Tri-State Generation and Transmission Association, Inc. (Tri-State), Salt River Project, Platte River Power Authority, Public Service Company of Colorado (PSCo), and PacifiCorp (PacifiCorp owns 19.28 percent of the units). Unit 3 is solely owned by Tri-State. Tri-State operates all units at the facility.

Q. Please provide a general description of the Craig Unit 2 SCR system.

A. Generally consistent with the description provided for the Jim Bridger Units 3-4 SCRs, the Craig Unit 2 SCR system is primarily comprised of a reactor with multiple catalyst levels; inlet and outlet ductwork; an ammonia reagent system; certain boiler structure and ancillary infrastructure retrofits; electrical and control system installation and integration with the existing plant.

Q. What was the required timeline for Tri-State to install the SCR system at Craig Unit 2?

A. The Craig Unit 2 SCR was required by the Clean Air Act Regional Haze Rules and the associated state of Colorado Regional Haze SIP to be installed by January 30, 2018. Colorado's Regional Haze SIP was first approved by the Colorado Air Quality Control Commission in January 2011, and was submitted to EPA for review and approval on May 25, 2011.

Q. Did EPA approve the State of Colorado's Regional Haze SIP compliance requirements for Craig Unit 2?

A. Yes. EPA published its approval of the Colorado Regional Haze SIP compliance requirements for Craig Unit 2 in the *Federal Register* on December 31, 2012. EPA's final rule became effective January 30, 2013.[10]

---

[13] The Company did not include the Craig Unit 2 SCR investment as an action item in the 2013 IRP filed in Docket No. LC 57. While noting that these investments should not be an action item, the Commission directed the Company to hold a technical workshop to review existing analysis on the investment. *See In the Matter of PacifiCorp d/b/a Pacific Power, 2013 Integrated Resource Plan,* Docket No. LC 57, Order No. 14-252 at 10 (Jul. 8, 2014). A special public meeting was held on August 6, 2014 to provide the requested analysis. The meeting was confidential, limited to parties subject to the confidentiality provisions included with Docket No. LC 57. *See In the Matter of PacifiCorp d/b/a Pacific Power, 2015 Integrated Resource Plan,* Docket No. LC 62, 2015 Integrated Resource Plan, Vol. II, App. B at 29 (filed Mar. 31, 2015).

Q. Please generally describe the joint ownership governance of Craig Unit 2.

A. The terms and conditions of joint ownership in Craig Unit 2 are governed by a Participation Agreement. The Participation Agreement mandates the installation of capital improvements that are required by applicable law. The Participation Agreement also places an independent obligation on Tri-State, as Operating Agent, to operate Craig Unit 2 in accordance with applicable laws. The applicable laws requiring the Craig Unit 2 SCR installation are discussed earlier in my testimony.

As Operating Agent, Tri-State is also responsible for development of operating budgets and capital investment recommendations to be set forth for joint owner review and approvals. The Participation Agreement's provisions for approval of capital expenditures requires that the proposed expenditures be included in the annual capital expenditure budget prepared by the Operating Agent and that the annual capital expenditure budget is approved by a majority vote (*i.e.* greater than 50 percent ownership share) of the joint owners.

Q. Did Tri-State request approval of the Craig Unit 2 SCR capital investment in accordance with the terms of the Participation Agreement and was it approved by greater than 50 percent ownership share of the joint owners?

A. Yes. Tri-State initially included costs associated with the Craig Unit 2 SCR in the 2013 capital expenditures budget for review and approval pursuant to the Participation Agreement. The project was approved by a greater than 50 percent ownership share of the joint owners.

Q. Did PacifiCorp independently assess the benefits associated with the Craig Unit 2 SCR project?

A. Yes. In July 2013, PacifiCorp independently assessed the benefits associated with the Craig Unit 2 SCR project against a hypothetical wherein PacifiCorp could unilaterally effectuate an accelerated shutdown of the unit. This hypothetical was not a realistic option because PacifiCorp cannot unilaterally effectuate an accelerated shutdown of the Craig units based on the language of the Participation Agreement. PacifiCorp's hypothetical did not support the installation of SCRs.

Q. What position did PacifiCorp take with respect to the Craig Unit 2 SCR project capital budget approval?

A. The Company voted no with respect to the Craig Unit 2 SCR project. PacifiCorp recognized that under the terms of the Participation Agreement its no vote alone would not change the outcome with the other joint-owners voting yes, and PacifiCorp remained obligated to pay its share of the Craig Unit 2 SCR.

Q. Did PacifiCorp also independently assess its legal options with respect to the capital expenditures approval process incorporated into the Participation Agreement?

A. Yes. In June 2013, PacifiCorp engaged internal and external counsel to independently assess PacifiCorp's rights under the Participation Agreement with respect to payment options and dispute resolution that may occur with a majority decision on capital expenditures that was not supported by PacifiCorp. The ultimate determination of the internal and external legal reviews of the Participation Agreement was that PacifiCorp had the right to challenge the majority's decision, but there was little to no opportunity to successfully challenge the project through arbitration or litigation. This was primarily because the project met the requirements under the Participation Agreements, specifically: (i) the project is required by applicable law (the Colorado Regional Haze SIP); (ii) Craig Unit 2 is required to be operated in accordance with applicable law under the Participation Agreement; and (iii) the majority of the Craig Unit 2 joint-owners (in fact all other than PacifiCorp) voted in support of the project.

Q. Considering the terms and conditions of the Participation Agreement, did PacifiCorp pursue arbitration or litigation of the Craig Unit 2 SCR project decision?

A. No, for the reasons explained above.

Q. What was the Company's cost to complete the Craig Unit 2 SCR system?

A. The cost of the Craig Unit 2 SCR system included in this proceeding is [redacted] on a total-company basis, or approximately [redacted] on an Oregon-allocated basis with an in-service date of December 2017.

Q. What is the current status of the Craig Unit 2 SCR system?

A. The Craig Unit 2 SCR system was placed in service in December 2017, following the planned major maintenance overhaul for the unit. Completion of the Craig Unit 2 SCR system satisfied the compliance deadlines established for the unit, as well as the prescribed emissions reductions.

In each case, installation of these major emissions control retrofit projects have been aligned with scheduled major maintenance outages for the affected units to mitigate replacement power cost impacts while benefiting from overlapping major maintenance outage time frames. These environmental compliance projects allow the retrofitted facilities to continue to operate as low-cost generation resources for the benefit of customers.

Hayden Units 1 & 2 SCRs

Q. Please describe the Hayden Facility.

A. The Hayden plant is a 441 MW, two-unit coal-fired electrical generating facility located in Routt County, Colorado. Unit 1 is jointly owned by PSCo and PacifiCorp (PacifiCorp owns 24.5 percent). Unit 2 is jointly owned by PSCo, Salt River Project, and PacifiCorp (PacifiCorp owns 12.6 percent). PSCo operates the plant.

Q. Please provide a general description of the Hayden Units 1-2 SCR systems.

A. Generally consistent with the description provided for the Jim Bridger Units 3-4 SCRs, the Hayden Units 1-2 SCR systems are primarily comprised of: reactors with multiple catalyst levels; inlet and outlet ductwork; ammonia reagent systems; certain boiler structures and ancillary infrastructure retrofits; electrical and control systems installation; and integration with the existing plant.

Q. What was the required timeline for the Company to install the SCR systems at Hayden Units 1-2?

A. The Hayden Units 1-2 SCRs were required by the State of Colorado's Regional Haze SIP to be installed no later than December 31, 2016.

Q. Did EPA approve the state of Colorado's Regional Haze SIP compliance requirements for Hayden Units 1-2?

A. Yes. The EPA published its approval of the Colorado Regional Haze SIP in the

Federal Register on December 31, 2012.[11] EPA's final approval made these emissions reduction compliance requirements at Hayden Units 1-2 federally enforceable, in addition to being enforceable under state law.[12]

Q. What regulations required the Hayden Units 1-2 SCR projects to be installed?

A. In December 2010, the Colorado Air Quality Control Commission promulgated new BART determinations and emissions control requirements for the Hayden units in the Colorado Regional Haze SIP. These BART determinations set emissions limits of 0.08 lbs NO_X/million Btu (MMBtu) for Hayden Unit 1 and 0.07 lbs NO_X/MMBtu for Hayden Unit 2. Although the BART determinations did not specify how these limits were to be achieved, installation of SCRs was the only technically feasible method available.

Q. Was a CPCN acquired for the Hayden Units 1-2 SCR systems in the state of Colorado, where the projects were constructed?

A. On January 26, 2011, the Colorado Public Utilities Commission approved the installation of SCR systems on Hayden Units 1-2, finding that PSCo had demonstrated that the installation of the project was in the best interest of customers but still required the filing of a modified CPCN application primarily because the cost

[15] The Company did not include the Hayden Units 1 and 2 SCR investments as an action item in the 2013 IRP filed in Docket No. LC 57. While noting that these investments should not be an action item, the Commission directed the Company to hold a technical workshop to review existing analysis on the investments. *See In the Matter of PacifiCorp d/b/a Pacific Power, 2013 Integrated Resource Plan,* Docket No. LC 57, Order No. 14-252 at 10 (Jul. 8, 2014). A special public meeting was held on August 6, 2014 to provide the requested analysis. The meeting was confidential, limited to parties subject to the confidentiality provisions included with Docket No. LC 57. *See In the Matter of PacifiCorp d/b/a Pacific Power, 2015 Integrated Resource Plan,* Docket No. LC 62, PacifiCorp's 2015 Integrated Resource Plan, Vol. II, App. B at 29 (filed Mar. 31, 2015).

information presented was not adequate.[13] The Colorado Public Utilities Commission approved PSCo's CPCN application on July18, 2012.[14]

Q. Please generally describe the joint ownership governance of Hayden Units 1-2.

A. The terms and conditions of joint ownership in Hayden Units 1-2 are governed by a Participation Agreement. The Participation Agreement mandates the installation of capital improvements that are required by applicable law. The Participation Agreement also places an independent obligation on PSCo, as Operating Agent, to operate Hayden Units 1-2 in accordance with applicable laws. The applicable laws requiring the Hayden Units 1-2 SCR installation are discussed earlier in my testimony. PacifiCorp owns 24.5 percent of Unit 1 and 12.6 percent of Unit 2.

Q. What is the current status of the Hayden Units 1-2 SCR system?

A. The Hayden Units 1 and 2 SCR systems were placed in service in May 2015 and August 2016 respectively, following the planned major maintenance overhaul for the units. Completion of the Hayden Units 1-2 SCR systems satisfied the compliance deadlines established for the units, as well as the prescribed emissions reductions.

In each case, installation of these major emissions control retrofit projects have been aligned with scheduled major maintenance outages for the affected units to

[17] *In re Public Service Co. of Colorado's Application for a Certificate of Public Convenience and Necessity for the Hayden Emissions Control Project*, Docket No. 11A-917E, Decision No. C12-0843 at pp. 1, 6 (July 18, 2012)(available at https://www.dora.state.co.us/pls/efi/EFI_SEARCH_UI.SEARCH?p_session_id=&p_results=Documents&p_proceeding_number=11A917E&p_document_type=Choose%20One&p_docket_status=Choose%20One&p_decision_type=Choose%20One&p_decision_author=Choose%20One&p_auto_search=Y).

mitigate replacement power cost impacts while benefiting from overlapping major maintenance outage time frames. These environmental compliance projects allow the retrofitted facilities to continue to operate as low-cost generation resources for the benefit of customers.

Q. Were the emissions control retrofit projects included in this proceeding intended to extend the operational life of either Jim Bridger Units 3-4, Hunter Unit 1, Craig Unit 2, or Hayden Units 1-2?

A. No. The emissions control retrofit projects included in this proceeding were required to continue operations in Wyoming, Utah, and Colorado to meet state requirements. The Hayden Units 1-2 SCRs were key components of the NO_X reduction plan required by PSCo (the operator of Hayden Unit 1) to the Colorado Public Utilities Commission under the Colorado Clean Air Clean Jobs Act. The Colorado Public Utilities Commission approved PSCo's NO_X reduction plan, including the Hayden Units 1-2 SCRs on December 9, 2010.[15]

VII. NAUGHTON UNIT 3 GAS CONVERSION

Q. Please describe why Naughton Unit 3 is being converted to natural gas fueling.

A. The Company was required to cease coal-fired operations in Naughton Unit 3 on January 30, 2019, to maintain compliance with certain environmental regulations. Completion of natural gas conversion of Naughton Unit 3 will increase the unit's generating capacity when fueled by natural gas from 35 MW (utilizing existing start-up fuel infrastructure) to 247 MW.

[18] http://www.dora.state.co.us/PUC/DocketsDecisions/decisions/2010/C10-1328_10M-245E.pdf.

Q. Please describe the permitting process for Naughton Unit 3.

A. On July 5, 2013, the Wyoming Department of Environmental Quality (WDEQ) issued Air Permit MD 14506, which establishes natural gas emission and heat input limits for Naughton Unit 3 which would "become effective upon conversion" of Unit 3 to natural gas firing. On November 28, 2017, the WDEQ submitted to the EPA a regional haze SIP revision which required Naughton Unit 3 to cease burning coal no later than January 30, 2019; the SIP proposes federally enforceable emission limits for Naughton Unit 3 to fire on natural gas. The EPA issued its proposed approval of WDEQ's SIP revision on November 7, 2018, seeking public comments on the proposal.

On February 4, 2019, PacifiCorp filed a notification to the WDEQ that Naughton Unit 3 had ceased coal combustion; PacifiCorp designated Naughton Unit 3 as "temporarily 'mothballed' while awaiting final federal action" from the EPA on approval of the WDEQ SIP. PacifiCorp clarified in its notification that Naughton Unit 3 remained capable of generating 35 MW when fueled on natural gas, and that the unit could be considered effectively converted following EPA approval of the Wyoming SIP.

On March 21, 2019, the EPA published its approval of the Naughton Unit 3 conversion to natural gas and incorporated by reference the natural gas emission limits from Wyoming state air permits. PacifiCorp submitted a notification to WDEQ on May 24, 2019, for initial startup of Naughton Unit 3 on natural gas and commencement of construction for additional upgrades supporting the full conversion to 247 MW. PacifiCorp removed Naughton Unit 3 from designation as 'temporarily mothballed' and committed to completion of all construction relating to natural gas conversion by June 24, 2021.

PacifiCorp filed a notification with WDEQ on July 3, 2019, that Naughton Unit 3 was first fired (initial start-up after being temporarily mothballed) on natural gas on July 1, 2019.

Project activities to date in support of the increase in unit capacity to 247 MW are limited to design engineering and procurement of materials, no physical upgrades have been made as of yet as the Company is awaiting material deliveries to initiate construction. The project is expected to be completed by mid-2020.

Q. What is the cost to complete the full conversion of Naughton Unit 3 to a 247 MW natural gas fired generation resource?

A. The cost of the Naughton Unit 3 gas conversion to 247 MW included in this proceeding is [redacted] on a total-company basis, or approximately [redacted] on an Oregon-allocated basis.

Q. Does the Naughton Unit 3 gas conversion to a 247 MW natural gas fired generation resource provide customer benefits?

A. Yes. As discussed in the testimony from Mr. Link, full conversion of Naughton Unit 3 to a 247 MW gas fueled resource is projected to provide $18.3 million in savings for customers as analyzed in the 2019 IRP against early retirement of the unit. As such, the 2019 IRP Preferred Portfolio included Naughton Unit 3 gas conversion as a generation resource available to serve customers going forward.

VIII. CONCLUSION AND RECOMMENDATION

Q. Please summarize your testimony.

A. The Company prudently managed the analysis, implementation, and costs of the Energy Vision 2020 Wind Projects and the Pryor Mountain Wind Project which provide benefits to Oregon customers. These projects should be approved as prudent expenditures.

In addition, the Company prudently managed the analysis, implementation, and costs of the Jim Bridger Units 3-4 SCR projects. The projects were analyzed and managed in accordance with the Company's environmental compliance obligations, the Wyoming Public Service Commission Order granting a CPCN for the projects, the Utah Public Service Commission Order granting Resource Decision Pre-approval for the projects, and the Company's IRP processes. The Company completed the Jim Bridger Units 3-4 projects on time to meet all environmental compliance deadlines and performance requirements under budget, further supporting the prudence of the projects.

The Company prudently managed the analysis, implementation, and costs of the Hunter Unit 1 LNB and baghouse projects. The projects were analyzed and managed in accordance with the Company's environmental compliance obligations and the Company's IRP processes. The Company completed the Hunter Unit 1 projects on time to meet all environmental compliance deadlines and performance requirements under budget, further supporting the prudence of the projects.

The Company also prudently managed the analysis and appropriately exercised its rights under the Participation Agreement with respect to the Craig Unit 2

SCR project. The project was completed on time to meet all environmental compliance deadlines and performance requirements, and was administered by the plant Operating Agent, and supported by a majority vote of the unit's remaining joint owners, in accordance with Participation Agreement terms and conditions.

The Company's support of the Hayden Units 1-2 SCR installations included in this case has been administered pursuant to applicable law and the Partnership Agreement applicable to those Units.

These environmental compliance projects have allowed the retrofitted facilities to continue to operate as low-cost generation resources for the benefit of PacifiCorp's customers.

Finally, the Naughton Unit 3 natural gas conversion to 247 MW has been prudently analyze and implemented. The natural gas conversion project is *de minimis* in scope and facilitates operation of a significant generation resource during periods of peak loads across PacifiCorp's system for the benefit of customers.

Based on these conclusions, I recommend that the Commission approve each of the projects described in my testimony for inclusion in rates.

Q. Does this conclude your direct testimony?

A. Yes.

Large Generator Interconnection Agreement Ekola Flats

February 2020

STANDARD LARGE GENERATOR

INTERCONNECTION AGREEMENT (LGIA)
between
PACIFICORP
and
Ekola Flats Wind Energy LLC
CARBON COUNTY 1 - Q706

TABLE OF CONTENTS

STANDARD LARGE GENERATOR INTERCONNECTION AGREEMENT

THIS STANDARD LARGE GENERATOR INTERCONNECTION AGREEMENT ("Agreement") is made and entered into this 27th day of November, 20 17 by and between Ekola Flats Wind Energy LLC, a Limited Liability Company organized and existing under the laws of the State of Delaware ("Interconnection Customer") with a Large Generating Facility), and PacifiCorp a corporation organized and existing under the laws of the State of Oregon ("Transmission Provider and/or Transmission Owner"). Interconnection Customer and Transmission Provider each may be referred to as a "Party" or collectively as the "Parties."

Recitals

WHEREAS, Transmission Provider operates the Transmission System; and

WHEREAS, Interconnection Customer intends to own, lease and/or control and operate the Generating Facility identified as a Large Generating Facility in Appendix C to this Agreement; and,

WHEREAS, Interconnection Customer and Transmission Provider have agreed to enter into this Agreement for the purpose of interconnecting the Large Generating Facility with the Transmission System;

NOW, THEREFORE, in consideration of and subject to the mutual covenants contained herein, it is agreed:

When used in this Standard Large Generator Interconnection Agreement, terms with initial capitalization that are not defined in Article 1 shall have the meanings specified in the Article in which they are used or the Open Access Transmission Tariff (Tariff).

Article 1. Definitions

Adverse System Impact shall mean the negative effects due to technical or operational limits on conductors or equipment being exceeded that may compromise the safety and reliability of the electric system.

Affected System shall mean an electric system other than the Transmission Provider's Transmission System that may be affected by the proposed interconnection.

Affected System Operator shall mean the entity that operates an Affected System.

Affiliate shall mean, with respect to a corporation, partnership or other entity, each such other corporation, partnership or other entity that directly or indirectly, through one or more intermediaries, controls, is controlled by, or is under common control with, such corporation, partnership or other entity.

Ancillary Services shall mean those services that are necessary to support the transmission of capacity and energy from resources to loads while maintaining reliable operation of the Transmission Provider's Transmission System in accordance with Good Utility Practice.

Applicable Laws and Regulations shall mean all duly promulgated applicable federal, state and local laws, regulations, rules, ordinances, codes, decrees, judgments, directives, or judicial or administrative orders, permits and other duly authorized actions of any Governmental Authority.

Applicable Reliability Council shall mean the reliability council applicable to the Transmission System to which the Generating Facility is directly interconnected.

Applicable Reliability Standards shall mean the requirements and guidelines of NERC, the Applicable Reliability Council, and the Control Area of the Transmission System to which the Generating Facility is directly interconnected.

Base Case shall mean the base case power flow, short circuit, and stability data bases used for the Interconnection Studies by the Transmission Provider or Interconnection Customer.

Breach shall mean the failure of a Party to perform or observe any material term or condition of the Standard Large Generator Interconnection Agreement.

Breaching Party shall mean a Party that is in Breach of the Standard Large Generator Interconnection Agreement.

Business Day shall mean Monday through Friday, excluding Federal Holidays.

Calendar Day shall mean any day including Saturday, Sunday or a Federal Holiday.

Clustering shall mean the process whereby a group of Interconnection Requests is studied together, instead of serially, for the purpose of conducting the Interconnection System Impact Study.

Commercial Operation shall mean the status of a Generating Facility that has commenced generating electricity for sale, excluding electricity generated during Trial Operation.

Commercial Operation Date of a unit shall mean the date on which the Generating Facility commences Commercial Operation as agreed to by the Parties pursuant to Appendix E to the Standard Large Generator Interconnection Agreement.

Confidential Information shall mean any confidential, proprietary or trade secret information of a plan, specification, pattern, procedure, design, device, list, concept, policy or compilation relating to the present or planned business of a Party, which is designated as confidential by the Party supplying the information, whether conveyed orally, electronically, in writing, through inspection, or otherwise.

Control Area shall mean an electrical system or systems bounded by interconnection metering and telemetry, capable of controlling generation to maintain its interchange schedule with other Control Areas and contributing to frequency regulation of the interconnection. A Control Area must be certified by the Applicable Reliability Council.

Default shall mean the failure of a Breaching Party to cure its Breach in accordance with Article 17 of the Standard Large Generator Interconnection Agreement.

Dispute Resolution shall mean the procedure for resolution of a dispute between the Parties in which they will first attempt to resolve the dispute on an informal basis.

Distribution System shall mean the Transmission Provider's facilities and equipment used to transmit electricity to ultimate usage points such as homes and industries directly from nearby generators or from interchanges with higher voltage transmission networks which transport bulk power over longer distances. The voltage levels at which distribution systems operate differ among areas.

Distribution Upgrades shall mean the additions, modifications, and upgrades to the Transmission Provider's Distribution System at or beyond the Point of Interconnection to facilitate interconnection of the Generating Facility and render the transmission service necessary to effect Interconnection Customer's wholesale sale of electricity in interstate commerce. Distribution Upgrades do not include Interconnection Facilities.

Effective Date shall mean the date on which the Standard Large Generator Interconnection Agreement becomes effective upon execution by the Parties subject to acceptance by FERC, or if filed unexecuted, upon the date specified by FERC.

Emergency Condition shall mean a condition or situation: (1) that in the judgment of the Party making the claim is imminently likely to endanger life or property; or (2) that, in the case of a Transmission Provider, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to Transmission Provider's Transmission System, Transmission Provider's Interconnection Facilities or the electric systems of others to which the Transmission Provider's Transmission System is directly connected; or (3) that, in the case of Interconnection Customer, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to, the Generating Facility or

Interconnection Customer's Interconnection Facilities. System restoration and black start shall be considered Emergency Conditions; provided, that Interconnection Customer is not obligated by the Standard Large Generator Interconnection Agreement to possess black start capability.

Energy Resource Interconnection Service shall mean an Interconnection Service that allows the Interconnection Customer to connect its Generating Facility to the Transmission Provider's Transmission System to be eligible to deliver the Generating Facility's electric output using the existing firm or nonfirm capacity of the Transmission Provider's Transmission System on an as available basis. Energy Resource Interconnection Service in and of itself does not convey transmission service.

Engineering & Procurement (E&P) Agreement shall mean an agreement that authorizes the Transmission Provider to begin engineering and procurement of long lead-time items necessary for the establishment of the interconnection in order to advance the implementation of the Interconnection Request.

Environmental Law shall mean Applicable Laws or Regulations relating to pollution or protection of the environment or natural resources.

Federal Power Act shall mean the Federal Power Act, as amended, 16 U.S.C. §§ 791a et seq.

FERC shall mean the Federal Energy Regulatory Commission (Commission) or its successor.

Force Majeure shall mean any act of God, labor disturbance, act of the public enemy, war, insurrection, riot, fire, storm or flood, explosion, breakage or accident to machinery or equipment, any order, regulation or restriction imposed by governmental, military or lawfully established civilian authorities, or any other cause beyond a Party's control. A Force Majeure event does not include acts of negligence or intentional wrongdoing by the Party claiming Force Majeure.

Generating Facility shall mean Interconnection Customer's device for the production of electricity identified in the Interconnection Request, but shall not

include the Interconnection Customer's Interconnection Facilities.

Generating Facility Capacity shall mean the net capacity of the Generating Facility and the aggregate net capacity of the Generating Facility where it includes multiple energy production devices.

Good Utility Practice shall mean any of the practices, methods and acts engaged in or approved by a significant portion of the electric industry during the relevant time period, or any of the practices, methods and acts which, in the exercise of reasonable judgment in light of the facts known at the time the decision was made, could have been expected to accomplish the desired result at a reasonable cost consistent with good business practices, reliability, safety and expedition. Good Utility Practice is not intended to be limited to the optimum practice, method, or act to the exclusion of all others, but rather to be acceptable practices, methods, or acts generally accepted in the region.

Governmental Authority shall mean any federal, state, local or other governmental regulatory or administrative agency, court, commission, department, board, or other governmental subdivision, legislature, rulemaking board, tribunal, or other governmental authority having jurisdiction over the Parties, their respective facilities, or the respective services they provide, and exercising or entitled to exercise any administrative, executive, police, or taxing authority or power; provided, however, that such term does not include Interconnection Customer, Transmission Provider, or any Affiliate thereof.

Hazardous Substances shall mean any chemicals, materials or substances defined as or included in the definition of "hazardous substances," "hazardous wastes," "hazardous materials," "hazardous constituents," "restricted hazardous materials," "extremely hazardous substances," "toxic substances," "radioactive substances," "contaminants," "pollutants," "toxic pollutants" or words of similar meaning and regulatory effect under any applicable Environmental Law, or any other chemical, material or substance, exposure to which is prohibited, limited or regulated by any applicable Environmental Law.

Initial Synchronization Date shall mean the date upon which the Generating Facility is initially synchronized and upon which Trial Operation begins.

In-Service Date shall mean the date upon which the Interconnection Customer reasonably expects it will be ready to begin use of the Transmission Provider's Interconnection Facilities to obtain back feed power.

Interconnection Customer shall mean any entity, including the Transmission Provider, Transmission Owner or any of the Affiliates or subsidiaries of either, that proposes to interconnect its Generating Facility with the Transmission Provider's Transmission System.

Interconnection Customer's Interconnection Facilities shall mean all facilities and equipment, as identified in Appendix A of the Standard Large Generator Interconnection Agreement, that are located between the Generating Facility and the Point of Change of Ownership, including any modification, addition, or upgrades to such facilities and equipment necessary to physically and electrically interconnect the Generating Facility to the Transmission Provider's Transmission System. Interconnection Customer's Interconnection Facilities are sole use facilities.

Interconnection Facilities shall mean the Transmission Provider's Interconnection Facilities and the Interconnection Customer's Interconnection Facilities. Collectively, Interconnection Facilities include all facilities and equipment between the Generating Facility and the Point of Interconnection, including any modification, additions or upgrades that are necessary to physically and electrically interconnect the Generating Facility to the Transmission Provider's Transmission System. Interconnection Facilities are sole use facilities and shall not include Distribution Upgrades, Stand Alone Network Upgrades or Network Upgrades.

Interconnection Facilities Study shall mean a study conducted by the Transmission Provider or a third party consultant for the Interconnection Customer to determine a list of facilities (including Transmission Provider's Interconnection Facilities and Network Upgrades as identified in the Interconnection System Impact Study), the cost of those facilities, and the time required to interconnect the Generating Facility with the Transmission

Provider's Transmission System. The scope of the study is defined in Section 43 of the Standard Large Generator Interconnection Procedures.

Interconnection Facilities Study Agreement shall mean the form of agreement contained in Appendix 4 of the Standard Large Generator Interconnection Procedures for conducting the Interconnection Facilities Study.

Interconnection Feasibility Study shall mean a preliminary evaluation of the system impact and cost of interconnecting the Generating Facility to the Transmission Provider's Transmission System, the scope of which is described in Section 41 of the Standard Large Generator Interconnection Procedures.

Interconnection Feasibility Study Agreement shall mean the form of agreement contained in Appendix 2 of the Standard Large Generator Interconnection Procedures for conducting the Interconnection Feasibility Study.

Interconnection Request shall mean an Interconnection Customer's request, in the form of Appendix 1 to the Standard Large Generator Interconnection Procedures, in accordance with the Tariff, to interconnect a new Generating Facility, or to increase the capacity of, or make a Material Modification to the operating characteristics of, an existing Generating Facility that is interconnected with the Transmission Provider's Transmission System.

Interconnection Service shall mean the service provided by the Transmission Provider associated with interconnecting the Interconnection Customer's Generating Facility to the Transmission Provider's Transmission System and enabling it to receive electric energy and capacity from the Generating Facility at the Point of Interconnection, pursuant to the terms of the Standard Large Generator Interconnection Agreement and, if applicable, the Transmission Provider's Tariff.

Interconnection Study shall mean any of the following studies: the Interconnection Feasibility Study, the Interconnection System Impact Study, and the Interconnection Facilities Study described in the Standard Large Generator Interconnection Procedures.

Interconnection System Impact Study shall mean an engineering study that evaluates the impact of the proposed interconnection on the safety and reliability of Transmission Provider's Transmission System and, if applicable, an Affected System. The study shall identify and detail the system impacts that would result if the Generating Facility were interconnected without project modifications or system modifications, focusing on the Adverse System Impacts identified in the Interconnection Feasibility Study, or to study potential impacts, including but not limited to those identified in the Scoping Meeting as described in the Standard Large Generator Interconnection Procedures.

Interconnection System Impact Study Agreement shall mean the form of agreement contained in Appendix 3 of the Standard Large Generator Interconnection Procedures for conducting the Interconnection System Impact Study.

IRS shall mean the Internal Revenue Service.

Joint Operating Committee shall be a group made up of representatives from Interconnection Customers and the Transmission Provider to coordinate operating and technical considerations of Interconnection Service.

Large Generating Facility shall mean a Generating Facility having a Generating Facility Capacity of more than 20 MW.

Loss shall mean any and all losses relating to injury to or death of any person or damage to property, demand, suits, recoveries, costs and expenses, court costs, attorney fees, and all other obligations by or to third parties, arising out of or resulting from the other Party's performance, or non-performance of its obligations under the Standard Large Generator Interconnection Agreement on behalf of the indemnifying Party, except in cases of gross negligence or intentional wrongdoing by the indemnifying Party.

Material Modification shall mean those modifications that have a material impact on the cost or timing of any Interconnection Request with a later queue priority date.

Metering Equipment shall mean all metering equipment installed or to be installed at the Generating Facility

pursuant to the Standard Large Generator Interconnection Agreement at the metering points, including but not limited to instrument transformers, MWh-meters, data acquisition equipment, transducers, remote terminal unit, communications equipment, phone lines, and fiber optics.

NERC shall mean the North American Electric Reliability Council or its successor organization.

Network Resource shall mean any designated generating resource owned, purchased, or leased by a Network Customer under the Network Integration Transmission Service Tariff. Network Resources do not include any resource, or any portion thereof, that is committed for sale to third parties or otherwise cannot be called upon to meet the Network Customer's Network Load on a non-interruptible basis.

Network Resource Interconnection Service shall mean an Interconnection Service that allows the Interconnection Customer to integrate its Large Generating Facility with the Transmission Provider's Transmission System (1) in a manner comparable to that in which the Transmission Provider integrates its generating facilities to serve native load customers; or (2) in an RTO or ISO with market based congestion management, in the same manner as Network Resources. Network Resource Interconnection Service in and of itself does not convey transmission service.

Network Upgrades shall mean the additions, modifications, and upgrades to the Transmission Provider's Transmission System required at or beyond the point at which the Interconnection Facilities connect to the Transmission Provider's Transmission System to accommodate the interconnection of the Large Generating Facility to the Transmission Provider's Transmission System.

Notice of Dispute shall mean a written notice of a dispute or claim that arises out of or in connection with the Standard Large Generator Interconnection Agreement or its performance.

Optional Interconnection Study shall mean a sensitivity analysis based on assumptions specified by the Interconnection Customer in the Optional Interconnection Study Agreement.

Optional Interconnection Study Agreement shall mean the form of agreement contained in Appendix 5 of the Standard Large Generator Interconnection Procedures for conducting the Optional Interconnection Study.

Party or Parties shall mean Transmission Provider, Transmission Owner, Interconnection Customer or any combination of the above.

Point of Change of Ownership shall mean the point, as set forth in Appendix A to the Standard Large Generator Interconnection Agreement, where the Interconnection Customer's Interconnection Facilities connect to the Transmission Provider's Interconnection Facilities.

Point of Interconnection shall mean the point, as set forth in Appendix A to the Standard Large Generator Interconnection Agreement, where the Interconnection Facilities connect to the Transmission Provider's Transmission System.

Queue Position shall mean the order of a valid Interconnection Request, relative to all other pending valid Interconnection Requests, that is established based upon the date and time of receipt of the valid Interconnection Request by the Transmission Provider.

Reasonable Efforts shall mean, with respect to an action required to be attempted or taken by a Party under the Standard Large Generator Interconnection Agreement, efforts that are timely and consistent with Good Utility Practice and are otherwise substantially equivalent to those a Party would use to protect its own interests.

Scoping Meeting shall mean the meeting between representatives of the Interconnection Customer and Transmission Provider conducted for the purpose of discussing alternative interconnection options, to exchange information including any transmission data and earlier study evaluations that would be reasonably expected to impact such interconnection options, to analyze such information, and to determine the potential feasible Points of Interconnection.

Site Control shall mean documentation reasonably demonstrating: (1) ownership of, a leasehold interest in, or a right to develop a site for the purpose of

constructing the Generating Facility; (2) an option to purchase or acquire a leasehold site for such purpose; or (3) an exclusivity or other business relationship between Interconnection Customer and the entity having the right to sell, lease or grant Interconnection Customer the right to possess or occupy a site for such purpose.

Small Generating Facility shall mean a Generating Facility that has a Generating Facility Capacity of no more than 20 MW.

Stand Alone Network Upgrades shall mean Network Upgrades that an Interconnection Customer may construct without affecting day-to-day operations of the Transmission System during their construction. Both the Transmission Provider and the Interconnection Customer must agree as to what constitutes Stand Alone Network Upgrades and identify them in Appendix A to the Standard Large Generator Interconnection Agreement.

Standard Large Generator Interconnection Agreement (LGIA) shall mean the form of interconnection agreement applicable to an Interconnection Request pertaining to a Large Generating Facility that is included in the Transmission Provider's Tariff.

Standard Large Generator Interconnection Procedures (LGIP) shall mean the interconnection procedures applicable to an Interconnection Request pertaining to a Large Generating Facility that are included in the Transmission Provider's Tariff.

System Protection Facilities shall mean the equipment, including necessary protection signal communications equipment, required to protect (1) the Transmission Provider's Transmission System from faults or other electrical disturbances occurring at the Generating Facility and (2) the Generating Facility from faults or other electrical system disturbances occurring on the Transmission Provider's Transmission System or on other delivery systems or other generating systems to which the Transmission Provider's Transmission System is directly connected.

Tariff shall mean the Transmission Provider's Tariff through which open access transmission service and Interconnection Service are offered, as filed with FERC,

and as amended or supplemented from time to time, or any successor tariff.

Transmission Owner shall mean an entity that owns, leases or otherwise possesses an interest in the portion of the Transmission System at the Point of Interconnection and may be a Party to the Standard Large Generator Interconnection Agreement to the extent necessary.

Transmission Provider shall mean the public utility (or its designated agent) that owns, controls, or operates transmission or distribution facilities used for the transmission of electricity in interstate commerce and provides transmission service under the Tariff. The term Transmission Provider should be read to include the Transmission Owner when the Transmission Owner is separate from the Transmission Provider.

Transmission Provider's Interconnection Facilities shall mean all facilities and equipment owned, controlled or operated by the Transmission Provider from the Point of Change of Ownership to the Point of Interconnection as identified in Appendix A to the Standard Large Generator Interconnection Agreement, including any modifications, additions or upgrades to such facilities and equipment. Transmission Provider's Interconnection Facilities are sole use facilities and shall not include Distribution Upgrades, Stand Alone Network Upgrades or Network Upgrades.

Transmission System shall mean the facilities owned, controlled or operated by the Transmission Provider or Transmission Owner that are used to provide transmission service under the Tariff.

Trial Operation shall mean the period during which Interconnection Customer is engaged in on-site test operations and commissioning of the Generating Facility prior to Commercial Operation.

Variable Energy Resource shall mean a device for the production of electricity that is characterized by an energy source that: (1) is renewable; (2) cannot be stored by the facility owner or operator; and (3) has variability that is beyond the control of the facility owner or operator.

Article 2. Effective Date, Term, and Termination

2.1 **Effective Date.** This LGIA shall become effective upon execution by the Parties subject to acceptance by FERC (if applicable), or if filed unexecuted, upon the date specified by FERC. Transmission Provider shall promptly file this LGIA with FERC upon execution in accordance with Article 3.1, if required.

2.2 **Term of Agreement.** Subject to the provisions of Article 2.3, this LGIA shall remain in effect for a period of ten (10) years from the Effective Date or such other longer period as Interconnection Customer may request (Term to be specified in individual agreements) and shall be automatically renewed for each successive one-year period thereafter.

2.3 **Termination Procedures.**

2.3.1 **Written Notice.** This LGIA may be terminated by Interconnection Customer after giving Transmission Provider ninety (90) Calendar Days advance written notice, or by Transmission Provider notifying FERC after the Generating Facility permanently ceases Commercial Operation.

2.3.2 **Default.** Either Party may terminate this LGIA in accordance with Article 17.

2.3.3 Notwithstanding Articles 2.3.1 and 2.3.2, no termination shall become effective until the Parties have complied with all Applicable Laws and Regulations applicable to such termination, including the filing with FERC of a notice of termination of this LGIA, which notice has been accepted for filing by FERC.

2.4 **Termination Costs.** If a Party elects to terminate this Agreement pursuant to Article 2.3 above, each Party shall pay all costs incurred (including any cancellation costs relating to orders or contracts for Interconnection Facilities and equipment) or charges assessed by the other Party, as of the date of the other Party's receipt of such notice of

termination, that are the responsibility of the Terminating Party under this LGIA. In the event of termination by a Party, the Parties shall use commercially Reasonable Efforts to mitigate the costs, damages and charges arising as a consequence of termination. Upon termination of this LGIA, unless otherwise ordered or approved by FERC:

2.4.1 With respect to any portion of Transmission Provider's Interconnection Facilities that have not yet been constructed or installed, Transmission Provider shall to the extent possible and with Interconnection Customer's authorization cancel any pending orders of, or return, any materials or equipment for, or contracts for construction of, such facilities; provided that in the event Interconnection Customer elects not to authorize such cancellation, Interconnection Customer shall assume all payment obligations with respect to such materials, equipment, and contracts, and Transmission Provider shall deliver such material and equipment, and, if necessary, assign such contracts, to Interconnection Customer as soon as practicable, at Interconnection Customer's expense. To the extent that Interconnection Customer has already paid Transmission Provider for any or all such costs of materials or equipment not taken by Interconnection Customer, Transmission Provider shall promptly refund such amounts to Interconnection Customer, less any costs, including penalties incurred by Transmission Provider to cancel any pending orders of or return such materials, equipment, or contracts.

If an Interconnection Customer terminates this LGIA, it shall be responsible for all costs incurred in association with that Interconnection Customer's interconnection, including any cancellation costs relating to orders or contracts for Interconnection Facilities

and equipment, and other expenses including any Network Upgrades for which Transmission Provider has incurred expenses and has not been reimbursed by Interconnection Customer.

2.4.2 Transmission Provider may, at its option, retain any portion of such materials, equipment, or facilities that Interconnection Customer chooses not to accept delivery of, in which case Transmission Provider shall be responsible for all costs associated with procuring such materials, equipment, or facilities.

2.4.3 With respect to any portion of the Interconnection Facilities, and any other facilities already installed or constructed pursuant to the terms of this LGIA, Interconnection Customer shall be responsible for all costs associated with the removal, relocation or other disposition or retirement of such materials, equipment, or facilities.

2.5 **Disconnection.** Upon termination of this LGIA, the Parties will take all appropriate steps to disconnect the Large Generating Facility from the Transmission System. All costs required to effectuate such disconnection shall be borne by the terminating Party, unless such termination resulted from the non-terminating Party's Default of this LGIA or such non-terminating Party otherwise is responsible for these costs under this LGIA.

2.6 **Survival.** This LGIA shall continue in effect after termination to the extent necessary to provide for final billings and payments and for costs incurred hereunder, including billings and payments pursuant to this LGIA; to permit the determination and enforcement of liability and indemnification obligations arising from acts or events that occurred while this LGIA was in effect; and to permit each Party to have access to the lands of the other Party pursuant to this LGIA or other applicable agreements, to disconnect, remove or salvage its own facilities and equipment.

Article 3. Regulatory Filings

3.1 **Filing**. Transmission Provider shall file this LGIA (and any amendment hereto) with the appropriate Governmental Authority, if required. Interconnection Customer may request that any information so provided be subject to the confidentiality provisions of Article 22. If Interconnection Customer has executed this LGIA, or any amendment thereto, Interconnection Customer shall reasonably cooperate with Transmission Provider with respect to such filing and to provide any information reasonably requested by Transmission Provider needed to comply with applicable regulatory requirements.

Article 4. Scope of Service

4.1 **Interconnection Product Options.** Interconnection Customer has selected the following (checked) type of Interconnection Service:

☐ 4.1.1 **Energy Resource Interconnection Service.**

4.1.1.1 **The Product**. Energy Resource Interconnection Service allows Interconnection Customer to connect the Large Generating Facility to the Transmission System and be eligible to deliver the Large Generating Facility's output using the existing firm or non-firm capacity of the Transmission System on an "as available" basis. To the extent Interconnection Customer wants to receive Energy Resource Interconnection Service, Transmission Provider shall construct facilities identified in Attachment A.

4.1.1.2 **Transmission Delivery Service Implications**. Under Energy

Resource Interconnection Service, Interconnection Customer will be eligible to inject power from the Large Generating Facility into and deliver power across the interconnecting Transmission Provider's Transmission System on an "as available" basis up to the amount of MWs identified in the applicable stability and steady state studies to the extent the upgrades initially required to qualify for Energy Resource Interconnection Service have been constructed. Where eligible to do so (e.g., PJM, ISO-NE, NYISO), Interconnection Customer may place a bid to sell into the market up to the maximum identified Large Generating Facility output, subject to any conditions specified in the interconnection service approval, and the Large Generating Facility will be dispatched to the extent Interconnection Customer's bid clears. In all other instances, no transmission delivery service from the Large Generating Facility is assured, but Interconnection Customer may obtain Point-to-Point Transmission Service, Network Integration Transmission Service, or be used for secondary network transmission service, pursuant to Transmission Provider's Tariff, up to the maximum output identified in the stability and steady state studies. In those instances, in order for Interconnection Customer to obtain the right to deliver or inject energy beyond the Large Generating Facility Point of Interconnection or to improve its ability to do so, transmission

delivery service must be obtained pursuant to the provisions of Transmission Provider's Tariff. The Interconnection Customer's ability to inject its Large Generating Facility output beyond the Point of Interconnection, therefore, will depend on the existing capacity of Transmission Provider's Transmission System at such time as a transmission service request is made that would accommodate such delivery. The provision of firm Point-to-Point Transmission Service or Network Integration Transmission Service may require the construction of additional Network Upgrades.

☐ 4.1.2 **Network Resource Interconnection Service.**

4.1.2.1 **The Product**. Transmission Provider must conduct the necessary studies and construct the Network Upgrades needed to integrate the Large Generating Facility (1) in a manner comparable to that in which Transmission Provider integrates its generating facilities to serve native load customers; or (2) in an ISO or RTO with market based congestion management, in the same manner as all Network Resources. To the extent Interconnection Customer wants to receive Network Resource Interconnection Service, Transmission Provider shall construct the facilities identified in Attachment A to this LGIA.

4.1.2.2 **Transmission Delivery Service Implications**. Network Resource

Interconnection Service allows Interconnection Customer's Large Generating Facility to be designated by any Network Customer under the Tariff on Transmission Provider's Transmission System as a Network Resource, up to the Large Generating Facility's full output, on the same basis as existing Network Resources interconnected to Transmission Provider's Transmission System, and to be studied as a Network Resource on the assumption that such a designation will occur. Although Network Resource Interconnection Service does not convey a reservation of transmission service, any Network Customer under the Tariff can utilize its network service under the Tariff to obtain delivery of energy from the interconnected Interconnection Customer's Large Generating Facility in the same manner as it accesses Network Resources. A Large Generating Facility receiving Network Resource Interconnection Service may also be used to provide Ancillary Services after technical studies and/or periodic analyses are performed with respect to the Large Generating Facility's ability to provide any applicable Ancillary Services, provided that such studies and analyses have been or would be required in connection with the provision of such Ancillary Services by any existing Network Resource. However, if an Interconnection Customer's Large Generating Facility has not been designated as a Network Resource by any load, it cannot be

required to provide Ancillary Services except to the extent such requirements extend to all generating facilities that are similarly situated. The provision of Network Integration Transmission Service or firm Point-to-Point Transmission Service may require additional studies and the construction of additional upgrades. Because such studies and upgrades would be associated with a request for delivery service under the Tariff, cost responsibility for the studies and upgrades would be in accordance with FERC's policy for pricing transmission delivery services.

Network Resource Interconnection Service does not necessarily provide Interconnection Customer with the capability to physically deliver the output of its Large Generating Facility to any particular load on Transmission Provider's Transmission System without incurring congestion costs. In the event of transmission constraints on Transmission Provider's Transmission System, Interconnection Customer's Large Generating Facility shall be subject to the applicable congestion management procedures in Transmission Provider's Transmission System in the same manner as Network Resources.

There is no requirement either at the time of study or interconnection, or at any point in the future, that Interconnection Customer's Large Generating Facility be designated

as a Network Resource by a Network Service Customer under the Tariff or that Interconnection Customer identify a specific buyer (or sink). To the extent a Network Customer does designate the Large Generating Facility as a Network Resource, it must do so pursuant to Transmission Provider's Tariff.

Once an Interconnection Customer satisfies the requirements for obtaining Network Resource Interconnection Service, any future transmission service request for delivery from the Large Generating Facility within Transmission Provider's Transmission System of any amount of capacity and/or energy, up to the amount initially studied, will not require that any additional studies be performed or that any further upgrades associated with such Large Generating Facility be undertaken, regardless of whether or not such Large Generating Facility is ever designated by a Network Customer as a Network Resource and regardless of changes in ownership of the Large Generating Facility. However, the reduction or elimination of congestion or redispatch costs may require additional studies and the construction of additional upgrades.

To the extent Interconnection Customer enters into an arrangement for long term transmission service for deliveries from the Large Generating Facility outside

Transmission Provider's Transmission System, such request may require additional studies and upgrades in order for Transmission Provider to grant such request.

4.2 **Provision of Service.** Transmission Provider shall provide Interconnection Service for the Large Generating Facility at the Point of Interconnection.

4.3 **Performance Standards.** Each Party shall perform all of its obligations under this LGIA in accordance with Applicable Laws and Regulations, Applicable Reliability Standards, and Good Utility Practice, and to the extent a Party is required or prevented or limited in taking any action by such regulations and standards, such Party shall not be deemed to be in Breach of this LGIA for its compliance therewith. If such Party is a Transmission Provider or Transmission Owner, then that Party shall amend the LGIA and submit the amendment to FERC for approval.

4.4 **No Transmission Delivery Service.** The execution of this LGIA does not constitute a request for, nor the provision of, any transmission delivery service under Transmission Provider's Tariff, and does not convey any right to deliver electricity to any specific customer or Point of Delivery.

4.5 **Interconnection Customer Provided Services.** The services provided by Interconnection Customer under this LGIA are set forth in Article 9.6 and Article 13.5.1.

Interconnection Customer shall be paid for such services in accordance with Article 11.6.

Article 5. Interconnection Facilities Engineering, Procurement, and Construction

5.1 **Options.** Unless otherwise mutually agreed to between the Parties, Interconnection Customer shall select the In-Service Date, Initial Synchronization Date, and Commercial Operation Date; and either Standard Option or Alternate Option set forth below for

completion of Transmission Provider's Interconnection Facilities and Network Upgrades as set forth in Appendix A, Interconnection Facilities and Network Upgrades, and such dates and selected option shall be set forth in Appendix B, Milestones.

5.1.1 **Standard Option**. Transmission Provider shall design, procure, and construct Transmission Provider's Interconnection Facilities and Network Upgrades, using Reasonable Efforts to complete Transmission Provider's Interconnection Facilities and Network Upgrades by the dates set forth in Appendix B, Milestones. Transmission Provider shall not be required to undertake any action which is inconsistent with its standard safety practices, its material and equipment specifications, its design criteria and construction procedures, its labor agreements, and Applicable Laws and Regulations. In the event Transmission Provider reasonably expects that it will not be able to complete Transmission Provider's Interconnection Facilities and Network Upgrades by the specified dates, Transmission Provider shall promptly provide written notice to Interconnection Customer and shall undertake Reasonable Efforts to meet the earliest dates thereafter.

5.1.2 **Alternate Option**. If the dates designated by Interconnection Customer are acceptable to Transmission Provider, Transmission Provider shall so notify Interconnection Customer within thirty (30) Calendar Days, and shall assume responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities by the designated dates.

If Transmission Provider subsequently fails to complete Transmission Provider's Interconnection Facilities by the In-Service Date, to the extent necessary to provide back feed power; or fails to

complete Network Upgrades by the Initial Synchronization Date to the extent necessary to allow for Trial Operation at full power output, unless other arrangements are made by the Parties for such Trial Operation; or fails to complete the Network Upgrades by the Commercial Operation Date, as such dates are reflected in Appendix B, Milestones; Transmission Provider shall pay Interconnection Customer liquidated damages in accordance with Article 5.3, Liquidated Damages, provided, however, the dates designated by Interconnection Customer shall be extended day for day for each day that the applicable RTO or ISO refuses to grant clearances to install equipment.

5.1.3 **Option to Build.** If the dates designated by Interconnection Customer are not acceptable to Transmission Provider, Transmission Provider shall so notify Interconnection Customer within thirty (30) Calendar Days, and unless the Parties agree otherwise, Interconnection Customer shall have the option to assume responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades on the dates specified in Article 5.1.2. Transmission Provider and Interconnection Customer must agree as to what constitutes Stand Alone Network Upgrades and identify such Stand Alone Network Upgrades in Appendix A. Except for Stand Alone Network Upgrades, Interconnection Customer shall have no right to construct Network Upgrades under this option.

5.1.4 **Negotiated Option.** If Interconnection Customer elects not to exercise its option under Article 5.1.3, Option to Build, Interconnection Customer shall so notify Transmission Provider within thirty (30) Calendar Days, and the Parties shall in

good faith attempt to negotiate terms and conditions (including revision of the specified dates and liquidated damages, the provision of incentives or the procurement and construction of a portion of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades by Interconnection Customer) pursuant to which Transmission Provider is responsible for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Network Upgrades. If the Parties are unable to reach agreement on such terms and conditions, Transmission Provider shall assume responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Network Upgrades pursuant to 5.1.1, Standard Option.

5.2 **General Conditions Applicable to Option to Build.** If Interconnection Customer assumes responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades,

(1) Interconnection Customer shall engineer, procure equipment, and construct Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades (or portions thereof) using Good Utility Practice and using standards and specifications provided in advance by Transmission Provider;

(2) Interconnection Customer's engineering, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades shall comply with all requirements of law to which Transmission Provider would be subject in the engineering, procurement or construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades;

(3) Transmission Provider shall review and approve the engineering design, equipment acceptance tests, and the construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades;

(4) prior to commencement of construction, Interconnection Customer shall provide to Transmission Provider a schedule for construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades, and shall promptly respond to requests for information from Transmission Provider;

(5) at any time during construction, Transmission Provider shall have the right to gain unrestricted access to Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades and to conduct inspections of the same;

(6) at any time during construction, should any phase of the engineering, equipment procurement, or construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades not meet the standards and specifications provided by Transmission Provider, Interconnection Customer shall be obligated to remedy deficiencies in that portion of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades;

(7) Interconnection Customer shall indemnify Transmission Provider for claims arising from Interconnection Customer's construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades under the terms and procedures applicable to Article 18.1 Indemnity;

(8) Interconnection Customer shall transfer control of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades to Transmission Provider;

(9) Unless Parties otherwise agree, Interconnection Customer shall transfer ownership of Transmission Provider's Interconnection Facilities and Stand-Alone Network Upgrades to Transmission Provider;

(10) Transmission Provider shall approve and accept for operation and maintenance Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades to the extent engineered, procured, and constructed in accordance with this Article 5.2; and

(11) Interconnection Customer shall deliver to Transmission Provider "as-built" drawings, information, and any other documents that are reasonably required by Transmission Provider to assure that the Interconnection Facilities and Stand-Alone Network Upgrades are built to the standards and specifications required by Transmission Provider.

5.3 **Liquidated Damages.** The actual damages to Interconnection Customer, in the event Transmission Provider's Interconnection Facilities or Network Upgrades are not completed by the dates designated by Interconnection Customer and accepted by Transmission Provider pursuant to subparagraphs 5.1.2 or 5.1.4, above, may include Interconnection Customer's fixed operation and maintenance costs and lost opportunity costs. Such actual damages are uncertain and impossible to determine at this time. Because of such uncertainty, any liquidated damages paid by Transmission Provider to Interconnection Customer in the event that Transmission Provider does not complete any portion of Transmission Provider's Interconnection Facilities or Network Upgrades by the applicable dates, shall be an amount equal to ½ of 1 percent per day of the actual cost of Transmission Provider's Interconnection Facilities and Network

Upgrades, in the aggregate, for which Transmission Provider has assumed responsibility to design, procure and construct.

However, in no event shall the total liquidated damages exceed 20 percent of the actual cost of Transmission Provider's Interconnection Facilities and Network Upgrades for which Transmission Provider has assumed responsibility to design, procure, and construct. The foregoing payments will be made by Transmission Provider to Interconnection Customer as just compensation for the damages caused to Interconnection Customer, which actual damages are uncertain and impossible to determine at this time, and as reasonable liquidated damages, but not as a penalty or a method to secure performance of this LGIA. Liquidated damages, when the Parties agree to them, are the exclusive remedy for the Transmission Provider's failure to meet its schedule.

No liquidated damages shall be paid to Interconnection Customer if: (1) Interconnection Customer is not ready to commence use of Transmission Provider's Interconnection Facilities or Network Upgrades to take the delivery of power for the Large Generating Facility's Trial Operation or to export power from the Large Generating Facility on the specified dates, unless Interconnection Customer would have been able to commence use of Transmission Provider's Interconnection Facilities or Network Upgrades to take the delivery of power for Large Generating Facility's Trial Operation or to export power from the Large Generating Facility, but for Transmission Provider's delay; (2) Transmission Provider's failure to meet the specified dates is the result of the action or inaction of Interconnection Customer or any other Interconnection Customer who has entered into an LGIA with Transmission Provider or any cause beyond Transmission Provider's reasonable control or reasonable ability to cure; (3) the interconnection Customer has assumed responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades; or (4) the Parties have otherwise agreed.

5.4 **Power System Stabilizers.** The Interconnection Customer shall procure, install, maintain and operate Power System Stabilizers in accordance with the guidelines and procedures established by the Applicable Reliability Council. Transmission Provider reserves the right to reasonably establish minimum acceptable settings for any installed Power System Stabilizers, subject to the design and operating limitations of the Large Generating Facility. If the Large Generating Facility's Power System Stabilizers are removed from service or not capable of automatic operation, Interconnection Customer shall immediately notify Transmission Provider's system operator, or its designated representative. The requirements of this paragraph shall not apply to wind generators.

5.5 **Equipment Procurement.** If responsibility for construction of Transmission Provider's Interconnection Facilities or Network Upgrades is to be borne by Transmission Provider, then Transmission Provider shall commence design of Transmission Provider's Interconnection Facilities or Network Upgrades and procure necessary equipment as soon as practicable after all of the following conditions are satisfied, unless the Parties otherwise agree in writing:

5.5.1 Transmission Provider has completed the Facilities Study pursuant to the Facilities Study Agreement;

5.5.2 Transmission Provider has received written authorization to proceed with design and procurement from Interconnection Customer by the date specified in Appendix B, Milestones; and

5.5.3 Interconnection Customer has provided security to Transmission Provider in accordance with Article 11.5 by the dates specified in Appendix B, Milestones.

5.6 **Construction Commencement.** Transmission Provider shall commence construction of Transmission Provider's Interconnection Facilities and Network Upgrades for which it is responsible as soon as

practicable after the following additional conditions are satisfied:

5.6.1 Approval of the appropriate Governmental Authority has been obtained for any facilities requiring regulatory approval;

5.6.2 Necessary real property rights and rights-of-way have been obtained, to the extent required for the construction of a discrete aspect of Transmission Provider's Interconnection Facilities and Network Upgrades;

5.6.3 Transmission Provider has received written authorization to proceed with construction from Interconnection Customer by the date specified in Appendix B, Milestones; and

5.6.4 Interconnection Customer has provided security to Transmission Provider in accordance with Article 11.5 by the dates specified in Appendix B, Milestones.

5.7 **Work Progress**. The Parties will keep each other advised periodically as to the progress of their respective design, procurement and construction efforts. Either Party may, at any time, request a progress report from the other Party. If, at any time, Interconnection Customer determines that the completion of Transmission Provider's Interconnection Facilities will not be required until after the specified In-Service Date, Interconnection Customer will provide written notice to Transmission Provider of such later date upon which the completion of Transmission Provider's Interconnection Facilities will be required.

5.8 **Information Exchange**. As soon as reasonably practicable after the Effective Date, the Parties shall exchange information regarding the design and compatibility of the Parties' Interconnection Facilities and compatibility of the Interconnection Facilities with Transmission Provider's Transmission System, and shall work diligently and in good faith to make any necessary design changes.

5.9 **Limited Operation.** If any of Transmission Provider's Interconnection Facilities or Network Upgrades are not reasonably expected to be completed prior to the Commercial Operation Date of the Large Generating Facility, Transmission Provider shall, upon the request and at the expense of Interconnection Customer, perform operating studies on a timely basis to determine the extent to which the Large Generating Facility and Interconnection Customer's Interconnection Facilities may operate prior to the completion of Transmission Provider's Interconnection Facilities or Network Upgrades consistent with Applicable Laws and Regulations, Applicable Reliability Standards, Good Utility Practice, and this LGIA. Transmission Provider shall permit Interconnection Customer to operate the Large Generating Facility and Interconnection Customer's Interconnection Facilities in accordance with the results of such studies.

5.10 **Interconnection Customer's Interconnection Facilities ('ICIF').** Interconnection Customer shall, at its expense, design, procure, construct, own and install the ICIF, as set forth in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades.

5.10.1 **Interconnection Customer's Interconnection Facility Specifications.** Interconnection Customer shall submit initial specifications for the ICIF, including System Protection Facilities, to Transmission Provider at least one hundred eighty (180) Calendar Days prior to the Initial Synchronization Date; and final specifications for review and comment at least ninety (90) Calendar Days prior to the Initial Synchronization Date. Transmission Provider shall review such specifications to ensure that the ICIF are compatible with the technical specifications, operational control, and safety requirements of Transmission Provider and comment on such specifications within thirty (30) Calendar Days of Interconnection Customer's

submission. All specifications provided hereunder shall be deemed confidential.

5.10.2 **Transmission Provider's Review.** Transmission Provider's review of Interconnection Customer's final specifications shall not be construed as confirming, endorsing, or providing a warranty as to the design, fitness, safety, durability or reliability of the Large Generating Facility, or the ICIF. Interconnection Customer shall make such changes to the ICIF as may reasonably be required by Transmission Provider, in accordance with Good Utility Practice, to ensure that the ICIF are compatible with the technical specifications, operational control, and safety requirements of Transmission Provider.

5.10.3 **ICIF Construction.** The ICIF shall be designed and constructed in accordance with Good Utility Practice. Within one hundred twenty (120) Calendar Days after the Commercial Operation Date, unless the Parties agree on another mutually acceptable deadline, Interconnection Customer shall deliver to Transmission Provider "as-built" drawings, information and documents for the ICIF, such as: a one-line diagram, a site plan showing the Large Generating Facility and the ICIF, plan and elevation drawings showing the layout of the ICIF, a relay functional diagram, relaying AC and DC schematic wiring diagrams and relay settings for all facilities associated with Interconnection Customer's step-up transformers, the facilities connecting the Large Generating Facility to the step-up transformers and the ICIF, and the impedances (determined by factory tests) for the associated step-up transformers and the Large Generating Facility. The Interconnection Customer shall provide Transmission Provider specifications for the excitation system, automatic voltage regulator, Large

Generating Facility control and protection settings, transformer tap settings, and communications, if applicable.

5.11 **Transmission Provider's Interconnection Facilities Construction.** Transmission Provider's Interconnection Facilities shall be designed and constructed in accordance with Good Utility Practice. Upon request, within one hundred twenty (120) Calendar Days after the Commercial Operation Date, unless the Parties agree on another mutually acceptable deadline, Transmission Provider shall deliver to Interconnection Customer the following "as-built" drawings, information and documents for Transmission Provider's Interconnection Facilities [include appropriate drawings and relay diagrams].

Transmission Provider will obtain control of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades upon completion of such facilities.

5.12 **Access Rights.** Upon reasonable notice and supervision by a Party, and subject to any required or necessary regulatory approvals, a Party ("Granting Party") shall furnish at no cost to the other Party ("Access Party") any rights of use, licenses, rights of way and easements with respect to lands owned or controlled by the Granting Party, its agents (if allowed under the applicable agency agreement), or any Affiliate, that are necessary to enable the Access Party to obtain ingress and egress to construct, operate, maintain, repair, test (or witness testing), inspect, replace or remove facilities and equipment to: (i) interconnect the Large Generating Facility with the Transmission System; (ii) operate and maintain the Large Generating Facility, the Interconnection Facilities and the Transmission System; and (iii) disconnect or remove the Access Party's facilities and equipment upon termination of this LGIA. In exercising such licenses, rights of way and easements, the Access Party shall not unreasonably disrupt or interfere with normal operation of the Granting Party's business and shall adhere to the safety rules and procedures established in advance, as may be changed

from time to time, by the Granting Party and provided to the Access Party.

5.13 **Lands of Other Property Owners.** If any part of Transmission Provider or Transmission Owner's Interconnection Facilities and/or Network Upgrades is to be installed on property owned by persons other than Interconnection Customer or Transmission Provider or Transmission Owner, Transmission Provider or Transmission Owner shall at Interconnection Customer's expense use efforts, similar in nature and extent to those that it typically undertakes on its own behalf or on behalf of its Affiliates, including use of its eminent domain authority, and to the extent consistent with state law, to procure from such persons any rights of use, licenses, rights of way and easements that are necessary to construct, operate, maintain, test, inspect, replace or remove Transmission Provider or Transmission Owner's Interconnection Facilities and/or Network Upgrades upon such property.

5.14 **Permits.** Transmission Provider or Transmission Owner and Interconnection Customer shall cooperate with each other in good faith in obtaining all permits, licenses and authorizations that are necessary to accomplish the interconnection in compliance with Applicable Laws and Regulations. With respect to this paragraph, Transmission Provider or Transmission Owner shall provide permitting assistance to Interconnection Customer comparable to that provided to Transmission Provider's own, or an Affiliate's generation.

5.15 **Early Construction of Base Case Facilities.** Interconnection Customer may request Transmission Provider to construct, and Transmission Provider shall construct, using Reasonable Efforts to accommodate Interconnection Customer's In-Service Date, all or any portion of any Network Upgrades required for Interconnection Customer to be interconnected to the Transmission System which are included in the Base Case of the Facilities Study for Interconnection Customer, and which also are required to be constructed for another Interconnection Customer, but where such construction is not

scheduled to be completed in time to achieve Interconnection Customer's In-Service Date.

5.16 **Suspension.** Interconnection Customer reserves the right, upon written notice to Transmission Provider, to suspend at any time all work by Transmission Provider associated with the construction and installation of Transmission Provider's Interconnection Facilities and/or Network Upgrades required under this LGIA with the condition that Transmission System shall be left in a safe and reliable condition in accordance with Good Utility Practice and Transmission Provider's safety and reliability criteria. In such event, Interconnection Customer shall be responsible for all reasonable and necessary costs which Transmission Provider (i) has incurred pursuant to this LGIA prior to the suspension and (ii) incurs in suspending such work, including any costs incurred to perform such work as may be necessary to ensure the safety of persons and property and the integrity of the Transmission System during such suspension and, if applicable, any costs incurred in connection with the cancellation or suspension of material, equipment and labor contracts which Transmission Provider cannot reasonably avoid; provided, however, that prior to canceling or suspending any such material, equipment or labor contract, Transmission Provider shall obtain Interconnection Customer's authorization to do so.

Transmission Provider shall invoice Interconnection Customer for such costs pursuant to Article 12 and shall use due diligence to minimize its costs. In the event Interconnection Customer suspends work by Transmission Provider required under this LGIA pursuant to this Article 5.16, and has not requested Transmission Provider to recommence the work required under this LGIA on or before the expiration of three (3) years following commencement of such suspension, this LGIA shall be deemed terminated. The three-year period shall begin on the date the suspension is requested, or the date of the written notice to Transmission Provider, if no effective date is specified.

5.17 **Taxes.**

5.17.1 **Interconnection Customer Payments Not Taxable.** The Parties intend that all payments or property transfers made by Interconnection Customer to Transmission Provider for the installation of Transmission Provider's Interconnection Facilities and the Network Upgrades shall be non-taxable, either as contributions to capital, or as an advance, in accordance with the Internal Revenue Code and any applicable state income tax laws and shall not be taxable as contributions in aid of construction or otherwise under the Internal Revenue Code and any applicable state income tax laws.

5.17.2 **Representations and Covenants.** In accordance with IRS Notice 2001-82 and IRS Notice 88-129, Interconnection Customer represents and covenants that (i) ownership of the electricity generated at the Large Generating Facility will pass to another party prior to the transmission of the electricity on the Transmission System, (ii) for income tax purposes, the amount of any payments and the cost of any property transferred to Transmission Provider for Transmission Provider's Interconnection Facilities will be capitalized by Interconnection Customer as an intangible asset and recovered using the straight-line method over a useful life of twenty (20) years, and (iii) any portion of Transmission Provider's Interconnection Facilities that is a "dual-use intertie," within the meaning of IRS Notice 88-129, is reasonably expected to carry only a de minimis amount of electricity in the direction of the Large Generating Facility. For this purpose, "de minimis amount" means no more than 5 percent of the total power flows in both directions, calculated in accordance with the "5 percent test" set forth in IRS Notice 88-129. This is not intended to be an exclusive list of the relevant conditions that must be met to conform to

IRS requirements for non-taxable treatment.

At Transmission Provider's request, Interconnection Customer shall provide Transmission Provider with a report from an independent engineer confirming its representation in clause (iii), above. Transmission Provider represents and covenants that the cost of Transmission Provider's Interconnection Facilities paid for by Interconnection Customer will have no net effect on the base upon which rates are determined.

5.17.3 **Indemnification for the Cost Consequences of Current Tax Liability Imposed Upon the Transmission Provider.** Notwithstanding Article 5.17.1, Interconnection Customer shall protect, indemnify and hold harmless Transmission Provider from the cost consequences of any current tax liability imposed against Transmission Provider as the result of payments or property transfers made by Interconnection Customer to Transmission Provider under this LGIA for Interconnection Facilities, as well as any interest and penalties, other than interest and penalties attributable to any delay caused by Transmission Provider.

Transmission Provider shall not include a gross-up for the cost consequences of any current tax liability in the amounts it charges Interconnection Customer under this LGIA unless (i) Transmission Provider has determined, in good faith, that the payments or property transfers made by Interconnection Customer to Transmission Provider should be reported as income subject to taxation or (ii) any Governmental Authority directs Transmission Provider to report payments or property as income subject to taxation; provided, however, that Transmission Provider may require Interconnection Customer to provide security for

Interconnection Facilities, in a form reasonably acceptable to Transmission Provider (such as a parental guarantee or a letter of credit), in an amount equal to the cost consequences of any current tax liability under this Article 5.17. Interconnection Customer shall reimburse Transmission Provider for such costs on a fully grossed-up basis, in accordance with Article 5.17.4, within thirty (30) Calendar Days of receiving written notification from Transmission Provider of the amount due, including detail about how the amount was calculated.

The indemnification obligation shall terminate at the earlier of (1) the expiration of the ten year testing period and the applicable statute of limitation, as it may be extended by Transmission Provider upon request of the IRS, to keep these years open for audit or adjustment, or (2) the occurrence of a subsequent taxable event and the payment of any related indemnification obligations as contemplated by this Article 5.17.

5.17.4 **Tax Gross-Up Amount.** Interconnection Customer's liability for the cost consequences of any current tax liability under this Article 5.17 shall be calculated on a fully grossed-up basis. Except as may otherwise be agreed to by the parties, this means that Interconnection Customer will pay Transmission Provider, in addition to the amount paid for the Interconnection Facilities and Network Upgrades, an amount equal to (1) the current taxes imposed on Transmission Provider ("Current Taxes") on the excess of (a) the gross income realized by Transmission Provider as a result of payments or property transfers made by Interconnection Customer to Transmission Provider under this LGIA (without regard to any payments under this Article 5.17) (the "Gross Income Amount")

over (b) the present value of future tax deductions for depreciation that will be available as a result of such payments or property transfers (the "Present Value Depreciation Amount"), plus (2) an additional amount sufficient to permit Transmission Provider to receive and retain, after the payment of all Current Taxes, an amount equal to the net amount described in clause (1).

For this purpose, (i) Current Taxes shall be computed based on Transmission Provider's composite federal and state tax rates at the time the payments or property transfers are received and Transmission Provider will be treated as being subject to tax at the highest marginal rates in effect at that time (the "Current Tax Rate"), and (ii) the Present Value Depreciation Amount shall be computed by discounting Transmission Provider's anticipated tax depreciation deductions as a result of such payments or property transfers by Transmission Provider's current weighted average cost of capital. Thus, the formula for calculating Interconnection Customer's liability to Transmission Owner pursuant to this Article 5.17.4 can be expressed as follows: (Current Tax Rate x (Gross Income Amount - Present Value of Tax Depreciation))/(1-Current Tax Rate). Interconnection Customer's estimated tax liability in the event taxes are imposed shall be stated in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades.

5.17.5 **Private Letter Ruling or Change or Clarification of Law.** At Interconnection Customer's request and expense, Transmission Provider shall file with the IRS a request for a private letter ruling as to whether any property transferred or sums paid, or to be paid, by Interconnection Customer to Transmission

Provider under this LGIA are subject to federal income taxation. Interconnection Customer will prepare the initial draft of the request for a private letter ruling, and will certify under penalties of perjury that all facts represented in such request are true and accurate to the best of Interconnection Customer's knowledge. Transmission Provider and Interconnection Customer shall cooperate in good faith with respect to the submission of such request.

Transmission Provider shall keep Interconnection Customer fully informed of the status of such request for a private letter ruling and shall execute either a privacy act waiver or a limited power of attorney, in a form acceptable to the IRS, that authorizes Interconnection Customer to participate in all discussions with the IRS regarding such request for a private letter ruling. Transmission Provider shall allow Interconnection Customer to attend all meetings with IRS officials about the request and shall permit Interconnection Customer to prepare the initial drafts of any follow-up letters in connection with the request.

5.17.6 **Subsequent Taxable Events.** If, within 10 years from the date on which the relevant Transmission Provider's Interconnection Facilities are placed in service, (i) Interconnection Customer Breaches the covenants contained in Article 5.17.2, (ii) a "disqualification event" occurs within the meaning of IRS Notice 88-129, or (iii) this LGIA terminates and Transmission Provider retains ownership of the Interconnection Facilities and Network Upgrades, Interconnection Customer shall pay a tax gross-up for the cost consequences of any current tax liability imposed on Transmission Provider, calculated using the methodology described

in Article 5.17.4 and in accordance with IRS Notice 90-60.

5.17.7 **Contests.** In the event any Governmental Authority determines that Transmission Provider's receipt of payments or property constitutes income that is subject to taxation, Transmission Provider shall notify Interconnection Customer, in writing, within thirty (30) Calendar Days of receiving notification of such determination by a Governmental Authority. Upon the timely written request by Interconnection Customer and at Interconnection Customer's sole expense, Transmission Provider may appeal, protest, seek abatement of, or otherwise oppose such determination. Upon Interconnection Customer's written request and sole expense, Transmission Provider may file a claim for refund with respect to any taxes paid under this Article 5.17, whether or not it has received such a determination. Transmission Provider reserves the right to make all decisions with regard to the prosecution of such appeal, protest, abatement or other contest, including the selection of counsel and compromise or settlement of the claim, but Transmission Provider shall keep Interconnection Customer informed, shall consider in good faith suggestions from Interconnection Customer about the conduct of the contest, and shall reasonably permit Interconnection Customer or an Interconnection Customer representative to attend contest proceedings.

Interconnection Customer shall pay to Transmission Provider on a periodic basis, as invoiced by Transmission Provider, Transmission Provider's documented reasonable costs of prosecuting such appeal, protest, abatement or other contest. At any time during the contest, Transmission Provider may agree to a settlement either with Interconnection

Customer's consent or after obtaining written advice from nationally-recognized tax counsel, selected by Transmission Provider, but reasonably acceptable to Interconnection Customer, that the proposed settlement represents a reasonable settlement given the hazards of litigation. Interconnection Customer's obligation shall be based on the amount of the settlement agreed to by Interconnection Customer, or if a higher amount, so much of the settlement that is supported by the written advice from nationally-recognized tax counsel selected under the terms of the preceding sentence. The settlement amount shall be calculated on a fully grossed-up basis to cover any related cost consequences of the current tax liability. Any settlement without Interconnection Customer's consent or such written advice will relieve Interconnection Customer from any obligation to indemnify Transmission Provider for the tax at issue in the contest.

5.17.8 **Refund.** In the event that (a) a private letter ruling is issued to Transmission Provider which holds that any amount paid or the value of any property transferred by Interconnection Customer to Transmission Provider under the terms of this LGIA is not subject to federal income taxation, (b) any legislative change or administrative announcement, notice, ruling or other determination makes it reasonably clear to Transmission Provider in good faith that any amount paid or the value of any property transferred by Interconnection Customer to Transmission Provider under the terms of this LGIA is not taxable to Transmission Provider, (c) any abatement, appeal, protest, or other contest results in a determination that any payments or transfers made by Interconnection Customer to Transmission Provider are not subject to federal income

tax, or (d) if Transmission Provider receives a refund from any taxing authority for any overpayment of tax attributable to any payment or property transfer made by Interconnection Customer to Transmission Provider pursuant to this LGIA, Transmission Provider shall promptly refund to Interconnection Customer the following:

(i) any payment made by Interconnection Customer under this Article 5.17 for taxes that is attributable to the amount determined to be non-taxable, together with interest thereon,

(ii) interest on any amounts paid by Interconnection Customer to Transmission Provider for such taxes which Transmission Provider did not submit to the taxing authority, calculated in accordance with the methodology set forth in FERC's regulations at 18 CFR §35.19a(a)(2)(iii) from the date payment was made by Interconnection Customer to the date Transmission Provider refunds such payment to Interconnection Customer, and

(iii) with respect to any such taxes paid by Transmission Provider, any refund or credit Transmission Provider receives or to which it may be entitled from any Governmental Authority, interest (or that portion thereof attributable to the payment described in clause (i), above) owed to Transmission Provider for such overpayment of taxes (including any reduction in interest otherwise payable by Transmission Provider to any Governmental Authority resulting

from an offset or credit); provided, however, that Transmission Provider will remit such amount promptly to Interconnection Customer only after and to the extent that Transmission Provider has received a tax refund, credit or offset from any Governmental Authority for any applicable overpayment of income tax related to Transmission Provider's Interconnection Facilities.

The intent of this provision is to leave the Parties, to the extent practicable, in the event that no taxes are due with respect to any payment for Interconnection Facilities and Network Upgrades hereunder, in the same position they would have been in had no such tax payments been made.

5.17.9 **Taxes Other Than Income Taxes.** Upon the timely request by Interconnection Customer, and at Interconnection Customer's sole expense, Transmission Provider may appeal, protest, seek abatement of, or otherwise contest any tax (other than federal or state income tax) asserted or assessed against Transmission Provider for which Interconnection Customer may be required to reimburse Transmission Provider under the terms of this LGIA. Interconnection Customer shall pay to Transmission Provider on a periodic basis, as invoiced by Transmission Provider, Transmission Provider's documented reasonable costs of prosecuting such appeal, protest, abatement, or other contest. Interconnection Customer and Transmission Provider shall cooperate in good faith with respect to any such contest. Unless the payment of such taxes is a prerequisite to an appeal or abatement or cannot be deferred, no amount shall be payable by Interconnection Customer to Transmission Provider for such

taxes until they are assessed by a final, non-appealable order by any court or agency of competent jurisdiction. In the event that a tax payment is withheld and ultimately due and payable after appeal, Interconnection Customer will be responsible for all taxes, interest and penalties, other than penalties attributable to any delay caused by Transmission Provider.

5.17.10 **Transmission Owners Who Are Not Transmission Providers.** If Transmission Provider is not the same entity as the Transmission Owner, then (i) all references in this Article 5.17 to Transmission Provider shall be deemed also to refer to and to include the Transmission Owner, as appropriate, and (ii) this LGIA shall not become effective until such Transmission Owner shall have agreed in writing to assume all of the duties and obligations of Transmission Provider under this Article 5.17 of this LGIA.

5.18 **Tax Status.** Each Party shall cooperate with the other to maintain the other Party's tax status. Nothing in this LGIA is intended to adversely affect any Transmission Provider's tax exempt status with respect to the issuance of bonds including, but not limited to, Local Furnishing Bonds.

5.19 **Modification.**

5.19.1 **General.** Either Party may undertake modifications to its facilities. If a Party plans to undertake a modification that reasonably may be expected to affect the other Party's facilities, that Party shall provide to the other Party sufficient information regarding such modification so that the other Party may evaluate the potential impact of such modification prior to commencement of the work. Such information shall be deemed to be confidential hereunder and shall

include information concerning the timing of such modifications and whether such modifications are expected to interrupt the flow of electricity from the Large Generating Facility. The Party desiring to perform such work shall provide the relevant drawings, plans, and specifications to the other Party at least ninety (90) Calendar Days in advance of the commencement of the work or such shorter period upon which the Parties may agree, which agreement shall not unreasonably be withheld, conditioned or delayed.

In the case of Large Generating Facility modifications that do not require Interconnection Customer to submit an Interconnection Request, Transmission Provider shall provide, within thirty (30) Calendar Days (or such other time as the Parties may agree), an estimate of any additional modifications to the Transmission System, Transmission Provider's Interconnection Facilities or Network Upgrades necessitated by such Interconnection Customer modification and a good faith estimate of the costs thereof.

5.19.2 **Standards.** Any additions, modifications, or replacements made to a Party's facilities shall be designed, constructed and operated in accordance with this LGIA and Good Utility Practice.

5.19.3 **Modification Costs.** Interconnection Customer shall not be directly assigned for the costs of any additions, modifications, or replacements that Transmission Provider makes to Transmission Provider's Interconnection Facilities or the Transmission System to facilitate the interconnection of a third party to Transmission Provider's Interconnection Facilities or the Transmission System, or to provide

transmission service to a third party under Transmission Provider's Tariff. Interconnection Customer shall be responsible for the costs of any additions, modifications, or replacements to Interconnection Customer's Interconnection Facilities that may be necessary to maintain or upgrade such Interconnection Customer's Interconnection Facilities consistent with Applicable Laws and Regulations, Applicable Reliability Standards or Good Utility Practice.

Article 6. Testing and Inspection

6.1 **Pre-Commercial Operation Date Testing and Modifications.** Prior to the Commercial Operation Date, Transmission Provider shall test Transmission Provider's Interconnection Facilities and Network Upgrades and Interconnection Customer shall test the Large Generating Facility and Interconnection Customer's Interconnection Facilities to ensure their safe and reliable operation. Similar testing may be required after initial operation. Each Party shall make any modifications to its facilities that are found to be necessary as a result of such testing. Interconnection Customer shall bear the cost of all such testing and modifications. Interconnection Customer shall generate test energy at the Large Generating Facility only if it has arranged for the delivery of such test energy.

6.2 **Post-Commercial Operation Date Testing and Modifications.** Each Party shall at its own expense perform routine inspection and testing of its facilities and equipment in accordance with Good Utility Practice as may be necessary to ensure the continued interconnection of the Large Generating Facility with the Transmission System in a safe and reliable manner. Each Party shall have the right, upon advance written notice, to require reasonable additional testing of the other Party's facilities, at the requesting Party's expense, as may be in accordance with Good Utility Practice.

6.3 **Right to Observe Testing**. Each Party shall notify the other Party in advance of its performance of tests of its Interconnection Facilities. The other Party has the right, at its own expense, to observe such testing.

6.4 **Right to Inspect**. Each Party shall have the right, but shall have no obligation to: (i) observe the other Party's tests and/or inspection of any of its System Protection Facilities and other protective equipment, including Power System Stabilizers; (ii) review the settings of the other Party's System Protection Facilities and other protective equipment; and (iii) review the other Party's maintenance records relative to the Interconnection Facilities, the System Protection Facilities and other protective equipment. A Party may exercise these rights from time to time as it deems necessary upon reasonable notice to the other Party. The exercise or non-exercise by a Party of any such rights shall not be construed as an endorsement or confirmation of any element or condition of the Interconnection Facilities or the System Protection Facilities or other protective equipment or the operation thereof, or as a warranty as to the fitness, safety, desirability, or reliability of same. Any information that a Party obtains through the exercise of any of its rights under this Article 6.4 shall be deemed to be Confidential Information and treated pursuant to Article 22 of this LGIA.

Article 7. Metering

7.1 **General.** Each Party shall comply with the Applicable Reliability Council requirements. Unless otherwise agreed by the Parties, Transmission Provider shall install Metering Equipment at the Point of Interconnection prior to any operation of the Large Generating Facility and shall own, operate, test and maintain such Metering Equipment. Power flows to and from the Large Generating Facility shall be measured at or, at Transmission Provider's option, compensated to, the Point of Interconnection. Transmission Provider shall provide metering quantities, in analog and/or digital form, to Interconnection Customer upon request. Interconnection Customer shall bear all

reasonable documented costs associated with the purchase, installation, operation, testing and maintenance of the Metering Equipment.

7.2 **Check Meters**. Interconnection Customer, at its option and expense, may install and operate, on its premises and on its side of the Point of Interconnection, one or more check meters to check Transmission Provider's meters. Such check meters shall be for check purposes only and shall not be used for the measurement of power flows for purposes of this LGIA, except as provided in Article 7.4 below. The check meters shall be subject at all reasonable times to inspection and examination by Transmission Provider or its designee. The installation, operation and maintenance thereof shall be performed entirely by Interconnection Customer in accordance with Good Utility Practice.

7.3 **Standards**. Transmission Provider shall install, calibrate, and test revenue quality Metering Equipment in accordance with applicable ANSI standards.

7.4 **Testing of Metering Equipment**. Transmission Provider shall inspect and test all Transmission Provider-owned Metering Equipment upon installation and at least once every two (2) years thereafter. If requested to do so by Interconnection Customer, Transmission Provider shall, at Interconnection Customer's expense, inspect or test Metering Equipment more frequently than every two (2) years. Transmission Provider shall give reasonable notice of the time when any inspection or test shall take place, and Interconnection Customer may have representatives present at the test or inspection. If at any time Metering Equipment is found to be inaccurate or defective, it shall be adjusted, repaired or replaced at Interconnection Customer's expense, in order to provide accurate metering, unless the inaccuracy or defect is due to Transmission Provider's failure to maintain, then Transmission Provider shall pay. If Metering Equipment fails to register, or if the measurement made by Metering Equipment during a test varies by more than two percent from the measurement made by the standard meter used in the test, Transmission

Provider shall adjust the measurements by correcting all measurements for the period during which Metering Equipment was in error by using Interconnection Customer's check meters, if installed. If no such check meters are installed or if the period cannot be reasonably ascertained, the adjustment shall be for the period immediately preceding the test of the Metering Equipment equal to one-half the time from the date of the last previous test of the Metering Equipment.

7.5 **Metering Data.** At Interconnection Customer's expense, the metered data shall be telemetered to one or more locations designated by Transmission Provider and one or more locations designated by Interconnection Customer. Such telemetered data shall be used, under normal operating conditions, as the official measurement of the amount of energy delivered from the Large Generating Facility to the Point of Interconnection.

Article 8. Communications

8.1 **Interconnection Customer Obligations.** Interconnection Customer shall maintain satisfactory operating communications with Transmission Provider's Transmission System dispatcher or representative designated by Transmission Provider. Interconnection Customer shall provide standard voice line, dedicated voice line and facsimile communications at its Large Generating Facility control room or central dispatch facility through use of either the public telephone system, or a voice communications system that does not rely on the public telephone system. Interconnection Customer shall also provide the dedicated data circuit(s) necessary to provide Interconnection Customer data to Transmission Provider as set forth in Appendix D, Security Arrangements Details. The data circuit(s) shall extend from the Large Generating Facility to the location(s) specified by Transmission Provider. Any required maintenance of such communications equipment shall be performed by Interconnection Customer. Operational communications shall be activated and maintained under, but not be limited to, the following events: system paralleling or separation,

scheduled and unscheduled shutdowns, equipment clearances, and hourly and daily load data.

8.2 **Remote Terminal Unit**. Prior to the Initial Synchronization Date of the Large Generating Facility, a Remote Terminal Unit, or equivalent data collection and transfer equipment acceptable to the Parties, shall be installed by Interconnection Customer, or by Transmission Provider at Interconnection Customer's expense, to gather accumulated and instantaneous data to be telemetered to the location(s) designated by Transmission Provider through use of a dedicated point-to-point data circuit(s) as indicated in Article 8.1. The communication protocol for the data circuit(s) shall be specified by Transmission Provider. Instantaneous bi-directional analog real power and reactive power flow information must be telemetered directly to the location(s) specified by Transmission Provider.

Each Party will promptly advise the other Party if it detects or otherwise learns of any metering, telemetry or communications equipment errors or malfunctions that require the attention and/or correction by the other Party. The Party owning such equipment shall correct such error or malfunction as soon as reasonably feasible.

8.3 **No Annexation.** Any and all equipment placed on the premises of a Party shall be and remain the property of the Party providing such equipment regardless of the mode and manner of annexation or attachment to real property, unless otherwise mutually agreed by the Parties.

8.4 **Provision of Data from a Variable Energy Resource.** The Interconnection Customer whose Generating Facility is a Variable Energy Resource shall provide meteorological and forced outage data to the Transmission Provider to the extent necessary for the Transmission Provider's development and deployment of power production forecasts for that class of Variable Energy Resources. The Interconnection Customer with a Variable Energy Resource having wind as the energy source, at a minimum, will be required to provide the Transmission Provider with site-specific meteorological data including: temperature, wind

speed, wind direction, and atmospheric pressure. The Interconnection Customer with a Variable Energy Resource having solar as the energy source, at a minimum, will be required to provide the Transmission Provider with site-specific meteorological data including: temperature, atmospheric pressure, and irradiance. The Transmission Provider and Interconnection Customer whose Generating Facility is a Variable Energy Resource shall mutually agree to any additional meteorological data that are required for the development and deployment of a power production forecast. The Interconnection Customer whose Generating Facility is a Variable Energy Resource also shall submit data to the Transmission Provider regarding all forced outages to the extent necessary for the Transmission Provider's development and deployment of power production forecasts for that class of Variable Energy Resources. The exact specifications of the meteorological and forced outage data to be provided by the Interconnection Customer to the Transmission Provider, including the frequency and timing of data submittals, shall be made taking into account the size and configuration of the Variable Energy Resource, its characteristics, location, and its importance in maintaining generation resource adequacy and transmission system reliability in its area. All requirements for meteorological and forced outage data must be commensurate with the power production forecasting employed by the Transmission Provider. Such requirements for meteorological and forced outage data are set forth in Appendix C, Interconnection Details, of this LGIA, as they may change from time to time.

Article 9. Operations

9.1 **General.** Each Party shall comply with the Applicable Reliability Council requirements. Each Party shall provide to the other Party all information that may reasonably be required by the other Party to comply with Applicable Laws and Regulations and Applicable Reliability Standards.

9.2 **Control Area Notification.** At least three months before Initial Synchronization Date, Interconnection Customer shall notify Transmission Provider in

writing of the Control Area in which the Large Generating Facility will be located. If Interconnection Customer elects to locate the Large Generating Facility in a Control Area other than the Control Area in which the Large Generating Facility is physically located, and if permitted to do so by the relevant transmission tariffs, all necessary arrangements, including but not limited to those set forth in Article 7 and Article 8 of this LGIA, and remote Control Area generator interchange agreements, if applicable, and the appropriate measures under such agreements, shall be executed and implemented prior to the placement of the Large Generating Facility in the other Control Area.

9.3 **Transmission Provider Obligations.** Transmission Provider shall cause the Transmission System and Transmission Provider's Interconnection Facilities to be operated, maintained and controlled in a safe and reliable manner and in accordance with this LGIA. Transmission Provider may provide operating instructions to Interconnection Customer consistent with this LGIA and Transmission Provider's operating protocols and procedures as they may change from time to time. Transmission Provider will consider changes to its operating protocols and procedures proposed by Interconnection Customer.

9.4 **Interconnection Customer Obligations.** Interconnection Customer shall at its own expense operate, maintain and control the Large Generating Facility and Interconnection Customer's Interconnection Facilities in a safe and reliable manner and in accordance with this LGIA. Interconnection Customer shall operate the Large Generating Facility and Interconnection Customer's Interconnection Facilities in accordance with all applicable requirements of the Control Area of which it is part, as such requirements are set forth in Appendix C, Interconnection Details, of this LGIA. Appendix C, Interconnection Details, will be modified to reflect changes to the requirements as they may change from time to time. Either Party may request that the other Party provide copies of the requirements set forth in Appendix C, Interconnection Details, of this LGIA.

9.5 **Start-Up and Synchronization.** Consistent with the Parties' mutually acceptable procedures, Interconnection Customer is responsible for the proper synchronization of the Large Generating Facility to Transmission Provider's Transmission System.

9.6 **Reactive Power.**

9.6.1 **Power Factor Design Criteria.** Interconnection Customer shall design the Large Generating Facility to maintain a composite power delivery at continuous rated power output at the Point of Interconnection at a power factor within the range of 0.95 leading to 0.95 lagging, unless Transmission Provider has established different requirements that apply to all generators in the Control Area on a comparable basis. The requirements of this paragraph shall not apply to wind generators.

9.6.1.1 **Synchronous Generation** Interconnection Customer shall design the Large Generating Facility to maintain a composite power deliver at continuous rated power output at the Point of Interconnection at a power factor within the range of 0.95 leading to 0.95 lagging, unless the Transmission Provider has established different requirements that apply to all synchronous generators in the Control Area on a comparable basis.

9.6.1.2 **Non-Synchronous Generation** Interconnection Customer shall design the Large Generating Facility to maintain a composite power delivery at continuous rated power output at the high-side of the generator substation at a power factor within the range of 0.95 leading to 0.95 lagging, unless the Transmission Provider has established a different power factor range that applies to all non-synchronous generators in the Control Area on a comparable basis. This power factor range standard shall be dynamic and can be met using, for example, power electronics designed to supply this level of reactive capability (taking into account any limitations due to voltage level, real power output, etc.) or fixed and switched capacitors, or a combination of the two. This requirement shall only apply to newly interconnecting non-synchronous generators that have not yet executed a Facilities Study Agreement as of the effective date of the Final Rule establishing this requirement (Order No. 827).

9.6.2 **Voltage Schedules.** Once Interconnection Customer has synchronized the Large Generating Facility with the Transmission System, Transmission Provider shall require Interconnection Customer to operate the Large Generating Facility to produce or absorb reactive power within the design limitations of the Large Generating Facility set forth in Article 9.6.1 (Power Factor Design Criteria). Transmission Provider's voltage schedules shall treat all sources of reactive power in the Control Area in an equitable and not unduly discriminatory manner. Transmission Provider shall exercise Reasonable Efforts to provide Interconnection Customer with such schedules at least one (1) day in advance,

and may make changes to such schedules as necessary to maintain the reliability of the Transmission System. Interconnection Customer shall operate the Large Generating Facility to maintain the specified output voltage or power factor at the Point of Interconnection within the design limitations of the Large Generating Facility set forth in Article 9.6.1 (Power Factor Design Criteria). If Interconnection Customer is unable to maintain the specified voltage or power factor, it shall promptly notify the System Operator.

9.6.2.1 Governors and Regulators. Whenever the Large Generating Facility is operated in parallel with the Transmission System and the speed governors (if installed on the generating unit pursuant to Good Utility Practice) and voltage regulators are capable of operation, Interconnection Customer shall operate the Large Generating Facility with its speed governors and voltage regulators in automatic operation. If the Large Generating Facility's speed governors and voltage regulators are not capable of such automatic operation, Interconnection Customer shall immediately notify Transmission Provider's system operator, or its designated representative, and ensure that such Large Generating Facility's reactive power production or absorption (measured in MVARs) are within the design capability of the Large Generating Facility's generating unit(s) and steady state stability limits. Interconnection Customer shall not cause its Large Generating Facility to disconnect automatically or instantaneously from the Transmission System or trip any generating unit comprising the Large Generating Facility for an under or over frequency condition unless the abnormal frequency condition persists for a time period beyond the limits set forth in ANSI/IEEE Standard C37.106, or such other standard as applied to other generators in the Control Area on a comparable basis.

9.6.3 **Payment for Reactive Power.** Transmission Provider is required to pay Interconnection Customer for reactive power that Interconnection Customer provides or absorbs from the Large Generating Facility when Transmission Provider requests Interconnection Customer to operate its Large Generating Facility outside the range specified in Article 9.6.1, provided that if Transmission Provider pays its own or affiliated generators for reactive power service within the specified range, it must also pay Interconnection Customer. Payments shall be pursuant to Article 11.6 or such other agreement to which the Parties have otherwise agreed.

9.7 **Outages and Interruptions.**

9.7.1 **Outages.**

9.7.1.1 **Outage Authority and Coordination.** Each Party may in accordance with Good Utility Practice in coordination with the other Party remove from service any of its respective Interconnection Facilities or Network Upgrades that may impact the other Party's facilities as necessary to perform maintenance or testing or to install or replace equipment. Absent an

Emergency Condition, the Party scheduling a removal of such facility(ies) from service will use Reasonable Efforts to schedule such removal on a date and time mutually acceptable to the Parties. In all circumstances, any Party planning to remove such facility(ies) from service shall use Reasonable Efforts to minimize the effect on the other Party of such removal.

9.7.1.2 **Outage Schedules.** Transmission Provider shall post scheduled outages of its transmission facilities on the OASIS. Interconnection Customer shall submit its planned maintenance schedules for the Large Generating Facility to Transmission Provider for a minimum of a rolling twenty-four month period. Interconnection Customer shall update its planned maintenance schedules as necessary. Transmission Provider may request Interconnection Customer to reschedule its maintenance as necessary to maintain the reliability of the Transmission System; provided, however, adequacy of generation supply shall not be a criterion in determining Transmission System reliability. Transmission Provider shall compensate Interconnection Customer for any additional direct costs that Interconnection Customer incurs as a result of having to reschedule maintenance, including any additional overtime, breaking of maintenance contracts or other costs above and beyond the cost Interconnection Customer would have incurred absent Transmission

Provider's request to reschedule maintenance. Interconnection Customer will not be eligible to receive compensation, if during the twelve (12) months prior to the date of the scheduled maintenance, Interconnection Customer had modified its schedule of maintenance activities.

9.7.1.3 **Outage Restoration**. If an outage on a Party's Interconnection Facilities or Network Upgrades adversely affects the other Party's operations or facilities, the Party that owns or controls the facility that is out of service shall use Reasonable Efforts to promptly restore such facility(ies) to a normal operating condition consistent with the nature of the outage. The Party that owns or controls the facility that is out of service shall provide the other Party, to the extent such information is known, information on the nature of the Emergency Condition, an estimated time of restoration, and any corrective actions required. Initial verbal notice shall be followed up as soon as practicable with written notice explaining the nature of the outage.

9.7.2 **Interruption of Service**. If required by Good Utility Practice to do so, Transmission Provider may require Interconnection Customer to interrupt or reduce deliveries of electricity if such delivery of electricity could adversely affect Transmission Provider's ability to perform such activities as are necessary to safely and reliably operate and maintain the Transmission System. The following provisions shall apply to any interruption or reduction permitted under this Article 9.7.2:

9.7.2.1 The interruption or reduction shall continue only for so long as reasonably necessary under Good Utility Practice;

9.7.2.2 Any such interruption or reduction shall be made on an equitable, non-discriminatory basis with respect to all generating facilities directly connected to the Transmission System;

9.7.2.3 When the interruption or reduction must be made under circumstances which do not allow for advance notice, Transmission Provider shall notify Interconnection Customer by telephone as soon as practicable of the reasons for the curtailment, interruption, or reduction, and, if known, its expected duration. Telephone notification shall be followed by written notification as soon as practicable;

9.7.2.4 Except during the existence of an Emergency Condition, when the interruption or reduction can be scheduled without advance notice, Transmission Provider shall notify Interconnection Customer in advance regarding the timing of such scheduling and further notify Interconnection Customer of the expected duration. Transmission Provider shall coordinate with Interconnection Customer using Good Utility Practice to schedule the interruption or reduction during periods of least impact to Interconnection Customer and Transmission Provider;

9.7.2.5 The Parties shall cooperate and coordinate with each other to the extent necessary in order to restore the Large Generating Facility, Interconnection Facilities, and the Transmission System to their normal operating state, consistent with system conditions and Good Utility Practice.

9.7.3 **Under-Frequency and Over Frequency Conditions.** The Transmission System is designed to automatically activate a load-shed program as required by the Applicable Reliability Council in the event of an under-frequency system disturbance. Interconnection Customer shall implement under-frequency and over-frequency relay set points for the Large Generating Facility as required by the Applicable Reliability Council to ensure "ride through" capability of the Transmission System. Large Generating Facility response to frequency deviations of pre-determined magnitudes, both under-frequency and over-frequency deviations, shall be studied and coordinated with Transmission Provider in accordance with Good Utility Practice. The term "ride through" as used herein shall mean the ability of a Generating Facility to stay connected to and synchronized with the Transmission System during system disturbances within a range of under-frequency and over-frequency conditions, in accordance with Good Utility Practice.

9.7.4 **System Protection and Other Control Requirements.**

9.7.4.1 **System Protection Facilities.** Interconnection Customer shall, at its expense, install, operate and maintain System Protection Facilities as a part of the Large Generating Facility or Interconnection Customer's Interconnection Facilities. Transmission Provider shall install at Interconnection Customer's expense any System Protection Facilities that may be required on Transmission Provider's Interconnection Facilities or the Transmission System as a result of the interconnection of the Large Generating Facility and Interconnection Customer's Interconnection Facilities.

9.7.4.2 Each Party's protection facilities shall be designed and coordinated with other systems in accordance with Good Utility Practice.

9.7.4.3 Each Party shall be responsible for protection of its facilities consistent with Good Utility Practice.

9.7.4.4 Each Party's protective relay design shall incorporate the necessary test switches to perform the tests required in Article 6. The required test switches will be placed such that they allow operation of lockout relays while preventing breaker failure schemes from operating and causing unnecessary breaker operations and/or the tripping of Interconnection Customer's units.

9.7.4.5 Each Party will test, operate and maintain System Protection Facilities in accordance with Good Utility Practice.

9.7.4.6 Prior to the In-Service Date, and again prior to the Commercial Operation Date, each Party or its agent shall perform a complete calibration test and functional trip test of the System Protection Facilities. At intervals suggested by Good Utility Practice and following any apparent malfunction of the System Protection Facilities, each Party shall perform both calibration and functional trip tests of its System Protection Facilities. These tests do not require the tripping of any in-service generation unit. These tests do, however, require that all protective relays and lockout contacts be activated.

9.7.5 **Requirements for Protection.** In compliance with Good Utility Practice, Interconnection Customer shall provide, install, own, and maintain relays, circuit breakers and all other devices necessary to remove any fault contribution of the Large Generating Facility to any short circuit occurring on the Transmission System not otherwise isolated by Transmission Provider's equipment, such that the removal of the fault contribution shall be coordinated with the protective requirements of the Transmission System. Such protective equipment shall include, without limitation, a disconnecting device or switch with load-interrupting capability located between the Large Generating Facility and the Transmission System at a site selected upon mutual agreement (not to be unreasonably withheld, conditioned or delayed) of the Parties. Interconnection Customer shall be responsible for protection of the Large Generating Facility and Interconnection Customer's other equipment from such conditions as negative sequence currents, over- or under-frequency, sudden load rejection, over- or under-voltage, and generator loss-of-field. Interconnection Customer shall be solely responsible to disconnect the Large Generating Facility and Interconnection Customer's other equipment if conditions on the Transmission System could adversely affect the Large Generating Facility.

9.7.6 **Power Quality.** Neither Party's facilities shall cause excessive voltage flicker nor introduce excessive distortion to the sinusoidal voltage or current waves as defined by ANSI Standard C84.1-1989, in accordance with IEEE Standard 519, or any applicable superseding electric industry standard. In the event of a conflict between ANSI Standard C84.1-1989, or any applicable superseding electric industry standard, ANSI Standard C84.1-1989, or the applicable superseding electric industry standard, shall control.

9.8 **Switching and Tagging Rules.** Each Party shall provide the other Party a copy of its switching and tagging rules that are applicable to the other Party's activities. Such switching and tagging rules shall be developed on a non-discriminatory basis. The Parties shall comply with applicable switching and tagging rules, as amended from time to time, in

obtaining clearances for work or for switching operations on equipment.

9.9 **Use of Interconnection Facilities by Third Parties.**

9.9.1 **Purpose of Interconnection Facilities.** Except as may be required by Applicable Laws and Regulations, or as otherwise agreed to among the Parties, the Interconnection Facilities shall be constructed for the sole purpose of interconnecting the Large Generating Facility to the Transmission System and shall be used for no other purpose.

9.9.2 **Third Party Users.** If required by Applicable Laws and Regulations or if the Parties mutually agree, such agreement not to be unreasonably withheld, to allow one or more third parties to use Transmission Provider's Interconnection Facilities, or any part thereof, Interconnection Customer will be entitled to compensation for the capital expenses it incurred in connection with the Interconnection Facilities based upon the pro rata use of the Interconnection Facilities by Transmission Provider, all third party users, and Interconnection Customer, in accordance with Applicable Laws and Regulations or upon some other mutually-agreed upon methodology. In addition, cost responsibility for ongoing costs, including operation and maintenance costs associated with the Interconnection Facilities, will be allocated between Interconnection Customer and any third party users based upon the pro rata use of the Interconnection Facilities by Transmission Provider, all third party users, and Interconnection Customer, in accordance with Applicable Laws and Regulations or upon some other mutually agreed upon methodology. If the issue of such compensation or allocation cannot be resolved through such negotiations, it shall be submitted to FERC for resolution.

9.10 **Disturbance Analysis Data Exchange.** The Parties will cooperate with one another in the analysis of disturbances to either the Large Generating Facility or Transmission Provider's Transmission System by gathering and providing access to any information relating to any disturbance, including information from oscillography, protective relay targets, breaker operations and sequence of events records, and any disturbance information required by Good Utility Practice.

Article 10. Maintenance

10.1 **Transmission Provider Obligations.** Transmission Provider shall maintain the Transmission System and Transmission Provider's Interconnection Facilities in a safe and reliable manner and in accordance with this LGIA.

10.2 **Interconnection Customer Obligations.** Interconnection Customer shall maintain the Large Generating Facility and Interconnection Customer's Interconnection Facilities in a safe and reliable manner and in accordance with this LGIA.

10.3 **Coordination.** The Parties shall confer regularly to coordinate the planning, scheduling and performance of preventive and corrective maintenance on the Large Generating Facility and the Interconnection Facilities.

10.4 **Secondary Systems.** Each Party shall cooperate with the other in the inspection, maintenance, and testing of control or power circuits that operate below 600 volts, AC or DC, including, but not limited to, any hardware, control or protective devices, cables, conductors, electric raceways, secondary equipment panels, transducers, batteries, chargers, and voltage and current transformers that directly affect the operation of a Party's facilities and equipment which may reasonably be expected to impact the other Party. Each Party shall provide advance notice to the other Party before undertaking any work on such circuits, especially on electrical circuits involving circuit

breaker trip and close contacts, current transformers, or potential transformers.

10.5 **Operating and Maintenance Expenses.** Subject to the provisions herein addressing the use of facilities by others, and except for operations and maintenance expenses associated with modifications made for providing interconnection or transmission service to a third party and such third party pays for such expenses, Interconnection Customer shall be responsible for all reasonable expenses including overheads, associated with: (1) owning, operating, maintaining, repairing, and replacing Interconnection Customer's Interconnection Facilities; and (2) operation, maintenance, repair and replacement of Transmission Provider's Interconnection Facilities.

Article 11. Performance Obligation

11.1 **Interconnection Customer Interconnection Facilities.** Interconnection Customer shall design, procure, construct, install, own and/or control Interconnection Customer Interconnection Facilities described in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades, at its sole expense.

11.2 **Transmission Provider's Interconnection Facilities.** Transmission Provider or Transmission Owner shall design, procure, construct, install, own and/or control the Transmission Provider's Interconnection Facilities described in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades, at the sole expense of the Interconnection Customer.

11.3 **Network Upgrades and Distribution Upgrades.** Transmission Provider or Transmission Owner shall design, procure, construct, install, and own the Network Upgrades and Distribution Upgrades described in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades. The Interconnection Customer shall be responsible for all costs related to Distribution Upgrades. Unless Transmission Provider or Transmission Owner elects to fund the capital for the Network Upgrades, they shall

be solely funded by Interconnection Customer. In the event that Transmission Provider must change the voltage levels of a discrete portion of the Transmission System to which the Interconnection Customer is connected, Transmission Provider shall give reasonable notice of such change and the Interconnection Customer shall be solely responsible for all costs related to upgrades or modifications to Interconnection Customer's Interconnection Facilities resulting from Transmission Provider's increase in the voltage levels of the Transmission System, in order to remain interconnected with the Transmission System at the new operating voltage. To the extent that the modifications necessary to upgrade Interconnection Facilities qualify as Network Upgrades, Transmission Provider shall be solely responsible for the expense of such modifications or upgrades.

11.4 Transmission Credits.

11.4.1 **Repayment of Amounts Advanced for Network Upgrades**. Interconnection Customer shall be entitled to a cash repayment, equal to the total amount paid to Transmission Provider and Affected System Operator, if any, for the Network Upgrades, including any tax gross-up or other tax-related payments associated with Network Upgrades, and not refunded to Interconnection Customer pursuant to Article 5.17.8 or otherwise, to be paid to Interconnection Customer on a dollar-for-dollar basis for the non-usage sensitive portion of transmission charges, as payments are made under Transmission Provider's Tariff and Affected System's Tariff for transmission services with respect to the Large Generating Facility. Any repayment shall include interest calculated in accordance with the methodology set forth in FERC=s regulations at 18 C.F.R. § 35.19a(a)(2)(iii) from the date of any payment for Network Upgrades through the date on which the Interconnection Customer receives a repayment of such payment pursuant to this subparagraph.

Interconnection Customer may assign such repayment rights to any person.

Notwithstanding the foregoing, Interconnection Customer, Transmission Provider, and Affected System Operator may adopt any alternative payment schedule that is mutually agreeable so long as Transmission Provider and Affected System Operator take one of the following actions no later than five years from the Commercial Operation Date: (1) return to Interconnection Customer any amounts advanced for Network Upgrades not previously repaid, or (2) declare in writing that Transmission Provider or Affected System Operator will continue to provide payments to Interconnection Customer on a dollar-for-dollar basis for the non-usage sensitive portion of transmission charges, or develop an alternative schedule that is mutually agreeable and provides for the return of all amounts advanced for Network Upgrades not previously repaid; however, full reimbursement shall not extend beyond twenty (20) years from the Commercial Operation Date.

If the Large Generating Facility fails to achieve commercial operation, but it or another Generating Facility is later constructed and makes use of the Network Upgrades, Transmission Provider and Affected System Operator shall at that time reimburse Interconnection Customer for the amounts advanced for the Network Upgrades. Before any such reimbursement can occur, the Interconnection Customer, or the entity that ultimately constructs the Generating Facility, if different, is responsible for identifying the entity to which reimbursement must be made.

11.4.2 **Special Provisions for Affected Systems.** Unless Transmission Provider provides, under the LGIA, for the repayment of

amounts advanced to Affected System Operator for Network Upgrades, Interconnection Customer and Affected System Operator shall enter into an agreement that provides for such repayment. The agreement shall specify the terms governing payments to be made by Interconnection Customer to the Affected System Operator as well as the repayment by the Affected System Operator.

11.4.3 Notwithstanding any other provision of this LGIA, nothing herein shall be construed as relinquishing or foreclosing any rights, including but not limited to firm transmission rights, capacity rights, transmission congestion rights, or transmission credits, that Interconnection Customer, shall be entitled to, now or in the future under any other agreement or tariff as a result of, or otherwise associated with, the transmission capacity, if any, created by the Network Upgrades, including the right to obtain cash reimbursements or transmission credits for transmission service that is not associated with the Large Generating Facility.

11.5 **Provision of Security**. At least thirty (30) Calendar Days prior to the commencement of the first of the following to occur: design, procurement, installation, or construction of a discrete portion of a Transmission Provider's Interconnection Facilities, Network Upgrades, or Distribution Upgrades, Interconnection Customer shall provide Transmission Provider, at Interconnection Customer's option, a guarantee, a surety bond, letter of credit or other form of security that is reasonably acceptable to Transmission Provider and is consistent with the Uniform Commercial Code of the jurisdiction identified in Article 14.2.1. Such security for payment shall be in an amount sufficient to cover the costs for constructing, designing, procuring, and installing the applicable portion of Transmission Provider's Interconnection Facilities, Network Upgrades, or Distribution Upgrades and shall be

reduced on a dollar-for-dollar basis for payments made to Transmission Provider for these purposes.

In addition:

11.5.1 The guarantee must be made by an entity that meets the creditworthiness requirements of Transmission Provider, and contain terms and conditions that guarantee payment of any amount that may be due from Interconnection Customer, up to an agreed-to maximum amount.

11.5.2 The letter of credit must be issued by a financial institution reasonably acceptable to Transmission Provider and must indicate that it would only expire upon final payment made to Transmission Provider to cover all relevant costs for designing, procuring, installing, and constructing the applicable portion of Interconnection Facilities, Network Upgrades, or Distribution Upgrades for which the letter of credit was provided.

11.5.3 The surety bond must be issued by an insurer reasonably acceptable to Transmission Provider and must indicate that it would only expire upon final payment made to Transmission Provider to cover all relevant costs for designing, procuring, installing, and constructing the applicable portion of Interconnection Facilities, Network Upgrades, or Distribution Upgrades for which the surety bond was provided.

11.6 **Interconnection Customer Compensation.** If Transmission Provider requests or directs Interconnection Customer to provide a service pursuant to Articles 9.6.3 (Payment for Reactive Power), or 13.5.1 of this LGIA, Transmission Provider shall compensate Interconnection Customer in accordance with Interconnection Customer's applicable rate schedule then in effect unless the provision of such service(s) is subject to an RTO or ISO FERC-approved rate schedule. Interconnection Customer

shall serve Transmission Provider or RTO or ISO with any filing of a proposed rate schedule at the time of such filing with FERC. To the extent that no rate schedule is in effect at the time the Interconnection Customer is required to provide or absorb any Reactive Power under this LGIA, Transmission Provider agrees to compensate Interconnection Customer in such amount as would have been due Interconnection Customer had the rate schedule been in effect at the time service commenced; provided, however, that such rate schedule must be filed at FERC or other appropriate Governmental Authority within sixty (60) Calendar Days of the commencement of service.

11.6.1 **Interconnection Customer Compensation for Actions During Emergency Condition.** Transmission Provider or RTO or ISO shall compensate Interconnection Customer for its provision of real and reactive power and other Emergency Condition services that Interconnection Customer provides to support the Transmission System during an Emergency Condition in accordance with Article 11.6.

Article 12. Invoice

12.1 **General.** Each Party shall submit to the other Party, on a monthly basis, invoices of amounts due for the preceding month. Each invoice shall state the month to which the invoice applies and fully describe the services and equipment provided. The Parties may discharge mutual debts and payment obligations due and owing to each other on the same date through netting, in which case all amounts a Party owes to the other Party under this LGIA, including interest payments or credits, shall be netted so that only the net amount remaining due shall be paid by the owing Party.

12.2 **Final Invoice.** Within six months after completion of the construction of Transmission Provider's Interconnection Facilities and the Network Upgrades, Transmission Provider shall provide an invoice of the final cost of the construction of Transmission Provider's Interconnection Facilities and the Network Upgrades and shall set forth such costs in sufficient

detail to enable Interconnection Customer to compare the actual costs with the estimates and to ascertain deviations, if any, from the cost estimates. Transmission Provider shall refund to Interconnection Customer any amount by which the actual payment by Interconnection Customer for estimated costs exceeds the actual costs of construction within thirty (30) Calendar Days of the issuance of such final construction invoice.

12.3 **Payment**. Invoices shall be rendered to the paying Party at the address specified in Appendix F. The Party receiving the invoice shall pay the invoice within thirty (30) Calendar Days of receipt. All payments shall be made in immediately available funds payable to the other Party, or by wire transfer to a bank named and account designated by the invoicing Party. Payment of invoices by either Party will not constitute a waiver of any rights or claims either Party may have under this LGIA.

12.4 **Disputes**. In the event of a billing dispute between Transmission Provider and Interconnection Customer, Transmission Provider shall continue to provide Interconnection Service under this LGIA as long as Interconnection Customer: (i) continues to make all payments not in dispute; and (ii) pays to Transmission Provider or into an independent escrow account the portion of the invoice in dispute, pending resolution of such dispute. If Interconnection Customer fails to meet these two requirements for continuation of service, then Transmission Provider may provide notice to Interconnection Customer of a Default pursuant to Article 17. Within thirty (30) Calendar Days after the resolution of the dispute, the Party that owes money to the other Party shall pay the amount due with interest calculated in accord with the methodology set forth in FERC's regulations at 18 CFR § 35.19a(a)(2)(iii).

Article 13. Emergencies

13.1 **Definition**. "Emergency Condition" shall mean a condition or situation: (i) that in the judgment of the Party making the claim is imminently likely to endanger life or property; or (ii) that, in the case

of Transmission Provider, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to the Transmission System, Transmission Provider's Interconnection Facilities or the Transmission Systems of others to which the Transmission System is directly connected; or (iii) that, in the case of Interconnection Customer, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to, the Large Generating Facility or Interconnection Customer's Interconnection Facilities' System restoration and black start shall be considered Emergency Conditions; provided, that Interconnection Customer is not obligated by this LGIA to possess black start capability.

13.2 **Obligations**. Each Party shall comply with the Emergency Condition procedures of the applicable ISO/RTO, NERC, the Applicable Reliability Council, Applicable Laws and Regulations, and any emergency procedures agreed to by the Joint Operating Committee.

13.3 **Notice.** Transmission Provider shall notify Interconnection Customer promptly when it becomes aware of an Emergency Condition that affects Transmission Provider's Interconnection Facilities or the Transmission System that may reasonably be expected to affect Interconnection Customer's operation of the Large Generating Facility or Interconnection Customer's Interconnection Facilities. Interconnection Customer shall notify Transmission Provider promptly when it becomes aware of an Emergency Condition that affects the Large Generating Facility or Interconnection Customer's Interconnection Facilities that may reasonably be expected to affect the Transmission System or Transmission Provider's Interconnection Facilities. To the extent information is known, the notification shall describe the Emergency Condition, the extent of the damage or deficiency, the expected effect on the operation of Interconnection Customer's or Transmission Provider's facilities and operations, its anticipated duration and the corrective action taken and/or to be taken. The initial notice shall

be followed as soon as practicable with written notice.

13.4 **Immediate Action.** Unless, in Interconnection Customer's reasonable judgment, immediate action is required, Interconnection Customer shall obtain the consent of Transmission Provider, such consent to not be unreasonably withheld, prior to performing any manual switching operations at the Large Generating Facility or Interconnection Customer's Interconnection Facilities in response to an Emergency Condition either declared by Transmission Provider or otherwise regarding the Transmission System.

13.5 **Transmission Provider Authority.**

13.5.1 **General.** Transmission Provider may take whatever actions or inactions with regard to the Transmission System or Transmission Provider's Interconnection Facilities it deems necessary during an Emergency Condition in order to (i) preserve public health and safety, (ii) preserve the reliability of the Transmission System or Transmission Provider's Interconnection Facilities, (iii) limit or prevent damage, and (iv) expedite restoration of service.

Transmission Provider shall use Reasonable Efforts to minimize the effect of such actions or inactions on the Large Generating Facility or Interconnection Customer's Interconnection Facilities. Transmission Provider may, on the basis of technical considerations, require the Large Generating Facility to mitigate an Emergency Condition by taking actions necessary and limited in scope to remedy the Emergency Condition, including, but not limited to, directing Interconnection Customer to shut-down, start-up, increase or decrease the real or reactive power output of the Large Generating Facility; implementing a

reduction or disconnection pursuant to Article 13.5.2; directing Interconnection Customer to assist with blackstart (if available) or restoration efforts; or altering the outage schedules of the Large Generating Facility and Interconnection Customer's Interconnection Facilities. Interconnection Customer shall comply with all of Transmission Provider's operating instructions concerning Large Generating Facility real power and reactive power output within the manufacturer's design limitations of the Large Generating Facility's equipment that is in service and physically available for operation at the time, in compliance with Applicable Laws and Regulations.

13.5.2 **Reduction and Disconnection.** Transmission Provider may reduce Interconnection Service or disconnect the Large Generating Facility or Interconnection Customer's Interconnection Facilities, when such, reduction or disconnection is necessary under Good Utility Practice due to Emergency Conditions. These rights are separate and distinct from any right of curtailment of Transmission Provider pursuant to Transmission Provider's Tariff. When Transmission Provider can schedule the reduction or disconnection in advance, Transmission Provider shall notify Interconnection Customer of the reasons, timing and expected duration of the reduction or disconnection. Transmission Provider shall coordinate with Interconnection Customer using Good Utility Practice to schedule the reduction or disconnection during periods of least impact to Interconnection Customer and Transmission Provider. Any reduction or disconnection shall continue only for so long as reasonably necessary under Good Utility Practice. The Parties shall cooperate with each other to restore the Large Generating Facility, the Interconnection Facilities, and the Transmission System to their normal

operating state as soon as practicable consistent with Good Utility Practice.

13.6 **Interconnection Customer Authority.** Consistent with Good Utility Practice and the LGIA and the LGIP, Interconnection Customer may take actions or inactions with regard to the Large Generating Facility or Interconnection Customer's Interconnection Facilities during an Emergency Condition in order to (i) preserve public health and safety, (ii) preserve the reliability of the Large Generating Facility or Interconnection Customer's Interconnection Facilities, (iii) limit or prevent damage, and (iv) expedite restoration of service. Interconnection Customer shall use Reasonable Efforts to minimize the effect of such actions or inactions on the Transmission System and Transmission Provider's Interconnection Facilities. Transmission Provider shall use Reasonable Efforts to assist Interconnection Customer in such actions.

13.7 **Limited Liability.** Except as otherwise provided in Article 11.6.1 of this LGIA, neither Party shall be liable to the other for any action it takes in responding to an Emergency Condition so long as such action is made in good faith and is consistent with Good Utility Practice.

Article 14. Regulatory Requirements and Governing Law

14.1 **Regulatory Requirements.** Each Party's obligations under this LGIA shall be subject to its receipt of any required approval or certificate from one or more Governmental Authorities in the form and substance satisfactory to the applying Party, or the Party making any required filings with, or providing notice to, such Governmental Authorities, and the expiration of any time period associated therewith. Each Party shall in good faith seek and use its Reasonable Efforts to obtain such other approvals. Nothing in this LGIA shall require Interconnection Customer to take any action that could result in its inability to obtain, or its loss of, status or exemption under the Federal Power Act, the Public Utility Holding Company

Act of 1935, as amended, or the Public Utility Regulatory Policies Act of 1978.

14.2 **Governing Law.**

14.2.1 The validity, interpretation and performance of this LGIA and each of its provisions shall be governed by the laws of the state where the Point of Interconnection is located, without regard to its conflicts of law principles.

14.2.2 This LGIA is subject to all Applicable Laws and Regulations.

14.2.3 Each Party expressly reserves the right to seek changes in, appeal, or otherwise contest any laws, orders, rules, or regulations of a Governmental Authority.

Article 15. Notices.

15.1 **General.** Unless otherwise provided in this LGIA, any notice, demand or request required or permitted to be given by either Party to the other and any instrument required or permitted to be tendered or delivered by either Party in writing to the other shall be effective when delivered and may be so given, tendered or delivered, by recognized national courier, or by depositing the same with the United States Postal Service with postage prepaid, for delivery by certified or registered mail, addressed to the Party, or personally delivered to the Party, at the address set out in Appendix F, Addresses for Delivery of Notices and Billings.

Either Party may change the notice information in this LGIA by giving five (5) Business Days written notice prior to the effective date of the change.

15.2 **Billings and Payments.** Billings and payments shall be sent to the addresses set out in Appendix F.

15.3 **Alternative Forms of Notice.** Any notice or request required or permitted to be given by a Party to the other and not required by this Agreement to be given

in writing may be so given by telephone, facsimile or email to the telephone numbers and email addresses set out in Appendix F.

15.4 **Operations and Maintenance Notice.** Each Party shall notify the other Party in writing of the identity of the person(s) that it designates as the point(s) of contact with respect to the implementation of Articles 9 and 10.

Article 16. Force Majeure

16.1 **Force Majeure.**

16.1.1 Economic hardship is not considered a Force Majeure event.

16.1.2 Neither Party shall be considered to be in Default with respect to any obligation hereunder, (including obligations under Article 4), other than the obligation to pay money when due, if prevented from fulfilling such obligation by Force Majeure. A Party unable to fulfill any obligation hereunder (other than an obligation to pay money when due) by reason of Force Majeure shall give notice and the full particulars of such Force Majeure to the other Party in writing or by telephone as soon as reasonably possible after the occurrence of the cause relied upon. Telephone notices given pursuant to this article shall be confirmed in writing as soon as reasonably possible and shall specifically state full particulars of the Force Majeure, the time and date when the Force Majeure occurred and when the Force Majeure is reasonably expected to cease. The Party affected shall exercise due diligence to remove such disability with reasonable dispatch, but shall not be required to accede or agree to any provision not satisfactory to it in order to settle and terminate a strike or other labor disturbance.

Article 17. Default

17.1 Default

17.1.1 **General.** No Default shall exist where such failure to discharge an obligation (other than the payment of money) is the result of Force Majeure as defined in this LGIA or the result of an act of omission of the other Party. Upon a Breach, the non-breaching Party shall give written notice of such Breach to the breaching Party. Except as provided in Article 17.1.2, the breaching Party shall have thirty (30) Calendar Days from receipt of the Default notice within which to cure such Breach; provided however, if such Breach is not capable of cure within thirty (30) Calendar Days, the breaching Party shall commence such cure within thirty (30) Calendar Days after notice and continuously and diligently complete such cure within ninety (90) Calendar Days from receipt of the Default notice; and, if cured within such time, the Breach specified in such notice shall cease to exist.

17.1.2 **Right to Terminate.** If a Breach is not cured as provided in this article, or if a Breach is not capable of being cured within the period provided for herein, the non-breaching Party shall have the right to declare a Default and terminate this LGIA by written notice at any time until cure occurs, and be relieved of any further obligation hereunder and, whether or not that Party terminates this LGIA, to recover from the breaching Party all amounts due hereunder, plus all other damages and remedies to which it is entitled at law or in equity. The provisions of this article will survive termination of this LGIA.

Article 18. Indemnity, Consequential Damages and Insurance

18.1 **Indemnity**. The Parties shall at all times indemnify, defend, and hold the other Party harmless from, any and all damages, losses, claims, including claims and actions relating to injury to or death of any person or damage to property, demand, suits, recoveries, costs and expenses, court costs, attorney fees, and all other obligations by or to third parties, arising out of or resulting from the other Party's action or inactions of its obligations under this LGIA on behalf of the Indemnifying Party, except in cases of gross negligence or intentional wrongdoing by the Indemnified Party.

18.1.1 **Indemnified Person**. If an Indemnified Person is entitled to indemnification under this Article 18 as a result of a claim by a third party, and the indemnifying Party fails, after notice and reasonable opportunity to proceed under Article 18.1, to assume the defense of such claim, such Indemnified Person may at the expense of the indemnifying Party contest, settle or consent to the entry of any judgment with respect to, or pay in full, such claim.

18.1.2 **Indemnifying Party**. If an Indemnifying Party is obligated to indemnify and hold any Indemnified Person harmless under this Article 18, the amount owing to the Indemnified Person shall be the amount of such Indemnified Person's actual Loss, net of any insurance or other recovery.

18.1.3 **Indemnity Procedures**. Promptly after receipt by an Indemnified Person of any claim or notice of the commencement of any action or administrative or legal proceeding or investigation as to which the indemnity provided for in Article 18.1 may apply, the Indemnified Person shall notify the Indemnifying Party of such fact. Any failure of or delay in such notification shall not affect a Party's indemnification obligation unless such failure or delay is materially prejudicial to the indemnifying Party.

The Indemnifying Party shall have the right to assume the defense thereof with counsel designated by such Indemnifying Party and reasonably satisfactory to the Indemnified Person. If the defendants in any such action include one or more Indemnified Persons and the Indemnifying Party and if the Indemnified Person reasonably concludes that there may be legal defenses available to it and/or other Indemnified Persons which are different from or additional to those available to the Indemnifying Party, the Indemnified Person shall have the right to select separate counsel to assert such legal defenses and to otherwise participate in the defense of such action on its own behalf. In such instances, the Indemnifying Party shall only be required to pay the fees and expenses of one additional attorney to represent an Indemnified Person or Indemnified Persons having such differing or additional legal defenses.

The Indemnified Person shall be entitled, at its expense, to participate in any such action, suit or proceeding, the defense of which has been assumed by the Indemnifying Party. Notwithstanding the foregoing, the Indemnifying Party (i) shall not be entitled to assume and control the defense of any such action, suit or proceedings if and to the extent that, in the opinion of the Indemnified Person and its counsel, such action, suit or proceeding involves the potential imposition of criminal liability on the Indemnified Person, or there exists a conflict or adversity of interest between the Indemnified Person and the Indemnifying Party, in such event the Indemnifying Party shall pay the reasonable expenses of the Indemnified

Person, and (ii) shall not settle or consent to the entry of any judgment in any action, suit or proceeding without the consent of the Indemnified Person, which shall not be reasonably withheld, conditioned or delayed.

18.2 **Consequential Damages.** Other than the Liquidated Damages heretofore described, in no event shall either Party be liable under any provision of this LGIA for any losses, damages, costs or expenses for any special, indirect, incidental, consequential, or punitive damages, including but not limited to loss of profit or revenue, loss of the use of equipment, cost of capital, cost of temporary equipment or services, whether based in whole or in part in contract, in tort, including negligence, strict liability, or any other theory of liability; provided, however, that damages for which a Party may be liable to the other Party under another agreement will not be considered to be special, indirect, incidental, or consequential damages hereunder.

18.3 **Insurance.** Each party shall, at its own expense, maintain in force throughout the period of this LGIA, and until released by the other Party, the following minimum insurance coverages, with insurers authorized to do business in the state where the Point of Interconnection is located:

18.3.1 Employers' Liability and Workers' Compensation Insurance providing statutory benefits in accordance with the laws and regulations of the state in which the Point of Interconnection is located.

18.3.2 Commercial General Liability Insurance including premises and operations, personal injury, broad form property damage, broad form blanket contractual liability coverage (including coverage for the contractual indemnification) products and completed operations coverage, coverage for explosion, collapse and underground hazards, independent contractors coverage, coverage for pollution to the extent normally available and punitive damages to the extent normally available and a cross liability endorsement, with minimum limits of One Million Dollars ($1,000,000) per occurrence/One Million Dollars ($1,000,000) aggregate combined single limit for personal injury, bodily injury, including death and property damage.

18.3.3 Comprehensive Automobile Liability Insurance for coverage of owned and non-owned and hired vehicles, trailers or semi-trailers designed for travel on public roads, with a minimum, combined single limit of One Million Dollars ($1,000,000) per occurrence for bodily injury, including death, and property damage.

18.3.4 Excess Public Liability Insurance over and above the Employers' Liability Commercial General Liability and Comprehensive Automobile Liability Insurance coverage, with a minimum combined single limit of Twenty Million Dollars ($20,000,000) per occurrence/Twenty Million Dollars ($20,000,000) aggregate.

18.3.5 The Commercial General Liability Insurance, Comprehensive Automobile Insurance and Excess Public Liability Insurance policies shall name the other Party, its parent, associated and Affiliate companies and their respective directors, officers, agents, servants and employees ("Other Party Group") as additional insured. All policies shall contain provisions whereby the insurers waive all rights of subrogation in accordance with the provisions of this LGIA against the Other Party Group and provide thirty (30) Calendar Days advance written notice to the Other Party Group prior to anniversary date of cancellation or any material change in coverage or condition.

18.3.6 The Commercial General Liability Insurance, Comprehensive Automobile Liability Insurance and Excess Public Liability Insurance policies shall contain provisions that specify that the policies are primary and shall apply to such extent without consideration for other policies separately carried and shall state that each insured is provided coverage as though a separate policy had been issued to each, except the insurer's liability shall not be increased beyond the amount for which the insurer would have been liable had only one insured been covered. Each Party shall be responsible for its respective deductibles or retentions.

18.3.7 The Commercial General Liability Insurance, Comprehensive Automobile Liability Insurance and Excess Public Liability Insurance policies, if written on a Claims First Made Basis, shall be maintained in full force and effect for two (2) years after termination of this LGIA, which coverage may be in the form of tail coverage or extended reporting period coverage if agreed by the Parties.

18.3.8 The requirements contained herein as to the types and limits of all insurance to be maintained by the Parties are not intended to and shall not in any manner, limit or qualify the liabilities and obligations assumed by the Parties under this LGIA.

18.3.9 Within ten (10) days following execution of this LGIA, and as soon as practicable after the end of each fiscal year or at the renewal of the insurance policy and in any event within ninety (90) days thereafter, each Party shall provide certification of all insurance required in this LGIA, executed by each insurer or by an authorized representative of each insurer.

18.3.10 Notwithstanding the foregoing, each Party may self-insure to meet the minimum insurance requirements of Articles 18.3.2 through 18.3.8 to the extent it maintains a self-insurance program; provided that, such Party's senior secured debt is rated at investment grade or better by Standard & Poor's and that its self-insurance program meets the minimum insurance requirements of Articles 18.3.2 through 18.3.8. For any period of time that a Party's senior secured debt is unrated by Standard & Poor's or is rated at less than investment grade by Standard & Poor's, such Party shall comply with the insurance requirements applicable to it under Articles 18.3.2 through 18.3.9. In the event that a Party is permitted to self-insure pursuant to this article, it shall notify the other Party that it meets the requirements to self-insure and that its self-insurance program meets the minimum insurance requirements in a manner consistent with that specified in Article 18.3.9.

18.3.11 The Parties agree to report to each other in writing as soon as practical all accidents or occurrences resulting in injuries to any person, including death, and any property damage arising out of this LGIA.

Article 19. Assignment

19.1 **Assignment**. This LGIA may be assigned by either Party only with the written consent of the other; provided that either Party may assign this LGIA without the consent of the other Party to any Affiliate of the assigning Party with an equal or greater credit rating and with the legal authority and operational ability to satisfy the obligations of the assigning Party under this LGIA; and provided further that Interconnection Customer shall have the right to assign this LGIA, without the consent of Transmission Provider, for collateral security purposes to aid in providing financing for the Large Generating Facility, provided that Interconnection Customer will promptly notify Transmission Provider of any such assignment. Any financing arrangement entered into by Interconnection Customer pursuant to this article will provide that prior to or upon the exercise of the secured Party's, trustee's or mortgagee's assignment rights pursuant to said arrangement, the secured creditor, the trustee or mortgagee will notify Transmission Provider of the date and particulars of any such exercise of assignment right(s), including providing the Transmission Provider with proof that it meets the requirements of Articles 11.5 and 18.3. Any attempted assignment that violates this article is void and ineffective. Any assignment under this LGIA shall not relieve a Party of its obligations, nor shall a Party's obligations be enlarged, in whole or in part, by reason thereof. Where required, consent to assignment will not be unreasonably withheld, conditioned or delayed.

Article 20. Severability

20.1 **Severability**. If any provision in this LGIA is finally determined to be invalid, void or unenforceable by any court or other Governmental Authority having jurisdiction, such determination shall not invalidate, void or make unenforceable any other provision, agreement or covenant of this LGIA; provided that if Interconnection Customer (or any third party, but only if such third party is not acting at the direction of Transmission Provider) seeks and obtains such a final determination with respect to any provision of the Alternate Option (Article 5.1.2), or the Negotiated Option (Article 5.1.4), then none of these provisions shall thereafter have any force or effect and the Parties' rights and obligations shall be governed solely by the Standard Option (Article 5.1.1).

Article 21. Comparability

21.1 **Comparability.** The Parties will comply with all applicable comparability and code of conduct laws, rules and regulations, as amended from time to time.

Article 22. Confidentiality

22.1 **Confidentiality.** Confidential Information shall include, without limitation, all information relating to a Party's technology, research and development, business affairs, and pricing, and any information supplied by either of the Parties to the other prior to the execution of this LGIA.

Information is Confidential Information only if it is clearly designated or marked in writing as confidential on the face of the document, or, if the information is conveyed orally or by inspection, if the Party providing the information orally informs the Party receiving the information that the information is confidential.

If requested by either Party, the other Party shall provide in writing, the basis for asserting that the information referred to in this Article 22 warrants confidential treatment, and the requesting Party may disclose such writing to the appropriate Governmental Authority. Each Party shall be responsible for the costs associated with affording confidential treatment to its information.

22.1.1 **Term.** During the term of this LGIA, and for a period of three (3) years after the expiration or termination of this LGIA, except as otherwise provided in this Article 22, each Party shall hold in confidence and shall not disclose to any person Confidential Information.

22.1.2 **Scope.** Confidential Information shall not include information that the receiving Party can demonstrate: (1) is generally available to the public other than as a result of a disclosure by the receiving Party; (2) was in the lawful possession of the receiving Party on a non-confidential basis before receiving it from the disclosing Party; (3) was supplied to the receiving Party without restriction by a third party, who, to the knowledge of the receiving Party after due inquiry, was under no obligation to the disclosing Party to keep such information confidential; (4) was independently developed by the receiving Party without reference to Confidential Information of the disclosing Party; (5) is, or becomes, publicly known, through no wrongful act or omission of the receiving Party or Breach of this LGIA; or (6) is required, in accordance with Article 22.1.7 of the LGIA, Order of Disclosure, to be disclosed by any Governmental Authority or is otherwise required to be disclosed by law or subpoena, or is necessary in any legal proceeding establishing rights and obligations under this LGIA. Information designated as Confidential Information will no longer be deemed confidential if the Party that designated the information as confidential notifies the other Party that it no longer is confidential.

22.1.3 **Release of Confidential Information.** Neither Party shall release or disclose Confidential Information to any other person, except to its Affiliates (limited by the Standards of Conduct requirements), subcontractors, employees, consultants, or to parties who may be or considering providing financing to or equity participation with Interconnection Customer, or to potential purchasers or assignees of Interconnection Customer, on a need-to-know basis in connection with this LGIA, unless such person has first been advised of the confidentiality provisions of this Article 22 and has agreed to comply with such provisions. Notwithstanding the foregoing, a Party providing Confidential Information to any person shall remain primarily responsible for any release of Confidential

Information in contravention of this Article 22.

22.1.4 **Rights.** Each Party retains all rights, title, and interest in the Confidential Information that each Party discloses to the other Party. The disclosure by each Party to the other Party of Confidential Information shall not be deemed a waiver by either Party or any other person or entity of the right to protect the Confidential Information from public disclosure.

22.1.5 **No Warranties.** By providing Confidential Information, neither Party makes any warranties or representations as to its accuracy or completeness. In addition, by supplying Confidential Information, neither Party obligates itself to provide any particular information or Confidential Information to the other Party nor to enter into any further agreements or proceed with any other relationship or joint venture.

22.1.6 **Standard of Care.** Each Party shall use at least the same standard of care to protect Confidential Information it receives as it uses to protect its own Confidential Information from unauthorized disclosure, publication or dissemination. Each Party may use Confidential Information solely to fulfill its obligations to the other Party under this LGIA or its regulatory requirements.

22.1.7 **Order of Disclosure.** If a court or a Government Authority or entity with the right, power, and apparent authority to do so requests or requires either Party, by subpoena, oral deposition, interrogatories, requests for production of documents, administrative order, or otherwise, to disclose Confidential Information, that Party shall provide the other Party with prompt notice of such

request(s) or requirement(s) so that the other Party may seek an appropriate protective order or waive compliance with the terms of this LGIA.

Notwithstanding the absence of a protective order or waiver, the Party may disclose such Confidential Information which, in the opinion of its counsel, the Party is legally compelled to disclose. Each Party will use Reasonable Efforts to obtain reliable assurance that confidential treatment will be accorded any Confidential Information so furnished.

22.1.8 **Termination of Agreement.** Upon termination of this LGIA for any reason, each Party shall, within ten (10) Calendar Days of receipt of a written request from the other Party, use Reasonable Efforts to destroy, erase, or delete (with such destruction, erasure, and deletion certified in writing to the other Party) or return to the other Party, without retaining copies thereof, any and all written or electronic Confidential Information received from the other Party.

22.1.9 **Remedies.** The Parties agree that monetary damages would be inadequate to compensate a Party for the other Party's Breach of its obligations under this Article 22. Each Party accordingly agrees that the other Party shall be entitled to equitable relief, by way of injunction or otherwise, if the first Party Breaches or threatens to Breach its obligations under this Article 22, which equitable relief shall be granted without bond or proof of damages, and the receiving Party shall not plead in defense that there would be an adequate remedy at law. Such remedy shall not be deemed an exclusive remedy for the Breach of this Article 22, but shall be in addition to all other remedies available at law or in equity. The Parties further acknowledge and agree that the covenants

contained herein are necessary for the protection of legitimate business interests and are reasonable in scope. No Party, however, shall be liable for indirect, incidental, or consequential or punitive damages of any nature or kind resulting from or arising in connection with this Article 22.

22.1.10 **Disclosure to FERC, its Staff, or a State.** Notwithstanding anything in this Article 22 to the contrary, and pursuant to 18 CFR section 1b.20, if FERC or its staff, during the course of an investigation or otherwise, requests information from one of the Parties that is otherwise required to be maintained in confidence pursuant to this LGIA, the Party shall provide the requested information to FERC or its staff, within the time provided for in the request for information. In providing the information to FERC or its staff, the Party must, consistent with 18 CFR section 388.112, request that the information be treated as confidential and non-public by FERC and its staff and that the information be withheld from public disclosure. Parties are prohibited from notifying the other Party to this LGIA prior to the release of the Confidential Information to FERC or its staff. The Party shall notify the other Party to the LGIA when it is notified by FERC or its staff that a request to release Confidential Information has been received by FERC, at which time either of the Parties may respond before such information would be made public, pursuant to 18 CFR section 388.112. Requests from a state regulatory body conducting a confidential investigation shall be treated in a similar manner if consistent with the applicable state rules and regulations.

22.1.11 Subject to the exception in Article 22.1.10, any information that a Party

claims is competitively sensitive, commercial or financial information under this LGIA ("Confidential Information") shall not be disclosed by the other Party to any person not employed or retained by the other Party, except to the extent disclosure is (i) required by law; (ii) reasonably deemed by the disclosing Party to be required to be disclosed in connection with a dispute between or among the Parties, or the defense of litigation or dispute; (iii) otherwise permitted by consent of the other Party, such consent not to be unreasonably withheld; or (iv) necessary to fulfill its obligations under this LGIA or as a transmission service provider or a Control Area operator including disclosing the Confidential Information to an RTO or ISO or to a regional or national reliability organization. The Party asserting confidentiality shall notify the other Party in writing of the information it claims is confidential. Prior to any disclosures of the other Party's Confidential Information under this subparagraph, or if any third party or Governmental Authority makes any request or demand for any of the information described in this subparagraph, the disclosing Party agrees to promptly notify the other Party in writing and agrees to assert confidentiality and cooperate with the other Party in seeking to protect the Confidential Information from public disclosure by confidentiality agreement, protective order or other reasonable measures.

Article 23. Environmental Releases

23.1 Each Party shall notify the other Party, first orally and then in writing, of the release of any Hazardous Substances, any asbestos or lead abatement activities, or any type of remediation activities related to the Large Generating Facility or the

Interconnection Facilities, each of which may reasonably be expected to affect the other Party. The notifying Party shall: (i) provide the notice as soon as practicable, provided such Party makes a good faith effort to provide the notice no later than twenty-four hours after such Party becomes aware of the occurrence; and (ii) promptly furnish to the other Party copies of any publicly available reports filed with any Governmental Authorities addressing such events.

Article 24. Information Requirements

24.1 **Information Acquisition.** Transmission Provider and Interconnection Customer shall submit specific information regarding the electrical characteristics of their respective facilities to each other as described below and in accordance with Applicable Reliability Standards.

24.2 **Information Submission by Transmission Provider.** The initial information submission by Transmission Provider shall occur no later than one hundred eighty (180) Calendar Days prior to Trial Operation and shall include Transmission System information necessary to allow Interconnection Customer to select equipment and meet any system protection and stability requirements, unless otherwise agreed to by the Parties. On a monthly basis Transmission Provider shall provide Interconnection Customer a status report on the construction and installation of Transmission Provider's Interconnection Facilities and Network Upgrades, including, but not limited to, the following information: (1) progress to date; (2) a description of the activities since the last report; (3) a description of the action items for the next period; and (4) the delivery status of equipment ordered.

24.3 **Updated Information Submission by Interconnection Customer.** The updated information submission by Interconnection Customer, including manufacturer information, shall occur no later than one hundred eighty (180) Calendar Days prior to the Trial Operation. Interconnection Customer shall submit a completed copy of the Large Generating Facility data

requirements contained in Appendix 1 to the LGIP. It shall also include any additional information provided to Transmission Provider for the Feasibility and Facilities Study. Information in this submission shall be the most current Large Generating Facility design or expected performance data. Information submitted for stability models shall be compatible with Transmission Provider standard models. If there is no compatible model, Interconnection Customer will work with a consultant mutually agreed to by the Parties to develop and supply a standard model and associated information.

If Interconnection Customer's data is materially different from what was originally provided to Transmission Provider pursuant to the Interconnection Study Agreement between Transmission Provider and Interconnection Customer, then Transmission Provider will conduct appropriate studies to determine the impact on Transmission Provider Transmission System based on the actual data submitted pursuant to this Article 24.3. The Interconnection Customer shall not begin Trial Operation until such studies are completed.

24.4 **Information Supplementation.** Prior to the Operation Date, the Parties shall supplement their information submissions described above in this Article 24 with any and all "as-built" Large Generating Facility information or "as-tested" performance information that differs from the initial submissions or, alternatively, written confirmation that no such differences exist. The Interconnection Customer shall conduct tests on the Large Generating Facility as required by Good Utility Practice such as an open circuit "step voltage" test on the Large Generating Facility to verify proper operation of the Large Generating Facility's automatic voltage regulator.

Unless otherwise agreed, the test conditions shall include: (1) Large Generating Facility at synchronous speed; (2) automatic voltage regulator on and in voltage control mode; and (3) a five percent change in Large Generating Facility terminal voltage initiated by a change in the voltage regulators reference voltage. Interconnection Customer shall provide validated test recordings showing the

responses of Large Generating Facility terminal and field voltages. In the event that direct recordings of these voltages is impractical, recordings of other voltages or currents that mirror the response of the Large Generating Facility's terminal or field voltage are acceptable if information necessary to translate these alternate quantities to actual Large Generating Facility terminal or field voltages is provided. Large Generating Facility testing shall be conducted and results provided to Transmission Provider for each individual generating unit in a station.

Subsequent to the Operation Date, Interconnection Customer shall provide Transmission Provider any information changes due to equipment replacement, repair, or adjustment. Transmission Provider shall provide Interconnection Customer any information changes due to equipment replacement, repair or adjustment in the directly connected substation or any adjacent Transmission Provider-owned substation that may affect Interconnection Customer's Interconnection Facilities equipment ratings, protection or operating requirements. The Parties shall provide such information no later than thirty (30) Calendar Days after the date of the equipment replacement, repair or adjustment.

Article 25. Information Access and Audit Rights

25.1 **Information Access**. Each Party (the "disclosing Party") shall make available to the other Party information that is in the possession of the disclosing Party and is necessary in order for the other Party to: (i) verify the costs incurred by the disclosing Party for which the other Party is responsible under this LGIA; and (ii) carry out its obligations and responsibilities under this LGIA. The Parties shall not use such information for purposes other than those set forth in this Article 25.1 and to enforce their rights under this LGIA.

25.2 **Reporting of Non-Force Majeure Events**. Each Party (the "notifying Party") shall notify the other Party when the notifying Party becomes aware of its inability to comply with the provisions of this LGIA for a reason other than a Force Majeure event. The

Parties agree to cooperate with each other and provide necessary information regarding such inability to comply, including the date, duration, reason for the inability to comply, and corrective actions taken or planned to be taken with respect to such inability to comply. Notwithstanding the foregoing, notification, cooperation or information provided under this article shall not entitle the Party receiving such notification to allege a cause for anticipatory breach of this LGIA.

25.3 **Audit Rights.** Subject to the requirements of confidentiality under Article 22 of this LGIA, each Party shall have the right, during normal business hours, and upon prior reasonable notice to the other Party, to audit at its own expense the other Party's accounts and records pertaining to either Party's performance or either Party's satisfaction of obligations under this LGIA. Such audit rights shall include audits of the other Party's costs, calculation of invoiced amounts, Transmission Provider's efforts to allocate responsibility for the provision of reactive support to the Transmission System, Transmission Provider's efforts to allocate responsibility for interruption or reduction of generation on the Transmission System, and each Party's actions in an Emergency Condition. Any audit authorized by this article shall be performed at the offices where such accounts and records are maintained and shall be limited to those portions of such accounts and records that relate to each Party's performance and satisfaction of obligations under this LGIA. Each Party shall keep such accounts and records for a period equivalent to the audit rights periods described in Article 25.4.

25.4 **Audit Rights Periods.**

25.4.1 **Audit Rights Period for Construction-Related Accounts and Records.** Accounts and records related to the design, engineering, procurement, and construction of Transmission Provider's Interconnection Facilities and Network Upgrades shall be subject to audit for a period of twenty-four months following Transmission

Provider's issuance of a final invoice in accordance with Article 12.2.

25.4.2 **Audit Rights Period for All Other Accounts and Records.** Accounts and records related to either Party's performance or satisfaction of all obligations under this LGIA other than those described in Article 25.4.1 shall be subject to audit as follows: (i) for an audit relating to cost obligations, the applicable audit rights period shall be twenty-four months after the auditing Party's receipt of an invoice giving rise to such cost obligations; and (ii) for an audit relating to all other obligations, the applicable audit rights period shall be twenty-four months after the event for which the audit is sought.

25.5 **Audit Results.** If an audit by a Party determines that an overpayment or an underpayment has occurred, a notice of such overpayment or underpayment shall be given to the other Party together with those records from the audit which support such determination.

Article 26. Subcontractors

26.1 **General.** Nothing in this LGIA shall prevent a Party from utilizing the services of any subcontractor as it deems appropriate to perform its obligations under this LGIA; provided, however, that each Party shall require its subcontractors to comply with all applicable terms and conditions of this LGIA in providing such services and each Party shall remain primarily liable to the other Party for the performance of such subcontractor.

26.2 **Responsibility of Principal.** The creation of any subcontract relationship shall not relieve the hiring Party of any of its obligations under this LGIA. The hiring Party shall be fully responsible to the other Party for the acts or omissions of any subcontractor the hiring Party hires as if no subcontract had been made; provided, however, that in no event shall Transmission Provider be liable for the actions or

inactions of Interconnection Customer or its subcontractors with respect to obligations of Interconnection Customer under Article 5 of this LGIA. Any applicable obligation imposed by this LGIA upon the hiring Party shall be equally binding upon, and shall be construed as having application to, any subcontractor of such Party.

26.3 **No Limitation by Insurance**. The obligations under this Article 26 will not be limited in any way by any limitation of subcontractor's insurance.

Article 27. Disputes

27.1 **Submission.** In the event either Party has a dispute, or asserts a claim, that arises out of or in connection with this LGIA or its performance, such Party (the "disputing Party") shall provide the other Party with written notice of the dispute or claim ("Notice of Dispute"). Such dispute or claim shall be referred to a designated senior representative of each Party for resolution on an informal basis as promptly as practicable after receipt of the Notice of Dispute by the other Party. In the event the designated representatives are unable to resolve the claim or dispute through unassisted or assisted negotiations within thirty (30) Calendar Days of the other Party's receipt of the Notice of Dispute, such claim or dispute may, upon mutual agreement of the Parties, be submitted to arbitration and resolved in accordance with the arbitration procedures set forth below. In the event the Parties do not agree to submit such claim or dispute to arbitration, each Party may exercise whatever rights and remedies it may have in equity or at law consistent with the terms of this LGIA.

27.2 **External Arbitration Procedures**. Any arbitration initiated under this LGIA shall be conducted before a single neutral arbitrator appointed by the Parties. If the Parties fail to agree upon a single arbitrator within ten (10) Calendar Days of the submission of the dispute to arbitration, each Party shall choose one arbitrator who shall sit on a three-member arbitration panel. The two arbitrators so chosen shall within twenty (20) Calendar Days select a third

arbitrator to chair the arbitration panel. In either case, the arbitrators shall be knowledgeable in electric utility matters, including electric transmission and bulk power issues, and shall not have any current or past substantial business or financial relationships with any party to the arbitration (except prior arbitration). The arbitrator(s) shall provide each of the Parties an opportunity to be heard and, except as otherwise provided herein, shall conduct the arbitration in accordance with the Commercial Arbitration Rules of the American Arbitration Association ("Arbitration Rules") and any applicable FERC regulations or RTO rules; provided, however, in the event of a conflict between the Arbitration Rules and the terms of this Article 27, the terms of this Article 27 shall prevail.

27.3 Arbitration Decisions. Unless otherwise agreed by the Parties, the arbitrator(s) shall render a decision within ninety (90) Calendar Days of appointment and shall notify the Parties in writing of such decision and the reasons therefore. The arbitrator(s) shall be authorized only to interpret and apply the provisions of this LGIA and shall have no power to modify or change any provision of this Agreement in any manner. The decision of the arbitrator(s) shall be final and binding upon the Parties, and judgment on the award may be entered in any court having jurisdiction. The decision of the arbitrator(s) may be appealed solely on the grounds that the conduct of the arbitrator(s), or the decision itself, violated the standards set forth in the Federal Arbitration Act or the Administrative Dispute Resolution Act. The final decision of the arbitrator must also be filed with FERC if it affects jurisdictional rates, terms and conditions of service, Interconnection Facilities, or Network Upgrades.

27.4 Costs. Each Party shall be responsible for its own costs incurred during the arbitration process and for the following costs, if applicable: (1) the cost of the arbitrator chosen by the Party to sit on the three member panel and one half of the cost of the third arbitrator chosen; or (2) one half the cost of the single arbitrator jointly chosen by the Parties.

Article 28. Representations, Warranties, and Covenants

28.1 **General.** Each Party makes the following representations, warranties and covenants:

28.1.1 **Good Standing.** Such Party is duly organized, validly existing and in good standing under the laws of the state in which it is organized, formed, or incorporated, as applicable; that it is qualified to do business in the state or states in which the Large Generating Facility, Interconnection Facilities and Network Upgrades owned by such Party, as applicable, are located; and that it has the corporate power and authority to own its properties, to carry on its business as now being conducted and to enter into this LGIA and carry out the transactions contemplated hereby and perform and carry out all covenants and obligations on its part to be performed under and pursuant to this LGIA.

28.1.2 **Authority.** Such Party has the right, power and authority to enter into this LGIA, to become a Party hereto and to perform its obligations hereunder. This LGIA is a legal, valid and binding obligation of such Party, enforceable against such Party in accordance with its terms, except as the enforceability thereof may be limited by applicable bankruptcy, insolvency, reorganization or other similar laws affecting creditors' rights generally and by general equitable principles (regardless of whether enforceability is sought in a proceeding in equity or at law).

28.1.3 **No Conflict.** The execution, delivery and performance of this LGIA does not violate or conflict with the organizational or formation documents, or bylaws or operating agreement, of such Party, or any

judgment, license, permit, order, material agreement or instrument applicable to or binding upon such Party or any of its assets.

28.1.4 **Consent and Approval.** Such Party has sought or obtained, or, in accordance with this LGIA will seek or obtain, each consent, approval, authorization, order, or acceptance by any Governmental Authority in connection with the execution, delivery and performance of this LGIA, and it will provide to any Governmental Authority notice of any actions under this LGIA that are required by Applicable Laws and Regulations.

Article 29. Joint Operating Committee

29.1 Joint Operating Committee. Except in the case of ISOs and RTOs, Transmission Provider shall constitute a Joint Operating Committee to coordinate operating and technical considerations of Interconnection Service. At least six (6) months prior to the expected Initial Synchronization Date, Interconnection Customer and Transmission Provider shall each appoint one representative and one alternate to the Joint Operating Committee. Each Interconnection Customer shall notify Transmission Provider of its appointment in writing. Such appointments may be changed at any time by similar notice. The Joint Operating Committee shall meet as necessary, but not less than once each calendar year, to carry out the duties set forth herein. The Joint Operating Committee shall hold a meeting at the request of either Party, at a time and place agreed upon by the representatives. The Joint Operating Committee shall perform all of its duties consistent with the provisions of this LGIA. Each Party shall cooperate in providing to the Joint Operating Committee all information required in the performance of the Joint Operating Committee's duties. All decisions and agreements, if any, made by the Joint Operating Committee, shall be evidenced in writing. The duties of the Joint Operating Committee shall include the following:

29.1.1 Establish data requirements and operating record requirements.

29.1.2 Review the requirements, standards, and procedures for data acquisition equipment, protective equipment, and any other equipment or software.

29.1.3 Annually review the one (1) year forecast of maintenance and planned outage schedules of Transmission Provider's and Interconnection Customer's facilities at the Point of Interconnection.

29.1.4 Coordinate the scheduling of maintenance and planned outages on the Interconnection Facilities, the Large Generating Facility and other facilities that impact the normal operation of the interconnection of the Large Generating Facility to the Transmission System.

29.1.5 Ensure that information is being provided by each Party regarding equipment availability.

29.1.6 Perform such other duties as may be conferred upon it by mutual agreement of the Parties.

Article 30. Miscellaneous

30.1 **Binding Effect.** This LGIA and the rights and obligations hereof, shall be binding upon and shall inure to the benefit of the successors and assigns of the Parties hereto.

30.2 **Conflicts.** In the event of a conflict between the body of this LGIA and any attachment, appendices or exhibits hereto, the terms and provisions of the body of this LGIA shall prevail and be deemed the final intent of the Parties.

30.3 **Rules of Interpretation.** This LGIA, unless a clear contrary intention appears, shall be construed and interpreted as follows: (1) the singular number includes the plural number and vice versa; (2) reference to any person includes such person's successors and assigns but, in the case of a Party, only if such successors and assigns are permitted by this LGIA, and reference to a person in a particular capacity excludes such person in any other capacity or individually; (3) reference to any agreement (including this LGIA), document, instrument or tariff means such agreement, document, instrument, or tariff as amended or modified and in effect from time to time in accordance with the terms thereof and, if applicable, the terms hereof; (4) reference to any Applicable Laws and Regulations means such Applicable Laws and Regulations as amended, modified, codified, or reenacted, in whole or in part, and in effect from time to time, including, if applicable, rules and regulations promulgated thereunder; (5) unless expressly stated otherwise, reference to any Article, Section or Appendix means such Article of this LGIA or such Appendix to this LGIA, or such Section to the LGIP or such Appendix to the LGIP, as the case may be; (6) "hereunder", "hereof", "herein", "hereto" and words of similar import shall be deemed references to this LGIA as a whole and not to any particular Article or other provision hereof or thereof; (7) "including" (and with correlative meaning "include") means including without limiting the generality of any description preceding such term; and (8) relative to the determination of any period of time, "from" means "from and including", "to" means "to but excluding" and "through" means "through and including".

30.4 **Entire Agreement.** This LGIA, including all Appendices and Schedules attached hereto, constitutes the entire agreement between the Parties with reference to the subject matter hereof, and supersedes all prior and contemporaneous understandings or agreements, oral or written, between the Parties with respect to the subject matter of this LGIA. There are no other agreements, representations, warranties, or covenants which constitute any part of the consideration for, or any condition to, either Party's compliance with its obligations under this LGIA.

30.5 **No Third Party Beneficiaries.** This LGIA is not intended to and does not create rights, remedies, or benefits of any character whatsoever in favor of any persons, corporations, associations, or entities other than the Parties, and the obligations herein assumed are solely for the use and benefit of the Parties, their successors in interest and, where permitted, their assigns.

30.6 **Waiver.** The failure of a Party to this LGIA to insist, on any occasion, upon strict performance of any provision of this LGIA will not be considered a waiver of any obligation, right, or duty of, or imposed upon, such Party. Any waiver at any time by either Party of its rights with respect to this LGIA shall not be deemed a continuing waiver or a waiver with respect to any other failure to comply with any other obligation, right, duty of this LGIA. Termination or Default of this LGIA for any reason by Interconnection Customer shall not constitute a waiver of Interconnection Customer's legal rights to obtain an interconnection from Transmission Provider. Any waiver of this LGIA shall, if requested, be provided in writing.

30.7 **Headings.** The descriptive headings of the various Articles of this LGIA have been inserted for convenience of reference only and are of no significance in the interpretation or construction of this LGIA.

30.8 **Multiple Counterparts.** This LGIA may be executed in two or more counterparts, each of which is deemed an original but all constitute one and the same instrument.

30.9 **Amendment.** The Parties may by mutual agreement amend this LGIA by a written instrument duly executed by the Parties.

30.10 **Modification by the Parties.** The Parties may by mutual agreement amend the Appendices to this LGIA by a written instrument duly executed by the Parties. Such amendment shall become effective and a part of this LGIA upon satisfaction of all Applicable Laws and Regulations.

30.11 Reservation of Rights. Transmission Provider shall have the right to make a unilateral filing with FERC to modify this LGIA with respect to any rates, terms and conditions, charges, classifications of service, rule or regulation under section 205 or any other applicable provision of the Federal Power Act and FERC's rules and regulations thereunder, and Interconnection Customer shall have the right to make a unilateral filing with FERC to modify this LGIA pursuant to section 206 or any other applicable provision of the Federal Power Act and FERC's rules and regulations thereunder; provided that each Party shall have the right to protest any such filing by the other Party and to participate fully in any proceeding before FERC in which such modifications may be considered. Nothing in this LGIA shall limit the rights of the Parties or of FERC under sections 205 or 206 of the Federal Power Act and FERC's rules and regulations thereunder, except to the extent that the Parties otherwise mutually agree as provided herein.

30.12 No Partnership. This LGIA shall not be interpreted or construed to create an association, joint venture, agency relationship, or partnership between the Parties or to impose any partnership obligation or partnership liability upon either Party. Neither Party shall have any right, power or authority to enter into any agreement or undertaking for, or act on behalf of, or to act as or be an agent or representative of, or to otherwise bind, the other Party.

IN WITNESS WHEREOF, the Parties have executed this LGIA in duplicate originals, each of which shall constitute and be an original effective Agreement between the Parties.

Appendix A to LGIA

Interconnection Facilities, Network Upgrades and Distribution Upgrades

1. **Interconnection Facilities:**

   (a) **Interconnection Customer's Interconnection Facilities:** Two (2) circuit breakers (one per step up transformer) connected to approximately seven (7) miles of generator tie line for the Q706 collector substation to the Point of Interconnection (Aeolus substation). One circuit breaker will be located approximately adjacent to Aeolus substation. Please see Exhibit 1 to Attachment A.

   (b) **Transmission Provider's Interconnection Facilities:** Two (2) production meters located at the high side of the step up transformers at the Q706 collector substation, one (1) interchange meter at the Point of Change of Ownership, relay and grounding upgrades required for the new line position, and one new line position (dead end structure, disconnect switch, metering structure) located at the Point of Interconnection (Aeolus substation). Customer will also install fiber optic cable (to be owned by Transmission Provider) on generation tie line. Please see Exhibit 1 to Attachment A.

2. **Network Upgrades:**

   (a) **Stand Alone Network Upgrades:** None

   (b) **Other Network Upgrades:** None

3. **Distribution Upgrades:** None

4. **Point of Interconnection ("POI"):** The point at which Transmission Provider Interconnection Facilities connect to the substation bus at Aeolus substation (see Exhibit 1 to Appendix A).

5. **Point of Change of Ownership:** The point at which Interconnection Customer and Transmission Provider

Interconnection Facilities meet (see Exhibit 1 to Appendix A).

6. **One-Line Diagram:** is attached to this agreement as Exhibit 1 to Appendix A.

7. **Contingent Facilities:** The Point of Interconnection for this project is Aeolus 230 kV substation which is planned to be constructed as part of the Transmission Provider Gateway West D2 project. Aeolus substation, as well as the Gateway West Segment D2 500 kV transmission line (Aeolus-Anticline) are contingent for this project and must be in service prior to approval of generation activities for this project. If the schedule for completion of Aeolus substation or Gateway West Segment D2 are modified then the schedule for this project will need to be modified to align with the new completion date.

8. **Tax Gross-Up Amount:** There is no tax gross-up anticipated for the Direct Assignment Facilities and Transmission Provider's Interconnection Facilities installed under this Agreement. The estimated tax liability, in the event that Transmission Provider is assessed a tax liability for these facilities, is calculated pursuant to the formula in Article 5.17.4 of this Agreement as follows:

Current Tax Rate - 37.95%
Gross Income Amount - $2,760,000
Present Value of Tax Depreciation - $561,267

Estimated Tax Liability - 37.95% x ($2,760,000-$561,267)/(1-37.95%) = $1,842,341

The above tax liability calculation is an example only. In the event Transmission Provider is assessed a tax liability for the Direct Assignment Facilities and Transmission Provider's Interconnection Facilities installed pursuant to this LGIA, the actual tax liability will be calculated at that time based upon the actual values then obtained for current tax rate, gross income amount and present value of the tax depreciation.

Appendix B To LGIA

Milestones

Milestone/Date	Party
Execute Interconnection Agreement November 15, 2017	Interconnection Customer
Provision of Financial Security ($550,000) July 27, 2018	Interconnection Customer
Final Issue for Construction Design Package Provided August 31, 2018	Interconnection Customer
*Engineering & Procurement Commences November 6, 2018	Transmission Provider
**Energy Imbalance Market Modeling Data Submittal January 9, 2019	Interconnection Customer
Engineering Design Complete March 6, 2019	Transmission Provider
Property/Permits/ROW Procured April 10, 2019	Interconnection Customer
Construction Begins August 7, 2019	Transmission Provider
Facilities Receive Backfeed Power October 1, 2020	Interconnection Customer
***Initial Synchronization and Customer Generation Testing October 15, 2020	Interconnection
Commercial Operation November 1, 2020	Interconnection Customer

*As applicable and determined by the Transmission Provider, within 60 days of the Interconnection Customer's authorization for the Transmission Provider to begin engineering, the Interconnection Customer shall provide a detailed short circuit model of its generation system. This model must be constructed using the ASPEN OneLine short circuit simulation program and contain all individual electrical components of the Interconnection Customer's generation system.

**Any design modifications to the Interconnection Customer's Generating Facility after this date requiring updates to the Transmission Provider's network model will result in a minimum of 3 months added to all future milestones including Commercial Operation.

***The Transmission Provider's Gateway West Segment D2 500 kV transmission line (Aeolus-Anticline) must be in service prior to commencement of any generation activities.

Term of Agreement: In accordance with LGIA Article 2.2, the Parties agree that the term of the LGIA shall be ten (10) years from the Effective Date and shall be automatically renewed for each successive one-year period thereafter.

Construction Option: The Network Upgrades, Direct Assignment Facilities and Transmission Provider Interconnection Facilities will be designed, procured and constructed by the Transmission Provider in accordance with the Standard Option outlined in Article 5.1.1 of this Agreement. The Network Upgrades, Direct Assignment Facilities and Transmission Provider Interconnection Facilities shall be constructed in accordance with the Scope of Work attached to this LGIA as Exhibit 1 to Appendix B. The Network Upgrades, Direct Assignment Facilities and Transmission Provider's Interconnection Facilities shall be designed, procured and constructed in a timely manner to support the Milestone Dates stated above.

Estimated Project Cost

Network Upgrades:	$0
Direct Assigned:	$2,760,000
Total	$2,760,000

Appendix C To LGIA

Interconnection Details

Description of the Large Generating Facility: The Q0706 Large Generating Facility consists of one hundred twenty five (125) GE 2.0-116 2 MW turbines connected to ten (10) 34.5 kV strings for a total generation output of 250 MW as measured by nameplate. Five (5) strings are then connected to a single 84/112/140 MVA 34.5 - 230 kV (9% impedance) transformer (x2). The Large Generating Facility is located in Carbon County, Wyoming. Please see Exhibit 1 to Attachment A.

Control Area Requirements: Interconnection Customer shall interconnect and operate the Large Generating Facility in accordance with the Transmission Provider's Facility Interconnection Requirements for Transmission Systems, as may be revised from time to time, attached hereto as Exhibit 1 to Appendix C and by this reference incorporated herein.

Interconnection Details:
Metering. With reference to Article 7.1, Transmission Provider will own and maintain the bi-directional revenue Metering Equipment in Transmission Provider's Point of Interconnection substation at the Interconnection Customer's expense.

Under Frequency and Over Frequency Conditions. Consistent with LGIA Article 9.7.3, Transmission Provider shall design, procure, install and maintain frequency and voltage protection to trip feeder breakers in accordance with the settings shown in Exhibit 1 to Appendix C.

Reactive Power and Voltage Schedule. All interconnecting synchronous and non-synchronous generators are required to design their Generating Facilities with reactive power capabilities necessary to operate within the full power factor range of 0.95 leading to 0.95 lagging. This power factor range shall be dynamic and can be met using a combination of the inherent dynamic reactive power capability of the generator or inverter, dynamic reactive power devices and static reactive power devices. For non-synchronous generators, the power factor requirement is to be measured at the high-side of the generator substation. The Generating Facility must provide dynamic reactive power to the system over the full range of real power output. If the Generating Facility is not capable of providing positive reactive support (i.e., supplying reactive power to the system) immediately following the removal of a fault or other transient low voltage perturbations, the facility will be required to add dynamic voltage support equipment. These additional dynamic reactive devices shall have correct protection settings such that the devices will remain on line and active during and immediately following a fault event.

Generators shall be equipped with automatic voltage-control equipment and normally operated with the voltage regulation control mode enabled unless written authorization, or directive, from the Transmission Provider is given to operate in another control mode (e.g., constant power factor control). The control mode of generating units shall be accurately represented in operating studies. The generators shall be capable of operating continuously at their maximum power output at its rated field current within +/- 5% of its rated terminal voltage. Phasor Measurement Units will be required at any Generating Facilities with an individual or aggregate nameplate capacity of 75 MVA or greater.

As required by NERC standard VAR-001-1a, the Transmission Provider will provide a voltage schedule for the Point of Interconnection. In general, Generating Facilities should be operated so as to maintain the voltage at the Point of Interconnection, or other designated point as deemed appropriated by Transmission Provider, in accordance with Transmission Provider Policy 139.

Generating Facilities capable of operating with a voltage droop are required to do so. Studies will be required to coordinate voltage droop settings if there are other facilities in the area. It will be the Interconnection Customer's responsibility to ensure that a voltage coordination study is performed, in coordination with Transmission Provider, and implemented with appropriate coordination settings prior to unit testing. If the need for a master controller is identified, the cost and all related installation requirements will be the responsibility of the Interconnection Customer. Participation by the Generation Facility in subsequent interaction/coordination studies will be required pre- and post-commercial operation in order ensure system reliability.

All generators must meet the Federal Energy Regulatory Commission (FERC) and WECC low voltage ride-through requirements.

support (i.e., supplying reactive power to the system) immediately following the removal of a fault or other transient low voltage perturbations, the facility will be required to add dynamic voltage support equipment. These additional dynamic reactive devices shall have correct protection settings such that the devices will remain on line and active during and immediately following a fault event.

Generators shall be equipped with automatic voltage-control equipment and normally operated with the voltage regulation control mode enabled unless written authorization, or directive, from the Transmission Provider is given to operate in another control mode (e.g., constant power factor control). The control mode of generating units shall be accurately represented in operating studies. The generators shall be capable of operating continuously at their maximum power output at its rated field current within +/- 5% of its rated terminal voltage. Phasor Measurement Units will be required at any Generating Facilities with an individual or aggregate nameplate capacity of 75 MVA or greater.

As required by NERC standard VAR-001-1a, the Transmission Provider will provide a voltage schedule for the Point of Interconnection. In general, Generating Facilities should be operated so as to maintain the voltage at the Point of Interconnection, or other designated point as deemed appropriated by Transmission Provider, in accordance with Transmission Provider Policy 139.

Generating Facilities capable of operating with a voltage droop are required to do so. Studies will be required to coordinate voltage droop settings if there are other facilities in the area. It will be the Interconnection Customer's responsibility to ensure that a voltage coordination study is performed, in coordination with Transmission Provider, and implemented with appropriate coordination settings prior to unit testing. If the need for a master controller is identified, the cost and all related installation requirements will be the responsibility of the Interconnection Customer. Participation by the Generation Facility in subsequent interaction/coordination studies will be required pre- and post-commercial operation in order ensure system reliability.

All generators must meet the Federal Energy Regulatory Commission (FERC) and WECC low voltage ride-through requirements.

As the Transmission Provider cannot submit a user written model to WECC for inclusion in base cases, a standard model from the WECC Approved Dynamic Model Library is required 180 days prior to trial operation. The list of approved generator models is continually updated and is available on the http://www.WECC.biz website.

Property Requirements. Subject to LGIA Articles 5.12 and 5.13, Interconnection Customer is required to obtain for the benefit of Transmission Provider at Interconnection Customer's sole cost and expense all real property rights, including but not limited to fee ownership, easements and/or rights of way, as applicable, for Transmission Provider owned facilities using forms acceptable to Transmission Provider. Transmission Provider shall not be obligated to accept any such real property right that does not, at Transmission Provider's sole discretion, confer sufficient rights to access, operate, construct, modify, maintain, place and remove Transmission Provider owned facilities or is otherwise conveyed using forms unacceptable to Transmission Provider. Further, all real property on which Transmission Provider's facilities are to be located must be environmentally, physically and operationally acceptable to the Transmission Provider in accordance with Good Utility Practice.

Subject to LGIA Article 5.14, Interconnection Customer is responsible for obtaining all permits required by all relevant jurisdictions for the project, including but not limited to, conditional use permits and construction permits; provided however, Transmission Provider shall obtain, at Interconnection Customer's cost and schedule risk, the permits necessary to construct Transmission Provider's facilities that are to be located on real property currently owned or held in fee or right by Transmission Provider.

Except as expressly waived in writing by an authorized officer of Transmission Provider, all of the foregoing permits and real property rights (conferring rights on real property that is environmentally, physically and operationally acceptable to Transmission Provider) shall be acquired as provided herein as a condition to Transmission Provider's contractual obligation to construct or take possession of facilities to be owned by the Transmission Provider under this Agreement. Transmission Provider shall have no liability for any project delays or cost overruns caused by delays in acquiring any of the foregoing permits and/or real property rights, whether such delay results from the failure to obtain such permits or rights or the failure of such permits or rights to meet the requirements set forth herein. Further, any completion dates, if any, set forth herein with regard to Transmission Provider's obligations shall be equitably extended based on the length and impact of any such delays.

With respect to the fiber optic cable on Interconnection Customer's tie line that will be owned by the Transmission Provider, the Interconnection Customer and the Transmission Provider agree that Transmission Provider's ownership and operation of fiber optic cable that is attached to poles or other structures that are owned or maintained by the Interconnection Customer is subject to LGIA Article 5.12, Good Utility Practice, and Transmission Provider's Interconnection Policy 139 (Exhibit 1 to Appendix C to LGIA).

Appendix D To LGIA

Security Arrangements Details

Infrastructure security of Transmission System equipment and operations and control hardware and software is essential to ensure day-to-day Transmission System reliability and operational security. FERC will expect all Transmission Providers, market participants, and Interconnection Customers interconnected to the Transmission System to comply with the recommendations offered by the President's Critical Infrastructure Protection Board and, eventually, best practice recommendations from the electric reliability authority. All public utilities will be expected to meet basic standards for system infrastructure and operational security, including physical, operational, and cyber-security practices.

Automatic Data Transfer. Throughout the term of this Agreement, Interconnection Customer shall provide the data specified below by automatic data transfer to the Transmission Provider Control Center specified by Transmission Provider or to a Third-Party System Operator designated by Transmission Provider (or both):

From the Interconnection Customer's collector substation:

- Analogs:
  - Transformer # 1 real power
  - Transformer # 1 reactive power
  - Real power flow through 34.5 kV line feeder breaker T1-1
  - Reactive power flow through 34.5 kV line feeder breaker T1-1
  - Real power flow through 34.5 kV line feeder breaker T1-2
  - Reactive power flow through 34.5 kV line feeder breaker T1-2
  - Real power flow through 34.5 kV line feeder breaker T1-3
  - Reactive power flow through 34.5 kV line feeder breaker T1-3
  - Real power flow through 34.5 kV line feeder breaker T1-4
  - Reactive power flow through 34.5 kV line feeder breaker T1-4

  - Real power flow through 34.5 kV line feeder breaker T1-5
  - Reactive power flow through 34.5 kV line feeder breaker T1-5
  - Transformer # 2 real power
  - Transformer # 2 reactive power
  - Real power flow through 34.5 kV line feeder breaker T2-1
  - Reactive power flow through 34.5 kV line feeder breaker T2-1
  - Real power flow through 34.5 kV line feeder breaker T2-2
  - Reactive power flow through 34.5 kV line feeder breaker T2-2
  - Real power flow through 34.5 kV line feeder breaker T2-3
  - Reactive power flow through 34.5 kV line feeder breaker T2-3
  - Real power flow through 34.5 kV line feeder breaker T2-4
  - Reactive power flow through 34.5 kV line feeder breaker T2-4
  - Real power flow through 34.5 kV line feeder breaker T2-5
  - Reactive power flow through 34.5 kV line feeder breaker T2-5
  - A phase 230 kV transmission voltage
  - B phase 230 kV transmission voltage
  - C phase 230 kV transmission voltage
  - Average Wind speed
  - Average Plant Atmospheric Pressure (Bar)
  - Average Plant Temperature (Celsius)
- Status
  - 230 kV breaker T1
  - 34.5 kV collector circuit breaker T1-1
  - 34.5 kV collector circuit breaker T1-2
  - 34.5 kV collector circuit breaker T1-3
  - 34.5 kV collector circuit breaker T1-4
  - 34.5 kV collector circuit breaker T1-5
  - 230 kV breaker T2
  - 34.5 kV collector circuit breaker T2-1
  - 34.5 kV collector circuit breaker T2-2
  - 34.5 kV collector circuit breaker T2-3
  - 34.5 kV collector circuit breaker T2-4
  - 34.5 kV collector circuit breaker T2-5

Billing Meter Data. Bi-directional revenue meter at the Point of Interconnection will not be configured to allow direct dial-up access by Interconnection Customer. The Transmission Provider will provide alternatives, at the Interconnection Customer's expense, upon request.

Additional Data. Interconnection Customer shall, at its sole expense, provide any additional Generating Facility data reasonably required and necessary for the Transmission Provider to operate the Transmission System in accordance with Good Utility Practice and Exhibit 1 to Appendix C, Facility Interconnection Requirements for Transmission Systems.

Relay and Control Settings

Interconnection Customer must allow PacifiCorp to hold all Level 2 relay passwords for any control and/or protective device within its control at the Point of Interconnection and/or customer facility which directly impacts PacifiCorp's distribution and/or transmission systems. Level 2 passwords are those which allow actual modifications to control and/or relay settings. This will ensure PacifiCorp is aware of and approves any changes being made by the customer. Furthermore, this will ensure there are no negative impacts to PacifiCorp's distribution system, transmission system, or existing customers.

If Interconnection Customer requires modifications to the settings associated with control/protective devices connected to the distribution and/or transmission system, Interconnection Customer will contact PacifiCorp and provide in writing the justification for the proposed modifications. This will allow PacifiCorp to analyze the modifications and ensure there will be no negative impacts to connected systems and customers.

Any modifications of control and/or relay settings without review and acknowledgement of acceptance by PacifiCorp will be considered a breach of the Interconnection Agreement and grounds for permanent disconnection from the PacifiCorp system.

Appendix E To LGIA

Commercial Operation Date

This Appendix E is a part of the LGIA between Transmission Provider and Interconnection Customer.

[Date]

[Transmission Provider Address]

Re: _______________ Large Generating Facility

Dear _______________:

On **[Date]** **[Interconnection Customer]** has completed Trial Operation of Unit No. __. This letter confirms that [Interconnection Customer] commenced Commercial Operation of Unit No. ___ at the Large Generating Facility, effective as of **[Date plus one day]**.

Thank you.

Appendix G to LGIA

INTERCONNECTION REQUIREMENTS FOR A WIND GENERATING PLANT

Appendix G sets forth requirements and provisions specific to a wind generating plant. All other requirements of this LGIA continue to apply to wind generating plant interconnections.

A. Technical Standards Applicable to a Wind Generating Plant

i. Low Voltage Ride-Through (LVRT) Capability

A wind generating plant shall be able to remain online during voltage disturbances up to the time periods and associated voltage levels set forth in the standard below. The LVRT standard provides for a transition period standard and a post-transition period standard.

Transition Period LVRT Standard

The transition period standard applies to wind generating plants subject to FERC Order 661 that have either: (i) interconnection agreements signed and filed with the Commission, filed with the Commission in unexecuted form, or filed with the Commission as non-conforming agreements between January 1, 2006 and December 31, 2006, with a scheduled in-service date no later than December 31, 2007, or (ii) wind generating turbines subject to a wind turbine procurement contract executed prior to December 31, 2005, for delivery through 2007.

1. Wind generating plants are required to remain in-service during three-phase faults with normal clearing (which is a time period of approximately 4 – 9 cycles) and single line to ground faults with delayed clearing, and subsequent post-fault voltage recovery to prefault voltage unless clearing the fault effectively disconnects the generator from the system. The clearing time requirement for a three-phase fault will be specific to the wind generating plant substation location, as determined by and documented by the transmission provider. The maximum clearing time the wind generating plant shall be required to withstand for a three-phase fault shall be 9 cycles at a voltage as low as 0.15 p.u., as measured at the high side of the wind generating

plant step-up transformer (i.e. the transformer that steps the voltage up to the transmission interconnection voltage or "GSU"), after which, if the fault remains following the location-specific normal clearing time for three-phase faults, the wind generating plant may disconnect from the transmission system.

2. This requirement does not apply to faults that would occur between the wind generator terminals and the high side of the GSU or to faults that would result in a voltage lower than 0.15 per unit on the high side of the GSU serving the facility.

3. Wind generating plants may be tripped after the fault period if this action is intended as part of a special protection system.

4. Wind generating plants may meet the LVRT requirements of this standard by the performance of the generators or by installing additional equipment (e.g., Static VAr Compensator, etc.) within the wind generating plant or by a combination of generator performance and additional equipment.

5. Existing individual generator units that are, or have been, interconnected to the network at the same location at the effective date of the Appendix G LVRT Standard are exempt from meeting the Appendix G LVRT Standard for the remaining life of the existing generation equipment. Existing individual generator units that are replaced are required to meet the Appendix G LVRT Standard.

Post-transition Period LVRT Standard

All wind generating plants subject to FERC Order No. 661 and not covered by the transition period described above must meet the following requirements:

1. Wind generating plants are required to remain in-service during three-phase faults with normal clearing (which is a time period of approximately 4 - 9 cycles) and single line to ground faults with delayed clearing, and subsequent post-fault voltage recovery to prefault voltage unless clearing the

fault effectively disconnects the generator from the system. The clearing time requirement for a three-phase fault will be specific to the wind generating plant substation location, as determined by and documented by the transmission provider. The maximum clearing time the wind generating plant shall be required to withstand for a three-phase fault shall be 9 cycles after which, if the fault remains following the location-specific normal clearing time for three-phase faults, the wind generating plant may disconnect from the transmission system. A wind generating plant shall remain interconnected during such a fault on the transmission system for a voltage level as low as zero volts, as measured at the high voltage side of the wind GSU.

2. This requirement does not apply to faults that would occur between the wind generator terminals and the high side of the GSU.

3. Wind generating plants may be tripped after the fault period if this action is intended as part of a special protection system.

4. Wind generating plants may meet the LVRT requirements of this standard by the performance of the generators or by installing additional equipment (e.g., Static VAr Compensator) within the wind generating plant or by a combination of generator performance and additional equipment.

5. Existing individual generator units that are, or have been, interconnected to the network at the same location at the effective date of the Appendix G LVRT Standard are exempt from meeting the Appendix G LVRT Standard for the remaining life of the existing generation equipment. Existing individual generator units that are replaced are required to meet the Appendix G LVRT Standard.

ii. <u>Power Factor Design Criteria (Reactive Power)</u>

The following reactive power requirements apply only to a newly interconnecting wind generating plant that has executed a Facilities Study Agreement as of the effective

date of the Final Rule establishing the reactive power requirements for non-synchronous generators in section 9.6.1 of this LGIA (Order No. 827). A wind generating plant to which this provision applies shall maintain a power factor within the range of 0.95 leading to 0.95 lagging, measured at the Point of Interconnection as defined in this LGIA, if the Transmission Provider's System Impact Study shows that such a requirement is necessary to ensure safety or reliability. The power factor range standard can be met by using, for example, power electronics designed to supply this level of reactive capability (taking into account any limitations due to voltage level, real power output, etc.) or fixed and switched capacitors if agreed to by the Transmission Provider, or a combination of the two. The Interconnection Customer shall not disable power factor equipment while the wind plant is in operation. Wind plants shall also be able to provide sufficient dynamic voltage support in lieu of the power system stabilizer and automatic voltage regulation at the generator excitation system if the System Impact Study shows this to be required for system safety or reliability.

iii. Supervisory Control and Data Acquisition (SCADA) Capability

The wind plant shall provide SCADA capability to transmit data and receive instructions from the Transmission Provider to protect system reliability. The Transmission Provider and the wind plant Interconnection Customer shall determine what SCADA information is essential for the proposed wind plant, taking into account the size of the plant and its characteristics, location, and importance in maintaining generation resource adequacy and transmission system reliability in its area.

Exhibit 1 to Appendix A to LGIA

One-Line Diagram

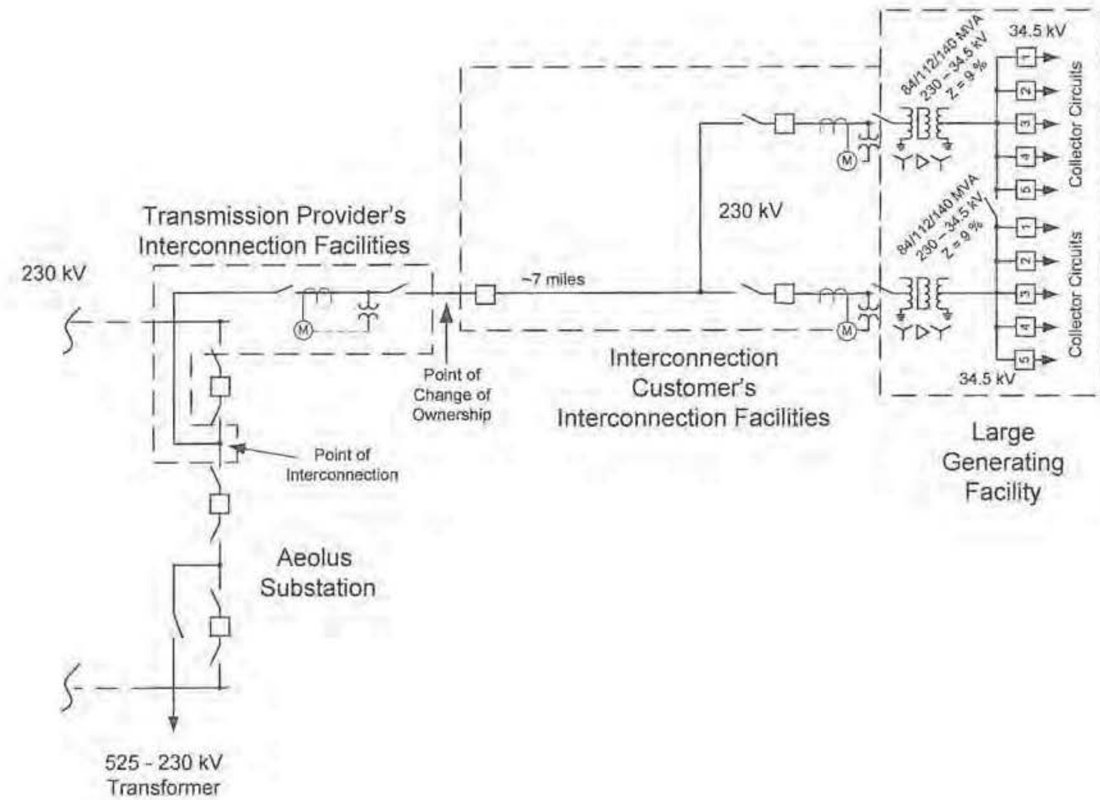

Exhibit 1 to Appendix B to LGIA

Scope of Work

Generating Facility Modifications

The following outlines the design, procurement, construction, installation, and ownership of equipment at the Interconnection Customer's Generation Facility.

Interconnection Customer to be Responsible For the following:

- Design, procure, install, and own all equipment required for the Large Generating Facility.
- Obtain all necessary permits, lands, rights of way and easements required for the construction and continued maintenance of the facilities required for the Q0706 Project. All easements and permits shall be recorded in the name of the Transmission Provider and shall be on forms acceptable to the Transmission Provider. All easements and rights of way will be obtained for durations acceptable to the Transmission Provider; this includes all permits/easements for ingress and egress prior to the start of construction.
  - Provide a separate fenced area along the perimeter of the Interconnection Customer's Generating Facility in which the Transmission Provider can install a control house for any protection and communication equipment. This area will share a fence and ground grid with the Generating Facility and have separate access. AC station service for the control house will be supplied by the Interconnection Customer.
- Provide a CDEGS grounding analysis.
- Design and install conduits, per Transmission Provider's standards, to the demarcation point.
- The collector substation batteries will be sized to carry the communication equipment with DC to DC converters.
- Demonstrate the reactive capability of the facility and the voltage control system prior to commercial operation. Conditions of operations include:
  - Operate in voltage control mode with the ability to deliver power output to the POI within the range of +/- 0.95 power factor. (Please see Standard Large Generator Interconnection Agreement, article 9.6.1 and 9.6.2 in OATT.) Any additional reactive

compensation must be designed such that the discrete switching of the reactive device, if required, does not cause step voltage changes greater than ± 3% at any load serving bus on the Transmission Provider's system.

- o As required by NERC standard VAR-001-1a, the Transmission Provider will provide a voltage schedule for the POI. Generating Facilities should be operated so as to maintain the voltage at the POI, or other designated point as deemed appropriate by Transmission Provider, between 1.00 per unit to 1.04 per unit. The Transmission Provider may also specify a voltage and/or reactive power bandwidth as needed to coordinate with upstream voltage control devices such as on-load tap changers. At the Transmission Provider's discretion, these values might be adjusted depending on operating conditions.
- o At low output levels, the Project needs to ensure that it maintains the power factor within ± 0.95 at the POI and minimize the reactive power flow towards the transmission system to prevent high voltages.
- o Generating Facilities capable of operating with a voltage droop are required to do so. Voltage droop control enables proportionate reactive power sharing among Generating Facilities. Studies will be required to coordinate voltage droop settings if there are other facilities in the area. It will be the Interconnection Customer's responsibility to ensure that a voltage coordination study is performed, in coordination with Transmission Provider, and implemented with appropriate coordination settings prior to unit testing.
- o For areas with multiple Generating Facilities, additional studies may be required to determine whether or not critical interactions, including but not limited to control systems, exist. These studies, to be coordinated with Transmission Provider, will be the responsibility of the Interconnection Customer. If the need for a master controller is identified, the cost and all related installation requirements will be the responsibility of the Interconnection Customer.

- Design, procure, install, and own Phasor Measurement Units (PMUs).

- Provide a standard model from the WECC Approved Dynamic Model Library prior to interconnection, since the Transmission Provider cannot submit a user written model to WECC for inclusion in base cases. The list of approved generator models is continually updated and is available on the http://www.WECC.biz website.
- All generators must meet the Federal Energy Regulatory Commission (FERC) and WECC low voltage ride-through requirements as specified in the Interconnection Agreement.
- Prior to construction, arrange construction power with the Transmission Provider. The Project is within the Transmission Provider's service territory and both station service and temporary construction power metering shall conform to the Six State Electric Service Requirements manual.
- Prior to back feed, arrange distribution voltage retail meter service for electricity consumed by the Project and arrange back up station service for power that will be drawn from the transmission or distribution line when the Project is not generating. Interconnection Customer must call the PCCC Solution Center 1-800-640-2212 to arrange this service. Approval for back feed is contingent upon obtaining station service.
- Provide the following data points from the Q0706 collector substation:
  - Analogs:
    - Transformer # 1 real power
    - Transformer # 1 reactive power
    - Real power flow through 34.5 kV line feeder breaker T1-1
    - Reactive power flow through 34.5 kV line feeder breaker T1-1
    - Real power flow through 34.5 kV line feeder breaker T1-2
    - Reactive power flow through 34.5 kV line feeder breaker T1-2
    - Real power flow through 34.5 kV line feeder breaker T1-3
    - Reactive power flow through 34.5 kV line feeder breaker T1-3
    - Real power flow through 34.5 kV line feeder breaker T1-4
    - Reactive power flow through 34.5 kV line feeder breaker T1-4

- Real power flow through 34.5 kV line feeder breaker T1-5
- Reactive power flow through 34.5 kV line feeder breaker T1-5
- Transformer # 2 real power
- Transformer # 2 reactive power
- Real power flow through 34.5 kV line feeder breaker T2-1
- Reactive power flow through 34.5 kV line feeder breaker T2-1
- Real power flow through 34.5 kV line feeder breaker T2-2
- Reactive power flow through 34.5 kV line feeder breaker T2-2
- Real power flow through 34.5 kV line feeder breaker T2-3
- Reactive power flow through 34.5 kV line feeder breaker T2-3
- Real power flow through 34.5 kV line feeder breaker T2-4
- Reactive power flow through 34.5 kV line feeder breaker T2-4
- Real power flow through 34.5 kV line feeder breaker T2-5

Transmission Provider to be Responsible For the following:

- Design, procure and install a small control building at a location provided and prepared by the Interconnection Customer inside the Generating Facility fence line.
- The list of major equipment identified for this portion of the Project is as follows:
  - (1) small control building AC and DC panels and temperature controlled
  - (1) 125VDC, 100Ah battery bank
  - (1) 130VDC, 12A battery charger
  - (1) GE D20 RTU
  - (1) 24" open frame rack (DNP 3.0 protocol with hard wired connections)
- Revenue metering is required for each of the two Interconnection Customer power transformers and will be located on the high side of each of the step-up transformers. The primary metering transformers shall be combination CT/VT extended range high accuracy metering with ratios to be determined during the design phase of the project.
- The Transmission Provider will design and procure the collector revenue metering panels. The panels shall be located inside the collector control house. The collector substation metering panel shall include two revenue quality meters, test switches, and all SCADA metering data terminated at a metering interposition block.
- An Ethernet or phone line is required for retail sales and generation accounting via the MV-90 translation system.

Tie Line Requirements and Point of Interconnection (Aeolus)

The following outlines the design, procurement, construction, installation, and ownership of equipment associated with the radial line connecting the Interconnection Customer's Generating Facility to the Transmission Provider's Point of Interconnection substation.

Interconnection Customer to be Responsible For the following:

- Obtain all necessary permits, lands, rights of way and easements required for the construction and continued maintenance of the facilities required for the Q0706 Project.

- Design and install approximately seven miles of 230kV transmission line between the Q0706 Generation Facility and the Aeolus substation. The Transmission Provider requires that the bus is built to the Transmission Provider's 230kV standard.
- Design and install ½" OPGW and attachment hardware per the Transmission Provider's standards with nodes and channel banks at both ends. The OPGW cable will be coiled on the above structure such that there is enough cable and conductor to reach the POI substation tower with normal sags. Also, provide all hardware for stringing of the last span of conductor and OPGW into the POI sub tower.
- This fiber is to be installed by the Interconnection Customer and upon acceptance will be owned and maintained by Transmission Provider. Channels will be crossed at Aeolus substation to the back bone communication system.
- Design and construct a single 230kV circuit breaker and associated equipment tie line substation adjacent to Aeolus substation with a common fence between the two facilities.
    - The ground mats between the Aeolus and the tie line substation will be tied together. Therefore, the Interconnection Customer must match the standards of the Aeolus substation.
- Conduit will be required to be installed between the Interconnection Customer's tie line substation and Aeolus substation. The Interconnection Customer will provide their conduit drawings and install the necessary conduit to demarcation point at the Point of Interconnection. The Transmission Provider will install the connecting conduit in the Aeolus substation.
- Design (per the Transmission Provider's standards) and install a dead-end structure with sufficient bus to allow for proper attachment to a 230kV disconnect switch inside the Transmission Provider's substation. The switch will be the Point of Change of Ownership.
- Provide the output from two sets of current transformers to be fed into the bus differential relays with a maximum current transformer ratio matching the maximum CT ratio of the breakers at Aeolus substation. The detection and clearing of faults on the tie line between the tie line and the collector substations will be the responsibility

of the Interconnection Customer. Facilities must be installed to detect and isolate the line if it is faulted in five cycles or less.

Transmission Provider to be Responsible For the following:

- Review the Interconnection Customer's design of the proposed new transmission line, OPGW and connection to the Aeolus substation structure for general conformance with Transmission Provider's construction standards.
- Provide a CDEGS grounding analysis of the Aeolus substation.
- Provide the Transmission Provider's construction standards and review the Interconnection Customer's design for the last bus support structure located outside the POI substation fence line to ensure compatibility with the termination switch.
- Connect the Interconnection Customer's last span of bus to the 230kV, disconnect switch at the change of ownership location including the OPGW cable. The Transmission Provider will maintain this last bus span at the Interconnection Customer's expense.
  - This short span of bus will be protected with a redundant bus differential relay systems. The bus differential relays will be located in Aeolus substation. The Interconnection Customer will need to provide the output from two sets of current transformers to be fed into the bus differential relays with a maximum current transformer ratio matching the maximum CT ratio of the breakers at Aeolus substation. If a fault is detected, both the 230 kV breakers in Aeolus substation and the 230 kV breaker in the Interconnection Customer's tie line substation will be tripped.
  - A relay at Aeolus substation will monitor the voltage magnitude and frequency. If the magnitude or frequency of the voltage is outside of normal range of operation a signal will be sent over the communication system to the collector substation. At the collector substation this signal is to trip open all of the 34.5 kV feeder breakers to disconnect the wind turbine generators. By tripping the 34.5 kV breakers instead of the 230 kV breakers the station service to the Generating Facility is maintained to facilitate the restoration of the generation. This relay will also have phase and ground directional overcurrent

elements set to operate for faults in the line between Shirley Basin substation and the Interconnection Customer's collector substation and serve as a back-up to the main protection installed by the Interconnection Customer.

Point of Interconnection (Aeolus substation)

The following outlines the design, procurement, construction, installation, and ownership of equipment at the Point of Interconnection.

Interconnection Customer to be Responsible For the following:

- Obtain all necessary permits, rights of way and easements required for the construction at Aeolus substation.

Transmission Provider to be Responsible For the following:

- Complete design and construction of one transformer bay at Aeolus to terminate the tie line in. Three (3) feet of panel space will be required in the 230 kV control house. The following equipment will be installed:
  - (1) - 230 kV circuit breaker
  - (3) - 230 kV CCVT
  - (2) - 230 kV group operated breaker disconnect switch
  - (1) - 230 kV group operated line disconnect switch, with ground blade, with motor operator
  - (3) - 144 kV MCOV surge arrester
  - (1) - RTAC
- The interchange metering will be designed bidirectional and rated for the total net generation of the Project including metering the retail load (per tariff) delivered to the Interconnection Customer. The Transmission Provider will specify and order all interconnection revenue metering, including the instrument transformers, metering panels, junction box and secondary metering wire. The primary metering transformers shall be combination CT/VT extended range for high accuracy metering with ratios to be determined during the design phase of the Project.
- The metering design package will include two revenue quality meters, test switch, with DNP real time digital data terminated at a metering interposition block. One

meter will be designated a primary SCADA meter and a second meter will be used designated as backup with metering DNP data delivered to the alternate control center. The metering data will include bidirectional KWH KVARH, revenue quantities including instantaneous PF, MW, MVAR, MVA, including per phase voltage and amps data.

- An Ethernet connection is required for retail sales and generation accounting via the MV-90 translation system.
- Listed below is the data that will be supplied by the Aeolus substation.
  - Analogs:
    - Net Generation real power
    - Net Generator reactive power
    - Interchange energy register
- From Tie Substation Adjacent to Aeolus
  - Status:
    - 230 kV breaker
- Modify the Remedial Action Scheme for outages of the Aeolus-Anticline 500 kV transmission line to trip this project.
- Present the Aeolus-Anticline 500 kV RAS to the Western Electricity Coordinating Council ("WECC") Remedial Action Scheme Reliability Subcommittee ("RASRS") for approval.

Exhibit 1 to Appendix C to LGIA

Facility Connection Requirements for Transmission Systems

AGREEMENT TO AMEND STANDARD LARGE GENERATOR INTERCONNECTION AGREEMENT

This **Agreement To Amend Standard Large Generator Interconnection Agreement** ("Agreement") is made and entered into this 1st day of November, 2018, by and between PacifiCorp, an Oregon corporation (the "Transmission Provider") and Ekola Flats Wind Energy LLC (Q706), a Delaware limited liability company (the "Interconnection Customer"). Transmission Provider and Interconnection Customer may be referred to as a "Party" or collectively as the "Parties."

RECITALS

WHEREAS, Transmission Provider and Interconnection Customer have entered into a Standard Large Generator Interconnection Agreement, dated November 27, 2017, and designated as Original PacifiCorp Service Agreement No. 875 (the "Interconnection Agreement");

WHEREAS, the Interconnection Agreement conforms to PacifiCorp's *pro forma* Standard Large Generator Interconnection Agreement included in PacifiCorp's Open Access Transmission Tariff;

WHEREAS, Transmission Provider and Interconnection Customer have mutually agreed to amend one or more appendices and exhibits to the Interconnection Agreement; and

WHEREAS, Articles 30.9 and 30.10 of the Interconnection Agreement state that the Parties may by mutual agreement amend the Interconnection Agreement or its Appendices by a written instrument duly executed by the Parties, and such amendment shall become effective and a part of this Interconnection Agreement upon satisfaction of all Applicable Laws and Regulations;

NOW, THEREFORE, in consideration of and subject to the mutual covenants contained herein, it is agreed:

1.0 The Parties acknowledge and mutually agree that the following attached appendices and exhibits will be substituted in their entirety for the same appendices and exhibits in the Interconnection Agreement:

- Appendix A
- Appendix B
- Appendix C
- Appendix D
- Exhibit 1 to Appendix A
- Exhibit 1 to Appendix B

2.0 Service under the Interconnection Agreement with the amended appendices and exhibits will commence only upon execution by both Parties.

3.0 The Interconnection Agreement shall be designated by PacifiCorp as First Revised Service Agreement No. 875. PacifiCorp shall report the Interconnection Agreement, as amended, in the Electric Quarterly Report for the quarter in which service commences.

4.0 The Interconnection Agreement, with the attached substitute appendices and exhibits shall constitute the entire agreement between the Parties.

5.0 All other provisions of the Interconnection Agreement will continue to apply.

6.0 TO THE FULLEST EXTENT PERMITTED BY LAW, EACH OF THE PARTIES HERETO WAIVES ANY RIGHT IT MAY HAVE TO A TRIAL BY JURY IN RESPECT OF LITIGATION DIRECTLY OR INDIRECTLY ARISING OUT OF, UNDER OR IN CONNECTION WITH THIS AGREEMENT. EACH PARTY FURTHER WAIVES ANY RIGHT TO CONSOLIDATE, OR TO REQUEST THE CONSOLIDATION OF, ANY ACTION IN WHICH A JURY TRIAL HAS BEEN WAIVED WITH ANY OTHER ACTION IN WHICH A JURY TRIAL CANNOT BE OR HAS NOT BEEN WAIVED.

IN WITNESS WHEREOF, the Parties have executed this Agreement in duplicate originals, each of which shall constitute and be an original effective Agreement between the Parties.

PacifiCorp

Appendix A to LGIA

Interconnection Facilities, Network Upgrades and Distribution Upgrades

1. **Interconnection Facilities:**

   (a) **Interconnection Customer's Interconnection Facilities:** Two (2) circuit breakers (one per step up transformer) connected to approximately one (1) mile of generator tie line for the Q706 collector substation to the Point of Interconnection (Aeolus substation). One circuit breaker will be located approximately adjacent to Aeolus substation. Please see Exhibit 1 to Attachment A.

   (b) **Transmission Provider's Interconnection Facilities:** Two (2) production meters located at the high side of the step up transformers at the Q706 collector substation, one (1) interchange meter at the Point of Change of Ownership, a 230 kV line position and bus expansion to terminate the Interconnection Customer's tie line, relay and grounding upgrades required for the new line position, and one new line position (dead end structure, disconnect switch, metering structure) located at the Point of Interconnection (Aeolus substation). Customer will also install fiber optic cable (to be owned by Transmission Provider) on generation tie line. Please see Exhibit 1 to Attachment A.

2. **Network Upgrades:**

   (a) **Stand Alone Network Upgrades:** None

   (b) **Other Network Upgrades:** None

3. **Distribution Upgrades:** None

4. **Point of Interconnection ("POI"):** The point at which Transmission Provider Interconnection Facilities connect to the substation bus at Aeolus substation (see Exhibit 1 to Appendix A).

5. **Point of Change of Ownership:** The point at which Interconnection Customer and Transmission Provider

Interconnection Facilities meet (see Exhibit 1 to Appendix A).

6. One-Line Diagram: is attached to this agreement as Exhibit 1 to Appendix A.

7. Contingent Facilities: The Point of Interconnection for this project is Aeolus 230 kV substation which is planned to be constructed as part of the Transmission Provider Gateway West D2 project. Aeolus substation, as well as the Gateway West Segment D2 500 kV transmission line (Aeolus-Anticline) are contingent for this project and must be in service prior to approval of generation activities for this project. If the schedule for completion of Aeolus substation or Gateway West Segment D2 are modified then the schedule for this project will need to be modified to align with the new completion date.

8. Estimated Project Cost: $2,862,000

Appendix B To LGIA

Milestones

Milestone/Date	Party
Execute Interconnection Agreement November 15, 2017	Interconnection Customer
Provision of Financial Security ($550,000) July 27, 2018	Interconnection Customer
Final Issue for Construction Design Package Provided August 31, 2018	Interconnection Customer
*Engineering & Procurement Commences November 6, 2018	Transmission Provider
**Energy Imbalance Market Modeling Data Submittal January 9, 2019	Interconnection Customer
Engineering Design Complete March 6, 2019	Transmission Provider
Property/Permits/ROW Procured April 10, 2019	Interconnection Customer
Construction Begins August 7, 2019	Transmission Provider
Facilities Receive Backfeed Power October 1, 2020	Interconnection Customer
***Initial Synchronization and Customer Generation Testing October 15, 2020	Interconnection
Commercial Operation November 1, 2020	Interconnection Customer

*As applicable and determined by the Transmission Provider, within 60 days of the Interconnection Customer's authorization for the Transmission Provider to begin engineering, the Interconnection Customer shall provide a detailed short circuit model of its generation system. This model must be constructed using the ASPEN OneLine short circuit simulation program and contain all individual electrical components of the Interconnection Customer's generation system.

**Any design modifications to the Interconnection Customer's Generating Facility after this date requiring updates to the Transmission Provider's network model will result in a minimum of 3 months added to all future milestones including Commercial Operation.

***The Transmission Provider's Gateway West Segment D2 500 kV transmission line (Aeolus-Anticline) must be in service prior to commencement of any generation activities.

Term of Agreement: In accordance with LGIA Article 2.2, the Parties agree that the term of the LGIA shall be ten (10) years from the Effective Date and shall be automatically renewed for each successive one-year period thereafter.

Construction Option: The Network Upgrades, Direct Assignment Facilities and Transmission Provider Interconnection Facilities will be designed, procured and constructed by the Transmission Provider in accordance with the Standard Option outlined in Article 5.1.1 of this Agreement. The Network Upgrades, Direct Assignment Facilities and Transmission Provider Interconnection Facilities shall be constructed in accordance with the Scope of Work attached to this LGIA as Exhibit 1 to Appendix B. The Network Upgrades, Direct Assignment Facilities and Transmission Provider's Interconnection Facilities shall be designed, procured and constructed in a timely manner to support the Milestone Dates stated above.

Appendix C To LGIA

Interconnection Details

Description of the Large Generating Facility: The Q0706 Large Generating Facility consists of ten (10) GE 2.3 MW 116/80 turbines connected to a single 34.5 kV string and fifty-four (54) Vestas V136/82 4.2 MW turbines connected to eleven (11) 34.5 kV strings for a total requested generation output of 250 MW. The strings are then connected to a two 90/120/150 MVA 34.5 - 230 kV (7.2% impedance) transformers. The Large Generating Facility is located in Carbon County, Wyoming. Please see Exhibit 1 to Attachment A.

Control Area Requirements: Interconnection Customer shall interconnect and operate the Large Generating Facility in accordance with the Transmission Provider's Facility Interconnection Requirements for Transmission Systems, as may be revised from time to time, attached hereto as Exhibit 1 to Appendix C and by this reference incorporated herein.

Interconnection Details:
Metering. With reference to Article 7.1, Transmission Provider will own and maintain the bi-directional revenue Metering Equipment in Transmission Provider's Point of Interconnection substation at the Interconnection Customer's expense.

Under Frequency and Over Frequency Conditions. Consistent with LGIA Article 9.7.3, Transmission Provider shall design, procure, install and maintain frequency and voltage protection to trip feeder breakers in accordance with the settings shown in Exhibit 1 to Appendix C.

Reactive Power and Voltage Schedule. All interconnecting synchronous and non-synchronous generators are required to design their Generating Facilities with reactive power capabilities necessary to operate within the full power factor range of 0.95 leading to 0.95 lagging. This power factor range shall be dynamic and can be met using a combination of the inherent dynamic reactive power capability of the generator or inverter, dynamic reactive power devices and static reactive power devices. For non-synchronous generators, the power factor requirement is to be measured at the high-side of the generator substation. The Generating Facility must provide dynamic reactive power to the system over the full range of real power output. If the Generating

Facility is not capable of providing positive reactive support (i.e., supplying reactive power to the system) immediately following the removal of a fault or other transient low voltage perturbations, the facility will be required to add dynamic voltage support equipment. These additional dynamic reactive devices shall have correct protection settings such that the devices will remain on line and active during and immediately following a fault event.

Generators shall be equipped with automatic voltage-control equipment and normally operated with the voltage regulation control mode enabled unless written authorization, or directive, from the Transmission Provider is given to operate in another control mode (e.g., constant power factor control). The control mode of generating units shall be accurately represented in operating studies. The generators shall be capable of operating continuously at their maximum power output at its rated field current within +/- 5% of its rated terminal voltage. Phasor Measurement Units will be required at any Generating Facilities with an individual or aggregate nameplate capacity of 75 MVA or greater.

As required by NERC standard VAR-001-4.2, the Transmission Provider will provide a voltage schedule for the Point of Interconnection. In general, Generating Facilities should be operated so as to maintain the voltage at the Point of Interconnection, typically between 1.00 per unit to 1.04 per unit, or other designated point as deemed appropriate by Transmission Provider. The Transmission Provider may also specify a voltage and/or reactive power bandwidth as needed to coordinate with upstream voltage control devices such as on-load tap changers. At the Transmission Provider's discretion, these values might be adjusted depending on operating conditions.

Generating Facilities capable of operating with a voltage droop are required to do so. Studies will be required to coordinate voltage droop settings if there are other facilities in the area. It will be the Interconnection Customer's responsibility to ensure that a voltage coordination study is performed, in coordination with Transmission Provider, and implemented with appropriate coordination settings prior to unit testing. If the need for a master controller is identified, the cost and all related installation requirements will be the responsibility of the Interconnection Customer. Participation by the Generation Facility in subsequent interaction/coordination studies will be required pre- and post-commercial operation in order ensure system reliability.

All generators must meet the Federal Energy Regulatory Commission (FERC) and WECC low voltage ride-through requirements.

As the Transmission Provider cannot submit a user written model to WECC for inclusion in base cases, a standard model from the WECC Approved Dynamic Model Library is required 180 days prior to trial operation. The list of approved generator models is continually updated and is available on the http://www.WECC.biz website.

Property Requirements. Subject to LGIA Articles 5.12 and 5.13, Interconnection Customer is required to obtain for the benefit of Transmission Provider at Interconnection Customer's sole cost and expense all real property rights, including but not limited to fee ownership, easements and/or rights of way, as applicable, for Transmission Provider owned facilities using forms acceptable to Transmission Provider. Transmission Provider shall not be obligated to accept any such real property right that does not, at Transmission Provider's sole discretion, confer sufficient rights to access, operate, construct, modify, maintain, place and remove Transmission Provider owned facilities or is otherwise conveyed using forms unacceptable to Transmission Provider. Further, all real property on which Transmission Provider's facilities are to be located must be environmentally, physically and operationally acceptable to the Transmission Provider in accordance with Good Utility Practice.

Subject to LGIA Article 5.14, Interconnection Customer is responsible for obtaining all permits required by all relevant jurisdictions for the project, including but not limited to, conditional use permits and construction permits; provided however, Transmission Provider shall obtain, at Interconnection Customer's cost and schedule risk, the permits necessary to construct Transmission Provider's facilities that are to be located on real property currently owned or held in fee or right by Transmission Provider.

Except as expressly waived in writing by an authorized officer of Transmission Provider, all of the foregoing permits and real property rights (conferring rights on real property that is environmentally, physically and operationally acceptable to Transmission Provider) shall be acquired as provided herein as a condition to Transmission Provider's contractual obligation to construct or take possession of facilities to be owned by the Transmission Provider under this Agreement. Transmission Provider shall have no liability for any project delays or cost overruns caused by delays in acquiring any of the foregoing permits and/or real property rights, whether such delay results from the failure to obtain such permits or rights or the failure of such permits or rights to meet the requirements set forth herein. Further, any completion dates, if any, set forth herein with regard to Transmission Provider's obligations shall be equitably extended based on the length and impact of any such delays.

With respect to the fiber optic cable on Interconnection Customer's tie line that will be owned by the Transmission Provider, the Interconnection Customer and the Transmission Provider agree that Transmission Provider's ownership and operation of fiber optic cable that is attached to poles or other structures that are owned or maintained by the Interconnection Customer is subject to LGIA Article 5.12, Good Utility Practice, and Transmission Provider's Interconnection Policy 139 (Exhibit 1 to Appendix C to LGIA).

Appendix D To LGIA

Security Arrangements Details

Infrastructure security of Transmission System equipment and operations and control hardware and software is essential to ensure day-to-day Transmission System reliability and operational security. FERC will expect all Transmission Providers, market participants, and Interconnection Customers interconnected to the Transmission System to comply with the recommendations offered by the President's Critical Infrastructure Protection Board and, eventually, best practice recommendations from the electric reliability authority. All public utilities will be expected to meet basic standards for system infrastructure and operational security, including physical, operational, and cyber-security practices.

Automatic Data Transfer. Throughout the term of this Agreement, Interconnection Customer shall provide the data specified below by automatic data transfer to the Transmission Provider Control Center specified by Transmission Provider or to a Third-Party System Operator designated by Transmission Provider (or both):

From the Interconnection Customer's collector substation:

- Analogs:
  - Transformer # 1 real power
  - Transformer # 1 reactive power
  - Real power flow through 34.5 kV line feeder breaker 1
  - Reactive power flow through 34.5 kV line feeder breaker 1
  - Real power flow through 34.5 kV line feeder breaker 2
  - Reactive power flow through 34.5 kV line feeder breaker 2
  - Real power flow through 34.5 kV line feeder breaker 3
  - Reactive power flow through 34.5 kV line feeder breaker 3
  - Real power flow through 34.5 kV line feeder breaker 4
  - Reactive power flow through 34.5 kV line feeder breaker 4
  - Real power flow through 34.5 kV line feeder

breaker 5
- Reactive power flow through 34.5 kV line feeder breaker 5
- Real power flow through 34.5 kV line feeder breaker 6
- Reactive power flow through 34.5 kV line feeder breaker 6
- Reactive power flow through 34.5 kV reactor breaker T1-R1
- Reactive power flow through 34.5 kV capacitor breaker T1-C1
- Transformer # 2 real power
- Transformer # 2 reactive power
- Real power flow through 34.5 kV line feeder breaker 7
- Reactive power flow through 34.5 kV line feeder breaker 7
- Real power flow through 34.5 kV line feeder breaker 8
- Reactive power flow through 34.5 kV line feeder breaker 8
- Real power flow through 34.5 kV line feeder breaker 9
- Reactive power flow through 34.5 kV line feeder breaker 9
- Real power flow through 34.5 kV line feeder breaker 10
- Reactive power flow through 34.5 kV line feeder breaker 10
- Real power flow through 34.5 kV line feeder breaker 11
- Reactive power flow through 34.5 kV line feeder breaker 11
- Real power flow through 34.5 kV line feeder breaker 12
- Reactive power flow through 34.5 kV line feeder breaker 12
- Reactive power flow through 34.5 kV reactor breaker T2-R1
- Reactive power flow through 34.5 kV capacitor breaker T2-C1
- A phase 230 kV transmission voltage
- B phase 230 kV transmission voltage
- C phase 230 kV transmission voltage
- Average Wind speed
- Average Plant Atmospheric Pressure (Bar)
- Average Plant Temperature (Celsius)

- Status
  - 230 kV breaker T1
  - 34.5 kV collector circuit breaker 1
  - 34.5 kV collector circuit breaker 2
  - 34.5 kV collector circuit breaker 3
  - 34.5 kV collector circuit breaker 4
  - 34.5 kV collector circuit breaker 5
  - 34.5 kV collector circuit breaker 6
  - 34.5 kV collector circuit breaker T1-R1
  - 34.5 kV collector circuit breaker T1-C1
  - 230 kV breaker T2
  - 34.5 kV collector circuit breaker 7
  - 34.5 kV collector circuit breaker 8
  - 34.5 kV collector circuit breaker 9
  - 34.5 kV collector circuit breaker 10
  - 34.5 kV collector circuit breaker 11
  - 34.5 kV collector circuit breaker 12
  - 34.5 kV collector circuit breaker T2-R1
  - 34.5 kV collector circuit breaker T2-C1

Billing Meter Data. Bi-directional revenue meter at the Point of Interconnection will not be configured to allow direct dial-up access by Interconnection Customer. The Transmission Provider will provide alternatives, at the Interconnection Customer's expense, upon request.

Additional Data. Interconnection Customer shall, at its sole expense, provide any additional Generating Facility data reasonably required and necessary for the Transmission Provider to operate the Transmission System in accordance with Good Utility Practice and Exhibit 1 to Appendix C, Facility Interconnection Requirements for Transmission Systems.

Relay and Control Settings

Interconnection Customer must allow Transmission Provider to hold all Level 2 relay passwords for any control and/or protective device within its control at the Point of Interconnection and/or customer facility which directly impacts Transmission Provider's distribution and/or transmission systems. Level 2 passwords are those which allow actual modifications to control and/or relay settings. This will ensure PacifiCorp is aware of and approves any changes being made by the customer. Furthermore, this will ensure there are no negative impacts to Transmission Provider's distribution system, transmission system, or existing customers.

If Interconnection Customer requires modifications to the settings associated with control/protective devices connected to the distribution and/or transmission system, Interconnection Customer will contact PacifiCorp and provide in writing the justification for the proposed modifications. This will allow PacifiCorp to analyze the modifications and ensure there will be no negative impacts to connected systems and customers.

Any modifications of control and/or relay settings without review and acknowledgement of acceptance by PacifiCorp will be considered a breach of the Interconnection Agreement and grounds for permanent disconnection from the Transmission Provider system.

One-Line Diagram

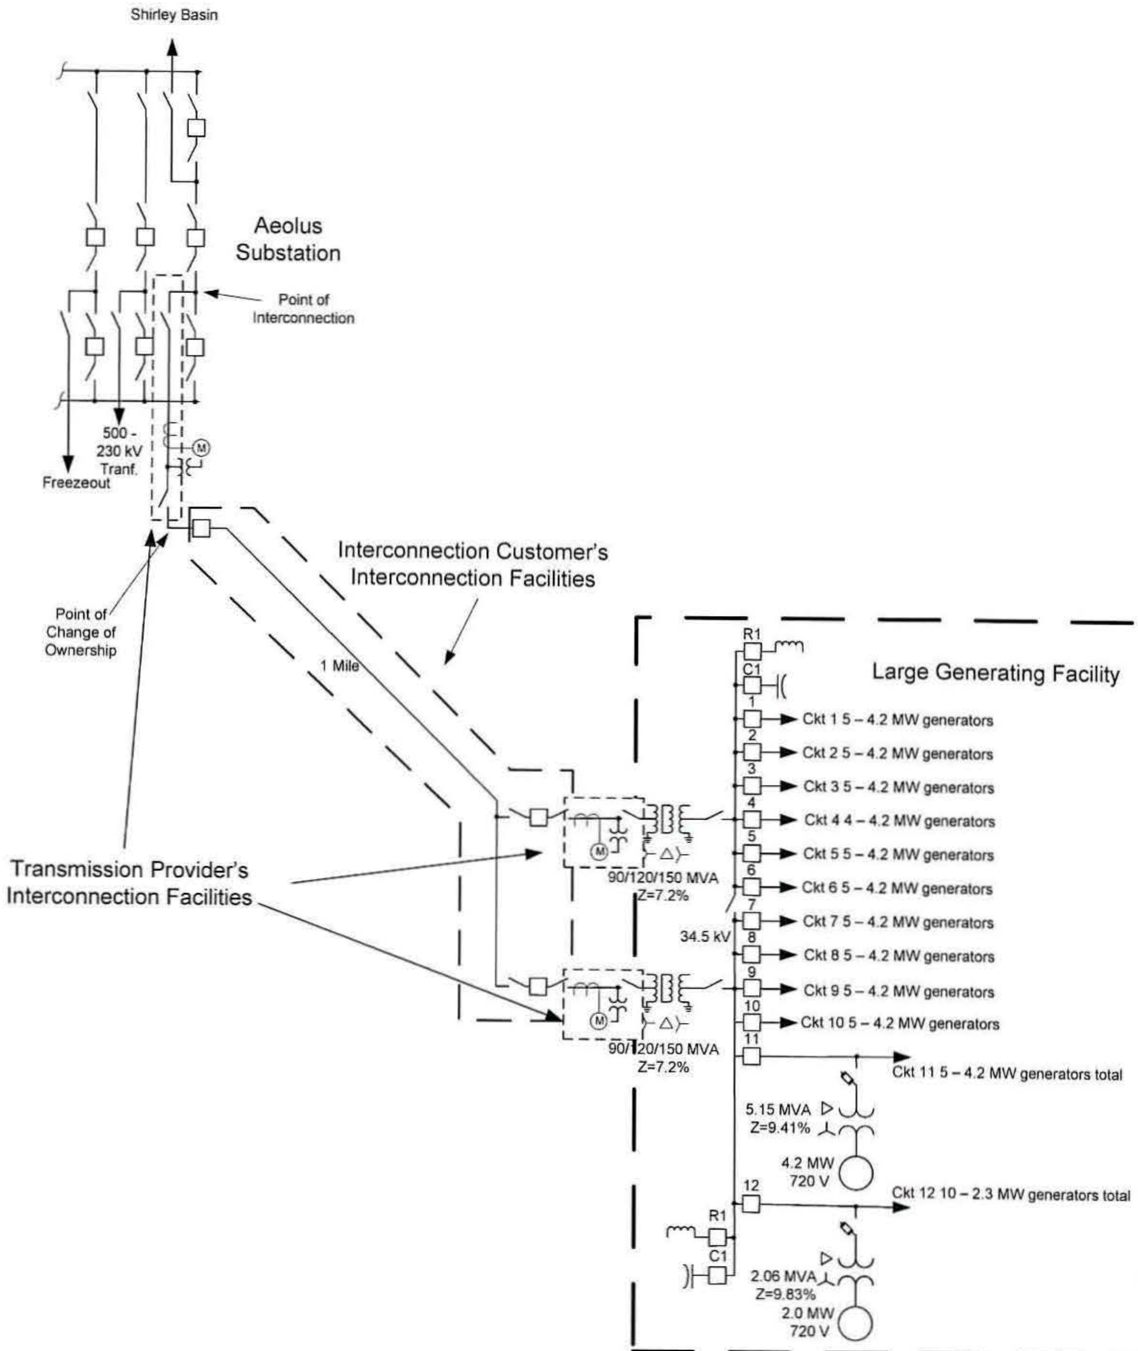

Exhibit 1 to Appendix B to LGIA

Scope of Work

Generating Facility Modifications

The following outlines the design, procurement, construction, installation, and ownership of equipment at the Interconnection Customer's Generation Facility.

Interconnection Customer to be Responsible For the following:

- Design, procure, install, and own all equipment required for the Large Generating Facility.
- Obtain all necessary permits, lands, rights of way and easements required for the construction and continued maintenance of the facilities required for the Q0706 Project. All necessary easements and permits procured by the Interconnection Customer for Transmission Provider Interconnection Facilities shall be recorded in the name of the Transmission Provider, shall be on forms acceptable to the Transmission Provider and obtained for durations acceptable to the Transmission Provider; this includes all permits/easements for ingress and egress prior to the start of construction.
- Provide a separate fenced area along the perimeter of the Interconnection Customer's Generating Facility in which the Transmission Provider can install a control building for metering and communication equipment. This area will share a fence and ground grid with the Generating Facility and have separate access. AC station service for the control building will be supplied by the Interconnection Customer.
- Provide a CDEGS grounding analysis of the control building site to the Transmission Provider.
- Demonstrate the reactive capability of the facility and the voltage control system prior to commercial operation. Conditions of operations include:
    - Operate in voltage control mode with the ability to deliver power output to the POI within the range of +/- 0.95 power factor. (Please see Standard Large Generator Interconnection Agreement, article 9.6.1 and 9.6.2 in OATT.) Any additional reactive compensation must be designed such that the discrete switching of the reactive device, if required, does not cause step voltage changes greater than ± 3% at

any load serving bus on the Transmission Provider's system.

- As required by NERC standard VAR-001-4.2, the Transmission Provider will provide a voltage schedule for the POI. Generating Facilities should be operated so as to maintain the voltage at the POI, or other designated point as deemed appropriate by Transmission Provider, typically between 1.00 per unit to 1.04 per unit. The Transmission Provider may also specify a voltage and/or reactive power bandwidth as needed to coordinate with upstream voltage control devices such as on-load tap changers. At the Transmission Provider's discretion, these values might be adjusted depending on operating conditions.
- At low output levels, the Project needs to ensure that it maintains the power factor within ± 0.95 at the POI and minimize the reactive power flow towards the transmission system to prevent high voltages.
- Generating Facilities capable of operating with a voltage droop are required to do so. Voltage droop control enables proportionate reactive power sharing among Generating Facilities. Studies will be required to coordinate voltage droop settings if there are other facilities in the area. It will be the Interconnection Customer's responsibility to ensure that a voltage coordination study is performed, in coordination with Transmission Provider, and implemented with appropriate coordination settings prior to unit testing.
- For areas with multiple Generating Facilities, additional studies may be required to determine whether or not critical interactions, including but not limited to control systems, exist. These studies, to be coordinated with Transmission Provider, will be the responsibility of the Interconnection Customer. If the need for a master controller is identified, the cost and all related installation requirements will be the responsibility of the Interconnection Customer.

- Design, procure, install, and own Phasor Measurement Units (PMUs).
- Provide a standard model from the WECC Approved Dynamic Model Library prior to interconnection, since the Transmission Provider cannot submit a user written model

to WECC for inclusion in base cases. The list of approved generator models is continually updated and is available on the http://www.WECC.biz website.

- All generators must meet the Federal Energy Regulatory Commission (FERC) and WECC low voltage ride-through requirements as specified in the Interconnection Agreement.
- Prior to construction, arrange construction power with the Transmission Provider. The Project is within the Transmission Provider's retail service territory and both station service and temporary construction power metering shall conform to the Six State Electric Service Requirements manual.
- Prior to back feed, arrange distribution voltage retail meter service for electricity consumed by the Project and arrange back up station service for power that will be drawn from the transmission or distribution line when the Project is not generating. Interconnection Customer must call the PCCC Solution Center 1-800-640-2212 to arrange this service. Approval for back feed is contingent upon obtaining station service.
- Procure, install, own and maintain a set of line relays that will detect and clear all faults on the tie line between the Interconnection Customer's collector and tie line substations in 5 cycles or less.
- Design, procure and install conduit and control cabling and hard wire the Interconnection Customer's source devices directly to the RTU located in the Transmission Provider's collector substation control building. Replicated values are not acceptable.
- Provide the following data points from the Q0706 collector substation:
  - Analogs:
    - Transformer # 1 real power
    - Transformer # 1 reactive power
    - Real power flow through 34.5 kV line feeder breaker 1
    - Reactive power flow through 34.5 kV line feeder breaker 1
    - Real power flow through 34.5 kV line feeder breaker 2
    - Reactive power flow through 34.5 kV line feeder breaker 2
    - Real power flow through 34.5 kV line feeder breaker 3

- Reactive power flow through 34.5 kV line feeder breaker 3
- Real power flow through 34.5 kV line feeder breaker 4
- Reactive power flow through 34.5 kV line feeder breaker 4
- Real power flow through 34.5 kV line feeder breaker 5
- Reactive power flow through 34.5 kV line feeder breaker 5
- Real power flow through 34.5 kV line feeder breaker 6
- Reactive power flow through 34.5 kV line feeder breaker 6
- Reactive power flow through 34.5 kV reactor breaker T1-R1
- Reactive power flow through 34.5 kV capacitor breaker T1-C1
- Transformer # 2 real power
- Transformer # 2 reactive power
- Real power flow through 34.5 kV line feeder breaker 7
- Reactive power flow through 34.5 kV line feeder breaker 7
- Real power flow through 34.5 kV line feeder breaker 8
- Reactive power flow through 34.5 kV line feeder breaker 8
- Real power flow through 34.5 kV line feeder breaker 9
- Reactive power flow through 34.5 kV line feeder breaker 9
- Real power flow through 34.5 kV line feeder breaker 10
- Reactive power flow through 34.5 kV line feeder breaker 10
- Real power flow through 34.5 kV line feeder breaker 11
- Reactive power flow through 34.5 kV line feeder breaker 11
- Real power flow through 34.5 kV line feeder breaker 12
- Reactive power flow through 34.5 kV line feeder breaker 12

        - Reactive power flow through 34.5 kV reactor breaker T2-R1
        - Reactive power flow through 34.5 kV capacitor breaker T2-C1
        - A phase 230 kV transmission voltage
        - B phase 230 kV transmission voltage
        - C phase 230 kV transmission voltage
        - Average Wind speed
        - Average Plant Atmospheric Pressure (Bar)

        - 34.5 kV collector circuit breaker 11
        - 34.5 kV collector circuit breaker 12
        - 34.5 kV collector circuit breaker T2-R1
        - 34.5 kV collector circuit breaker T2-C1
- Provide and install fiber optic cable from the Transmission Provider's collector substation control building to the first structure on which the Interconnection Customer's transmission tie line fiber optic cable is installed.

Transmission Provider to be Responsible For the following:

- Design, procure and install a small control building at a location provided and prepared by the Interconnection Customer inside the Generating Facility fence line.
- The list of major equipment identified for this portion of the Project is as follows:
    - (1) small control building AC and DC panels and temperature controlled
    - (1) 125VDC, 100Ah battery bank

  - (1) 130VDC, 12A battery charger
  - (1) GE D20 RTU
  - (1) 24″ open frame rack (DNP 3.0 protocol with hard wired connections)
- Revenue metering is required for each of the two Interconnection Customer power transformers and will be located on the high side of each of the step-up transformers. The primary metering transformers shall be combination CT/VT extended range high accuracy metering with ratios to be determined during the design phase of the project.
- The Transmission Provider will design and procure the collector revenue metering panels. The panels shall be located inside the collector control house. The collector substation metering panel shall include two revenue quality meters, test switches, and all SCADA metering data terminated at a metering interposition block.
- An Ethernet or phone line is required for retail sales and generation accounting via the MV-90 translation system.
- Terminate the fiber provided by the Interconnection Customer in the control building.

Tie Line Requirements and Point of Interconnection (Aeolus)

The following outlines the design, procurement, construction, installation, and ownership of equipment associated with the radial line connecting the Interconnection Customer's Generating Facility and tie line substation.

Interconnection Customer to be Responsible For the following:

- Obtain all necessary permits, lands, rights of way and easements required for the construction and continued maintenance of the facilities required for the Interconnection Customer's 230 kV transmission line between the Interconnection Customer's collector and tie line substations. The Interconnection Customer will be responsible for all required regulatory or compliance reporting associated with its transmission tie line facilities.
- Design and install approximately one mile of 230kV transmission line between the Q0706 Generation Facility and tie line substation.

- Design, install, own and maintain OPGW and attachment hardware per the Transmission Provider's standards with nodes and channel banks at both ends. The OPGW cable will be coiled on the Interconnection Customer's transmission tie line such that there is enough cable and conductor to reach the POI substation tower with normal sags. Also, provide all hardware for stringing of the last span of conductor and OPGW into the POI sub tower.
- Provide the Transmission Provider one buffer tube, with at least 12 fibers, of the Interconnection Customer's OPGW fiber optic cable for the Transmission Provider's sole use.
- Splice the Transmission Provider's sole use buffer tube to the fiber running from the Transmission Provider's collector substation control building.
- Splice the Transmission Provider's sole use buffer tube to the fiber running from the Aeolus substation control building.

Transmission Provider to be Responsible For the following:

- Review the Interconnection Customer's design of the proposed new transmission line, OPGW and connection to the Aeolus substation structure for general conformance with Transmission Provider's construction standards.
- Provide the Transmission Provider's construction standards and review the Interconnection Customer's design for the last bus support structure located outside the POI substation fence line to ensure compatibility with the termination switch.

Interconnection Customer Tie Line Substation

The following outlines the design, procurement, construction, installation, and ownership of the Interconnection Customer's tie line substation.

Interconnection Customer to be Responsible For the following:

- Obtain all necessary permits, rights of way and easements required for the construction and continued maintenance of the Interconnection Customer's tie line substation.
- Design, procure, construct, own and maintain the Interconnection Customer's tie line substation (consisting of a sole 230 kV circuit breaker and

associated equipment) adjacent (less than 800') to the POI substation. This includes all radial transmission line relaying to the collector station, breaker failure protection and associated communications. The short line/bus segment between the tie line substation and the POI substation will be considered a bus section and will be protected with redundant bus differential relay systems.

- Provide and install two sets of current transformers to be fed into the bus differential relays with a maximum current transformer ratio matching the maximum CT ratio of the breakers at the POI substation. Provide and install conduit and cabling to the POI substation marshalling cabinet with these outputs.
- Construct the tie line substation such that the ground grid can be connected to the POI substation ground grid to support the installation of a Transmission Provider owned and maintained bus differential scheme. The Interconnect Customer is responsible to ensure the ground grid design supports safe step and touch potentials.
- The following data points are required from the Interconnection Customer's tie line substation:
  Status:
  - 230 kV breaker
- Provide and install conduits (number and size TBD) and control cabling between the Interconnection Customer tie line substation and marshalling cabinet just inside the fence of the POI substation to support copper circuits installed between the facilities. Hard wire all tie line substation status, control, and protection circuit interface to the POI substation to a Transmission Provider owned and maintained marshalling cabinet.
- If a transmission structure is required between the POI substation and the tie line substation, construct to Transmission Provider's current design and installation standards.
- Provide and install conductor, shield wire and line hardware in sufficient quantities to allow the Transmission Provider to terminate the tie line into POI substation dead-end structure strain insulators.

Transmission Provider to be Responsible For

- Provide the Interconnection Customer the necessary specifications to allow the ground grids of the Interconnection Customer's tie line substation and the POI substation to be tied together.
- Provide the Interconnection Customer the necessary specifications for the last bus/line segment of the Interconnection Customer's tie line substation and the POI substation to be connected.
- If a transmission structure is required between the POI substation and the tie line substation provide current standard design and installation standards to Interconnection Customer.

Point of Interconnection (Aeolus substation)

The following outlines the design, procurement, construction, installation, and ownership of equipment at the Point of Interconnection.

Interconnection Customer to be Responsible For the following:

- Assist the Transmission Provider in the procurement of all necessary permits, rights of way and easements required for the construction at Aeolus substation.
- Test and commission of the communication path between the Interconnection Customer's collector substation and the POI substation in coordination with the Transmission Provider.

Transmission Provider to be Responsible For the following:

- Obtain all necessary permits, rights of way and easements required for the construction at Aeolus substation.
- Complete design and construction of one transformer bay at Aeolus to terminate the tie line in. Three (3) feet of panel space will be required in the 230 kV control house. The following equipment will be installed:
  - (1) - 230 kV circuit breaker
  - (3) - 230 kV CCVT
  - (2) - 230 kV group operated breaker disconnect switch
  - (1) - 230 kV group operated line disconnect switch, with ground blade, with motor operator
  - (3) - 144 kV MCOV surge arrester

  - (1) - RTAC
- Provide a CDEGS grounding analysis of the Aeolus substation.
- Connect the Interconnection Customer's last span of bus to the 230kV, disconnect switch at the change of ownership location. The Transmission Provider will maintain this last bus span at the Interconnection Customer's expense.
- This short span of bus between the POI substation and Interconnection Customer's tie line substation will be protected with a redundant bus differential relay system. If a fault is detected, both the 230 kV breakers in Aeolus substation and the 230 kV breaker in the Interconnection Customer's tie line substation will be tripped.
- A relay at Aeolus substation will monitor the voltage magnitude and frequency. If the magnitude or frequency of the voltage is outside of normal range of operation a signal will be sent over the communication system to the collector substation. At the collector substation this signal is to trip open all of the 34.5 kV feeder breakers to disconnect the wind turbine generators. By tripping the 34.5 kV breakers instead of the 230 kV breakers the station service to the Generating Facility is maintained to facilitate the restoration of the generation. This relay will also have phase and ground directional overcurrent elements set to operate for faults in the line between Shirley Basin substation and the Interconnection Customer's collector substation and serve as a back-up to the main protection installed by the Interconnection Customer.
- The interchange metering will be designed bidirectional and rated for the total net generation of the Project including metering the retail load (per tariff) delivered to the Interconnection Customer. The Transmission Provider will specify and order all interconnection revenue metering, including the instrument transformers, metering panels, junction box and secondary metering wire. The primary metering transformers shall be combination CT/VT extended range for high accuracy metering with ratios to be determined during the design phase of the Project.
- The metering design package will include two revenue quality meters, test switch, with DNP real time digital data terminated at a metering interposition block. One

meter will be designated a primary SCADA meter and a second meter will be used designated as backup with metering DNP data delivered to the alternate control center. The metering data will include bidirectional KWH KVARH, revenue quantities including instantaneous PF, MW, MVAR, MVA, including per phase voltage and amps data.

- An Ethernet connection is required for retail sales and generation accounting via the MV-90 translation system.
- Listed below is the data that will be supplied by the Aeolus substation.
    - Analogs:
        - Net Generation real power
        - Net Generator reactive power
        - Interchange energy register
- Review and confirm functionality of the Interconnection Customer's communications path between the collector substation and the POI substation.
- Modify the Remedial Action Scheme for various 500 kV outages to trip this project.
- Present the Aeolus-Anticline 500 kV RAS to the Western Electricity Coordinating Council ("WECC") Remedial Action Scheme Reliability Subcommittee ("RASRS") for approval.

INTERCONNECTION ASSIGNMENT AND ASSUMPTION AGREEMENT

THIS INTERCONNECTION ASSIGNMENT AND ASSUMPTION AGREEMENT (this "Assignment") is dated as of April 12, 2019, and is by and between **PACIFICORP**, an Oregon corporation, acting solely in its resource development capacity ("Assignee") **EKOLA FLATS WIND ENERGY LLC,** a Delaware limited liability company ("Assignor"). Capitalized terms used herein and not defined shall have the same meanings when used herein as in the Purchase Agreement (as hereinafter defined).

RECITALS

WHEREAS, Assignor and Assignee have entered into that certain Development Transfer Agreement, dated as of June 30, 2017 (the "Purchase Agreement"), pursuant to which, among other terms, Assignor has agreed to assign to Assignee all of its right, title and interest in and to the following items as of the date hereof (each of which shall have the meaning ascribed to it in the Purchase Agreement): (i) the Interconnection Agreement and (ii) the interconnection rights described on Exhibit A hereto (collectively, the "Interconnection Assets");

WHEREAS, pursuant to the Purchase Agreement, Assignee shall assume all of the Assumed Liabilities (as defined in the Purchase Agreement) relating to the Interconnection Assets; and

WHEREAS, Assignor and Assignee desire to enter into this Assignment to effect such assignment and assumption.

AGREEMENT

NOW, THEREFORE, for good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, Assignor and Assignee agree as follows effective as of the Closing:

1. Pursuant to and in accordance with the terms of the Purchase Agreement, Assignor hereby assigns, transfers, sells and conveys to Assignee all of Assignor's right, title and interest in and to the Interconnection Assets, free and clear of all Liens other than Permitted Liens.

2. Pursuant to and in accordance with the terms of the Purchase Agreement, Assignee hereby assumes, and agrees to pay and perform or discharge when due, the Assumed Liabilities relating to the Interconnection Assets.

3. None of the Excluded Assets and none of the Excluded Liabilities are assigned or transferred by Assignor to, or assumed by, Assignee.

4. Unless required by Applicable Law or otherwise agreed to by the Parties after the date hereof, Assignor and Assignee hereby agree that this Assignment and Assumption Agreement shall not be recorded in the public records of any Governmental Entity.

5. This Assignment is intended to evidence the consummation of the transactions contemplated by the Purchase Agreement. This Assignment is made without representation or

warranty except as expressly provided herein or as provided in and by the Purchase Agreement. This Assignment is in all respects subject to the provisions of the Purchase Agreement and is not intended in any way to supersede, limit, alter or qualify any obligation in or provision of the Purchase Agreement.

6. Assignor does hereby agree, from time to time as and when reasonably requested by Assignee, to execute and deliver (or cause to be executed and delivered) such documents or instruments and to take (or cause to be taken) such further or other actions, as may be reasonably necessary to carry out the purposes of this Assignment.

7. This Assignment shall be construed, interpreted and the rights of the parties hereto determined in accordance with the Laws of the State of New York without reference to its choice of law provisions.

8. This Agreement shall be binding upon and inure to the benefit of the parties hereto and their respective successors and permitted assigns. This Assignment may be executed in counterparts, each of which will be deemed to be an original and all of which together constitute one and the same instrument.

[SIGNATURE PAGES FOLLOW]

IN WITNESS WHEREOF, Assignor and Assignee have caused this Interconnection Assignment and Assumption Agreement to be duly executed by their respective representatives thereunto duly authorized, all as of the day and year first above written.

ASSIGNOR

Ekola Flats Wind Energy LLC,
a Delaware limited liability company

By: ______________________
Name: James Williams
Title: Vice President

ASSIGNEE

PacifiCorp,
an Oregon corporation, solely in its resource development capacity

By:______________________ JP
Name: Chad A Teply
Title: Sr. VP, Bus. Policy & Dev.

CONSENT

Subject to and in accordance with Article 19 of the Interconnection Agreement, PacifiCorp, solely in its capacity as the "Transmission Provider" and "Transmission Owner" (as such terms are defined in the Interconnection Agreement), hereby consents to the assignment and assumption of the assigned Interconnection Assets as provided herein.

PacifiCorp,
an Oregon corporation

Name: Rick Vail
Title: VP, Transmission
Date: 4/12/19

EXHIBIT A

TO INTERCONNECTION ASSIGNMENT AND ASSUMPTION AGREEMENT

Interconnection Agreement

The Large Generator Interconnection Agreement, dated as of November 27, 2017, by and between Ekola Flats Wind Energy LLC, a Delaware limited liability company ("Interconnection Customer"), and PacifiCorp, an Oregon corporation ("Transmission Provider" and "Transmission Owner"), as amended by that certain Agreement to Amend Large Generator Interconnection Agreement dated November 1, 2018.

Interconnection Rights

(a) Any and all of Interconnection Customer's rights, title and interest in the Interconnection Agreement, including (i) any and all amounts deposited with the Transmission Provider by Interconnection Customer and (ii) any and all refunds or credits due or owing from the Transmission Provider to Interconnection Customer, now or hereafter, and related to the Ekola Flats Project (it being acknowledged by the parties that the assignment of the rights set forth in this clause (a) shall not relieve Assignee of its obligations pursuant to Section 7.12 or 9.3(iii) of the Purchase Agreement);

(b) to the extent they have continued in effect after the execution and delivery of the Interconnection Agreement, any and all of the assignable rights and interests of Interconnection Customer in the Ekola Flats Project's transmission interconnection queue position;

(c) the application for interconnection of the Ekola Flats Project filed by Interconnection Customer with the Transmission Provider;

(d) any studies, reports or other documents regarding the Ekola Flats Project provided by the Transmission Provider or Transmission Owner;

(e) other rights with respect to the Interconnection Agreement that the Interconnection Customer may have with the Transmission Provider or Transmission Owner, and

(f) any and all other assignable rights relating to the interconnection of the Ekola Flats Project to the transmission grid.

STANDARD LARGE GENERATOR

INTERCONNECTION AGREEMENT (LGIA)
between
PACIFICORP, on behalf of its Transmission function
and
PacifiCorp, on behalf of its Marketing function
TB Flats I – Q707

TABLE OF CONTENTS

STANDARD LARGE GENERATOR INTERCONNECTION AGREEMENT

THIS STANDARD LARGE GENERATOR INTERCONNECTION AGREEMENT ("Agreement") is made and entered into this 19th day of February, 20 19 by and between PacifiCorp, on behalf of its Marketing function, a Corporation organized and existing under the laws of the State of Oregon ("Interconnection Customer") with a Large Generating Facility), and PacifiCorp, on behalf of its Transmission function, a corporation organized and existing under the laws of the State of Oregon ("Transmission Provider and/or Transmission Owner"). Interconnection Customer and Transmission Provider each may be referred to as a "Party" or collectively as the "Parties."

Recitals

WHEREAS, Transmission Provider operates the Transmission System; and

WHEREAS, Interconnection Customer intends to own, lease and/or control and operate the Generating Facility identified as a Large Generating Facility in Appendix C to this Agreement; and,

WHEREAS, Interconnection Customer and Transmission Provider have agreed to enter into this Agreement for the purpose of interconnecting the Large Generating Facility with the Transmission System;

NOW, THEREFORE, in consideration of and subject to the mutual covenants contained herein, it is agreed:

When used in this Standard Large Generator Interconnection Agreement, terms with initial capitalization that are not defined in Article 1 shall have the meanings specified in the Article in which they are used or the Open Access Transmission Tariff (Tariff).

Article 1. Definitions

Adverse System Impact shall mean the negative effects due to technical or operational limits on conductors or equipment being exceeded that may compromise the safety and reliability of the electric system.

Affected System shall mean an electric system other than the Transmission Provider's Transmission System that may be affected by the proposed interconnection.

Affected System Operator shall mean the entity that operates an Affected System.

Affiliate shall mean, with respect to a corporation, partnership or other entity, each such other corporation, partnership or other entity that directly or indirectly, through one or more intermediaries, controls, is controlled by, or is under common control with, such corporation, partnership or other entity.

Ancillary Services shall mean those services that are necessary to support the transmission of capacity and energy from resources to loads while maintaining reliable operation of the Transmission Provider's Transmission System in accordance with Good Utility Practice.

Applicable Laws and Regulations shall mean all duly promulgated applicable federal, state and local laws, regulations, rules, ordinances, codes, decrees, judgments, directives, or judicial or administrative orders, permits and other duly authorized actions of any Governmental Authority.

Applicable Reliability Council shall mean the reliability council applicable to the Transmission System to which the Generating Facility is directly interconnected.

Applicable Reliability Standards shall mean the requirements and guidelines of NERC, the Applicable Reliability Council, and the Control Area of the Transmission System to which the Generating Facility is directly interconnected.

Base Case shall mean the base case power flow, short circuit, and stability data bases used for the Interconnection Studies by the Transmission Provider or Interconnection Customer.

Breach shall mean the failure of a Party to perform or observe any material term or condition of the Standard Large Generator Interconnection Agreement.

Breaching Party shall mean a Party that is in Breach of the Standard Large Generator Interconnection Agreement.

Business Day shall mean Monday through Friday, excluding Federal Holidays.

Calendar Day shall mean any day including Saturday, Sunday or a Federal Holiday.

Clustering shall mean the process whereby a group of Interconnection Requests is studied together, instead of serially, for the purpose of conducting the Interconnection System Impact Study.

Commercial Operation shall mean the status of a Generating Facility that has commenced generating electricity for sale, excluding electricity generated during Trial Operation.

Commercial Operation Date of a unit shall mean the date on which the Generating Facility commences Commercial Operation as agreed to by the Parties pursuant to Appendix E to the Standard Large Generator Interconnection Agreement.

Confidential Information shall mean any confidential, proprietary or trade secret information of a plan, specification, pattern, procedure, design, device, list, concept, policy or compilation relating to the present or planned business of a Party, which is designated as confidential by the Party supplying the information, whether conveyed orally, electronically, in writing, through inspection, or otherwise.

Control Area shall mean an electrical system or systems bounded by interconnection metering and telemetry, capable of controlling generation to maintain its interchange schedule with other Control Areas and contributing to frequency regulation of the interconnection. A Control Area must be certified by the Applicable Reliability Council.

Default shall mean the failure of a Breaching Party to cure its Breach in accordance with Article 17 of the Standard Large Generator Interconnection Agreement.

Dispute Resolution shall mean the procedure for resolution of a dispute between the Parties in which they will first attempt to resolve the dispute on an informal basis.

Distribution System shall mean the Transmission Provider's facilities and equipment used to transmit electricity to ultimate usage points such as homes and industries directly from nearby generators or from interchanges with higher voltage transmission networks which transport bulk power over longer distances. The voltage levels at which distribution systems operate differ among areas.

Distribution Upgrades shall mean the additions, modifications, and upgrades to the Transmission Provider's Distribution System at or beyond the Point of Interconnection to facilitate interconnection of the Generating Facility and render the transmission service necessary to effect Interconnection Customer's wholesale sale of electricity in interstate commerce. Distribution Upgrades do not include Interconnection Facilities.

Effective Date shall mean the date on which the Standard Large Generator Interconnection Agreement becomes effective upon execution by the Parties subject to acceptance by FERC, or if filed unexecuted, upon the date specified by FERC.

Emergency Condition shall mean a condition or situation: (1) that in the judgment of the Party making the claim is imminently likely to endanger life or property; or (2) that, in the case of a Transmission Provider, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to Transmission Provider's Transmission System, Transmission Provider's Interconnection Facilities or the electric systems of others to which the Transmission Provider's Transmission System is directly connected; or (3) that, in the case of Interconnection Customer, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to, the Generating Facility or

Interconnection Customer's Interconnection Facilities. System restoration and black start shall be considered Emergency Conditions; provided, that Interconnection Customer is not obligated by the Standard Large Generator Interconnection Agreement to possess black start capability.

Energy Resource Interconnection Service shall mean an Interconnection Service that allows the Interconnection Customer to connect its Generating Facility to the Transmission Provider's Transmission System to be eligible to deliver the Generating Facility's electric output using the existing firm or nonfirm capacity of the Transmission Provider's Transmission System on an as available basis. Energy Resource Interconnection Service in and of itself does not convey transmission service.

Engineering & Procurement (E&P) Agreement shall mean an agreement that authorizes the Transmission Provider to begin engineering and procurement of long lead-time items necessary for the establishment of the interconnection in order to advance the implementation of the Interconnection Request.

Environmental Law shall mean Applicable Laws or Regulations relating to pollution or protection of the environment or natural resources.

Federal Power Act shall mean the Federal Power Act, as amended, 16 U.S.C. §§ 791a et seq.

FERC shall mean the Federal Energy Regulatory Commission (Commission) or its successor.

Force Majeure shall mean any act of God, labor disturbance, act of the public enemy, war, insurrection, riot, fire, storm or flood, explosion, breakage or accident to machinery or equipment, any order, regulation or restriction imposed by governmental, military or lawfully established civilian authorities, or any other cause beyond a Party's control. A Force Majeure event does not include acts of negligence or intentional wrongdoing by the Party claiming Force Majeure.

Generating Facility shall mean Interconnection Customer's device for the production of electricity identified in the Interconnection Request, but shall not

include the Interconnection Customer's Interconnection Facilities.

Generating Facility Capacity shall mean the net capacity of the Generating Facility and the aggregate net capacity of the Generating Facility where it includes multiple energy production devices.

Good Utility Practice shall mean any of the practices, methods and acts engaged in or approved by a significant portion of the electric industry during the relevant time period, or any of the practices, methods and acts which, in the exercise of reasonable judgment in light of the facts known at the time the decision was made, could have been expected to accomplish the desired result at a reasonable cost consistent with good business practices, reliability, safety and expedition. Good Utility Practice is not intended to be limited to the optimum practice, method, or act to the exclusion of all others, but rather to be acceptable practices, methods, or acts generally accepted in the region.

Governmental Authority shall mean any federal, state, local or other governmental regulatory or administrative agency, court, commission, department, board, or other governmental subdivision, legislature, rulemaking board, tribunal, or other governmental authority having jurisdiction over the Parties, their respective facilities, or the respective services they provide, and exercising or entitled to exercise any administrative, executive, police, or taxing authority or power; provided, however, that such term does not include Interconnection Customer, Transmission Provider, or any Affiliate thereof.

Hazardous Substances shall mean any chemicals, materials or substances defined as or included in the definition of "hazardous substances," "hazardous wastes," "hazardous materials," "hazardous constituents," "restricted hazardous materials," "extremely hazardous substances," "toxic substances," "radioactive substances," "contaminants," "pollutants," "toxic pollutants" or words of similar meaning and regulatory effect under any applicable Environmental Law, or any other chemical, material or substance, exposure to which is prohibited, limited or regulated by any applicable Environmental Law.

Initial Synchronization Date shall mean the date upon which the Generating Facility is initially synchronized and upon which Trial Operation begins.

In-Service Date shall mean the date upon which the Interconnection Customer reasonably expects it will be ready to begin use of the Transmission Provider's Interconnection Facilities to obtain back feed power.

Interconnection Customer shall mean any entity, including the Transmission Provider, Transmission Owner or any of the Affiliates or subsidiaries of either, that proposes to interconnect its Generating Facility with the Transmission Provider's Transmission System.

Interconnection Customer's Interconnection Facilities shall mean all facilities and equipment, as identified in Appendix A of the Standard Large Generator Interconnection Agreement, that are located between the Generating Facility and the Point of Change of Ownership, including any modification, addition, or upgrades to such facilities and equipment necessary to physically and electrically interconnect the Generating Facility to the Transmission Provider's Transmission System. Interconnection Customer's Interconnection Facilities are sole use facilities.

Interconnection Facilities shall mean the Transmission Provider's Interconnection Facilities and the Interconnection Customer's Interconnection Facilities. Collectively, Interconnection Facilities include all facilities and equipment between the Generating Facility and the Point of Interconnection, including any modification, additions or upgrades that are necessary to physically and electrically interconnect the Generating Facility to the Transmission Provider's Transmission System. Interconnection Facilities are sole use facilities and shall not include Distribution Upgrades, Stand Alone Network Upgrades or Network Upgrades.

Interconnection Facilities Study shall mean a study conducted by the Transmission Provider or a third party consultant for the Interconnection Customer to determine a list of facilities (including Transmission Provider's Interconnection Facilities and Network Upgrades as identified in the Interconnection System Impact Study), the cost of those facilities, and the time required to interconnect the Generating Facility with the Transmission

Provider's Transmission System. The scope of the study is defined in Section 43 of the Standard Large Generator Interconnection Procedures.

Interconnection Facilities Study Agreement shall mean the form of agreement contained in Appendix 4 of the Standard Large Generator Interconnection Procedures for conducting the Interconnection Facilities Study.

Interconnection Feasibility Study shall mean a preliminary evaluation of the system impact and cost of interconnecting the Generating Facility to the Transmission Provider's Transmission System, the scope of which is described in Section 41 of the Standard Large Generator Interconnection Procedures.

Interconnection Feasibility Study Agreement shall mean the form of agreement contained in Appendix 2 of the Standard Large Generator Interconnection Procedures for conducting the Interconnection Feasibility Study.

Interconnection Request shall mean an Interconnection Customer's request, in the form of Appendix 1 to the Standard Large Generator Interconnection Procedures, in accordance with the Tariff, to interconnect a new Generating Facility, or to increase the capacity of, or make a Material Modification to the operating characteristics of, an existing Generating Facility that is interconnected with the Transmission Provider's Transmission System.

Interconnection Service shall mean the service provided by the Transmission Provider associated with interconnecting the Interconnection Customer's Generating Facility to the Transmission Provider's Transmission System and enabling it to receive electric energy and capacity from the Generating Facility at the Point of Interconnection, pursuant to the terms of the Standard Large Generator Interconnection Agreement and, if applicable, the Transmission Provider's Tariff.

Interconnection Study shall mean any of the following studies: the Interconnection Feasibility Study, the Interconnection System Impact Study, and the Interconnection Facilities Study described in the Standard Large Generator Interconnection Procedures.

Interconnection System Impact Study shall mean an engineering study that evaluates the impact of the proposed interconnection on the safety and reliability of Transmission Provider's Transmission System and, if applicable, an Affected System. The study shall identify and detail the system impacts that would result if the Generating Facility were interconnected without project modifications or system modifications, focusing on the Adverse System Impacts identified in the Interconnection Feasibility Study, or to study potential impacts, including but not limited to those identified in the Scoping Meeting as described in the Standard Large Generator Interconnection Procedures.

Interconnection System Impact Study Agreement shall mean the form of agreement contained in Appendix 3 of the Standard Large Generator Interconnection Procedures for conducting the Interconnection System Impact Study.

IRS shall mean the Internal Revenue Service.

Joint Operating Committee shall be a group made up of representatives from Interconnection Customers and the Transmission Provider to coordinate operating and technical considerations of Interconnection Service.

Large Generating Facility shall mean a Generating Facility having a Generating Facility Capacity of more than 20 MW.

Loss shall mean any and all losses relating to injury to or death of any person or damage to property, demand, suits, recoveries, costs and expenses, court costs, attorney fees, and all other obligations by or to third parties, arising out of or resulting from the other Party's performance, or non-performance of its obligations under the Standard Large Generator Interconnection Agreement on behalf of the indemnifying Party, except in cases of gross negligence or intentional wrongdoing by the indemnifying Party.

Material Modification shall mean those modifications that have a material impact on the cost or timing of any Interconnection Request with a later queue priority date.

Metering Equipment shall mean all metering equipment installed or to be installed at the Generating Facility

pursuant to the Standard Large Generator Interconnection Agreement at the metering points, including but not limited to instrument transformers, MWh-meters, data acquisition equipment, transducers, remote terminal unit, communications equipment, phone lines, and fiber optics.

NERC shall mean the North American Electric Reliability Council or its successor organization.

Network Resource shall mean any designated generating resource owned, purchased, or leased by a Network Customer under the Network Integration Transmission Service Tariff. Network Resources do not include any resource, or any portion thereof, that is committed for sale to third parties or otherwise cannot be called upon to meet the Network Customer's Network Load on a non-interruptible basis.

Network Resource Interconnection Service shall mean an Interconnection Service that allows the Interconnection Customer to integrate its Large Generating Facility with the Transmission Provider's Transmission System (1) in a manner comparable to that in which the Transmission Provider integrates its generating facilities to serve native load customers; or (2) in an RTO or ISO with market based congestion management, in the same manner as Network Resources. Network Resource Interconnection Service in and of itself does not convey transmission service.

Network Upgrades shall mean the additions, modifications, and upgrades to the Transmission Provider's Transmission System required at or beyond the point at which the Interconnection Facilities connect to the Transmission Provider's Transmission System to accommodate the interconnection of the Large Generating Facility to the Transmission Provider's Transmission System.

Notice of Dispute shall mean a written notice of a dispute or claim that arises out of or in connection with the Standard Large Generator Interconnection Agreement or its performance.

Optional Interconnection Study shall mean a sensitivity analysis based on assumptions specified by the Interconnection Customer in the Optional Interconnection Study Agreement.

Optional Interconnection Study Agreement shall mean the form of agreement contained in Appendix 5 of the Standard Large Generator Interconnection Procedures for conducting the Optional Interconnection Study.

Party or Parties shall mean Transmission Provider, Transmission Owner, Interconnection Customer or any combination of the above.

Point of Change of Ownership shall mean the point, as set forth in Appendix A to the Standard Large Generator Interconnection Agreement, where the Interconnection Customer's Interconnection Facilities connect to the Transmission Provider's Interconnection Facilities.

Point of Interconnection shall mean the point, as set forth in Appendix A to the Standard Large Generator Interconnection Agreement, where the Interconnection Facilities connect to the Transmission Provider's Transmission System.

Queue Position shall mean the order of a valid Interconnection Request, relative to all other pending valid Interconnection Requests, that is established based upon the date and time of receipt of the valid Interconnection Request by the Transmission Provider.

Reasonable Efforts shall mean, with respect to an action required to be attempted or taken by a Party under the Standard Large Generator Interconnection Agreement, efforts that are timely and consistent with Good Utility Practice and are otherwise substantially equivalent to those a Party would use to protect its own interests.

Scoping Meeting shall mean the meeting between representatives of the Interconnection Customer and Transmission Provider conducted for the purpose of discussing alternative interconnection options, to exchange information including any transmission data and earlier study evaluations that would be reasonably expected to impact such interconnection options, to analyze such information, and to determine the potential feasible Points of Interconnection.

Site Control shall mean documentation reasonably demonstrating: (1) ownership of, a leasehold interest in, or a right to develop a site for the purpose of

constructing the Generating Facility; (2) an option to purchase or acquire a leasehold site for such purpose; or (3) an exclusivity or other business relationship between Interconnection Customer and the entity having the right to sell, lease or grant Interconnection Customer the right to possess or occupy a site for such purpose.

Small Generating Facility shall mean a Generating Facility that has a Generating Facility Capacity of no more than 20 MW.

Stand Alone Network Upgrades shall mean Network Upgrades that an Interconnection Customer may construct without affecting day-to-day operations of the Transmission System during their construction. Both the Transmission Provider and the Interconnection Customer must agree as to what constitutes Stand Alone Network Upgrades and identify them in Appendix A to the Standard Large Generator Interconnection Agreement.

Standard Large Generator Interconnection Agreement (LGIA) shall mean the form of interconnection agreement applicable to an Interconnection Request pertaining to a Large Generating Facility that is included in the Transmission Provider's Tariff.

Standard Large Generator Interconnection Procedures (LGIP) shall mean the interconnection procedures applicable to an Interconnection Request pertaining to a Large Generating Facility that are included in the Transmission Provider's Tariff.

System Protection Facilities shall mean the equipment, including necessary protection signal communications equipment, required to protect (1) the Transmission Provider's Transmission System from faults or other electrical disturbances occurring at the Generating Facility and (2) the Generating Facility from faults or other electrical system disturbances occurring on the Transmission Provider's Transmission System or on other delivery systems or other generating systems to which the Transmission Provider's Transmission System is directly connected.

Tariff shall mean the Transmission Provider's Tariff through which open access transmission service and Interconnection Service are offered, as filed with FERC,

and as amended or supplemented from time to time, or any successor tariff.

Transmission Owner shall mean an entity that owns, leases or otherwise possesses an interest in the portion of the Transmission System at the Point of Interconnection and may be a Party to the Standard Large Generator Interconnection Agreement to the extent necessary.

Transmission Provider shall mean the public utility (or its designated agent) that owns, controls, or operates transmission or distribution facilities used for the transmission of electricity in interstate commerce and provides transmission service under the Tariff. The term Transmission Provider should be read to include the Transmission Owner when the Transmission Owner is separate from the Transmission Provider.

Transmission Provider's Interconnection Facilities shall mean all facilities and equipment owned, controlled or operated by the Transmission Provider from the Point of Change of Ownership to the Point of Interconnection as identified in Appendix A to the Standard Large Generator Interconnection Agreement, including any modifications, additions or upgrades to such facilities and equipment. Transmission Provider's Interconnection Facilities are sole use facilities and shall not include Distribution Upgrades, Stand Alone Network Upgrades or Network Upgrades.

Transmission System shall mean the facilities owned, controlled or operated by the Transmission Provider or Transmission Owner that are used to provide transmission service under the Tariff.

Trial Operation shall mean the period during which Interconnection Customer is engaged in on-site test operations and commissioning of the Generating Facility prior to Commercial Operation.

Variable Energy Resource shall mean a device for the production of electricity that is characterized by an energy source that: (1) is renewable; (2) cannot be stored by the facility owner or operator; and (3) has variability that is beyond the control of the facility owner or operator.

Article 2. Effective Date, Term, and Termination

2.1 Effective Date. This LGIA shall become effective upon execution by the Parties subject to acceptance by FERC (if applicable), or if filed unexecuted, upon the date specified by FERC. Transmission Provider shall promptly file this LGIA with FERC upon execution in accordance with Article 3.1, if required.

2.2 Term of Agreement. Subject to the provisions of Article 2.3, this LGIA shall remain in effect for a period of ten (10) years from the Effective Date or such other longer period as Interconnection Customer may request (Term to be specified in individual agreements) and shall be automatically renewed for each successive one-year period thereafter.

2.3 Termination Procedures.

2.3.1 Written Notice. This LGIA may be terminated by Interconnection Customer after giving Transmission Provider ninety (90) Calendar Days advance written notice, or by Transmission Provider notifying FERC after the Generating Facility permanently ceases Commercial Operation.

2.3.2 Default. Either Party may terminate this LGIA in accordance with Article 17.

2.3.3 Notwithstanding Articles 2.3.1 and 2.3.2, no termination shall become effective until the Parties have complied with all Applicable Laws and Regulations applicable to such termination, including the filing with FERC of a notice of termination of this LGIA, which notice has been accepted for filing by FERC.

2.4 Termination Costs. If a Party elects to terminate this Agreement pursuant to Article 2.3 above, each Party shall pay all costs incurred (including any cancellation costs relating to orders or contracts for Interconnection Facilities and equipment) or charges assessed by the other Party, as of the date of the other Party's receipt of such notice of

termination, that are the responsibility of the Terminating Party under this LGIA. In the event of termination by a Party, the Parties shall use commercially Reasonable Efforts to mitigate the costs, damages and charges arising as a consequence of termination. Upon termination of this LGIA, unless otherwise ordered or approved by FERC:

2.4.1 With respect to any portion of Transmission Provider's Interconnection Facilities that have not yet been constructed or installed, Transmission Provider shall to the extent possible and with Interconnection Customer's authorization cancel any pending orders of, or return, any materials or equipment for, or contracts for construction of, such facilities; provided that in the event Interconnection Customer elects not to authorize such cancellation, Interconnection Customer shall assume all payment obligations with respect to such materials, equipment, and contracts, and Transmission Provider shall deliver such material and equipment, and, if necessary, assign such contracts, to Interconnection Customer as soon as practicable, at Interconnection Customer's expense. To the extent that Interconnection Customer has already paid Transmission Provider for any or all such costs of materials or equipment not taken by Interconnection Customer, Transmission Provider shall promptly refund such amounts to Interconnection Customer, less any costs, including penalties incurred by Transmission Provider to cancel any pending orders of or return such materials, equipment, or contracts.

If an Interconnection Customer terminates this LGIA, it shall be responsible for all costs incurred in association with that Interconnection Customer's interconnection, including any cancellation costs relating to orders or contracts for Interconnection Facilities

and equipment, and other expenses including any Network Upgrades for which Transmission Provider has incurred expenses and has not been reimbursed by Interconnection Customer.

2.4.2 Transmission Provider may, at its option, retain any portion of such materials, equipment, or facilities that Interconnection Customer chooses not to accept delivery of, in which case Transmission Provider shall be responsible for all costs associated with procuring such materials, equipment, or facilities.

2.4.3 With respect to any portion of the Interconnection Facilities, and any other facilities already installed or constructed pursuant to the terms of this LGIA, Interconnection Customer shall be responsible for all costs associated with the removal, relocation or other disposition or retirement of such materials, equipment, or facilities.

2.5 **Disconnection.** Upon termination of this LGIA, the Parties will take all appropriate steps to disconnect the Large Generating Facility from the Transmission System. All costs required to effectuate such disconnection shall be borne by the terminating Party, unless such termination resulted from the non-terminating Party's Default of this LGIA or such non-terminating Party otherwise is responsible for these costs under this LGIA.

2.6 **Survival.** This LGIA shall continue in effect after termination to the extent necessary to provide for final billings and payments and for costs incurred hereunder, including billings and payments pursuant to this LGIA; to permit the determination and enforcement of liability and indemnification obligations arising from acts or events that occurred while this LGIA was in effect; and to permit each Party to have access to the lands of the other Party pursuant to this LGIA or other applicable agreements, to disconnect, remove or salvage its own facilities and equipment.

Article 3. Regulatory Filings

3.1 Filing. Transmission Provider shall file this LGIA (and any amendment hereto) with the appropriate Governmental Authority, if required. Interconnection Customer may request that any information so provided be subject to the confidentiality provisions of Article 22. If Interconnection Customer has executed this LGIA, or any amendment thereto, Interconnection Customer shall reasonably cooperate with Transmission Provider with respect to such filing and to provide any information reasonably requested by Transmission Provider needed to comply with applicable regulatory requirements.

Article 4. Scope of Service

4.1 Interconnection Product Options. Interconnection Customer has selected the following (checked) type of Interconnection Service:

X **4.1.1 Energy Resource Interconnection Service.**

4.1.1.1 The Product. Energy Resource Interconnection Service allows Interconnection Customer to connect the Large Generating Facility to the Transmission System and be eligible to deliver the Large Generating Facility's output using the existing firm or non-firm capacity of the Transmission System on an "as available" basis. To the extent Interconnection Customer wants to receive Energy Resource Interconnection Service, Transmission Provider shall construct facilities identified in Attachment A.

4.1.1.2 Transmission Delivery Service Implications. Under Energy

Resource Interconnection Service, Interconnection Customer will be eligible to inject power from the Large Generating Facility into and deliver power across the interconnecting Transmission Provider's Transmission System on an "as available" basis up to the amount of MWs identified in the applicable stability and steady state studies to the extent the upgrades initially required to qualify for Energy Resource Interconnection Service have been constructed. Where eligible to do so (e.g., PJM, ISO-NE, NYISO), Interconnection Customer may place a bid to sell into the market up to the maximum identified Large Generating Facility output, subject to any conditions specified in the interconnection service approval, and the Large Generating Facility will be dispatched to the extent Interconnection Customer's bid clears. In all other instances, no transmission delivery service from the Large Generating Facility is assured, but Interconnection Customer may obtain Point-to-Point Transmission Service, Network Integration Transmission Service, or be used for secondary network transmission service, pursuant to Transmission Provider's Tariff, up to the maximum output identified in the stability and steady state studies. In those instances, in order for Interconnection Customer to obtain the right to deliver or inject energy beyond the Large Generating Facility Point of Interconnection or to improve its ability to do so, transmission

delivery service must be obtained pursuant to the provisions of Transmission Provider's Tariff. The Interconnection Customer's ability to inject its Large Generating Facility output beyond the Point of Interconnection, therefore, will depend on the existing capacity of Transmission Provider's Transmission System at such time as a transmission service request is made that would accommodate such delivery. The provision of firm Point-to-Point Transmission Service or Network Integration Transmission Service may require the construction of additional Network Upgrades.

☐ **4.1.2 Network Resource Interconnection Service.**

4.1.2.1 The Product. Transmission Provider must conduct the necessary studies and construct the Network Upgrades needed to integrate the Large Generating Facility (1) in a manner comparable to that in which Transmission Provider integrates its generating facilities to serve native load customers; or (2) in an ISO or RTO with market based congestion management, in the same manner as all Network Resources. To the extent Interconnection Customer wants to receive Network Resource Interconnection Service, Transmission Provider shall construct the facilities identified in Attachment A to this LGIA.

4.1.2.2 Transmission Delivery Service Implications. Network Resource

Interconnection Service allows Interconnection Customer's Large Generating Facility to be designated by any Network Customer under the Tariff on Transmission Provider's Transmission System as a Network Resource, up to the Large Generating Facility's full output, on the same basis as existing Network Resources interconnected to Transmission Provider's Transmission System, and to be studied as a Network Resource on the assumption that such a designation will occur. Although Network Resource Interconnection Service does not convey a reservation of transmission service, any Network Customer under the Tariff can utilize its network service under the Tariff to obtain delivery of energy from the interconnected Interconnection Customer's Large Generating Facility in the same manner as it accesses Network Resources. A Large Generating Facility receiving Network Resource Interconnection Service may also be used to provide Ancillary Services after technical studies and/or periodic analyses are performed with respect to the Large Generating Facility's ability to provide any applicable Ancillary Services, provided that such studies and analyses have been or would be required in connection with the provision of such Ancillary Services by any existing Network Resource. However, if an Interconnection Customer's Large Generating Facility has not been designated as a Network Resource by any load, it cannot be

required to provide Ancillary Services except to the extent such requirements extend to all generating facilities that are similarly situated. The provision of Network Integration Transmission Service or firm Point-to-Point Transmission Service may require additional studies and the construction of additional upgrades. Because such studies and upgrades would be associated with a request for delivery service under the Tariff, cost responsibility for the studies and upgrades would be in accordance with FERC's policy for pricing transmission delivery services.

Network Resource Interconnection Service does not necessarily provide Interconnection Customer with the capability to physically deliver the output of its Large Generating Facility to any particular load on Transmission Provider's Transmission System without incurring congestion costs. In the event of transmission constraints on Transmission Provider's Transmission System, Interconnection Customer's Large Generating Facility shall be subject to the applicable congestion management procedures in Transmission Provider's Transmission System in the same manner as Network Resources.

There is no requirement either at the time of study or interconnection, or at any point in the future, that Interconnection Customer's Large Generating Facility be designated

as a Network Resource by a Network Service Customer under the Tariff or that Interconnection Customer identify a specific buyer (or sink). To the extent a Network Customer does designate the Large Generating Facility as a Network Resource, it must do so pursuant to Transmission Provider's Tariff.

Once an Interconnection Customer satisfies the requirements for obtaining Network Resource Interconnection Service, any future transmission service request for delivery from the Large Generating Facility within Transmission Provider's Transmission System of any amount of capacity and/or energy, up to the amount initially studied, will not require that any additional studies be performed or that any further upgrades associated with such Large Generating Facility be undertaken, regardless of whether or not such Large Generating Facility is ever designated by a Network Customer as a Network Resource and regardless of changes in ownership of the Large Generating Facility. However, the reduction or elimination of congestion or redispatch costs may require additional studies and the construction of additional upgrades.

To the extent Interconnection Customer enters into an arrangement for long term transmission service for deliveries from the Large Generating Facility outside

Transmission Provider's Transmission System, such request may require additional studies and upgrades in order for Transmission Provider to grant such request.

4.2 **Provision of Service.** Transmission Provider shall provide Interconnection Service for the Large Generating Facility at the Point of Interconnection.

4.3 **Performance Standards.** Each Party shall perform all of its obligations under this LGIA in accordance with Applicable Laws and Regulations, Applicable Reliability Standards, and Good Utility Practice, and to the extent a Party is required or prevented or limited in taking any action by such regulations and standards, such Party shall not be deemed to be in Breach of this LGIA for its compliance therewith. If such Party is a Transmission Provider or Transmission Owner, then that Party shall amend the LGIA and submit the amendment to FERC for approval.

4.4 **No Transmission Delivery Service.** The execution of this LGIA does not constitute a request for, nor the provision of, any transmission delivery service under Transmission Provider's Tariff, and does not convey any right to deliver electricity to any specific customer or Point of Delivery.

4.5 **Interconnection Customer Provided Services.** The services provided by Interconnection Customer under this LGIA are set forth in Article 9.6 and Article 13.5.1.

Interconnection Customer shall be paid for such services in accordance with Article 11.6.

Article 5. Interconnection Facilities Engineering, Procurement, and Construction

5.1 **Options.** Unless otherwise mutually agreed to between the Parties, Interconnection Customer shall select the In-Service Date, Initial Synchronization Date, and Commercial Operation Date; and either Standard Option or Alternate Option set forth below for

completion of Transmission Provider's Interconnection Facilities and Network Upgrades as set forth in Appendix A, Interconnection Facilities and Network Upgrades, and such dates and selected option shall be set forth in Appendix B, Milestones.

5.1.1 **Standard Option.** Transmission Provider shall design, procure, and construct Transmission Provider's Interconnection Facilities and Network Upgrades, using Reasonable Efforts to complete Transmission Provider's Interconnection Facilities and Network Upgrades by the dates set forth in Appendix B, Milestones. Transmission Provider shall not be required to undertake any action which is inconsistent with its standard safety practices, its material and equipment specifications, its design criteria and construction procedures, its labor agreements, and Applicable Laws and Regulations. In the event Transmission Provider reasonably expects that it will not be able to complete Transmission Provider's Interconnection Facilities and Network Upgrades by the specified dates, Transmission Provider shall promptly provide written notice to Interconnection Customer and shall undertake Reasonable Efforts to meet the earliest dates thereafter.

5.1.2 **Alternate Option.** If the dates designated by Interconnection Customer are acceptable to Transmission Provider, Transmission Provider shall so notify Interconnection Customer within thirty (30) Calendar Days, and shall assume responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities by the designated dates.

If Transmission Provider subsequently fails to complete Transmission Provider's Interconnection Facilities by the In-Service Date, to the extent necessary to provide back feed power; or fails to

complete Network Upgrades by the Initial Synchronization Date to the extent necessary to allow for Trial Operation at full power output, unless other arrangements are made by the Parties for such Trial Operation; or fails to complete the Network Upgrades by the Commercial Operation Date, as such dates are reflected in Appendix B, Milestones; Transmission Provider shall pay Interconnection Customer liquidated damages in accordance with Article 5.3, Liquidated Damages, provided, however, the dates designated by Interconnection Customer shall be extended day for day for each day that the applicable RTO or ISO refuses to grant clearances to install equipment.

5.1.3 **Option to Build.** If the dates designated by Interconnection Customer are not acceptable to Transmission Provider, Transmission Provider shall so notify Interconnection Customer within thirty (30) Calendar Days, and unless the Parties agree otherwise, Interconnection Customer shall have the option to assume responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades on the dates specified in Article 5.1.2. Transmission Provider and Interconnection Customer must agree as to what constitutes Stand Alone Network Upgrades and identify such Stand Alone Network Upgrades in Appendix A. Except for Stand Alone Network Upgrades, Interconnection Customer shall have no right to construct Network Upgrades under this option.

5.1.4 **Negotiated Option.** If Interconnection Customer elects not to exercise its option under Article 5.1.3, Option to Build, Interconnection Customer shall so notify Transmission Provider within thirty (30) Calendar Days, and the Parties shall in

good faith attempt to negotiate terms and conditions (including revision of the specified dates and liquidated damages, the provision of incentives or the procurement and construction of a portion of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades by Interconnection Customer) pursuant to which Transmission Provider is responsible for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Network Upgrades. If the Parties are unable to reach agreement on such terms and conditions, Transmission Provider shall assume responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Network Upgrades pursuant to 5.1.1, Standard Option.

5.2 General Conditions Applicable to Option to Build. If Interconnection Customer assumes responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades,

(1) Interconnection Customer shall engineer, procure equipment, and construct Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades (or portions thereof) using Good Utility Practice and using standards and specifications provided in advance by Transmission Provider;

(2) Interconnection Customer's engineering, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades shall comply with all requirements of law to which Transmission Provider would be subject in the engineering, procurement or construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades;

(3) Transmission Provider shall review and approve the engineering design, equipment acceptance tests, and the construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades;

(4) prior to commencement of construction, Interconnection Customer shall provide to Transmission Provider a schedule for construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades, and shall promptly respond to requests for information from Transmission Provider;

(5) at any time during construction, Transmission Provider shall have the right to gain unrestricted access to Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades and to conduct inspections of the same;

(6) at any time during construction, should any phase of the engineering, equipment procurement, or construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades not meet the standards and specifications provided by Transmission Provider, Interconnection Customer shall be obligated to remedy deficiencies in that portion of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades;

(7) Interconnection Customer shall indemnify Transmission Provider for claims arising from Interconnection Customer's construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades under the terms and procedures applicable to Article 18.1 Indemnity;

(8) Interconnection Customer shall transfer control of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades to Transmission Provider;

(9) Unless Parties otherwise agree, Interconnection Customer shall transfer ownership of Transmission Provider's Interconnection Facilities and Stand-Alone Network Upgrades to Transmission Provider;

(10) Transmission Provider shall approve and accept for operation and maintenance Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades to the extent engineered, procured, and constructed in accordance with this Article 5.2; and

(11) Interconnection Customer shall deliver to Transmission Provider "as-built" drawings, information, and any other documents that are reasonably required by Transmission Provider to assure that the Interconnection Facilities and Stand-Alone Network Upgrades are built to the standards and specifications required by Transmission Provider.

5.3 Liquidated Damages. The actual damages to Interconnection Customer, in the event Transmission Provider's Interconnection Facilities or Network Upgrades are not completed by the dates designated by Interconnection Customer and accepted by Transmission Provider pursuant to subparagraphs 5.1.2 or 5.1.4, above, may include Interconnection Customer's fixed operation and maintenance costs and lost opportunity costs. Such actual damages are uncertain and impossible to determine at this time. Because of such uncertainty, any liquidated damages paid by Transmission Provider to Interconnection Customer in the event that Transmission Provider does not complete any portion of Transmission Provider's Interconnection Facilities or Network Upgrades by the applicable dates, shall be an amount equal to ½ of 1 percent per day of the actual cost of Transmission Provider's Interconnection Facilities and Network

Upgrades, in the aggregate, for which Transmission Provider has assumed responsibility to design, procure and construct.

However, in no event shall the total liquidated damages exceed 20 percent of the actual cost of Transmission Provider's Interconnection Facilities and Network Upgrades for which Transmission Provider has assumed responsibility to design, procure, and construct. The foregoing payments will be made by Transmission Provider to Interconnection Customer as just compensation for the damages caused to Interconnection Customer, which actual damages are uncertain and impossible to determine at this time, and as reasonable liquidated damages, but not as a penalty or a method to secure performance of this LGIA. Liquidated damages, when the Parties agree to them, are the exclusive remedy for the Transmission Provider's failure to meet its schedule.

No liquidated damages shall be paid to Interconnection Customer if: (1) Interconnection Customer is not ready to commence use of Transmission Provider's Interconnection Facilities or Network Upgrades to take the delivery of power for the Large Generating Facility's Trial Operation or to export power from the Large Generating Facility on the specified dates, unless Interconnection Customer would have been able to commence use of Transmission Provider's Interconnection Facilities or Network Upgrades to take the delivery of power for Large Generating Facility's Trial Operation or to export power from the Large Generating Facility, but for Transmission Provider's delay; (2) Transmission Provider's failure to meet the specified dates is the result of the action or inaction of Interconnection Customer or any other Interconnection Customer who has entered into an LGIA with Transmission Provider or any cause beyond Transmission Provider's reasonable control or reasonable ability to cure; (3) the interconnection Customer has assumed responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades; or (4) the Parties have otherwise agreed.

5.4 Power System Stabilizers. The Interconnection Customer shall procure, install, maintain and operate Power System Stabilizers in accordance with the guidelines and procedures established by the Applicable Reliability Council. Transmission Provider reserves the right to reasonably establish minimum acceptable settings for any installed Power System Stabilizers, subject to the design and operating limitations of the Large Generating Facility. If the Large Generating Facility's Power System Stabilizers are removed from service or not capable of automatic operation, Interconnection Customer shall immediately notify Transmission Provider's system operator, or its designated representative. The requirements of this paragraph shall not apply to wind generators.

5.5 Equipment Procurement. If responsibility for construction of Transmission Provider's Interconnection Facilities or Network Upgrades is to be borne by Transmission Provider, then Transmission Provider shall commence design of Transmission Provider's Interconnection Facilities or Network Upgrades and procure necessary equipment as soon as practicable after all of the following conditions are satisfied, unless the Parties otherwise agree in writing:

5.5.1 Transmission Provider has completed the Facilities Study pursuant to the Facilities Study Agreement;

5.5.2 Transmission Provider has received written authorization to proceed with design and procurement from Interconnection Customer by the date specified in Appendix B, Milestones; and

5.5.3 Interconnection Customer has provided security to Transmission Provider in accordance with Article 11.5 by the dates specified in Appendix B, Milestones.

5.6 Construction Commencement. Transmission Provider shall commence construction of Transmission Provider's Interconnection Facilities and Network Upgrades for which it is responsible as soon as

practicable after the following additional conditions are satisfied:

5.6.1 Approval of the appropriate Governmental Authority has been obtained for any facilities requiring regulatory approval;

5.6.2 Necessary real property rights and rights-of-way have been obtained, to the extent required for the construction of a discrete aspect of Transmission Provider's Interconnection Facilities and Network Upgrades;

5.6.3 Transmission Provider has received written authorization to proceed with construction from Interconnection Customer by the date specified in Appendix B, Milestones; and

5.6.4 Interconnection Customer has provided security to Transmission Provider in accordance with Article 11.5 by the dates specified in Appendix B, Milestones.

5.7 **Work Progress.** The Parties will keep each other advised periodically as to the progress of their respective design, procurement and construction efforts. Either Party may, at any time, request a progress report from the other Party. If, at any time, Interconnection Customer determines that the completion of Transmission Provider's Interconnection Facilities will not be required until after the specified In-Service Date, Interconnection Customer will provide written notice to Transmission Provider of such later date upon which the completion of Transmission Provider's Interconnection Facilities will be required.

5.8 **Information Exchange.** As soon as reasonably practicable after the Effective Date, the Parties shall exchange information regarding the design and compatibility of the Parties' Interconnection Facilities and compatibility of the Interconnection Facilities with Transmission Provider's Transmission System, and shall work diligently and in good faith to make any necessary design changes.

5.9 Limited Operation. If any of Transmission Provider's Interconnection Facilities or Network Upgrades are not reasonably expected to be completed prior to the Commercial Operation Date of the Large Generating Facility, Transmission Provider shall, upon the request and at the expense of Interconnection Customer, perform operating studies on a timely basis to determine the extent to which the Large Generating Facility and Interconnection Customer's Interconnection Facilities may operate prior to the completion of Transmission Provider's Interconnection Facilities or Network Upgrades consistent with Applicable Laws and Regulations, Applicable Reliability Standards, Good Utility Practice, and this LGIA. Transmission Provider shall permit Interconnection Customer to operate the Large Generating Facility and Interconnection Customer's Interconnection Facilities in accordance with the results of such studies.

5.10 Interconnection Customer's Interconnection Facilities ('ICIF'). Interconnection Customer shall, at its expense, design, procure, construct, own and install the ICIF, as set forth in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades.

5.10.1 Interconnection Customer's Interconnection Facility Specifications. Interconnection Customer shall submit initial specifications for the ICIF, including System Protection Facilities, to Transmission Provider at least one hundred eighty (180) Calendar Days prior to the Initial Synchronization Date; and final specifications for review and comment at least ninety (90) Calendar Days prior to the Initial Synchronization Date. Transmission Provider shall review such specifications to ensure that the ICIF are compatible with the technical specifications, operational control, and safety requirements of Transmission Provider and comment on such specifications within thirty (30) Calendar Days of Interconnection Customer's

submission. All specifications provided hereunder shall be deemed confidential.

5.10.2 **Transmission Provider's Review**. Transmission Provider's review of Interconnection Customer's final specifications shall not be construed as confirming, endorsing, or providing a warranty as to the design, fitness, safety, durability or reliability of the Large Generating Facility, or the ICIF. Interconnection Customer shall make such changes to the ICIF as may reasonably be required by Transmission Provider, in accordance with Good Utility Practice, to ensure that the ICIF are compatible with the technical specifications, operational control, and safety requirements of Transmission Provider.

5.10.3 **ICIF Construction.** The ICIF shall be designed and constructed in accordance with Good Utility Practice. Within one hundred twenty (120) Calendar Days after the Commercial Operation Date, unless the Parties agree on another mutually acceptable deadline, Interconnection Customer shall deliver to Transmission Provider "as-built" drawings, information and documents for the ICIF, such as: a one-line diagram, a site plan showing the Large Generating Facility and the ICIF, plan and elevation drawings showing the layout of the ICIF, a relay functional diagram, relaying AC and DC schematic wiring diagrams and relay settings for all facilities associated with Interconnection Customer's step-up transformers, the facilities connecting the Large Generating Facility to the step-up transformers and the ICIF, and the impedances (determined by factory tests) for the associated step-up transformers and the Large Generating Facility. The Interconnection Customer shall provide Transmission Provider specifications for the excitation system, automatic voltage regulator, Large

Generating Facility control and protection settings, transformer tap settings, and communications, if applicable.

5.11 Transmission Provider's Interconnection Facilities Construction. Transmission Provider's Interconnection Facilities shall be designed and constructed in accordance with Good Utility Practice. Upon request, within one hundred twenty (120) Calendar Days after the Commercial Operation Date, unless the Parties agree on another mutually acceptable deadline, Transmission Provider shall deliver to Interconnection Customer the following "as-built" drawings, information and documents for Transmission Provider's Interconnection Facilities [include appropriate drawings and relay diagrams].

Transmission Provider will obtain control of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades upon completion of such facilities.

5.12 Access Rights. Upon reasonable notice and supervision by a Party, and subject to any required or necessary regulatory approvals, a Party ("Granting Party") shall furnish at no cost to the other Party ("Access Party") any rights of use, licenses, rights of way and easements with respect to lands owned or controlled by the Granting Party, its agents (if allowed under the applicable agency agreement), or any Affiliate, that are necessary to enable the Access Party to obtain ingress and egress to construct, operate, maintain, repair, test (or witness testing), inspect, replace or remove facilities and equipment to: (i) interconnect the Large Generating Facility with the Transmission System; (ii) operate and maintain the Large Generating Facility, the Interconnection Facilities and the Transmission System; and (iii) disconnect or remove the Access Party's facilities and equipment upon termination of this LGIA. In exercising such licenses, rights of way and easements, the Access Party shall not unreasonably disrupt or interfere with normal operation of the Granting Party's business and shall adhere to the safety rules and procedures established in advance, as may be changed

from time to time, by the Granting Party and provided to the Access Party.

5.13 Lands of Other Property Owners. If any part of Transmission Provider or Transmission Owner's Interconnection Facilities and/or Network Upgrades is to be installed on property owned by persons other than Interconnection Customer or Transmission Provider or Transmission Owner, Transmission Provider or Transmission Owner shall at Interconnection Customer's expense use efforts, similar in nature and extent to those that it typically undertakes on its own behalf or on behalf of its Affiliates, including use of its eminent domain authority, and to the extent consistent with state law, to procure from such persons any rights of use, licenses, rights of way and easements that are necessary to construct, operate, maintain, test, inspect, replace or remove Transmission Provider or Transmission Owner's Interconnection Facilities and/or Network Upgrades upon such property.

5.14 Permits. Transmission Provider or Transmission Owner and Interconnection Customer shall cooperate with each other in good faith in obtaining all permits, licenses and authorizations that are necessary to accomplish the interconnection in compliance with Applicable Laws and Regulations. With respect to this paragraph, Transmission Provider or Transmission Owner shall provide permitting assistance to Interconnection Customer comparable to that provided to Transmission Provider's own, or an Affiliate's generation.

5.15 Early Construction of Base Case Facilities. Interconnection Customer may request Transmission Provider to construct, and Transmission Provider shall construct, using Reasonable Efforts to accommodate Interconnection Customer's In-Service Date, all or any portion of any Network Upgrades required for Interconnection Customer to be interconnected to the Transmission System which are included in the Base Case of the Facilities Study for Interconnection Customer, and which also are required to be constructed for another Interconnection Customer, but where such construction is not

scheduled to be completed in time to achieve Interconnection Customer's In-Service Date.

5.16 Suspension. Interconnection Customer reserves the right, upon written notice to Transmission Provider, to suspend
at any time all work by Transmission Provider associated with the construction and installation of Transmission Provider's Interconnection Facilities and/or Network Upgrades required under this LGIA with the condition that Transmission System shall be left in a safe and reliable condition in accordance with Good Utility Practice and Transmission Provider's safety and reliability criteria. In such event, Interconnection Customer shall be responsible for all reasonable and necessary costs which Transmission Provider (i) has incurred pursuant to this LGIA prior to the suspension and (ii) incurs in suspending such work, including any costs incurred to perform such work as may be necessary to ensure the safety of persons and property and the integrity of the Transmission System during such suspension and, if applicable, any costs incurred in connection with the cancellation or suspension of material, equipment and labor contracts which Transmission Provider cannot reasonably avoid; provided, however, that prior to canceling or suspending any such material, equipment or labor contract, Transmission Provider shall obtain Interconnection Customer's authorization to do so.

Transmission Provider shall invoice Interconnection Customer for such costs pursuant to Article 12 and shall use due diligence to minimize its costs. In the event Interconnection Customer suspends work by Transmission Provider required under this LGIA pursuant to this Article 5.16, and has not requested Transmission Provider to recommence the work required under this LGIA on or before the expiration of three (3) years following commencement of such suspension, this LGIA shall be deemed terminated. The three-year period shall begin on the date the suspension is requested, or the date of the written notice to Transmission Provider, if no effective date is specified.

5.17 Taxes.

5.17.1 **Interconnection Customer Payments Not Taxable.** The Parties intend that all payments or property transfers made by Interconnection Customer to Transmission Provider for the installation of Transmission Provider's Interconnection Facilities and the Network Upgrades shall be non-taxable, either as contributions to capital, or as an advance, in accordance with the Internal Revenue Code and any applicable state income tax laws and shall not be taxable as contributions in aid of construction or otherwise under the Internal Revenue Code and any applicable state income tax laws.

5.17.2 **Representations and Covenants.** In accordance with IRS Notice 2001-82 and IRS Notice 88-129, Interconnection Customer represents and covenants that (i) ownership of the electricity generated at the Large Generating Facility will pass to another party prior to the transmission of the electricity on the Transmission System, (ii) for income tax purposes, the amount of any payments and the cost of any property transferred to Transmission Provider for Transmission Provider's Interconnection Facilities will be capitalized by Interconnection Customer as an intangible asset and recovered using the straight-line method over a useful life of twenty (20) years, and (iii) any portion of Transmission Provider's Interconnection Facilities that is a "dual-use intertie," within the meaning of IRS Notice 88-129, is reasonably expected to carry only a de minimis amount of electricity in the direction of the Large Generating Facility. For this purpose, "de minimis amount" means no more than 5 percent of the total power flows in both directions, calculated in accordance with the "5 percent test" set forth in IRS Notice 88-129. This is not intended to be an exclusive list of the relevant conditions that must be met to conform to

IRS requirements for non-taxable treatment.

At Transmission Provider's request, Interconnection Customer shall provide Transmission Provider with a report from an independent engineer confirming its representation in clause (iii), above. Transmission Provider represents and covenants that the cost of Transmission Provider's Interconnection Facilities paid for by Interconnection Customer will have no net effect on the base upon which rates are determined.

5.17.3 **Indemnification for the Cost Consequences of Current Tax Liability Imposed Upon the Transmission Provider.** Notwithstanding Article 5.17.1, Interconnection Customer shall protect, indemnify and hold harmless Transmission Provider from the cost consequences of any current tax liability imposed against Transmission Provider as the result of payments or property transfers made by Interconnection Customer to Transmission Provider under this LGIA for Interconnection Facilities, as well as any interest and penalties, other than interest and penalties attributable to any delay caused by Transmission Provider.

Transmission Provider shall not include a gross-up for the cost consequences of any current tax liability in the amounts it charges Interconnection Customer under this LGIA unless (i) Transmission Provider has determined, in good faith, that the payments or property transfers made by Interconnection Customer to Transmission Provider should be reported as income subject to taxation or (ii) any Governmental Authority directs Transmission Provider to report payments or property as income subject to taxation; provided, however, that Transmission Provider may require Interconnection Customer to provide security for

Interconnection Facilities, in a form reasonably acceptable to Transmission Provider (such as a parental guarantee or a letter of credit), in an amount equal to the cost consequences of any current tax liability under this Article 5.17. Interconnection Customer shall reimburse Transmission Provider for such costs on a fully grossed-up basis, in accordance with Article 5.17.4, within thirty (30) Calendar Days of receiving written notification from Transmission Provider of the amount due, including detail about how the amount was calculated.

The indemnification obligation shall terminate at the earlier of (1) the expiration of the ten year testing period and the applicable statute of limitation, as it may be extended by Transmission Provider upon request of the IRS, to keep these years open for audit or adjustment, or (2) the occurrence of a subsequent taxable event and the payment of any related indemnification obligations as contemplated by this Article 5.17.

5.17.4 **Tax Gross-Up Amount.** Interconnection Customer's liability for the cost consequences of any current tax liability under this Article 5.17 shall be calculated on a fully grossed-up basis. Except as may otherwise be agreed to by the parties, this means that Interconnection Customer will pay Transmission Provider, in addition to the amount paid for the Interconnection Facilities and Network Upgrades, an amount equal to (1) the current taxes imposed on Transmission Provider ("Current Taxes") on the excess of (a) the gross income realized by Transmission Provider as a result of payments or property transfers made by Interconnection Customer to Transmission Provider under this LGIA (without regard to any payments under this Article 5.17) (the "Gross Income Amount")

over (b) the present value of future tax deductions for depreciation that will be available as a result of such payments or property transfers (the "Present Value Depreciation Amount"), plus (2) an additional amount sufficient to permit Transmission Provider to receive and retain, after the payment of all Current Taxes, an amount equal to the net amount described in clause (1).

For this purpose, (i) Current Taxes shall be computed based on Transmission Provider's composite federal and state tax rates at the time the payments or property transfers are received and Transmission Provider will be treated as being subject to tax at the highest marginal rates in effect at that time (the "Current Tax Rate"), and (ii) the Present Value Depreciation Amount shall be computed by discounting Transmission Provider's anticipated tax depreciation deductions as a result of such payments or property transfers by Transmission Provider's current weighted average cost of capital. Thus, the formula for calculating Interconnection Customer's liability to Transmission Owner pursuant to this Article 5.17.4 can be expressed as follows: (Current Tax Rate x (Gross Income Amount – Present Value of Tax Depreciation))/(1-Current Tax Rate). Interconnection Customer's estimated tax liability in the event taxes are imposed shall be stated in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades.

5.17.5 Private Letter Ruling or Change or Clarification of Law. At Interconnection Customer's request and expense, Transmission Provider shall file with the IRS a request for a private letter ruling as to whether any property transferred or sums paid, or to be paid, by Interconnection Customer to Transmission

Provider under this LGIA are subject to federal income taxation. Interconnection Customer will prepare the initial draft of the request for a private letter ruling, and will certify under penalties of perjury that all facts represented in such request are true and accurate to the best of Interconnection Customer's knowledge. Transmission Provider and Interconnection Customer shall cooperate in good faith with respect to the submission of such request.

Transmission Provider shall keep Interconnection Customer fully informed of the status of such request for a private letter ruling and shall execute either a privacy act waiver or a limited power of attorney, in a form acceptable to the IRS, that authorizes Interconnection Customer to participate in all discussions with the IRS regarding such request for a private letter ruling. Transmission Provider shall allow Interconnection Customer to attend all meetings with IRS officials about the request and shall permit Interconnection Customer to prepare the initial drafts of any follow-up letters in connection with the request.

5.17.6 **Subsequent Taxable Events.** If, within 10 years from the date on which the relevant Transmission Provider's Interconnection Facilities are placed in service, (i) Interconnection Customer Breaches the covenants contained in Article 5.17.2, (ii) a "disqualification event" occurs within the meaning of IRS Notice 88-129, or (iii) this LGIA terminates and Transmission Provider retains ownership of the Interconnection Facilities and Network Upgrades, Interconnection Customer shall pay a tax gross-up for the cost consequences of any current tax liability imposed on Transmission Provider, calculated using the methodology described

in Article 5.17.4 and in accordance with IRS Notice 90-60.

5.17.7 **Contests.** In the event any Governmental Authority determines that Transmission Provider's receipt of payments or property constitutes income that is subject to taxation, Transmission Provider shall notify Interconnection Customer, in writing, within thirty (30) Calendar Days of receiving notification of such determination by a Governmental Authority. Upon the timely written request by Interconnection Customer and at Interconnection Customer's sole expense, Transmission Provider may appeal, protest, seek abatement of, or otherwise oppose such determination. Upon Interconnection Customer's written request and sole expense, Transmission Provider may file a claim for refund with respect to any taxes paid under this Article 5.17, whether or not it has received such a determination. Transmission Provider reserves the right to make all decisions with regard to the prosecution of such appeal, protest, abatement or other contest, including the selection of counsel and compromise or settlement of the claim, but Transmission Provider shall keep Interconnection Customer informed, shall consider in good faith suggestions from Interconnection Customer about the conduct of the contest, and shall reasonably permit Interconnection Customer or an Interconnection Customer representative to attend contest proceedings.

Interconnection Customer shall pay to Transmission Provider on a periodic basis, as invoiced by Transmission Provider, Transmission Provider's documented reasonable costs of prosecuting such appeal, protest, abatement or other contest. At any time during the contest, Transmission Provider may agree to a settlement either with Interconnection

Customer's consent or after obtaining written advice from nationally-recognized tax counsel, selected by Transmission Provider, but reasonably acceptable to Interconnection Customer, that the proposed settlement represents a reasonable settlement given the hazards of litigation. Interconnection Customer's obligation shall be based on the amount of the settlement agreed to by Interconnection Customer, or if a higher amount, so much of the settlement that is supported by the written advice from nationally-recognized tax counsel selected under the terms of the preceding sentence. The settlement amount shall be calculated on a fully grossed-up basis to cover any related cost consequences of the current tax liability. Any settlement without Interconnection Customer's consent or such written advice will relieve Interconnection Customer from any obligation to indemnify Transmission Provider for the tax at issue in the contest.

5.17.8 **Refund.** In the event that (a) a private letter ruling is issued to Transmission Provider which holds that any amount paid or the value of any property transferred by Interconnection Customer to Transmission Provider under the terms of this LGIA is not subject to federal income taxation, (b) any legislative change or administrative announcement, notice, ruling or other determination makes it reasonably clear to Transmission Provider in good faith that any amount paid or the value of any property transferred by Interconnection Customer to Transmission Provider under the terms of this LGIA is not taxable to Transmission Provider, (c) any abatement, appeal, protest, or other contest results in a determination that any payments or transfers made by Interconnection Customer to Transmission Provider are not subject to federal income

tax, or (d) if Transmission Provider receives a refund from any taxing authority for any overpayment of tax attributable to any payment or property transfer made by Interconnection Customer to Transmission Provider pursuant to this LGIA, Transmission Provider shall promptly refund to Interconnection Customer the following:

(i) any payment made by Interconnection Customer under this Article 5.17 for taxes that is attributable to the amount determined to be non-taxable, together with interest thereon,

(ii) interest on any amounts paid by Interconnection Customer to Transmission Provider for such taxes which Transmission Provider did not submit to the taxing authority, calculated in accordance with the methodology set forth in FERC's regulations at 18 CFR §35.19a(a)(2)(iii) from the date payment was made by Interconnection Customer to the date Transmission Provider refunds such payment to Interconnection Customer, and

(iii) with respect to any such taxes paid by Transmission Provider, any refund or credit Transmission Provider receives or to which it may be entitled from any Governmental Authority, interest (or that portion thereof attributable to the payment described in clause (i), above) owed to Transmission Provider for such overpayment of taxes (including any reduction in interest otherwise payable by Transmission Provider to any Governmental Authority resulting

from an offset or credit); provided, however, that Transmission Provider will remit such amount promptly to Interconnection Customer only after and to the extent that Transmission Provider has received a tax refund, credit or offset from any Governmental Authority for any applicable overpayment of income tax related to Transmission Provider's Interconnection Facilities.

The intent of this provision is to leave the Parties, to the extent practicable, in the event that no taxes are due with respect to any payment for Interconnection Facilities and Network Upgrades hereunder, in the same position they would have been in had no such tax payments been made.

5.17.9 **Taxes Other Than Income Taxes.** Upon the timely request by Interconnection Customer, and at Interconnection Customer's sole expense, Transmission Provider may appeal, protest, seek abatement of, or otherwise contest any tax (other than federal or state income tax) asserted or assessed against Transmission Provider for which Interconnection Customer may be required to reimburse Transmission Provider under the terms of this LGIA. Interconnection Customer shall pay to Transmission Provider on a periodic basis, as invoiced by Transmission Provider, Transmission Provider's documented reasonable costs of prosecuting such appeal, protest, abatement, or other contest. Interconnection Customer and Transmission Provider shall cooperate in good faith with respect to any such contest. Unless the payment of such taxes is a prerequisite to an appeal or abatement or cannot be deferred, no amount shall be payable by Interconnection Customer to Transmission Provider for such

taxes until they are assessed by a final, non-appealable order by any court or agency of competent jurisdiction. In the event that a tax payment is withheld and ultimately due and payable after appeal, Interconnection Customer will be responsible for all taxes, interest and penalties, other than penalties attributable to any delay caused by Transmission Provider.

5.17.10 Transmission Owners Who Are Not Transmission Providers. If Transmission Provider is not the same entity as the Transmission Owner, then (i) all references in this Article 5.17 to Transmission Provider shall be deemed also to refer to and to include the Transmission Owner, as appropriate, and (ii) this LGIA shall not become effective until such Transmission Owner shall have agreed in writing to assume all of the duties and obligations of Transmission Provider under this Article 5.17 of this LGIA.

5.18 Tax Status. Each Party shall cooperate with the other to maintain the other Party's tax status. Nothing in this LGIA is intended to adversely affect any Transmission Provider's tax exempt status with respect to the issuance of bonds including, but not limited to, Local Furnishing Bonds.

5.19 Modification.

5.19.1 General. Either Party may undertake modifications to its facilities. If a Party plans to undertake a modification that reasonably may be expected to affect the other Party's facilities, that Party shall provide to the other Party sufficient information regarding such modification so that the other Party may evaluate the potential impact of such modification prior to commencement of the work. Such information shall be deemed to be confidential hereunder and shall

include information concerning the timing of such modifications and whether such modifications are expected to interrupt the flow of electricity from the Large Generating Facility. The Party desiring to perform such work shall provide the relevant drawings, plans, and specifications to the other Party at least ninety (90) Calendar Days in advance of the commencement of the work or such shorter period upon which the Parties may agree, which agreement shall not unreasonably be withheld, conditioned or delayed.

In the case of Large Generating Facility modifications that do not require Interconnection Customer to submit an Interconnection Request, Transmission Provider shall provide, within thirty (30) Calendar Days (or such other time as the Parties may agree), an estimate of any additional modifications to the Transmission System, Transmission Provider's Interconnection Facilities or Network Upgrades necessitated by such Interconnection Customer modification and a good faith estimate of the costs thereof.

5.19.2 **Standards.** Any additions, modifications, or replacements made to a Party's facilities shall be designed, constructed and operated in accordance with this LGIA and Good Utility Practice.

5.19.3 **Modification Costs.** Interconnection Customer shall not be directly assigned for the costs of any additions, modifications, or replacements that Transmission Provider makes to Transmission Provider's Interconnection Facilities or the Transmission System to facilitate the interconnection of a third party to Transmission Provider's Interconnection Facilities or the Transmission System, or to provide

transmission service to a third party under Transmission Provider's Tariff. Interconnection Customer shall be responsible for the costs of any additions, modifications, or replacements to Interconnection Customer's Interconnection Facilities that may be necessary to maintain or upgrade such Interconnection Customer's Interconnection Facilities consistent with Applicable Laws and Regulations, Applicable Reliability Standards or Good Utility Practice.

Article 6. Testing and Inspection

6.1 Pre-Commercial Operation Date Testing and Modifications. Prior to the Commercial Operation Date, Transmission Provider shall test Transmission Provider's Interconnection Facilities and Network Upgrades and Interconnection Customer shall test the Large Generating Facility and Interconnection Customer's Interconnection Facilities to ensure their safe and reliable operation. Similar testing may be required after initial operation. Each Party shall make any modifications to its facilities that are found to be necessary as a result of such testing. Interconnection Customer shall bear the cost of all such testing and modifications. Interconnection Customer shall generate test energy at the Large Generating Facility only if it has arranged for the delivery of such test energy.

6.2 Post-Commercial Operation Date Testing and Modifications. Each Party shall at its own expense perform routine inspection and testing of its facilities and equipment in accordance with Good Utility Practice as may be necessary to ensure the continued interconnection of the Large Generating Facility with the Transmission System in a safe and reliable manner. Each Party shall have the right, upon advance written notice, to require reasonable additional testing of the other Party's facilities, at the requesting Party's expense, as may be in accordance with Good Utility Practice.

6.3 Right to Observe Testing. Each Party shall notify the other Party in advance of its performance of tests of its Interconnection Facilities. The other Party has the right, at its own expense, to observe such testing.

6.4 Right to Inspect. Each Party shall have the right, but shall have no obligation to: (i) observe the other Party's tests and/or inspection of any of its System Protection Facilities and other protective equipment, including Power System Stabilizers; (ii) review the settings of the other Party's System Protection Facilities and other protective equipment; and (iii) review the other Party's maintenance records relative to the Interconnection Facilities, the System Protection Facilities and other protective equipment. A Party may exercise these rights from time to time as it deems necessary upon reasonable notice to the other Party. The exercise or non-exercise by a Party of any such rights shall not be construed as an endorsement or confirmation of any element or condition of the Interconnection Facilities or the System Protection Facilities or other protective equipment or the operation thereof, or as a warranty as to the fitness, safety, desirability, or reliability of same. Any information that a Party obtains through the exercise of any of its rights under this Article 6.4 shall be deemed to be Confidential Information and treated pursuant to Article 22 of this LGIA.

Article 7. Metering

7.1 General. Each Party shall comply with the Applicable Reliability Council requirements. Unless otherwise agreed by the Parties, Transmission Provider shall install Metering Equipment at the Point of Interconnection prior to any operation of the Large Generating Facility and shall own, operate, test and maintain such Metering Equipment. Power flows to and from the Large Generating Facility shall be measured at or, at Transmission Provider's option, compensated to, the Point of Interconnection. Transmission Provider shall provide metering quantities, in analog and/or digital form, to Interconnection Customer upon request. Interconnection Customer shall bear all

reasonable documented costs associated with the purchase, installation, operation, testing and maintenance of the Metering Equipment.

7.2 **Check Meters.** Interconnection Customer, at its option and expense, may install and operate, on its premises and on its side of the Point of Interconnection, one or more check meters to check Transmission Provider's meters. Such check meters shall be for check purposes only and shall not be used for the measurement of power flows for purposes of this LGIA, except as provided in Article 7.4 below. The check meters shall be subject at all reasonable times to inspection and examination by Transmission Provider or its designee. The installation, operation and maintenance thereof shall be performed entirely by Interconnection Customer in accordance with Good Utility Practice.

7.3 **Standards.** Transmission Provider shall install, calibrate, and test revenue quality Metering Equipment in accordance with applicable ANSI standards.

7.4 **Testing of Metering Equipment.** Transmission Provider shall inspect and test all Transmission Provider-owned Metering Equipment upon installation and at least once every two (2) years thereafter. If requested to do so by Interconnection Customer, Transmission Provider shall, at Interconnection Customer's expense, inspect or test Metering Equipment more frequently than every two (2) years. Transmission Provider shall give reasonable notice of the time when any inspection or test shall take place, and Interconnection Customer may have representatives present at the test or inspection. If at any time Metering Equipment is found to be inaccurate or defective, it shall be adjusted, repaired or replaced at Interconnection Customer's expense, in order to provide accurate metering, unless the inaccuracy or defect is due to Transmission Provider's failure to maintain, then Transmission Provider shall pay. If Metering Equipment fails to register, or if the measurement made by Metering Equipment during a test varies by more than two percent from the measurement made by the standard meter used in the test, Transmission

Provider shall adjust the measurements by correcting all measurements for the period during which Metering Equipment was in error by using Interconnection Customer's check meters, if installed. If no such check meters are installed or if the period cannot be reasonably ascertained, the adjustment shall be for the period immediately preceding the test of the Metering Equipment equal to one-half the time from the date of the last previous test of the Metering Equipment.

7.5 Metering Data. At Interconnection Customer's expense, the metered data shall be telemetered to one or more locations designated by Transmission Provider and one or more locations designated by Interconnection Customer. Such telemetered data shall be used, under normal operating conditions, as the official measurement of the amount of energy delivered from the Large Generating Facility to the Point of Interconnection.

Article 8. Communications

8.1 Interconnection Customer Obligations. Interconnection Customer shall maintain satisfactory operating communications with Transmission Provider's Transmission System dispatcher or representative designated by Transmission Provider. Interconnection Customer shall provide standard voice line, dedicated voice line and facsimile communications at its Large Generating Facility control room or central dispatch facility through use of either the public telephone system, or a voice communications system that does not rely on the public telephone system. Interconnection Customer shall also provide the dedicated data circuit(s) necessary to provide Interconnection Customer data to Transmission Provider as set forth in Appendix D, Security Arrangements Details. The data circuit(s) shall extend from the Large Generating Facility to the location(s) specified by Transmission Provider. Any required maintenance of such communications equipment shall be performed by Interconnection Customer. Operational communications shall be activated and maintained under, but not be limited to, the following events: system paralleling or separation,

scheduled and unscheduled shutdowns, equipment clearances, and hourly and daily load data.

8.2 **Remote Terminal Unit.** Prior to the Initial Synchronization Date of the Large Generating Facility, a Remote Terminal Unit, or equivalent data collection and transfer equipment acceptable to the Parties, shall be installed by Interconnection Customer, or by Transmission Provider at Interconnection Customer's expense, to gather accumulated and instantaneous data to be telemetered to the location(s) designated by Transmission Provider through use of a dedicated point-to-point data circuit(s) as indicated in Article 8.1. The communication protocol for the data circuit(s) shall be specified by Transmission Provider. Instantaneous bi-directional analog real power and reactive power flow information must be telemetered directly to the location(s) specified by Transmission Provider.

Each Party will promptly advise the other Party if it detects or otherwise learns of any metering, telemetry or communications equipment errors or malfunctions that require the attention and/or correction by the other Party. The Party owning such equipment shall correct such error or malfunction as soon as reasonably feasible.

8.3 **No Annexation.** Any and all equipment placed on the premises of a Party shall be and remain the property of the Party providing such equipment regardless of the mode and manner of annexation or attachment to real property, unless otherwise mutually agreed by the Parties.

8.4 **Provision of Data from a Variable Energy Resource.** The Interconnection Customer whose Generating Facility is a Variable Energy Resource shall provide meteorological and forced outage data to the Transmission Provider to the extent necessary for the Transmission Provider’s development and deployment of power production forecasts for that class of Variable Energy Resources. The Interconnection Customer with a Variable Energy Resource having wind as the energy source, at a minimum, will be required to provide the Transmission Provider with site-specific meteorological data including: temperature, wind

speed, wind direction, and atmospheric pressure. The Interconnection Customer with a Variable Energy Resource having solar as the energy source, at a minimum, will be required to provide the Transmission Provider with site-specific meteorological data including: temperature, atmospheric pressure, and irradiance. The Transmission Provider and Interconnection Customer whose Generating Facility is a Variable Energy Resource shall mutually agree to any additional meteorological data that are required for the development and deployment of a power production forecast. The Interconnection Customer whose Generating Facility is a Variable Energy Resource also shall submit data to the Transmission Provider regarding all forced outages to the extent necessary for the Transmission Provider's development and deployment of power production forecasts for that class of Variable Energy Resources. The exact specifications of the meteorological and forced outage data to be provided by the Interconnection Customer to the Transmission Provider, including the frequency and timing of data submittals, shall be made taking into account the size and configuration of the Variable Energy Resource, its characteristics, location, and its importance in maintaining generation resource adequacy and transmission system reliability in its area. All requirements for meteorological and forced outage data must be commensurate with the power production forecasting employed by the Transmission Provider. Such requirements for meteorological and forced outage data are set forth in Appendix C, Interconnection Details, of this LGIA, as they may change from time to time.

Article 9. Operations

9.1 **General.** Each Party shall comply with the Applicable Reliability Council requirements. Each Party shall provide to the other Party all information that may reasonably be required by the other Party to comply with Applicable Laws and Regulations and Applicable Reliability Standards.

9.2 **Control Area Notification**. At least three months before Initial Synchronization Date, Interconnection Customer shall notify Transmission Provider in

writing of the Control Area in which the Large Generating Facility will be located. If Interconnection Customer elects to locate the Large Generating Facility in a Control Area other than the Control Area in which the Large Generating Facility is physically located, and if permitted to do so by the relevant transmission tariffs, all necessary arrangements, including but not limited to those set forth in Article 7 and Article 8 of this LGIA, and remote Control Area generator interchange agreements, if applicable, and the appropriate measures under such agreements, shall be executed and implemented prior to the placement of the Large Generating Facility in the other Control Area.

9.3 Transmission Provider Obligations. Transmission Provider shall cause the Transmission System and Transmission Provider's Interconnection Facilities to be operated, maintained and controlled in a safe and reliable manner and in accordance with this LGIA. Transmission Provider may provide operating instructions to Interconnection Customer consistent with this LGIA and Transmission Provider's operating protocols and procedures as they may change from time to time. Transmission Provider will consider changes to its operating protocols and procedures proposed by Interconnection Customer.

9.4 Interconnection Customer Obligations. Interconnection Customer shall at its own expense operate, maintain and control the Large Generating Facility and Interconnection Customer's Interconnection Facilities in a safe and reliable manner and in accordance with this LGIA. Interconnection Customer shall operate the Large Generating Facility and Interconnection Customer's Interconnection Facilities in accordance with all applicable requirements of the Control Area of which it is part, as such requirements are set forth in Appendix C, Interconnection Details, of this LGIA. Appendix C, Interconnection Details, will be modified to reflect changes to the requirements as they may change from time to time. Either Party may request that the other Party provide copies of the requirements set forth in Appendix C, Interconnection Details, of this LGIA.

9.5 Start-Up and Synchronization. Consistent with the Parties' mutually acceptable procedures, Interconnection Customer is responsible for the proper synchronization of the Large Generating Facility to Transmission Provider's Transmission System.

9.6 Reactive Power and Primary Frequency Response.

9.6.1 Power Factor Design Criteria. Interconnection Customer shall design the Large Generating Facility to maintain a composite power delivery at continuous rated power output at the Point of Interconnection at a power factor within the range of 0.95 leading to 0.95 lagging, unless Transmission Provider has established different requirements that apply to all generators in the Control Area on a comparable basis. The requirements of this paragraph shall not apply to wind generators.

9.6.1.1 Synchronous Generation. Interconnection Customer shall design the Large Generating Facility to maintain a composite power deliver at continuous rated power output at the Point of Interconnection at a power factor within the range of 0.95 leading to 0.95 lagging, unless the Transmission Provider has established different requirements that apply to all synchronous generators in the Control Area on a comparable basis.

9.6.1.2 Non-Synchronous Generation. Interconnection Customer shall design the Large Generating Facility to maintain composite power delivery at continuous rated power output at the high-side of the generator substation at a power factor within the range of 0.95 leading to 0.95 lagging, unless the Transmission Provider has established a different power factor range that applies to all non-synchronous generators in the Control Area on a comparable basis. This power factor range standard shall be dynamic and can be met using, for example, power electronics designed to supply this level of reactive capability (taking into account any limitations due to voltage level, real power output, etc.) or fixed and switched capacitors, or a combination of the two. This requirement shall only apply to newly interconnecting non-synchronous generators that have not yet executed a Facilities Study Agreement as of the effective date of the Final Rule establishing this requirement (Order No. 827).

9.6.2 **Voltage Schedules.** Once Interconnection Customer has synchronized the Large Generating Facility with the Transmission System, Transmission Provider shall require Interconnection Customer to operate the Large Generating Facility to produce or absorb reactive power within the design limitations of the Large Generating Facility set forth in Article 9.6.1 (Power Factor Design Criteria). Transmission Provider's voltage schedules shall treat all sources of reactive power in the Control Area in an equitable and not unduly discriminatory manner. Transmission Provider shall exercise Reasonable Efforts to provide Interconnection Customer with such schedules at least one (1) day in advance,

and may make changes to such schedules as necessary to maintain the reliability of the Transmission System. Interconnection Customer shall operate the Large Generating Facility to maintain the specified output voltage or power factor at the Point of Interconnection within the design limitations of the Large Generating Facility set forth in Article 9.6.1 (Power Factor Design Criteria). If Interconnection Customer is unable to maintain the specified voltage or power factor, it shall promptly notify the System Operator.

9.6.2.1 Voltage Regulators. Whenever the Large Generating Facility is operated in parallel with the Transmission System and voltage regulators are capable of operation, Interconnection Customer shall operate the Large Generating Facility with its voltage regulators in automatic operation. If the Large Generating Facility's voltage regulators are not capable of such automatic operation, Interconnection Customer shall immediately notify Transmission Provider's system operator, or its designated representative, and ensure that such Large Generating Facility's reactive power production or absorption (measured in MVARs) are within the design capability of the Large Generating Facility's generating unit(s) and steady state stability limits. Interconnection Customer shall not cause its Large Generating Facility to disconnect automatically or instantaneously from the Transmission System or trip any generating unit comprising the Large Generating

Facility for an under or over frequency condition unless the abnormal frequency condition persists for a time period beyond the limits set forth in ANSI/IEEE Standard C37.106, or such other standard as applied to other generators in the Control Area on a comparable basis.

9.6.3 **Payment for Reactive Power.** Transmission Provider is required to pay Interconnection Customer for reactive power that Interconnection Customer provides or absorbs from the Large Generating Facility when Transmission Provider requests Interconnection Customer to operate its Large Generating Facility outside the range specified in Article 9.6.1, provided that if Transmission Provider pays its own or affiliated generators for reactive power service within the specified range, it must also pay Interconnection Customer. Payments shall be pursuant to Article 11.6 or such other agreement to which the Parties have otherwise agreed.

9.6.4 Primary Frequency Response. Interconnection Customer shall ensure the primary frequency response capability of its Large Generating Facility by installing, maintaining, and operating a functioning governor or equivalent controls. The term “functioning governor or equivalent controls” as used herein shall mean the required hardware and/or software that provides frequency responsive real power control with the ability to sense changes in system frequency and autonomously adjust the Large Generating Facility’s real power output in accordance with the droop and deadband parameters and in the direction needed to correct frequency deviations. Interconnection Customer is required to install a governor or equivalent controls with the capability of operating: (1) with a maximum 5 percent droop and ±0.036 Hz deadband; or (2) in accordance with the relevant droop, deadband, and timely and sustained response settings from an approved NERC Reliability Standard providing for equivalent or more stringent parameters. The droop characteristic shall be: (1) based on the nameplate capacity of the Large Generating Facility, and shall be linear in the range of frequencies between 59 to 61 Hz that are outside of the deadband parameter; or (2) based an approved NERC Reliability Standard providing for an equivalent or more stringent parameter. The deadband parameter shall be: the range of frequencies above and below nominal (60 Hz) in which the governor or equivalent controls is not expected to adjust the Large Generating Facility's real power output in response to frequency deviations. The deadband shall be implemented: (1) without a step to the droop curve, that is, once the frequency deviation exceeds the deadband parameter, the expected change in the Large Generating Facility's real power output in response to frequency deviations shall start from zero and then increase (for under-frequency deviations) or decrease (for over-frequency deviations) linearly in proportion to the magnitude of the frequency deviation; or (2) in accordance with an approved NERC Reliability Standard providing for an equivalent or more stringent parameter. Interconnection Customer shall notify Transmission Provider that the primary frequency response capability of the Large Generating Facility has been tested and confirmed during commissioning. Once Interconnection Customer has synchronized the Large Generating Facility with the Transmission System, Interconnection Customer shall operate the Large Generating Facility consistent with the provisions specified in Sections 9.6.4.1 and 9.6.4.2 of this Agreement. The primary frequency response requirements contained herein shall apply to both synchronous and non-synchronous Large Generating Facilities.

9.6.4.1 Governor or Equivalent Controls. Whenever the Large Generating Facility is operated in parallel with the Transmission System, Interconnection Customer shall operate the Large Generating Facility with its governor or equivalent controls in service and responsive to frequency. Interconnection Customer shall: (1) in coordination with Transmission Provider and/or the relevant balancing authority, set the deadband parameter to: (1) a maximum of ±0.036 Hz and set the droop parameter to a maximum of 5 percent; or (2) implement the relevant droop and deadband settings from an approved NERC Reliability Standard that provides for equivalent or more stringent parameters. Interconnection Customer shall be required to provide the status and settings of the governor or equivalent controls to Transmission Provider and/or the relevant balancing authority upon request. If Interconnection Customer needs to operate the Large Generating Facility with its governor or equivalent controls not in service, Interconnection Customer shall immediately notify Transmission Provider and the relevant balancing authority, and provide both with the following information: (1) the operating status of the governor or equivalent controls (i.e., whether it is currently out of service or when it will be taken out of service); (2) the reasons for removing the governor or equivalent controls from service; and (3) a reasonable estimate of when the governor or equivalent controls will be returned to service. Interconnection Customer shall make Reasonable Efforts to return its governor or equivalent controls into service as soon as practicable. Interconnection Customer shall make Reasonable Efforts to keep outages of the Large Generating Facility's governor or equivalent controls to a minimum whenever the Large Generating Facility is operated in parallel with the Transmission System.

9.6.4.2 **Timely and Sustained Response.** Interconnection Customer shall ensure that the Large Generating Facility's real power response to sustained frequency deviations outside of the deadband setting is automatically provided and shall begin immediately after frequency deviates outside of the deadband, and to the extent the Large Generating Facility has operating capability in the direction needed to correct the frequency deviation. Interconnection Customer shall not block or otherwise inhibit the ability of the governor or equivalent controls to respond and shall ensure that the response is not inhibited, except under certain operational constraints including, but not limited to, ambient temperature limitations, physical energy limitations, outages of mechanical equipment, or regulatory requirements. The Large Generating Facility shall sustain the real power response at least until system frequency returns to a value within the deadband setting of the governor or equivalent controls. A Commission-approved Reliability Standard with equivalent or more stringent requirements shall supersede the above requirements.

9.6.4.3 **Exemptions.** Large Generating Facilities that are regulated by the United States Nuclear Regulatory Commission shall be exempt from Sections 9.6.4, 9.6.4.1, and 9.6.4.2 of this Agreement. Large Generating Facilities that are behind the meter generation that is sized-to-load (i.e., the thermal load and the generation are near-balanced in real-time operation and the generation is primarily controlled to maintain the unique thermal, chemical, or mechanical output necessary for the operating requirements of its host facility) shall be required to install primary frequency response capability in accordance with the droop and deadband capability requirements specified in Section 9.6.4, but shall be otherwise exempt from the operating requirements in Sections 9.6.4, 9.6.4.1, 9.6.4.2, and 9.6.4.4 of this Agreement.

9.6.4.4 **Electric Storage Resources.** Interconnection Customer interconnecting an electric storage resource shall establish an operating range in Appendix C of its LGIA that specifies a minimum state of charge and a maximum state of charge between which the electric storage resource will be required to provide primary frequency response consistent with the conditions set forth in Sections 9.6.4, 9.6.4.1, 9.6.4.2, and 9.6.4.3 of this Agreement. Appendix C shall specify whether the operating range is static or dynamic, and shall consider (1) the expected magnitude of frequency deviations in the interconnection; (2) the expected duration that system frequency will remain outside of the deadband parameter in the interconnection; (3) the expected incidence of frequency deviations outside of the deadband parameter in the interconnection; (4) the physical capabilities of the electric storage resource; (5) operational limitations of the electric storage resource due to manufacturer specifications; and (6) any other relevant factors agreed to by Transmission Provider and Interconnection Customer, and in consultation with the relevant transmission owner or balancing authority as appropriate. If the operating range is dynamic, then Appendix C must establish how frequently the operating range will be reevaluated and the factors that may be considered during its reevaluation.

Interconnection Customer’s electric storage resource is required to provide timely and sustained primary frequency response consistent with Section 9.6.4.2 of this Agreement when it is online and dispatched to inject electricity to the Transmission System and/or receive electricity from the Transmission System. This excludes circumstances when the electric storage resource is not dispatched to inject electricity to the Transmission System and/or dispatched to receive electricity from the Transmission System. If Interconnection Customer's electric storage resource is charging at the time of a frequency deviation outside of its deadband parameter, it is to increase (for over-frequency deviations) or decrease (for under-frequency deviations) the rate at which it is charging in accordance with its droop parameter. Interconnection Customer's electric storage resource is not required to change from charging to discharging, or vice versa, unless the response necessitated by the droop and deadband settings requires it to do so and it is technically capable of making such a transition.

9.7 Outages and Interruptions.

9.7.1 Outages.

9.7.1.1 Outage Authority and Coordination. Each Party may in accordance with Good Utility Practice in coordination with the other Party remove from service any of its respective Interconnection Facilities or Network Upgrades that may impact the other Party's facilities as necessary to perform maintenance or testing or to install or replace equipment. Absent an Emergency Condition, the Party scheduling a removal of such facility(ies) from service will use Reasonable Efforts to schedule such removal on a date and time mutually acceptable to the Parties. In all circumstances, any Party planning to remove such facility(ies) from service shall use Reasonable Efforts to minimize the effect on the other Party of such removal.

9.7.1.2 Outage Schedules. Transmission Provider shall post scheduled outages of its transmission facilities on the OASIS. Interconnection Customer shall submit its planned maintenance schedules for the Large Generating Facility to Transmission Provider for a minimum of a rolling twenty-four month period. Interconnection Customer shall update its planned maintenance schedules as necessary. Transmission Provider may request Interconnection Customer to reschedule its maintenance as necessary to maintain the reliability of the Transmission System; provided, however, adequacy of generation supply shall not be a criterion in determining Transmission System reliability. Transmission Provider shall compensate Interconnection Customer for any additional direct costs that Interconnection Customer incurs as a result of having to reschedule maintenance, including any additional overtime, breaking of maintenance contracts or other costs above and beyond the cost Interconnection Customer would have incurred absent Transmission Provider's request to reschedule maintenance. Interconnection Customer will not be eligible to receive compensation, if during the twelve (12) months prior to the date of the scheduled maintenance, Interconnection Customer had modified its schedule of maintenance activities.

9.7.1.3 **Outage Restoration.** If an outage on a Party's Interconnection Facilities or Network Upgrades adversely affects the other Party's operations or facilities, the Party that owns or controls the facility that is out of service shall use Reasonable Efforts to promptly restore such facility(ies) to a normal operating condition consistent with the nature of the outage. The Party that owns or controls the facility that is out of service shall provide the other Party, to the extent such information is known, information on the nature of the Emergency Condition, an estimated time of restoration, and any corrective actions required. Initial verbal notice shall be followed up as soon as practicable with written notice explaining the nature of the outage.

9.7.2 **Interruption of Service.** If required by Good Utility Practice to do so, Transmission Provider may require Interconnection Customer to interrupt or reduce deliveries of electricity if such delivery of electricity could adversely affect Transmission Provider's ability to perform such activities as are necessary to safely and reliably operate and maintain the Transmission System. The following provisions shall apply to any interruption or reduction permitted under this Article 9.7.2:

9.7.2.1 The interruption or reduction shall continue only for so long as reasonably necessary under Good Utility Practice;

9.7.2.2 Any such interruption or reduction shall be made on an equitable, non-discriminatory basis with respect to all generating facilities directly connected to the Transmission System;

9.7.2.3 When the interruption or reduction must be made under circumstances which do not allow for advance notice, Transmission Provider shall notify Interconnection Customer by telephone as soon as practicable of the reasons for the curtailment, interruption, or reduction, and, if known, its expected duration. Telephone notification shall be followed by written notification as soon as practicable;

9.7.2.4 Except during the existence of an Emergency Condition, when the interruption or reduction can be scheduled without advance notice, Transmission Provider shall notify Interconnection Customer in advance regarding the timing of such scheduling and further notify Interconnection Customer of the expected duration. Transmission Provider shall coordinate with Interconnection Customer using Good Utility Practice to schedule the interruption or reduction during periods of least impact to Interconnection Customer and Transmission Provider;

9.7.2.5 The Parties shall cooperate and coordinate with each other to the extent necessary in order to restore the Large Generating Facility, Interconnection Facilities, and the Transmission System to their normal operating state, consistent with system conditions and Good Utility Practice.

9.7.3 **Under-Frequency and Over Frequency Conditions.** The Transmission System is designed to automatically activate a load-shed program as required by the Applicable Reliability Council in the event of an under-frequency system disturbance. Interconnection Customer shall implement under-frequency and over-frequency relay set points for the Large Generating Facility as required by the Applicable Reliability Council to ensure "ride through" capability of the Transmission System. Large Generating Facility response to frequency deviations of pre-determined magnitudes, both under-frequency and over-frequency deviations, shall be studied and coordinated with Transmission Provider in accordance with Good Utility Practice. The term "ride through" as used herein shall mean the ability of a Generating Facility to stay connected to and synchronized with the Transmission System during system disturbances within a range of under-frequency and over-frequency conditions, in accordance with Good Utility Practice.

9.7.4 **System Protection and Other Control Requirements.**

9.7.4.1 **System Protection Facilities.** Interconnection Customer shall, at its expense, install, operate and maintain System Protection Facilities as a part of the Large Generating Facility or

Interconnection Customer's Interconnection Facilities. Transmission Provider shall install at Interconnection Customer's expense any System Protection Facilities that may be required on Transmission Provider's Interconnection Facilities or the Transmission System as a result of the interconnection of the Large Generating Facility and Interconnection Customer's Interconnection Facilities.

9.7.4.2 Each Party's protection facilities shall be designed and coordinated with other systems in accordance with Good Utility Practice.

9.7.4.3 Each Party shall be responsible for protection of its facilities consistent with Good Utility Practice.

9.7.4.4 Each Party's protective relay design shall incorporate the necessary test switches to perform the tests required in Article 6. The required test switches will be placed such that they allow operation of lockout relays while preventing breaker failure schemes from operating and causing unnecessary breaker operations and/or the tripping of Interconnection Customer's units.

9.7.4.5 Each Party will test, operate and maintain System Protection Facilities in accordance with Good Utility Practice.

9.7.4.6 Prior to the In-Service Date, and again prior to the Commercial Operation Date, each Party or its agent shall perform a complete calibration test and functional trip test of the System Protection Facilities. At intervals suggested by Good Utility Practice and following any apparent malfunction of the System Protection Facilities, each Party shall perform both calibration and functional trip tests of its System Protection Facilities. These tests do not require the tripping of any in-service generation unit. These tests do, however, require that all protective relays and lockout contacts be activated.

9.7.5 Requirements for Protection. In compliance with Good Utility Practice, Interconnection Customer shall provide, install, own, and maintain relays, circuit breakers and all other devices necessary to remove any fault contribution of the Large Generating Facility to any short circuit occurring on the Transmission System not otherwise isolated by Transmission Provider's equipment, such that the removal of the fault contribution shall be coordinated with the protective requirements of the Transmission System. Such protective equipment shall include, without limitation, a disconnecting device or switch with load-interrupting capability located between the Large Generating Facility and the Transmission System at a site selected upon mutual agreement (not to be unreasonably withheld, conditioned or delayed) of the Parties. Interconnection Customer shall be responsible for protection of the Large Generating Facility and Interconnection Customer's other equipment from such conditions as negative sequence currents, over- or under-frequency, sudden load rejection, over- or under-voltage, and generator loss-of-field. Interconnection Customer shall be solely responsible to disconnect the Large Generating Facility and Interconnection Customer's other equipment if conditions on the Transmission System could adversely affect the Large Generating Facility.

9.7.6 Power Quality. Neither Party's facilities shall cause excessive voltage flicker nor introduce excessive distortion to the sinusoidal voltage or current waves as defined by ANSI Standard C84.1-1989, in accordance with IEEE Standard 519, or any applicable superseding electric industry standard. In the event of a conflict between ANSI Standard C84.1-1989, or any applicable superseding electric industry standard, ANSI Standard C84.1-1989, or the applicable superseding electric industry standard, shall control.

9.8 **Switching and Tagging Rules.** Each Party shall provide the other Party a copy of its switching and tagging rules that are applicable to the other Party's activities. Such switching and tagging rules shall be developed on a non-discriminatory basis. The Parties shall comply with applicable switching and tagging rules, as amended from time to time, in obtaining clearances for work or for switching operations on equipment.

9.9 **Use of Interconnection Facilities by Third Parties.**

9.9.1 **Purpose of Interconnection Facilities.** Except as may be required by Applicable Laws and Regulations, or as otherwise agreed to among the Parties, the Interconnection Facilities shall be constructed for the sole purpose of interconnecting the Large Generating Facility to the Transmission System and shall be used for no other purpose.

9.9.2 **Third Party Users.** If required by Applicable Laws and Regulations or if the Parties mutually agree, such agreement not to be unreasonably withheld, to allow one or more third parties to use Transmission Provider's Interconnection Facilities, or any part thereof, Interconnection Customer will be entitled to compensation for the capital expenses it incurred in connection with the Interconnection Facilities based upon the pro rata use of the Interconnection Facilities by Transmission Provider, all third party users, and Interconnection Customer, in accordance with Applicable Laws and Regulations or upon some other mutually-agreed upon methodology. In addition, cost responsibility for ongoing costs, including operation and maintenance costs associated with the Interconnection Facilities, will be allocated between Interconnection Customer and any third party users based upon the pro rata use of the Interconnection Facilities by Transmission Provider, all third party users, and Interconnection Customer, in accordance with Applicable Laws and Regulations or upon some other mutually agreed upon methodology. If the issue of such compensation or allocation cannot be resolved through such negotiations, it shall be submitted to FERC for resolution.

9.10 Disturbance Analysis Data Exchange. The Parties will cooperate with one another in the analysis of disturbances to either the Large Generating Facility or Transmission Provider's Transmission System by gathering and providing access to any information relating to any disturbance, including information from oscillography, protective relay targets, breaker operations and sequence of events records, and any disturbance information required by Good Utility Practice.

Article 10. Maintenance

10.1 Transmission Provider Obligations. Transmission Provider shall maintain the Transmission System and Transmission Provider's Interconnection Facilities in a safe and reliable manner and in accordance with this LGIA.

10.2 Interconnection Customer Obligations. Interconnection Customer shall maintain the Large Generating Facility and Interconnection Customer's Interconnection Facilities in a safe and reliable manner and in accordance with this LGIA.

10.3 Coordination. The Parties shall confer regularly to coordinate the planning, scheduling and performance of preventive and corrective maintenance on the Large Generating Facility and the Interconnection Facilities.

10.4 **Secondary Systems.** Each Party shall cooperate with the other in the inspection, maintenance, and testing of control or power circuits that operate below 600 volts, AC or DC, including, but not limited to, any hardware, control or protective devices, cables, conductors, electric raceways, secondary equipment panels, transducers, batteries, chargers, and voltage and current transformers that directly affect the operation of a Party's facilities and equipment which may reasonably be expected to impact the other Party. Each Party shall provide advance notice to the other Party before undertaking any work on such circuits, especially on electrical circuits involving circuit breaker trip and close contacts, current transformers, or potential transformers.

10.5 **Operating and Maintenance Expenses.** Subject to the provisions herein addressing the use of facilities by others, and except for operations and maintenance expenses associated with modifications made for providing interconnection or transmission service to a third party and such third party pays for such expenses, Interconnection Customer shall be responsible for all reasonable expenses including overheads, associated with: (1) owning, operating, maintaining, repairing, and replacing Interconnection Customer's Interconnection Facilities; and (2) operation, maintenance, repair and replacement of Transmission Provider's Interconnection Facilities.

Article 11. Performance Obligation

11.1 **Interconnection Customer Interconnection Facilities.** Interconnection Customer shall design, procure, construct, install, own and/or control Interconnection Customer Interconnection Facilities described in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades, at its sole expense.

11.2 **Transmission Provider's Interconnection Facilities.** Transmission Provider or Transmission Owner shall design, procure, construct, install, own and/or control the Transmission Provider's Interconnection Facilities described in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades, at the sole expense of the Interconnection Customer.

11.3 Network Upgrades and Distribution Upgrades. Transmission Provider or Transmission Owner shall design, procure, construct, install, and own the Network Upgrades and Distribution Upgrades described in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades. The Interconnection Customer shall be responsible for all costs related to Distribution Upgrades. Unless Transmission Provider or Transmission Owner elects to fund the capital for the Network Upgrades, they shall be solely funded by Interconnection Customer. In the event that Transmission Provider must change the voltage levels of a discrete portion of the Transmission System to which the Interconnection Customer is connected, Transmission Provider shall give reasonable notice of such change and the Interconnection Customer shall be solely responsible for all costs related to upgrades or modifications to Interconnection Customer’s Interconnection Facilities resulting from Transmission Provider’s increase in the voltage levels of the Transmission System, in order to remain interconnected with the Transmission System at the new operating voltage. To the extent that the modifications necessary to upgrade Interconnection Facilities qualify as Network Upgrades, Transmission Provider shall be solely responsible for the expense of such modifications or upgrades.

11.4 Transmission Credits.

11.4.1 Repayment of Amounts Advanced for Network Upgrades. Interconnection Customer shall be entitled to a cash repayment, equal to the total amount paid to Transmission Provider and Affected System Operator, if any, for the Network Upgrades, including any tax gross-up or other tax-related payments associated with Network Upgrades, and not refunded to Interconnection

Customer pursuant to Article 5.17.8 or otherwise, to be paid to Interconnection Customer on a dollar-for-dollar basis for the non-usage sensitive portion of transmission charges, as payments are made under Transmission Provider's Tariff and Affected System's Tariff for transmission services with respect to the Large Generating Facility. Any repayment shall include interest calculated in accordance with the methodology set forth in FERC=s regulations at 18 C.F.R. § 35.19a(a)(2)(iii) from the date of any payment for Network Upgrades through the date on which the Interconnection Customer receives a repayment of such payment pursuant to this subparagraph. Interconnection Customer may assign such repayment rights to any person.

Notwithstanding the foregoing, Interconnection Customer, Transmission Provider, and Affected System Operator may adopt any alternative payment schedule that is mutually agreeable so long as Transmission Provider and Affected System Operator take one of the following actions no later than five years from the Commercial Operation Date: (1) return to Interconnection Customer any amounts advanced for Network Upgrades not previously repaid, or (2) declare in writing that Transmission Provider or Affected System Operator will continue to provide payments to Interconnection Customer on a dollar-for-dollar basis for the non-usage sensitive portion of transmission charges, or develop an alternative schedule that is mutually agreeable and provides for the return of all amounts advanced for Network Upgrades not previously repaid; however, full reimbursement shall not extend beyond twenty (20) years from the Commercial Operation Date.

If the Large Generating Facility fails to achieve commercial operation, but it or another Generating Facility is later constructed and makes use of the Network Upgrades, Transmission Provider and Affected System Operator shall at that time reimburse Interconnection Customer for the amounts advanced for the Network Upgrades. Before any such reimbursement can occur, the Interconnection Customer, or the entity that ultimately constructs the Generating Facility, if different, is responsible for identifying the entity to which reimbursement must be made.

11.4.2 **Special Provisions for Affected Systems.** Unless Transmission Provider provides, under the LGIA, for the repayment of amounts advanced to Affected System Operator for Network Upgrades, Interconnection Customer and Affected System Operator shall enter into an agreement that provides for such repayment. The agreement shall specify the terms governing payments to be made by Interconnection Customer to the Affected System Operator as well as the repayment by the Affected System Operator.

11.4.3 Notwithstanding any other provision of this LGIA, nothing herein shall be construed as relinquishing or foreclosing any rights, including but not limited to firm transmission rights, capacity rights, transmission congestion rights, or transmission credits, that Interconnection Customer, shall be entitled to, now or in the future under any other agreement or tariff as a result of, or otherwise associated with, the transmission capacity, if any, created by the Network Upgrades, including the right to obtain cash reimbursements or transmission credits for transmission service that is not associated with the Large Generating Facility.

11.5 Provision of Security. At least thirty (30) Calendar Days prior to the commencement of the first of the following to occur: design, procurement, installation, or construction of a discrete portion of a Transmission Provider's Interconnection Facilities, Network Upgrades, or Distribution Upgrades, Interconnection Customer shall provide Transmission Provider, at Interconnection Customer's option, a guarantee, a surety bond, letter of credit or other form of security that is reasonably acceptable to Transmission Provider and is consistent with the Uniform Commercial Code of the jurisdiction identified in Article 14.2.1. Such security for payment shall be in an amount sufficient to cover the costs for constructing, designing, procuring, and installing the applicable portion of Transmission Provider's Interconnection Facilities, Network Upgrades, or Distribution Upgrades and shall be reduced on a dollar-for-dollar basis for payments made to Transmission Provider for these purposes.

In addition:

11.5.1 The guarantee must be made by an entity that meets the creditworthiness requirements of Transmission Provider, and contain terms and conditions that guarantee payment of any amount that may be due from Interconnection Customer, up to an agreed-to maximum amount.

11.5.2 The letter of credit must be issued by a financial institution reasonably acceptable to Transmission Provider and must indicate that it would only expire upon final payment made to Transmission Provider to cover all relevant costs for designing, procuring, installing, and constructing the applicable portion of Interconnection Facilities, Network Upgrades, or Distribution Upgrades for which the letter of credit was provided.

11.5.3 The surety bond must be issued by an insurer reasonably acceptable to Transmission Provider and must indicate that it would only expire upon final payment made to Transmission Provider to cover all relevant costs for designing, procuring, installing, and constructing the applicable portion of Interconnection Facilities, Network Upgrades, or Distribution Upgrades for which the surety bond was provided.

11.6 Interconnection Customer Compensation. If Transmission Provider requests or directs Interconnection Customer to provide a service pursuant to Articles 9.6.3 (Payment for Reactive Power), or 13.5.1 of this LGIA, Transmission Provider shall compensate Interconnection Customer in accordance with Interconnection Customer's applicable rate schedule then in effect unless the provision of such service(s) is subject to an RTO or ISO FERC-approved rate schedule. Interconnection Customer shall serve Transmission Provider or RTO or ISO with any filing of a proposed rate schedule at the time of such filing with FERC. To the extent that no rate schedule is in effect at the time the Interconnection Customer is required to provide or absorb any Reactive Power under this LGIA, Transmission Provider agrees to compensate Interconnection Customer in such amount as would have been due Interconnection Customer had the rate schedule been in effect at the time service commenced; provided, however, that such rate schedule must be filed at FERC or other appropriate Governmental Authority within sixty (60) Calendar Days of the commencement of service.

11.6.1 Interconnection Customer Compensation for Actions During Emergency Condition. Transmission Provider or RTO or ISO shall compensate Interconnection Customer for its provision of real and reactive power and other Emergency Condition services that Interconnection Customer provides to support the Transmission System during an Emergency Condition in accordance with Article 11.6.

Article 12. Invoice

12.1 General. Each Party shall submit to the other Party, on a monthly basis, invoices of amounts due for the preceding month. Each invoice shall state the month to which the invoice applies and fully describe the services and equipment provided. The Parties may discharge mutual debts and payment obligations due and owing to each other on the same date through netting, in which case all amounts a Party owes to the other Party under this LGIA, including interest payments or credits, shall be netted so that only the net amount remaining due shall be paid by the owing Party.

12.2 Final Invoice. Within six months after completion of the construction of Transmission Provider's Interconnection Facilities and the Network Upgrades, Transmission Provider shall provide an invoice of the final cost of the construction of Transmission Provider's Interconnection Facilities and the Network Upgrades and shall set forth such costs in sufficient detail to enable Interconnection Customer to compare the actual costs with the estimates and to ascertain deviations, if any, from the cost estimates. Transmission Provider shall refund to Interconnection Customer any amount by which the actual payment by Interconnection Customer for estimated costs exceeds the actual costs of construction within thirty (30) Calendar Days of the issuance of such final construction invoice.

12.3 Payment. Invoices shall be rendered to the paying Party at the address specified in Appendix F. The Party receiving the invoice shall pay the invoice within thirty (30) Calendar Days of receipt. All payments shall be made in immediately available funds payable to the other Party, or by wire transfer to a bank named and account designated by the invoicing Party. Payment of invoices by either Party will not constitute a waiver of any rights or claims either Party may have under this LGIA.

12.4 Disputes. In the event of a billing dispute between Transmission Provider and Interconnection Customer, Transmission Provider shall continue to provide Interconnection Service under this LGIA as long as Interconnection Customer: (i) continues to make all payments not in dispute; and (ii) pays to Transmission Provider or into an independent escrow account the portion of the invoice in dispute, pending resolution of such dispute. If Interconnection Customer fails to meet these two requirements for continuation of service, then Transmission Provider may provide notice to Interconnection Customer of a Default pursuant to Article 17. Within thirty (30) Calendar Days after the resolution of the dispute, the Party that owes money to the other Party shall pay the amount due with interest calculated in accord with the methodology set forth in FERC's regulations at 18 CFR § 35.19a(a)(2)(iii).

Article 13. Emergencies

13.1 **Definition.** "Emergency Condition" shall mean a condition or situation: (i) that in the judgment of the Party making the claim is imminently likely to endanger life or property; or (ii) that, in the case of Transmission Provider, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to the Transmission System, Transmission Provider's Interconnection Facilities or the Transmission Systems of others to which the Transmission System is directly connected; or (iii) that, in the case of Interconnection Customer, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to, the Large Generating Facility or Interconnection Customer's Interconnection Facilities' System restoration and black start shall be considered Emergency Conditions; provided, that Interconnection Customer is not obligated by this LGIA to possess black start capability.

13.2 **Obligations.** Each Party shall comply with the Emergency Condition procedures of the applicable ISO/RTO, NERC, the Applicable Reliability Council, Applicable Laws and Regulations, and any emergency procedures agreed to by the Joint Operating Committee.

13.3 **Notice.** Transmission Provider shall notify Interconnection Customer promptly when it becomes aware of an Emergency Condition that affects Transmission Provider's Interconnection Facilities or the Transmission System that may reasonably be expected to affect Interconnection Customer's operation of the Large Generating Facility or Interconnection Customer's Interconnection Facilities. Interconnection Customer shall notify Transmission Provider promptly when it becomes aware of an Emergency Condition that affects the Large Generating Facility or Interconnection Customer's Interconnection Facilities that may reasonably be expected to affect the Transmission System or Transmission Provider's Interconnection Facilities. To the extent information is known, the notification shall describe the Emergency Condition, the extent of the damage or deficiency, the expected effect on the operation of Interconnection Customer's or Transmission Provider's facilities and operations, its anticipated duration and the corrective action taken and/or to be taken. The initial notice shall be followed as soon as practicable with written notice.

13.4 Immediate Action. Unless, in Interconnection Customer's reasonable judgment, immediate action is required, Interconnection Customer shall obtain the consent of Transmission Provider, such consent to not be unreasonably withheld, prior to performing any manual switching operations at the Large Generating Facility or Interconnection Customer's Interconnection Facilities in response to an Emergency Condition either declared by Transmission Provider or otherwise regarding the Transmission System.

13.5 Transmission Provider Authority.

13.5.1 General. Transmission Provider may take whatever actions or inactions with regard to the Transmission System or Transmission Provider's Interconnection Facilities it deems necessary during an Emergency Condition in order to (i) preserve public health and safety, (ii) preserve the reliability of the Transmission System or Transmission Provider's Interconnection

Facilities, (iii) limit or prevent damage, and (iv) expedite restoration of service.

Transmission Provider shall use Reasonable Efforts to minimize the effect of such actions or inactions on the Large Generating Facility or Interconnection Customer's Interconnection Facilities. Transmission Provider may, on the basis of technical considerations, require the Large Generating Facility to mitigate an Emergency Condition by taking actions necessary and limited in scope to remedy the Emergency Condition, including, but not limited to, directing Interconnection Customer to shut-down, start-up, increase or decrease the real or reactive power output of the Large Generating Facility; implementing a reduction or disconnection pursuant to Article 13.5.2; directing Interconnection Customer to assist with blackstart (if available) or restoration efforts; or altering the outage schedules of the Large Generating Facility and Interconnection Customer's Interconnection Facilities. Interconnection Customer shall comply with all of Transmission Provider's operating instructions concerning Large Generating Facility real power and reactive power output within the manufacturer's design limitations of the Large Generating Facility's equipment that is in service and physically available for operation at the time, in compliance with Applicable Laws and Regulations.

13.5.2 **Reduction and Disconnection.** Transmission Provider may reduce Interconnection Service or disconnect the Large Generating Facility or Interconnection Customer's Interconnection Facilities, when such, reduction or disconnection is necessary under Good Utility Practice due to Emergency Conditions. These rights are separate and distinct from any right of curtailment of Transmission Provider pursuant to Transmission Provider's Tariff. When

Transmission Provider can schedule the reduction or disconnection in advance, Transmission Provider shall notify Interconnection Customer of the reasons, timing and expected duration of the reduction or disconnection. Transmission Provider shall coordinate with Interconnection Customer using Good Utility Practice to schedule the reduction or disconnection during periods of least impact to Interconnection Customer and Transmission Provider. Any reduction or disconnection shall continue only for so long as reasonably necessary under Good Utility Practice. The Parties shall cooperate with each other to restore the Large Generating Facility, the Interconnection Facilities, and the Transmission System to their normal operating state as soon as practicable consistent with Good Utility Practice.

13.6 Interconnection Customer Authority. Consistent with Good Utility Practice and the LGIA and the LGIP, Interconnection Customer may take actions or inactions with regard to the Large Generating Facility or Interconnection Customer's Interconnection Facilities during an Emergency Condition in order to (i) preserve public health and safety, (ii) preserve the reliability of the Large Generating Facility or Interconnection Customer's Interconnection Facilities, (iii) limit or prevent damage, and (iv) expedite restoration of service. Interconnection Customer shall use Reasonable Efforts to minimize the effect of such actions or inactions on the Transmission System and Transmission Provider's Interconnection Facilities. Transmission Provider shall use Reasonable Efforts to assist Interconnection Customer in such actions.

13.7 Limited Liability. Except as otherwise provided in Article 11.6.1 of this LGIA, neither Party shall be liable to the other for any action it takes in responding to an Emergency Condition so long as such action is made in good faith and is consistent with Good Utility Practice.

Article 14. Regulatory Requirements and Governing Law

14.1 Regulatory Requirements. Each Party's obligations under this LGIA shall be subject to its receipt of any required approval or certificate from one or more Governmental Authorities in the form and substance satisfactory to the applying Party, or the Party making any required filings with, or providing notice to, such Governmental Authorities, and the expiration of any time period associated therewith. Each Party shall in good faith seek and use its Reasonable Efforts to obtain such other approvals. Nothing in this LGIA shall require Interconnection Customer to take any action that could result in its inability to obtain, or its loss of, status or exemption under the Federal Power Act, the Public Utility Holding Company Act of 1935, as amended, or the Public Utility Regulatory Policies Act of 1978.

14.2 Governing Law.

14.2.1 The validity, interpretation and performance of this LGIA and each of its provisions shall be governed by the laws of the state where the Point of Interconnection is located, without regard to its conflicts of law principles.

14.2.2 This LGIA is subject to all Applicable Laws and Regulations.

14.2.3 Each Party expressly reserves the right to seek changes in, appeal, or otherwise contest any laws, orders, rules, or regulations of a Governmental Authority.

Article 15. Notices.

15.1 General. Unless otherwise provided in this LGIA, any notice, demand or request required or permitted to be given by either Party to the other and any instrument required or permitted to be tendered or delivered by either Party in writing to the other shall be effective when delivered and may be so given, tendered or delivered, by recognized national courier, or by depositing the same with the United States Postal Service with postage prepaid, for delivery by certified or registered mail, addressed to the Party, or personally delivered to the Party, at the address set out in Appendix F, Addresses for Delivery of Notices and Billings.

Either Party may change the notice information in this LGIA by giving five (5) Business Days written notice prior to the effective date of the change.

15.2 Billings and Payments. Billings and payments shall be sent to the addresses set out in Appendix F.

15.3 Alternative Forms of Notice. Any notice or request required or permitted to be given by a Party to the other and not required by this Agreement to be given in writing may be so given by telephone, facsimile or email to the telephone numbers and email addresses set out in Appendix F.

15.4 Operations and Maintenance Notice. Each Party shall notify the other Party in writing of the identity of the person(s) that it designates as the point(s) of contact with respect to the implementation of Articles 9 and 10.

Article 16. Force Majeure

16.1 Force Majeure.

16.1.1 Economic hardship is not considered a Force Majeure event.

16.1.2 Neither Party shall be considered to be in Default with respect to any obligation hereunder, (including obligations under Article 4), other than the obligation to pay money when due, if prevented from fulfilling such obligation by Force Majeure. A Party unable to fulfill any obligation hereunder (other than an obligation to pay money when due) by reason of Force Majeure shall give notice and the full particulars of such Force Majeure to the other Party in writing or by telephone as soon as reasonably possible after the occurrence of the cause relied upon. Telephone notices given pursuant to this article shall be confirmed in writing as soon as reasonably possible and shall specifically state full particulars of the Force Majeure, the time and date when the Force Majeure occurred and when the Force Majeure is reasonably expected to cease. The Party affected shall exercise due diligence to remove such disability with reasonable dispatch, but shall not be required to accede or agree to any provision not satisfactory to it in order to settle and terminate a strike or other labor disturbance.

Article 17. Default

17.1 Default

17.1.1 **General.** No Default shall exist where such failure to discharge an obligation (other than the payment of money) is the result of Force Majeure as defined in this LGIA or the result of an act of omission of the other Party. Upon a Breach, the non-breaching Party shall give written notice of such Breach to the breaching Party. Except as provided in Article 17.1.2, the breaching Party shall have thirty (30) Calendar Days from receipt of the Default notice within which to cure such Breach; provided however, if such Breach is not capable of cure within thirty (30) Calendar Days, the breaching Party shall commence such cure within thirty (30) Calendar Days after notice and continuously and diligently complete such cure within ninety (90) Calendar Days from receipt of the Default notice; and, if cured within such time, the Breach specified in such notice shall cease to exist.

17.1.2 **Right to Terminate**. If a Breach is not cured as provided in this article, or if a Breach is not capable of being cured within the period provided for herein, the non-breaching Party shall have the right to declare a Default and terminate this LGIA by written notice at any time until cure occurs, and be relieved of any further obligation hereunder and, whether or not that Party terminates this LGIA, to recover from the breaching Party all amounts due hereunder, plus all other damages and remedies to which it is entitled at law or in equity. The provisions of this article will survive termination of this LGIA.

Article 18. Indemnity, Consequential Damages and Insurance

18.1 Indemnity. The Parties shall at all times indemnify, defend, and hold the other Party harmless from, any and all damages, losses, claims, including claims and actions relating to injury to or death of any person or damage to property, demand, suits, recoveries, costs and expenses, court costs, attorney fees, and all other obligations by or to third parties, arising out of or resulting from the other Party's action or inactions of its obligations under this LGIA on behalf of the Indemnifying Party, except in cases of gross negligence or intentional wrongdoing by the Indemnified Party.

18.1.1 **Indemnified Person**. If an Indemnified Person is entitled to indemnification under this Article 18 as a result of a claim by a third party, and the indemnifying Party fails, after notice and reasonable opportunity to proceed under Article 18.1, to assume the defense of such claim, such Indemnified Person may at the expense of the indemnifying Party contest, settle or consent to the entry of any judgment with respect to, or pay in full, such claim.

18.1.2 **Indemnifying Party**. If an Indemnifying Party is obligated to indemnify and hold any Indemnified Person harmless under this Article 18, the amount owing to the Indemnified Person shall be the amount of such Indemnified Person's actual Loss, net of any insurance or other recovery.

18.1.3 **Indemnity Procedures**. Promptly after receipt by an Indemnified Person of any claim or notice of the commencement of any action or administrative or legal proceeding or investigation as to which the indemnity provided for in Article 18.1 may apply, the Indemnified Person shall notify the Indemnifying Party of such fact. Any failure of or delay in such notification shall not affect a Party's indemnification obligation unless such failure or delay is materially prejudicial to the indemnifying Party.

The Indemnifying Party shall have the right to assume the defense thereof with counsel designated by such Indemnifying Party and reasonably satisfactory to the Indemnified Person. If the defendants in any such action include one or more Indemnified Persons and the Indemnifying Party and if the Indemnified Person reasonably concludes that there may be legal defenses available to it and/or other Indemnified Persons which are different from or additional to those available to the Indemnifying Party, the Indemnified Person shall have the right to select separate counsel to assert such legal defenses and to otherwise participate in the defense of such action on its own behalf. In such instances, the Indemnifying Party shall only be required to pay the fees and expenses of one additional attorney to represent an Indemnified Person or Indemnified Persons having such differing or additional legal defenses.

The Indemnified Person shall be entitled, at its expense, to participate in any such action, suit or proceeding, the defense of which has been assumed by the Indemnifying Party. Notwithstanding the foregoing, the Indemnifying Party (i) shall not be entitled to assume and control the defense of any such action, suit or proceedings if and to the extent that, in the opinion of the Indemnified Person and its counsel, such action, suit or proceeding involves the potential imposition of criminal liability on the Indemnified Person, or there exists a conflict or adversity of interest between the Indemnified Person and the Indemnifying Party, in such event the Indemnifying Party shall pay the reasonable expenses of the Indemnified Person, and (ii) shall not settle or consent to the entry of any judgment in any action, suit or proceeding without the consent of the Indemnified Person, which shall not be reasonably withheld, conditioned or delayed.

18.2 Consequential Damages. Other than the Liquidated Damages heretofore described, in no event shall either Party be liable under any provision of this LGIA for any losses, damages, costs or expenses for any special, indirect, incidental, consequential, or punitive damages, including but not limited to loss of profit or revenue, loss of the use of equipment, cost of capital, cost of temporary equipment or services, whether based in whole or in part in contract, in tort, including negligence, strict liability, or any other theory of liability; provided, however, that damages for which a Party may be liable to the other Party under another agreement will not be considered to be special, indirect, incidental, or consequential damages hereunder.

18.3 Insurance. Each party shall, at its own expense, maintain in force throughout the period of this LGIA, and until released by the other Party, the following minimum insurance coverages, with insurers authorized to do business in the state where the Point of Interconnection is located:

18.3.1 Employers' Liability and Workers' Compensation Insurance providing statutory benefits in accordance with the laws and regulations of the state in which the Point of Interconnection is located.

18.3.2 Commercial General Liability Insurance including premises and operations, personal injury, broad form property damage, broad form blanket contractual liability coverage (including coverage for the contractual indemnification) products and completed operations coverage, coverage for explosion, collapse and underground hazards, independent contractors coverage, coverage for pollution to the extent normally available and punitive damages to the extent normally available and a cross liability endorsement, with minimum limits of One Million Dollars ($1,000,000) per occurrence/One Million Dollars ($1,000,000) aggregate combined single limit for personal injury, bodily injury, including death and property damage.

18.3.3 Comprehensive Automobile Liability Insurance for coverage of owned and non-owned and hired vehicles, trailers or semi-trailers designed for travel on public roads, with a minimum, combined single limit of One Million Dollars ($1,000,000) per occurrence for bodily injury, including death, and property damage.

18.3.4 Excess Public Liability Insurance over and above the Employers' Liability Commercial General Liability and Comprehensive Automobile Liability Insurance coverage, with a minimum combined single limit of Twenty Million Dollars ($20,000,000) per occurrence/Twenty Million Dollars ($20,000,000) aggregate.

18.3.5 The Commercial General Liability Insurance, Comprehensive Automobile Insurance and Excess Public Liability Insurance policies shall name the other Party, its parent, associated and Affiliate companies and their respective directors, officers, agents, servants and employees ("Other Party Group") as additional insured. All policies shall contain provisions whereby the insurers waive all rights of subrogation in accordance with the provisions of this LGIA against the Other Party Group and provide thirty (30) Calendar Days advance written notice to the Other Party Group prior to anniversary date of cancellation or any material change in coverage or condition.

18.3.6 The Commercial General Liability Insurance, Comprehensive Automobile Liability Insurance and Excess Public Liability Insurance policies shall contain provisions that specify that the policies are primary and shall apply to such extent without consideration for other policies separately carried and shall state that each insured is provided coverage as though a separate policy had been issued to each, except the insurer's liability shall not be increased beyond the amount for which the insurer would have been liable had only one insured been covered. Each Party shall be responsible for its respective deductibles or retentions.

18.3.7 The Commercial General Liability Insurance, Comprehensive Automobile Liability Insurance and Excess Public Liability Insurance policies, if written on a Claims First Made Basis, shall be maintained in full force and effect for two (2) years after termination of this LGIA, which coverage may be in the form of tail coverage or extended reporting period coverage if agreed by the Parties.

18.3.8 The requirements contained herein as to the types and limits of all insurance to be maintained by the Parties are not intended to and shall not in any manner, limit or qualify the liabilities and obligations assumed by the Parties under this LGIA.

18.3.9 Within ten (10) days following execution of this LGIA, and as soon as practicable after the end of each fiscal year or at the renewal of the insurance policy and in any event within ninety (90) days thereafter, each Party shall provide certification of all insurance required in this LGIA, executed by each insurer or by an authorized representative of each insurer.

18.3.10 Notwithstanding the foregoing, each Party may self-insure to meet the minimum insurance requirements of Articles 18.3.2 through 18.3.8 to the extent it maintains a self-insurance program; provided that, such Party's senior secured debt is rated at investment grade or better by Standard & Poor's and that its self-insurance program meets the minimum insurance requirements of Articles 18.3.2 through 18.3.8. For any period of time that a Party's senior secured debt is unrated by Standard & Poor's or is rated at less than investment grade by Standard & Poor's, such Party shall comply with the insurance requirements applicable to it under Articles 18.3.2 through 18.3.9. In the event that a Party is permitted to self-insure pursuant to this article, it shall notify the other Party that it meets the requirements to self-insure and that its self-insurance program meets the minimum insurance requirements in a manner consistent with that specified in Article 18.3.9.

18.3.11 The Parties agree to report to each other in writing as soon as practical all accidents or occurrences resulting in injuries to any person, including death, and any property damage arising out of this LGIA.

Article 19. Assignment

19.1 Assignment. This LGIA may be assigned by either Party only with the written consent of the other; provided that either Party may assign this LGIA without the consent of the other Party to any Affiliate of the assigning Party with an equal or greater credit rating and with the legal authority and operational ability to satisfy the obligations of the assigning Party under this LGIA; and provided further that Interconnection Customer shall have the right to assign this LGIA, without the consent of Transmission Provider, for collateral security purposes to aid in providing financing for the Large Generating Facility, provided that Interconnection Customer will promptly notify Transmission Provider of any such assignment. Any financing arrangement entered into by Interconnection Customer pursuant to this article will provide that prior to or upon the exercise of the secured Party's, trustee's or mortgagee's assignment rights pursuant to said arrangement, the secured creditor, the trustee or mortgagee will notify Transmission Provider of the date and particulars of any such exercise of assignment right(s), including providing the Transmission Provider with proof that it meets the requirements of Articles 11.5 and 18.3. Any attempted assignment that violates this article is void and ineffective. Any assignment under this LGIA shall not relieve a Party of its obligations, nor shall a Party's obligations be enlarged, in whole or in part, by reason thereof. Where required, consent to assignment will not be unreasonably withheld, conditioned or delayed.

Article 20. Severability

20.1 Severability. If any provision in this LGIA is finally determined to be invalid, void or unenforceable by any court or other Governmental

Authority having jurisdiction, such determination shall not invalidate, void or make unenforceable any other provision, agreement or covenant of this LGIA; provided that if Interconnection Customer (or any third party, but only if such third party is not acting at the direction of Transmission Provider) seeks and obtains such a final determination with respect to any provision of the Alternate Option (Article 5.1.2), or the Negotiated Option (Article 5.1.4), then none of these provisions shall thereafter have any force or effect and the Parties' rights and obligations shall be governed solely by the Standard Option (Article 5.1.1).

Article 21. Comparability

21.1 **Comparability.** The Parties will comply with all applicable comparability and code of conduct laws, rules and regulations, as amended from time to time.

Article 22. Confidentiality

22.1 **Confidentiality.** Confidential Information shall include, without limitation, all information relating to a Party's technology, research and development, business affairs, and pricing, and any information supplied by either of the Parties to the other prior to the execution of this LGIA.

Information is Confidential Information only if it is clearly designated or marked in writing as confidential on the face of the document, or, if the information is conveyed orally or by inspection, if the Party providing the information orally informs the Party receiving the information that the information is confidential.

If requested by either Party, the other Party shall provide in writing, the basis for asserting that the information referred to in this Article 22 warrants confidential treatment, and the requesting Party may disclose such writing to the appropriate Governmental Authority. Each Party shall be responsible for the costs associated with affording confidential treatment to its information.

22.1.1 **Term.** During the term of this LGIA, and for a period of three (3) years after the expiration or termination of this LGIA, except as otherwise provided in this Article 22, each Party shall hold in confidence and shall not disclose to any person Confidential Information.

22.1.2 **Scope.** Confidential Information shall not include information that the receiving Party can demonstrate: (1) is generally available to the public other than as a result of a disclosure by the receiving Party; (2) was in the lawful possession of the receiving Party on a non-confidential basis before receiving it from the disclosing Party; (3) was supplied to the receiving Party without restriction by a third party, who, to the knowledge of the receiving Party after due inquiry, was under no obligation to the disclosing Party to keep such information confidential; (4) was independently developed by the receiving Party without reference to Confidential Information of the disclosing Party; (5) is, or becomes, publicly known, through no wrongful act or omission of the receiving Party or Breach of this LGIA; or (6) is required, in accordance with Article 22.1.7 of the LGIA, Order of Disclosure, to be disclosed by any Governmental Authority or is otherwise required to be disclosed by law or subpoena, or is necessary in any legal proceeding establishing rights and obligations under this LGIA. Information designated as Confidential Information will no longer be deemed confidential if the Party that designated the information as confidential notifies the other Party that it no longer is confidential.

22.1.3 **Release of Confidential Information.** Neither Party shall release or disclose Confidential Information to any other person, except to its Affiliates (limited by the Standards of Conduct requirements), subcontractors, employees, consultants, or to parties who may be or considering providing financing to or equity participation with Interconnection Customer, or to potential purchasers or assignees of Interconnection Customer, on a need-to-know basis in connection with this LGIA, unless such person has first been advised of the confidentiality provisions of this Article 22 and has agreed to comply with such provisions. Notwithstanding the foregoing, a Party providing Confidential Information to any person shall remain primarily responsible for any release of Confidential Information in contravention of this Article 22.

22.1.4 **Rights**. Each Party retains all rights, title, and interest in the Confidential Information that each Party discloses to the other Party. The disclosure by each Party to the other Party of Confidential Information shall not be deemed a waiver by either Party or any other person or entity of the right to protect the Confidential Information from public disclosure.

22.1.5 **No Warranties**. By providing Confidential Information, neither Party makes any warranties or representations as to its accuracy or completeness. In addition, by supplying Confidential Information, neither Party obligates itself to provide any particular information or Confidential Information to the other Party nor to enter into any further agreements or proceed with any other relationship or joint venture.

22.1.6 **Standard of Care**. Each Party shall use at least the same standard of care to protect Confidential Information it receives as it uses to protect its own Confidential Information from unauthorized disclosure, publication or dissemination. Each Party may use Confidential Information solely to fulfill its obligations to the other Party under this LGIA or its regulatory requirements.

22.1.7 **Order of Disclosure.** If a court or a Government Authority or entity with the right, power, and apparent authority to do so requests or requires either Party, by subpoena, oral deposition, interrogatories, requests for production of documents, administrative order, or otherwise, to disclose Confidential Information, that Party shall provide the other Party with prompt notice of such request(s) or requirement(s) so that the other Party may seek an appropriate protective order or waive compliance with the terms of this LGIA.

Notwithstanding the absence of a protective order or waiver, the Party may disclose such Confidential Information which, in the opinion of its counsel, the Party is legally compelled to disclose. Each Party will use Reasonable Efforts to obtain reliable assurance that confidential treatment will be accorded any Confidential Information so furnished.

22.1.8 **Termination of Agreement.** Upon termination of this LGIA for any reason, each Party shall, within ten (10) Calendar Days of receipt of a written request from the other Party, use Reasonable Efforts to destroy, erase, or delete (with such destruction, erasure, and deletion certified in writing to the other Party) or return to the other Party, without retaining copies thereof, any and all written or electronic Confidential Information received from the other Party.

22.1.9 **Remedies.** The Parties agree that monetary damages would be inadequate to compensate a Party for the other Party's Breach of its obligations under this Article 22. Each Party accordingly agrees that the other Party shall be entitled to equitable relief, by way of injunction or otherwise, if the first Party Breaches or threatens to Breach its obligations under this Article 22, which equitable relief shall be granted without bond or proof of damages, and the receiving Party shall not plead in defense that there would be an adequate remedy at law. Such remedy shall not be deemed an exclusive remedy for the Breach of this Article 22, but shall be in addition to all other remedies available at law or in equity. The Parties further acknowledge and agree that the covenants contained herein are necessary for the protection of legitimate business interests and are reasonable in scope. No Party, however, shall be liable for indirect, incidental, or consequential or punitive damages of any nature or kind resulting from or arising in connection with this Article 22.

22.1.10 **Disclosure to FERC, its Staff, or a State**. Notwithstanding anything in this Article 22 to the contrary, and pursuant to 18 CFR section 1b.20, if FERC or its staff, during the course of an investigation or otherwise, requests information from one of the Parties that is otherwise required to be maintained in confidence pursuant to this LGIA, the Party shall provide the requested information to FERC or its staff, within the time provided for in the request for information. In providing the information to FERC or its staff, the Party must, consistent with 18 CFR section 388.112, request that the information be treated as confidential and non-public by FERC and its staff and that the information be withheld from public disclosure. Parties are prohibited from notifying the other Party to this LGIA prior to the release of the Confidential Information to FERC or its staff. The

Party shall notify the other Party to the LGIA when it is notified by FERC or its staff that a request to release Confidential Information has been received by FERC, at which time either of the Parties may respond before such information would be made public, pursuant to 18 CFR section 388.112. Requests from a state regulatory body conducting a confidential investigation shall be treated in a similar manner if consistent with the applicable state rules and regulations.

22.1.11 Subject to the exception in Article 22.1.10, any information that a Party claims is competitively sensitive, commercial or financial information under this LGIA ("Confidential Information") shall not be disclosed by the other Party to any person not employed or retained by the other Party, except to the extent disclosure is (i) required by law; (ii) reasonably deemed by the disclosing Party to be required to be disclosed in connection with a dispute between or among the Parties, or the defense of litigation or dispute; (iii) otherwise permitted by consent of the other Party, such consent not to be unreasonably withheld; or (iv) necessary to fulfill its obligations under this LGIA or as a transmission service provider or a Control Area operator including disclosing the Confidential Information to an RTO or ISO or to a regional or national reliability organization. The Party asserting confidentiality shall notify the other Party in writing of the information it claims is confidential. Prior to any disclosures of the other Party's Confidential Information under this subparagraph, or if any third party or Governmental Authority makes any request or demand for any of the information described in this subparagraph, the disclosing Party agrees to promptly notify the other Party in writing and agrees to assert confidentiality and cooperate with the other Party in seeking to protect the Confidential Information from public disclosure by confidentiality agreement, protective order or other reasonable measures.

Article 23. Environmental Releases

23.1 Each Party shall notify the other Party, first orally and then in writing, of the release of any Hazardous Substances, any asbestos or lead abatement activities, or any type of remediation activities related to the Large Generating Facility or the Interconnection Facilities, each of which may reasonably be expected to affect the other Party. The notifying Party shall: (i) provide the notice as soon as practicable, provided such Party makes a good faith effort to provide the notice no later than twenty-four hours after such Party becomes aware of the occurrence; and (ii) promptly furnish to the other Party copies of any publicly available reports filed with any Governmental Authorities addressing such events.

Article 24. Information Requirements

24.1 **Information Acquisition**. Transmission Provider and Interconnection Customer shall submit specific information regarding the electrical characteristics of their respective facilities to each other as described below and in accordance with Applicable Reliability Standards.

24.2 **Information Submission by Transmission Provider**. The initial information submission by Transmission Provider shall occur no later than one hundred eighty (180) Calendar Days prior to Trial Operation and shall include Transmission System information necessary to allow Interconnection Customer to select equipment and meet any system protection and stability requirements, unless otherwise agreed to by the Parties. On a monthly basis Transmission Provider shall provide Interconnection Customer a status report on the construction and installation of Transmission Provider's Interconnection Facilities and Network Upgrades, including, but not limited to, the following information: (1) progress to date; (2) a description of the activities since the last report; (3) a description of the action items for the next period; and (4) the delivery status of equipment ordered.

24.3 Updated Information Submission by Interconnection Customer. The updated information submission by Interconnection Customer, including manufacturer information, shall occur no later than one hundred eighty (180) Calendar Days prior to the Trial Operation. Interconnection Customer shall submit a completed copy of the Large Generating Facility data requirements contained in Appendix 1 to the LGIP. It shall also include any additional information provided to Transmission Provider for the Feasibility and Facilities Study. Information in this submission shall be the most current Large Generating Facility design or expected performance data. Information submitted for stability models shall be compatible with Transmission Provider standard models. If there is no compatible model, Interconnection Customer will work with a consultant mutually agreed to by the Parties to develop and supply a standard model and associated information.

If Interconnection Customer's data is materially different from what was originally provided to Transmission Provider pursuant to the Interconnection Study Agreement between Transmission Provider and Interconnection Customer, then Transmission Provider will conduct appropriate studies to determine the impact on Transmission Provider Transmission System based on the actual data submitted pursuant to this Article 24.3. The Interconnection Customer shall not begin Trial Operation until such studies are completed.

24.4 Information Supplementation. Prior to the Operation Date, the Parties shall supplement their information submissions described above in this Article 24 with any and all "as-built" Large Generating Facility information or "as-tested" performance information that differs from the initial submissions or, alternatively, written confirmation that no such differences exist. The Interconnection Customer shall conduct tests on the Large Generating Facility as required by Good Utility Practice such as an open circuit "step voltage" test on the Large Generating Facility to verify proper operation of the Large Generating Facility's automatic voltage regulator.

Unless otherwise agreed, the test conditions shall include: (1) Large Generating Facility at synchronous speed; (2) automatic voltage regulator on and in voltage control mode; and (3) a five percent change in Large Generating Facility terminal voltage initiated by a change in the voltage regulators reference voltage. Interconnection Customer shall provide validated test recordings showing the responses of Large Generating Facility terminal and field voltages. In the event that direct recordings of these voltages is impractical, recordings of other voltages or currents that mirror the response of the Large Generating Facility's terminal or field voltage are acceptable if information necessary to translate these alternate quantities to actual Large Generating Facility terminal or field voltages is provided. Large Generating Facility testing shall be conducted and results provided to Transmission Provider for each individual generating unit in a station.

Subsequent to the Operation Date, Interconnection Customer shall provide Transmission Provider any information changes due to equipment replacement, repair, or adjustment. Transmission Provider shall provide Interconnection Customer any information changes due to equipment replacement, repair or adjustment in the directly connected substation or any adjacent Transmission Provider-owned substation that may affect Interconnection Customer's Interconnection Facilities equipment ratings, protection or operating requirements. The Parties shall provide such information no later than thirty (30) Calendar Days after the date of the equipment replacement, repair or adjustment.

Article 25. Information Access and Audit Rights

25.1 Information Access. Each Party (the "disclosing Party") shall make available to the other Party information that is in the possession of the disclosing Party and is necessary in order for the other Party to: (i) verify the costs incurred by the disclosing Party for which the other Party is responsible under this LGIA; and (ii) carry out its obligations and responsibilities under this LGIA. The Parties shall not use such information for purposes other than those set forth in this Article 25.1 and to enforce their rights under this LGIA.

25.2 Reporting of Non-Force Majeure Events. Each Party (the "notifying Party") shall notify the other Party when the notifying Party becomes aware of its inability to comply with the provisions of this LGIA for a reason other than a Force Majeure event. The Parties agree to cooperate with each other and provide necessary information regarding such inability to comply, including the date, duration, reason for the inability to comply, and corrective actions taken or planned to be taken with respect to such inability to comply. Notwithstanding the foregoing, notification, cooperation or information provided under this article shall not entitle the Party receiving such notification to allege a cause for anticipatory breach of this LGIA.

25.3 Audit Rights. Subject to the requirements of confidentiality under Article 22 of this LGIA, each Party shall have the right, during normal business hours, and upon prior reasonable notice to the other Party, to audit at its own expense the other Party's accounts and records pertaining to either Party's performance or either Party's satisfaction of obligations under this LGIA. Such audit rights shall include audits of the other Party's costs, calculation of invoiced amounts, Transmission Provider's efforts to allocate responsibility for the provision of reactive support to the Transmission System, Transmission Provider's efforts to allocate responsibility for interruption or reduction of generation on the Transmission System, and each Party's actions in an Emergency Condition. Any audit authorized by this article shall be performed at the offices where such accounts and records are maintained and shall be limited to those portions of such accounts and records that relate to each Party's performance and satisfaction of obligations under this LGIA. Each Party shall keep such accounts and records for a period equivalent to the audit rights periods described in Article 25.4.

25.4 Audit Rights Periods.

25.4.1 Audit Rights Period for Construction-Related Accounts and Records. Accounts and records related to the design, engineering, procurement, and construction of Transmission Provider's Interconnection Facilities and Network Upgrades shall be subject to audit for a period of twenty-four months following Transmission Provider's issuance of a final invoice in accordance with Article 12.2.

25.4.2 Audit Rights Period for All Other Accounts and Records. Accounts and records related to either Party's performance or satisfaction of all obligations under this LGIA other than those described in Article 25.4.1 shall be subject to audit as follows: (i) for an audit relating to cost obligations, the applicable audit rights period shall be twenty-four months after the auditing Party's receipt of an invoice giving rise to such cost obligations; and (ii) for an audit relating to all other obligations, the applicable audit rights period shall be twenty-four months after the event for which the audit is sought.

25.5 Audit Results. If an audit by a Party determines that an overpayment or an underpayment has occurred, a notice of such overpayment or underpayment shall be given to the other Party together with those records from the audit which support such determination.

Article 26. Subcontractors

26.1 General. Nothing in this LGIA shall prevent a Party from utilizing the services of any subcontractor as it deems appropriate to perform its obligations under this LGIA; provided, however, that each Party shall require its subcontractors to comply with all applicable terms and conditions of this LGIA in providing such services and each Party shall remain primarily liable to the other Party for the performance of such subcontractor.

26.2 Responsibility of Principal. The creation of any subcontract relationship shall not relieve the hiring Party of any of its obligations under this LGIA. The hiring Party shall be fully responsible to the other Party for the acts or omissions of any subcontractor the hiring Party hires as if no subcontract had been made; provided, however, that in no event shall Transmission Provider be liable for the actions or inactions of Interconnection Customer or its subcontractors with respect to obligations of Interconnection Customer under Article 5 of this LGIA. Any applicable obligation imposed by this LGIA upon the hiring Party shall be equally binding upon, and shall be construed as having application to, any subcontractor of such Party.

26.3 No Limitation by Insurance. The obligations under this Article 26 will not be limited in any way by any limitation of subcontractor's insurance.

Article 27. Disputes

27.1 Submission. In the event either Party has a dispute, or asserts a claim, that arises out of or in connection with this LGIA or its performance, such Party (the "disputing Party") shall provide the other Party with written notice of the dispute or claim ("Notice of Dispute"). Such dispute or claim shall be referred to a designated senior representative of each Party for resolution on an informal basis as promptly as practicable after receipt of the Notice of Dispute by the other Party. In the event the designated representatives are unable to resolve the claim or dispute through unassisted or assisted negotiations within thirty (30) Calendar Days of the other Party's receipt of the Notice of Dispute, such claim or dispute may, upon mutual agreement of the Parties, be submitted to arbitration and resolved in accordance with the arbitration procedures set forth below. In the event the Parties do not agree to submit such claim or dispute to arbitration, each Party may exercise whatever rights and remedies it may have in equity or at law consistent with the terms of this LGIA.

27.2 External Arbitration Procedures. Any arbitration initiated under this LGIA shall be conducted before a single neutral arbitrator appointed by the Parties. If the Parties fail to agree upon a single arbitrator within ten (10) Calendar Days of the submission of the dispute to arbitration, each Party shall choose one arbitrator who shall sit on a three-member arbitration panel. The two arbitrators so chosen shall within twenty (20) Calendar Days select a third arbitrator to chair the arbitration panel. In either case, the arbitrators shall be knowledgeable in electric utility matters, including electric transmission and bulk power issues, and shall not have any current or past substantial business or financial relationships with any party to the arbitration (except prior arbitration). The arbitrator(s) shall provide each of the Parties an opportunity to be heard and, except as otherwise provided herein, shall conduct the arbitration in accordance with the Commercial Arbitration Rules of the American Arbitration Association ("Arbitration Rules") and any applicable FERC regulations or RTO rules; provided, however, in the event of a conflict between the Arbitration Rules and the terms of this Article 27, the terms of this Article 27 shall prevail.

27.3 Arbitration Decisions. Unless otherwise agreed by the Parties, the arbitrator(s) shall render a decision within ninety (90) Calendar Days of appointment and shall notify the Parties in writing of such decision and the reasons therefore. The arbitrator(s) shall be authorized only to interpret and apply the provisions of this LGIA and shall have no power to modify or change any provision of this Agreement in any manner. The decision of the arbitrator(s) shall be final and binding upon the Parties, and judgment on the award may be entered in any court having jurisdiction. The decision of the arbitrator(s) may be appealed solely on the grounds that the conduct of the arbitrator(s), or the decision itself, violated the standards set forth in the Federal Arbitration Act or the Administrative Dispute Resolution Act. The final decision of the arbitrator must also be filed with FERC if it affects jurisdictional rates, terms and conditions of service, Interconnection Facilities, or Network Upgrades.

27.4 Costs. Each Party shall be responsible for its own costs incurred during the arbitration process and for the following costs, if applicable: (1) the cost of the arbitrator chosen by the Party to sit on the three member panel and one half of the cost of the third arbitrator chosen; or (2) one half the cost of the single arbitrator jointly chosen by the Parties.

Article 28. Representations, Warranties, and Covenants

28.1 General. Each Party makes the following representations, warranties and covenants:

28.1.1 Good Standing. Such Party is duly organized, validly existing and in good standing under the laws of the state in which it is organized, formed, or incorporated, as applicable; that it is qualified to do business in the state or states in which the Large Generating Facility, Interconnection Facilities and Network Upgrades owned by such Party, as applicable, are located; and that it has the corporate power and authority to own its properties, to carry on its business as now being conducted and to enter into this LGIA and carry out the transactions contemplated hereby and perform and carry out all covenants and obligations on its part to be performed under and pursuant to this LGIA.

28.1.2 Authority. Such Party has the right, power and authority to enter into this LGIA, to become a Party hereto and to perform its obligations hereunder. This LGIA is a legal, valid and binding obligation of such Party, enforceable against such Party in accordance with its terms, except as the enforceability thereof may be limited by applicable bankruptcy, insolvency, reorganization or other similar laws affecting creditors' rights generally and by general equitable principles (regardless of whether enforceability is sought in a proceeding in equity or at law).

28.1.3 **No Conflict**. The execution, delivery and performance of this LGIA does not violate or conflict with the organizational or formation documents, or bylaws or operating agreement, of such Party, or any judgment, license, permit, order, material agreement or instrument applicable to or binding upon such Party or any of its assets.

28.1.4 **Consent and Approval**. Such Party has sought or obtained, or, in accordance with this LGIA will seek or obtain, each consent, approval, authorization, order, or acceptance by any Governmental Authority in connection with the execution, delivery and performance of this LGIA, and it will provide to any Governmental Authority notice of any actions under this LGIA that are required by Applicable Laws and Regulations.

Article 29. Joint Operating Committee

29.1 Joint Operating Committee. Except in the case of ISOs and RTOs, Transmission Provider shall constitute a Joint Operating Committee to coordinate operating and technical considerations of Interconnection Service. At least six (6) months prior to the expected Initial Synchronization Date, Interconnection Customer and Transmission Provider shall each appoint one representative and one alternate to the Joint Operating Committee. Each Interconnection Customer shall notify Transmission Provider of its appointment in writing. Such appointments may be changed at any time by similar notice. The Joint Operating Committee shall meet as necessary, but not less than once each calendar year, to carry out the duties set forth herein. The Joint Operating Committee shall hold a meeting at the request of either Party, at a time and place agreed upon by the representatives. The Joint Operating Committee shall perform all of its duties consistent with the provisions of this LGIA. Each Party shall cooperate in providing to the Joint Operating Committee all information required in the performance of the Joint Operating Committee's duties. All decisions and agreements, if any, made by the Joint Operating Committee, shall be evidenced in writing. The duties of the Joint Operating Committee shall include the following:

29.1.1 Establish data requirements and operating record requirements.

29.1.2 Review the requirements, standards, and procedures for data acquisition equipment, protective equipment, and any other equipment or software.

29.1.3 Annually review the one (1) year forecast of maintenance and planned outage schedules of Transmission Provider's and Interconnection Customer's facilities at the Point of Interconnection.

29.1.4 Coordinate the scheduling of maintenance and planned outages on the Interconnection Facilities, the Large Generating Facility and other facilities that impact the normal operation of the interconnection of the Large Generating Facility to the Transmission System.

29.1.5 Ensure that information is being provided by each Party regarding equipment availability.

29.1.6 Perform such other duties as may be conferred upon it by mutual agreement of the Parties.

Article 30. Miscellaneous

30.1 Binding Effect. This LGIA and the rights and obligations hereof, shall be binding upon and shall inure to the benefit of the successors and assigns of the Parties hereto.

30.2 Conflicts. In the event of a conflict between the body of this LGIA and any attachment, appendices or exhibits hereto, the terms and provisions of the body of this LGIA shall prevail and be deemed the final intent of the Parties.

30.3 Rules of Interpretation. This LGIA, unless a clear contrary intention appears, shall be construed and interpreted as follows: (1) the singular number includes the plural number and vice versa; (2) reference to any person includes such person's successors and assigns but, in the case of a Party, only if such successors and assigns are permitted by this LGIA, and reference to a person in a particular capacity excludes such person in any other capacity or individually; (3) reference to any agreement (including this LGIA), document, instrument or tariff means such agreement, document, instrument, or tariff as amended or modified and in effect from time to time in accordance with the terms thereof and, if applicable, the terms hereof; (4) reference to any Applicable Laws and Regulations means such Applicable Laws and Regulations as amended, modified, codified, or reenacted, in whole or in part, and in effect from time to time, including, if applicable, rules and regulations promulgated thereunder; (5) unless expressly stated otherwise, reference to any Article, Section or Appendix means such Article of this LGIA or such Appendix to this LGIA, or such Section to the LGIP or such Appendix to the LGIP, as the case may be; (6) "hereunder", "hereof", "herein", "hereto" and words of similar import shall be deemed references to this LGIA as a whole and not to any particular Article or other provision hereof or thereof; (7) "including" (and with correlative meaning "include") means including without limiting the generality of any description preceding such term; and (8) relative to the determination of any period of time, "from" means "from and including", "to" means "to but excluding" and "through" means "through and including".

30.4 Entire Agreement. This LGIA, including all Appendices and Schedules attached hereto, constitutes the entire agreement between the Parties with reference to the subject matter hereof, and supersedes all prior and contemporaneous understandings or agreements, oral or written, between the Parties with respect to the subject matter of this LGIA. There are no other agreements, representations, warranties, or covenants which constitute any part of the consideration for, or any condition to, either Party's compliance with its obligations under this LGIA.

30.5 No Third Party Beneficiaries. This LGIA is not intended to and does not create rights, remedies, or benefits of any character whatsoever in favor of any persons, corporations, associations, or entities other than the Parties, and the obligations herein assumed are solely for the use and benefit of the Parties, their successors in interest and, where permitted, their assigns.

30.6 Waiver. The failure of a Party to this LGIA to insist, on any occasion, upon strict performance of any provision of this LGIA will not be considered a waiver of any obligation, right, or duty of, or imposed upon, such Party. Any waiver at any time by either Party of its rights with respect to this LGIA shall not be deemed a continuing waiver or a waiver with respect to any other failure to comply with any other obligation, right, duty of this LGIA. Termination or Default of this LGIA for any reason by Interconnection Customer shall not constitute a waiver of Interconnection Customer's legal rights to obtain an interconnection from Transmission Provider. Any waiver of this LGIA shall, if requested, be provided in writing.

30.7 Headings. The descriptive headings of the various Articles of this LGIA have been inserted for convenience of reference only and are of no significance in the interpretation or construction of this LGIA.

30.8 Multiple Counterparts. This LGIA may be executed in two or more counterparts, each of which is deemed an original but all constitute one and the same instrument.

30.9 Amendment. The Parties may by mutual agreement amend this LGIA by a written instrument duly executed by the Parties.

30.10 Modification by the Parties. The Parties may by mutual agreement amend the Appendices to this LGIA by a written instrument duly executed by the Parties. Such amendment shall become effective and a part of this LGIA upon satisfaction of all Applicable Laws and Regulations.

30.11 Reservation of Rights. Transmission Provider shall have the right to make a unilateral filing with FERC to modify this LGIA with respect to any rates, terms and conditions, charges, classifications of service, rule or regulation under section 205 or any other applicable provision of the Federal Power Act and FERC's rules and regulations thereunder, and Interconnection Customer shall have the right to make a unilateral filing with FERC to modify this LGIA pursuant to section 206 or any other applicable provision of the Federal Power Act and FERC's rules and regulations thereunder; provided that each Party shall have the right to protest any such filing by the other Party and to participate fully in any proceeding before FERC in which such modifications may be considered. Nothing in this LGIA shall limit the rights of the Parties or of FERC under sections 205 or 206 of the Federal Power Act and FERC's rules and regulations thereunder, except to the extent that the Parties otherwise mutually agree as provided herein.

30.12 No Partnership. This LGIA shall not be interpreted or construed to create an association, joint venture, agency relationship, or partnership between the Parties or to impose any partnership obligation or partnership liability upon either Party. Neither Party shall have any right, power or authority to enter into any agreement or undertaking for, or act on behalf of, or to act as or be an agent or representative of, or to otherwise bind, the other Party.

IN WITNESS WHEREOF, the Parties have executed this LGIA in duplicate originals, each of which shall constitute and be an original effective Agreement between the Parties.

PACIFICORP, on behalf of its Transmission function

Appendix A to LGIA

Interconnection Facilities, Network Upgrades and Distribution Upgrades

1. Interconnection Facilities:

(a) **Interconnection Customer's Interconnection Facilities:** Three (3) circuit breakers (one per step up transformer) connected to a short generator tie line for the Interconnection Customer collector substation to the Point of Interconnection (Shirley Basin) substation. Please see Exhibit 1 to Attachment A.

(b) **Transmission Provider's Interconnection Facilities:** Three (3) production meters located at the high side of the step up transformers at the Interconnection Customer collector substation as well as relaying and communications equipment, one (1) interchange meter at the Point of Change of Ownership, and one line position (dead end structure, disconnect switch, metering structure) located at the Point of Interconnection (Shirley Basin) substation. Please see Exhibit 1 to Attachment A.

2. Network Upgrades:

(a) **Stand Alone Network Upgrades:** None

(b) **Other Network Upgrades:** Five (5) new breakers and corresponding bus and relaying at Shirley basic substation, New line position at Aeolus substation for new transmission line from Shirley Basin substation, and new line from Shirley Basin to Aeolus substation.

3. Distribution Upgrades: None

4. Contingent Facilities: As identified in the System Impact Study for this project dated August 21, 2018 the following Network Upgrades are required to be in-service prior to this project:

- Segment D2 (500 kV line Aeolus-Anticline/Bridger). (Transmission Provider internal, 2020)

- A Remedial Action Scheme (“RAS”) for various 500 kV outages. (Transmission Provider internal, 2020)

If the schedule for completion of these upgrades changes the Transmission Provider reserves the right to restudy this project to determine any additional requirements to assign to this project necessary to facilitate interconnection of this project by the date required.

5. Point of Interconnection (“POI”): The point at which Transmission Provider Interconnection Facilities connect to the substation bus at the Shirley Basin substation (see Exhibit 1 to Appendix A).

6. Point of Change of Ownership: The point at which Interconnection Customer and Transmission Provider Interconnection Facilities meet (see Exhibit 1 to Appendix A)

7. One-Line Diagram: is attached to this agreement as Exhibit 1 to Appendix A.

8. **Estimated Project Cost:** $26,896,000
Direct Assigned: $1,660,000
Network Upgrade: $25,236,000

Appendix B To LGIA

Milestones

Milestone	**Party**
Execute Interconnection Agreement January 23, 2019	Interconnection Customer
Provision of Financial Security ($5,160,000) January 23, 2019	Interconnection Customer
Design Information Provided January 23, 2019	Interconnection Customer
Property/Permits/ROW Procured February 1, 2019	Interconnection Customer
Provide construction approval April 1, 2019	Interconnection Customer
**Energy Imbalance Market Modeling Data Submittal April 10, 2019	Interconnection Customer
Engineering Design Complete April 10, 2019	Transmission Provider
Construction Begins May 1, 2019	Transmission Provider
Facilities Receive Backfeed Power June 15, 2020	Interconnection Customer
***Contingent facilities complete October 1, 2020	Transmission Provider
Initial Synchronization and Generation Testing October 1, 2020	Interconnection Customer
Commercial Operation November 1, 2020	Interconnection Customer

*As applicable and determined by the Transmission Provider, within 60 days of the Interconnection Customer’s authorization for the Transmission Provider to begin engineering, the Interconnection Customer shall provide a detailed short circuit model of its generation system. This model must be constructed using the ASPEN One-Line short circuit simulation program and contain all individual electrical components of the Interconnection Customer's generation system.

**Any design modifications to the Interconnection Customer's Generating Facility after this date requiring updates to the Transmission Provider's network model will result in a minimum of 3 months added to all future milestones including Commercial Operation.

***Delays in completion of Contingent Facilities will impact the in-service date of the project.

Term of Agreement: In accordance with LGIA Article 2.2, the Parties agree that the term of the LGIA shall be ten (10) years from the Effective Date and shall be automatically renewed for each successive one-year period thereafter.

Construction Option: The Network Upgrades, Direct Assignment Facilities and Transmission Provider Interconnection Facilities will be designed, procured and constructed by the Transmission Provider in accordance with the Standard Option outlined in Article 5.1.1 of this Agreement. The Network Upgrades, Direct Assignment Facilities and Transmission Provider Interconnection Facilities shall be constructed in accordance with the Scope of Work attached to this LGIA as Exhibit 1 to Appendix B. The Network Upgrades, Direct Assignment Facilities and Transmission Provider's Interconnection Facilities shall be designed, procured and constructed in a timely manner to support the Milestone Dates stated above.

Appendix C To LGIA

Interconnection Details

Description of the Large Generating Facility: The Large Generating Facility consists of fourteen (14) Vestas V110 2.0 and fifty-three (53) Vestas V136 4.3 turbines connected to twelve (12) 34.5 kV strings for a total generation output of 250 MW as measured at the POI. The strings are then connected to a three (in parallel) 75/100/125 MVA 34.5 – 230 kV (7.5% impedance) transformers. The Large Generating Facility is located in Carbon County, Wyoming.

Please see Exhibit 1 to Attachment A.

Control Area Requirements: Interconnection Customer shall interconnect and operate the Large Generating Facility in accordance with the Transmission Provider's Facility Interconnection Requirements for Transmission Systems, as may be revised from time to time, attached hereto as Exhibit 1 to Appendix C and by this reference incorporated herein.

Interconnection Details:
Metering. With reference to Article 7.1, Transmission Provider will own and maintain the bi-directional revenue Metering Equipment in Transmission Provider's Point of Interconnection substation at the Interconnection Customer's expense.

Under Frequency and Over Frequency Conditions. Consistent with LGIA Article 9.7.3, Transmission Provider shall design, procure, install and maintain frequency and voltage protection to trip feeder breakers in accordance with the settings shown in Exhibit 1 to Appendix C.

Reactive Power and Voltage Schedule. All interconnecting synchronous and non-synchronous generators are required to design their Generating Facilities with reactive power capabilities necessary to operate within the full power factor range of 0.95 leading to 0.95 lagging. This power factor range shall be dynamic and can be met using a combination of the inherent dynamic reactive power capability of the generator or inverter, dynamic reactive power devices and static reactive power devices. For non-synchronous generators, the power factor requirement is to be measured at the high-side of the generator substation. The Generating Facility must provide dynamic reactive power to the system over the full range of real power output. If the Generating Facility is not capable of providing positive reactive support (i.e., supplying reactive power to the system) immediately following the removal of a fault or other transient low voltage perturbations, the facility will be required to add dynamic voltage support equipment. These additional dynamic reactive devices shall have correct protection settings such that the devices will remain on line and active during and immediately following a fault event.

Generators shall be equipped with automatic voltage-control equipment and normally operated with the voltage regulation control mode enabled unless written authorization, or directive, from the Transmission Provider is given to operate in another control mode (e.g., constant power factor control). The control mode of generating units shall be accurately represented in operating studies. The generators shall be capable of operating continuously at their rated power output within +/- 5% of its rated terminal voltage. Phasor Measurement Units will be required at any Generating Facilities with an individual or aggregate nameplate capacity of 75 MVA or greater.

As required by NERC standard VAR-001-1a, the Transmission Provider will provide a voltage schedule for the Point of Interconnection. In general, Generating Facilities should be operated so as to maintain the voltage at the Point of Interconnection, or other designated point as deemed appropriated by Transmission Provider, in accordance with Transmission Provider Policy 139.

Generating Facilities capable of operating with a voltage droop are required to do so. Studies will be required to coordinate voltage droop settings if there are other facilities in the area. It will be the Interconnection Customer’s responsibility to ensure that a voltage coordination study is performed, in coordination with Transmission Provider, and implemented with appropriate coordination settings prior to unit testing. If the need for a master controller is identified, the cost and all related installation requirements will be the responsibility of the Interconnection Customer. Participation by the Generation Facility in subsequent interaction/coordination studies will be required pre- and post-commercial operation in order ensure system reliability.

All generators must meet the Federal Energy Regulatory Commission (FERC) and WECC low voltage ride-through requirements.

As the Transmission Provider cannot submit a user written model to WECC for inclusion in base cases, a standard model from the WECC Approved Dynamic Model Library is required 180 days prior to trial operation. The list of approved generator models is continually updated and is available on the http://www.WECC.biz website.

Property Requirements. Subject to LGIA Articles 5.12 and 5.13, Interconnection Customer is required to obtain for the benefit of Transmission Provider at Interconnection Customer's sole cost and expense all real property rights, including but not limited to fee ownership, easements and/or rights of way, as applicable, for Transmission Provider owned facilities using forms acceptable to Transmission Provider. Transmission Provider shall not be obligated to accept any such real property right that does not, at Transmission Provider's sole discretion, confer sufficient rights to access, operate, construct, modify, maintain, place and remove Transmission Provider owned facilities or is otherwise conveyed using forms unacceptable to Transmission Provider. Further, all real property on which Transmission Provider's facilities are to be located must be environmentally, physically and operationally acceptable to the Transmission Provider in accordance with Good Utility Practice.

Subject to LGIA Article 5.14, Interconnection Customer is responsible for obtaining all permits required by all relevant jurisdictions for the project, including but not limited to, conditional use permits and construction permits; provided however, Transmission Provider shall obtain, at Interconnection Customer's cost and schedule risk, the permits necessary to construct Transmission Provider's facilities that are to be located on real property currently owned or held in fee or right by Transmission Provider.

Subject to applicable provisions in the Agreement and an express written waiver by an authorized officer of Transmission Provider, all of the foregoing permits and real property rights (conferring rights on real property that is environmentally, physically and operationally acceptable to Transmission Provider) shall be acquired as provided herein as a condition to Transmission Provider's contractual obligation to construct or take possession of facilities to be owned by the Transmission Provider under this Agreement. Transmission Provider shall have no liability for any project delays or cost overruns caused by delays in acquiring any of the foregoing permits and/or real property rights, whether such delay results from the failure to obtain such permits or rights or the failure of such permits or rights to meet the requirements set forth herein. Further, any completion dates, if any, set forth herein with regard to Transmission Provider's obligations shall be equitably extended based on the length and impact of any such delays.

With respect to the fiber optic cable on Interconnection Customer's tie line that will be owned by the Transmission Provider, the Interconnection Customer and the Transmission Provider agree that Transmission Provider's ownership and operation of fiber optic cable that is attached to poles or other structures that are owned or maintained by the Interconnection Customer is subject to LGIA Article 5.12, Good Utility Practice, and Transmission Provider's Interconnection Policy 139 (Exhibit 1 to Appendix C to LGIA).

Appendix D To LGIA

Security Arrangements Details

Infrastructure security of Transmission System equipment and operations and control hardware and software is essential to ensure day-to-day Transmission System reliability and operational security. FERC will expect all Transmission Providers, market participants, and Interconnection Customers interconnected to the Transmission System to comply with the recommendations offered by the President's Critical Infrastructure Protection Board and, eventually, best practice recommendations from the electric reliability authority. All public utilities will be expected to meet basic standards for system infrastructure and operational security, including physical, operational, and cyber-security practices.

Automatic Data Transfer. Throughout the term of this Agreement, Interconnection Customer shall provide the data specified below by automatic data transfer to the Transmission Provider Control Center specified by Transmission Provider or to a Third-Party System Operator designated by Transmission Provider (or both):

From the Interconnection Customer’s collector substation:

- Analogs:
  - Transformer # 1 real power
  - Transformer # 1 reactive power
  - Real power flow through 34.5 kV line feeder breaker 1
  - Reactive power flow through 34.5 kV line feeder breaker 1
  - Real power flow through 34.5 kV line feeder breaker 2
  - Reactive power flow through 34.5 kV line feeder breaker 2
  - Real power flow through 34.5 kV line feeder breaker 3
  - Reactive power flow through 34.5 kV line feeder breaker 3
  - Real power flow through 34.5 kV line feeder breaker 4
  - Reactive power flow through 34.5 kV line feeder breaker 4

- o Real power flow through 34.5 kV line feeder breaker 5
- o Reactive power flow through 34.5 kV line feeder breaker 5
- o Reactive power flow through 34.5 kV reactor breaker T1-R1
- o Reactive power flow through 34.5 kV capacitor breaker T1-C1
- o Transformer # 2 real power
- o Transformer # 2 reactive power
- o Real power flow through 34.5 kV line feeder breaker 6
- o Reactive power flow through 34.5 kV line feeder breaker 6
- o Real power flow through 34.5 kV line feeder breaker 7
- o Reactive power flow through 34.5 kV line feeder breaker 7
- o Real power flow through 34.5 kV line feeder breaker 8
- o Reactive power flow through 34.5 kV line feeder breaker 8
- o Real power flow through 34.5 kV line feeder breaker 9
- o Reactive power flow through 34.5 kV line feeder breaker 9
- o Real power flow through 34.5 kV line feeder breaker 10
- o Reactive power flow through 34.5 kV line feeder breaker 10
- o Reactive power flow through 34.5 kV reactor breaker T2-R1
- o Reactive power flow through 34.5 kV capacitor breaker T2-C1
- o Transformer # 3 real power
- o Transformer # 3 reactive power
- o Real power flow through 34.5 kV line feeder breaker 11
- o Reactive power flow through 34.5 kV line feeder breaker 11
- o Real power flow through 34.5 kV line feeder breaker 12
- o Reactive power flow through 34.5 kV line feeder breaker 12

   - o 34.5 kV collector circuit breaker 6
   - o 34.5 kV collector circuit breaker 7
   - o 34.5 kV collector circuit breaker 8
   - o 34.5 kV collector circuit breaker 9
   - o 34.5 kV collector circuit breaker 10
   - o 34.5 kV reactor circuit breaker T2-R1
   - o 34.5 kV capacitor circuit breaker T2-C1
   - o 230 kV breaker T3
   - o 34.5 kV collector circuit breaker 11
   - o 34.5 kV collector circuit breaker 12
   - o 34.5 kV reactor circuit breaker T3-R1
   - o 34.5 kV capacitor circuit breaker T3-C1

Billing Meter Data. Bi-directional revenue meter at the Point of Interconnection will not be configured to allow direct dial-up access by Interconnection Customer. The Transmission Provider will provide alternatives, at the Interconnection Customer’s expense, upon request.

Additional Data. Interconnection Customer shall, at its sole expense, provide any additional Generating Facility data reasonably required and necessary for the Transmission Provider to operate the Transmission System in accordance with Good Utility Practice and Exhibit 1 to Appendix C, Facility Interconnection Requirements for Transmission Systems.

Relay and Control Settings

If Interconnection Customer requires modifications to the settings associated with control/protective devices connected to the distribution and/or transmission system, Interconnection Customer will contact PacifiCorp and provide in writing the justification for the proposed modifications. This will allow PacifiCorp to analyze the modifications and ensure there will be no negative impacts to connected systems and customers. Any modifications of control and/or relay settings without review and acknowledgement of acceptance by PacifiCorp will be considered a breach of the Interconnection Agreement and grounds for disconnection from the PacifiCorp system.

Appendix E To LGIA

Commercial Operation Date

This Appendix E is a part of the LGIA between Transmission Provider and Interconnection Customer.

[Date]

[Transmission Provider Address]

Re: _______________ Large Generating Facility

Dear _______________:

On **[Date] [Interconnection Customer]** has completed Trial Operation of Unit No. __. This letter confirms that [Interconnection Customer] commenced Commercial Operation of Unit No. ___ at the Large Generating Facility, effective as of **[Date plus one day]**.

Thank you.

Appendix G to LGIA

INTERCONNECTION REQUIREMENTS FOR A WIND GENERATING PLANT

Appendix G sets forth requirements and provisions specific to a wind generating plant. All other requirements of this LGIA continue to apply to wind generating plant interconnections.

A. Technical Standards Applicable to a Wind Generating Plant

i. Low Voltage Ride-Through (LVRT) Capability

A wind generating plant shall be able to remain online during voltage disturbances up to the time periods and associated voltage levels set forth in the standard below. The LVRT standard provides for a transition period standard and a post-transition period standard.

Transition Period LVRT Standard

The transition period standard applies to wind generating plants subject to FERC Order 661 that have either: (i) interconnection agreements signed and filed with the Commission, filed with the Commission in unexecuted form, or filed with the Commission as non-conforming agreements between January 1, 2006 and December 31, 2006, with a scheduled in-service date no later than December 31, 2007, or (ii) wind generating turbines subject to a wind turbine procurement contract executed prior to December 31, 2005, for delivery through 2007.

1. Wind generating plants are required to remain in-service during three-phase faults with normal clearing (which is a time period of approximately 4 – 9 cycles) and single line to ground faults with delayed clearing, and subsequent post-fault voltage recovery to prefault voltage unless clearing the fault effectively disconnects the generator from the system. The clearing time requirement for a three-phase fault will be specific to the wind generating plant substation location, as determined by and documented by the transmission provider. The maximum clearing time the wind generating plant shall be required to withstand for a three-phase fault shall be 9 cycles at a voltage as low as 0.15 p.u., as measured at the high side of the wind generating

plant step-up transformer (i.e. the transformer that steps the voltage up to the transmission interconnection voltage or “GSU”), after which, if the fault remains following the location-specific normal clearing time for three-phase faults, the wind generating plant may disconnect from the transmission system.

2. This requirement does not apply to faults that would occur between the wind generator terminals and the high side of the GSU or to faults that would result in a voltage lower than 0.15 per unit on the high side of the GSU serving the facility.

3. Wind generating plants may be tripped after the fault period if this action is intended as part of a special protection system.

4. Wind generating plants may meet the LVRT requirements of this standard by the performance of the generators or by installing additional equipment (e.g., Static VAr Compensator, etc.) within the wind generating plant or by a combination of generator performance and additional equipment.

5. Existing individual generator units that are, or have been, interconnected to the network at the same location at the effective date of the Appendix G LVRT Standard are exempt from meeting the Appendix G LVRT Standard for the remaining life of the existing generation equipment. Existing individual generator units that are replaced are required to meet the Appendix G LVRT Standard.

Post-transition Period LVRT Standard

All wind generating plants subject to FERC Order No. 661 and not covered by the transition period described above must meet the following requirements:

1. Wind generating plants are required to remain in-service during three-phase faults with normal clearing (which is a time period of approximately 4 – 9 cycles) and single line to ground faults with delayed clearing, and subsequent post-fault voltage recovery to prefault voltage unless clearing the

fault effectively disconnects the generator from the system. The clearing time requirement for a three-phase fault will be specific to the wind generating plant substation location, as determined by and documented by the transmission provider. The maximum clearing time the wind generating plant shall be required to withstand for a three-phase fault shall be 9 cycles after which, if the fault remains following the location-specific normal clearing time for three-phase faults, the wind generating plant may disconnect from the transmission system. A wind generating plant shall remain interconnected during such a fault on the transmission system for a voltage level as low as zero volts, as measured at the high voltage side of the wind GSU.

2. This requirement does not apply to faults that would occur between the wind generator terminals and the high side of the GSU.

3. Wind generating plants may be tripped after the fault period if this action is intended as part of a special protection system.

4. Wind generating plants may meet the LVRT requirements of this standard by the performance of the generators or by installing additional equipment (e.g., Static VAr Compensator) within the wind generating plant or by a combination of generator performance and additional equipment.

5. Existing individual generator units that are, or have been, interconnected to the network at the same location at the effective date of the Appendix G LVRT Standard are exempt from meeting the Appendix G LVRT Standard for the remaining life of the existing generation equipment. Existing individual generator units that are replaced are required to meet the Appendix G LVRT Standard.

ii. Power Factor Design Criteria (Reactive Power)

The following reactive power requirements apply only to a newly interconnecting wind generating plant that has executed a Facilities Study Agreement as of the effective

date of the Final Rule establishing the reactive power requirements for non-synchronous generators in section 9.6.1 of this LGIA (Order No. 827). A wind generating plant to which this provision applies shall maintain a power factor within the range of 0.95 leading to 0.95 lagging, measured at the Point of Interconnection as defined in this LGIA, if the Transmission Provider's System Impact Study shows that such a requirement is necessary to ensure safety or reliability. The power factor range standard can be met by using, for example, power electronics designed to supply this level of reactive capability (taking into account any limitations due to voltage level, real power output, etc.) or fixed and switched capacitors if agreed to by the Transmission Provider, or a combination of the two. The Interconnection Customer shall not disable power factor equipment while the wind plant is in operation. Wind plants shall also be able to provide sufficient dynamic voltage support in lieu of the power system stabilizer and automatic voltage regulation at the generator excitation system if the System Impact Study shows this to be required for system safety or reliability.

iii. Supervisory Control and Data Acquisition (SCADA) Capability

The wind plant shall provide SCADA capability to transmit data and receive instructions from the Transmission Provider to protect system reliability. The Transmission Provider and the wind plant Interconnection Customer shall determine what SCADA information is essential for the proposed wind plant, taking into account the size of the plant and its characteristics, location, and importance in maintaining generation resource adequacy and transmission system reliability in its area.

Exhibit 1 to Appendix A to LGIA

One-Line Diagram

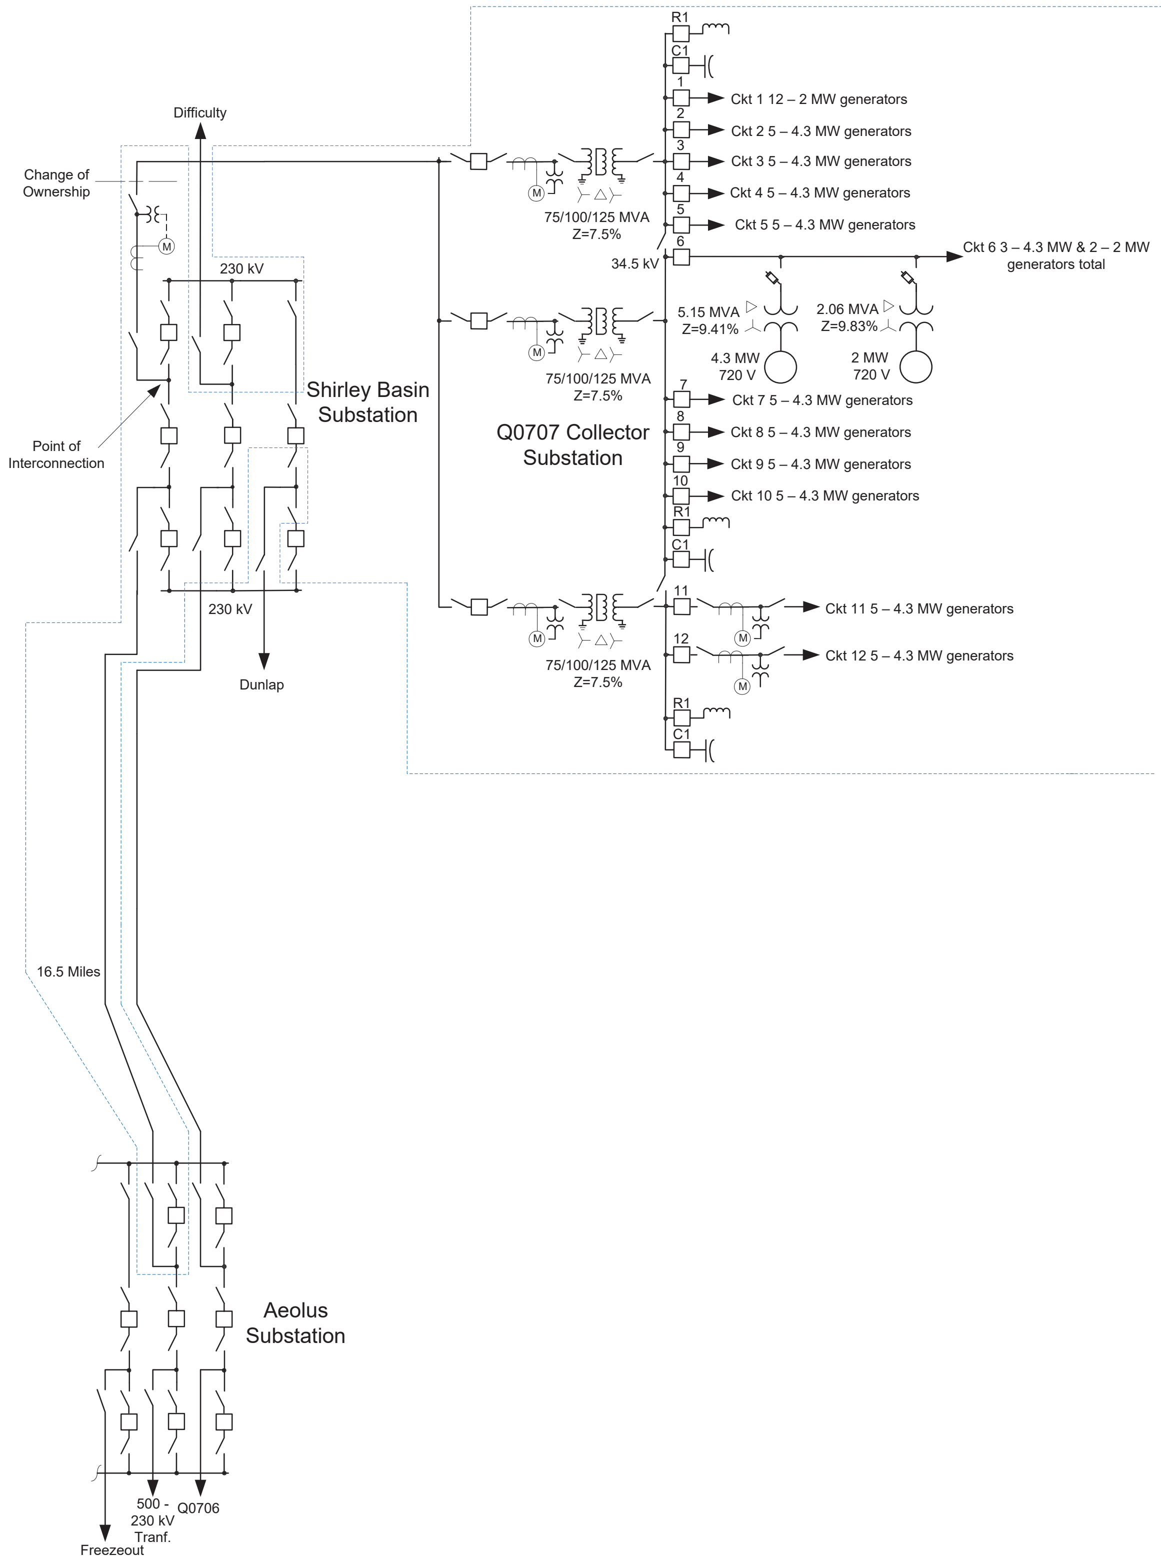

Exhibit 1 to Appendix B to LGIA

Scope of Work

Generating Facility Modifications

The following outlines the design, procurement, construction, installation, and ownership of equipment at the Interconnection Customer’s Generation Facility.

Interconnection Customer to be Responsible For

- Procure all necessary permits, lands, rights of way and easements required for the construction and continued maintenance of the Large Generating Facility and collector substation.
- Design, procure, construct, own and maintain the Interconnection Customer’s collector substation adjacent (less than 800’) to the POI substation. The segment between the collector substation and the POI substation will be considered a bus section and will be protected with redundant bus differential relay systems. The bus differential relays will be located in the POI substation.
- Design the Generating Facility with reactive power capabilities necessary to operate within the full power factor range of 0.95 leading to 0.95 lagging as measured at the high side of the Interconnection Customer’s GSU transformer. This power factor range shall be dynamic and can be met using a combination of the inherent dynamic reactive power capability of the generator or inverter, dynamic reactive power devices and static reactive power devices to make up for losses.
- Design the generating facility such that it can provide positive reactive support (i.e., supply reactive power to the system) immediately following the removal of a fault or other transient low voltage perturbations or install dynamic voltage support equipment. These additional dynamic reactive devices shall have correct protection settings such that the devices will remain on line and active during and immediately following a fault event.
- Equip the Generating Facility with automatic voltage-control equipment and operate with the voltage regulation control mode enabled unless explicitly authorized to operate another control mode by the Transmission Provider.

- Install a Phasor Measurement Unit to collect data from the Project. The data must be collected and be able to stream to the Planning Coordinator for each of the Generator Facility's step-up transformers measured on the low side of the GSU at a sample rate of at least 30 samples per second and synchronized within +/- 2 milliseconds of the Coordinated Universal Time (UTC). Initially, the following data must be collected:
  - o Three phase voltage and voltage angle (analog)
  - o Three phase current (analog)

  Data requirements are subject to change as deemed necessary to comply with local and federal regulations.
- Operate the Generating Facility so as to maintain the voltage at the POI, or other designated point as deemed appropriate by Transmission Provider, at a voltage schedule to be provided by the Transmission Provider following testing.
- Operate the Generating Facility with a voltage droop.
- Participate in any Transmission Provider required studies, such as a voltage coordination study. Any additional requirements identified in these studies will be the responsibility of the Interconnection Customer.
- Meet the Federal Energy Regulatory Commission (FERC) and WECC low voltage ride-through requirements as specified in the interconnection agreement.
- Provide the Transmission Provider a standard model from the WECC Approved Dynamic Model Library.
- Design the collector substation such that the ground grid can be connected to the POI substation ground grid to support the installation of a Transmission Provider owned and maintained bus differential scheme. The Interconnect Customer is responsible to ensure the ground grid design supports safe step and touch potentials.
- Design, provide and install conduits between the Interconnection Customer collector substation and the marshalling cabinet just inside the fence of the POI substation to support hard-wired circuits installed between the facilities.
- Design, provide and install control cabling (number and size TBD) and hard wire the Interconnection Customer's source devices to the marshalling cabinet. Replicated values are not acceptable.

- Provide and install complete conduit system, as designed by Transmission Provider, from each Transmission Provider metering instrument transformer to the POI substation marshalling cabinet just inside the fence of the POI substation.
- Provide and install complete conduit system, as designed by Transmission Provider, from each Transmission Provider metering instrument transformer to the POI substation marshalling cabinet just inside the fence of the POI substation.
- Install two sets of current transformers ("CT") from the 230 kV transformers and provide the output to be fed into the Transmission Provider's bus differential relays with current transformer ratio matching the CT ratio of the breakers at the POI substation.
- Provide the following data points from the collector substation via hardwire to the marshalling cabinet located in the POI substation:

  Analogs:

  - Transformer # 1 real power
  - Transformer # 1 reactive power
  - Real power flow through 34.5 kV line feeder breaker 1
  - Reactive power flow through 34.5 kV line feeder breaker 1
  - Real power flow through 34.5 kV line feeder breaker 2
  - Reactive power flow through 34.5 kV line feeder breaker 2
  - Real power flow through 34.5 kV line feeder breaker 3
  - Reactive power flow through 34.5 kV line feeder breaker 3
  - Real power flow through 34.5 kV line feeder breaker 4
  - Reactive power flow through 34.5 kV line feeder breaker 4
  - Real power flow through 34.5 kV line feeder breaker 5
  - Reactive power flow through 34.5 kV line feeder breaker 5
  - Reactive power flow through 34.5 kV reactor breaker T1-R1
  - Reactive power flow through 34.5 kV capacitor breaker T1-C1
  - Transformer # 2 real power
  - Transformer # 2 reactive power

- Real power flow through 34.5 kV line feeder breaker 6
- Reactive power flow through 34.5 kV line feeder breaker 6
- Real power flow through 34.5 kV line feeder breaker 7
- Reactive power flow through 34.5 kV line feeder breaker 7
- Real power flow through 34.5 kV line feeder breaker 8
- Reactive power flow through 34.5 kV line feeder breaker 8
- Real power flow through 34.5 kV line feeder breaker 9
- Reactive power flow through 34.5 kV line feeder breaker 9
- Real power flow through 34.5 kV line feeder breaker 10
- Reactive power flow through 34.5 kV line feeder breaker 10
- Reactive power flow through 34.5 kV reactor breaker T2-R1
- Reactive power flow through 34.5 kV capacitor breaker T2-C1
- Transformer # 3 real power
- Transformer # 3 reactive power
- Real power flow through 34.5 kV line feeder breaker 11
- Reactive power flow through 34.5 kV line feeder breaker 11
- Real power flow through 34.5 kV line feeder breaker 12
- Reactive power flow through 34.5 kV line feeder breaker 12
- Reactive power flow through 34.5 kV reactor breaker T3-R1
- Reactive power flow through 34.5 kV capacitor breaker T3-C1
- Average Plant Wind speed
- Average Plant Atmospheric Pressure (Bar)
- Average Plant Temperature (Celsius)

Status:

- 230 kV breaker T1
- 34.5 kV collector circuit breaker 1
- 34.5 kV collector circuit breaker 2
- 34.5 kV collector circuit breaker 3
- 34.5 kV collector circuit breaker 4

  - o 34.5 kV collector circuit breaker 5
  - o 34.5 kV reactor circuit breaker T1-R1
  - o 34.5 kV capacitor circuit breaker T1-C1
  - o 230 kV breaker T2
  - o 34.5 kV collector circuit breaker 6
  - o 34.5 kV collector circuit breaker 7
  - o 34.5 kV collector circuit breaker 8
  - o 34.5 kV collector circuit breaker 9
  - o 34.5 kV collector circuit breaker 10
  - o 34.5 kV reactor circuit breaker T2-R1
  - o 34.5 kV capacitor circuit breaker T2-C1
  - o 230 kV breaker T3
  - o 34.5 kV collector circuit breaker 11
  - o 34.5 kV collector circuit breaker 12
  - o 34.5 kV reactor circuit breaker T3-R1
  - o 34.5 kV capacitor circuit breaker T3-C1
- Provide and install conductor, shield wire and line hardware in sufficient quantities to allow the Transmission Provider to terminate the segment running from the collector substation deadend structure into the POI substation deadend structure.
- Provide Transmission Provider unfettered and maintained access to all of the Transmission Provider’s metering instrument transformers.
- Arrange for and provide permanent retail service for power that will flow from the Transmission Provider’s system when the Project is not generating with the retail service provider in this area. This will require the retail service provider to obtain transmission service from the Transmission Provider. These arrangements must be in place prior to approval for backfeed.
- Provide any construction or backup retail service necessary for the Project.
- The Transmission Provider recommends that the Interconnection Customer perform special studies and provide documentation that its turbines have been equipped with SSCI functionality.

TRANSMISSION PROVIDER TO BE RESPONSIBLE FOR

- Provide the Interconnection Customer the designated point at which the voltage is to be maintained and the associated voltage schedule.
- Identify any necessary studies that the Interconnection Customer must participate in.
- Identify the values to be stored in the PMU.

- Procure, install, own and maintain 230 kV instrument transformers on the high side of each of the three Interconnection Customer step up transformers.
- Procure, install, own and maintain 34.5 kV instrument transformers on the low side of the Interconnection Customer step up transformer 3 on circuits 11 and 12.
- Design complete conduit and control cable from each Transmission Provider metering instrument transformer to the POI substation marshalling cabinet just inside the fence of the POI substation.
- Install metering control cable in metering conduit system installed by Interconnection Customer.

Point of Interconnection

The following outlines the design, procurement, construction, installation, and ownership of equipment at the POI.

Interconnection Customer to be Responsible For

- Assist the Transmission Provider as necessary in the procurement of any property rights necessary to expand the substation.

Transmission Provider to be Responsible For

- Procure all necessary permits, property rights and/or rights of way to allow for the expansion of the substation.
- Expand the existing substation to allow for the breaker and a half scheme to be completed and to create two new line positions.
- Design, procure, construct, own and maintain the following major equipment:
  - (7) – 230kV circuit breakers
  - (5) – 230kV, CCVT's
  - (3) – 230 kV, combined CT/VT metering unit
  - (15) – 230kV, switch, breaker disconnect
  - (3) – 230 kV, switch, line disconnect
  - (1) – 230 kV, switch, meter disconnect
  - (6) – 230kV, surge arresters
  - (1) – Marshalling cabinet
- Terminate the new transmission line running from Aeolus substation in a new line position.
- Terminate the last bus/line segment running from the Interconnection Customer's collector substation deadend structure into the POI substation deadend

structure using Interconnection Customer provided and installed conductor, shield wire and line hardware.

- Procure and install a marshalling cabinet near the Interconnection Customer's collector substation.
- Provide and install conduit and control cabling between the marshalling cabinet and the control building and bus differential cabinet.
- Design, procure and install two bus differential relay systems for the connection to the Interconnection Customer's collector substation.
- Modify existing relay elements to monitor under/over voltage and over/under frequency of the Generating Facility.
- Procure and install a line current differential relay system for protection of the new transmission line to Aeolus substation.
- Reconnect the relays installed for protection of the transmission line running to Dunlap substation to the new 230 kV circuit breakers.
- Include all the data points provided by the Interconnection Customer from its collector substation as well as the following data points from the new POI substation into the new substation RTU:
  Analogs:
  - o New Generation MW
  - o Net Generator MVAr
  - o Energy Register
- Provide and install fiber between the control building and the OPGW to be installed on the new transmission line running to Aeolus substation. Terminate the fiber in the control building communications rack.
- Design, procure and install revenue metering equipment to serve as the overall Project interchange metering including two (2) revenue quality meters, test switch, 230 kV instrument transformers, metering panels, junction box and secondary metering wire.
- Design, procure and install three sets of 230 kV revenue metering equipment for each of the Interconnection Customer's step up transformers including two revenue quality meters, test switches, metering panels, junction box and secondary metering wire for each transformer.
- Design, procure and install two sets of 34.5 kV revenue metering equipment for the Interconnection Customer's circuits 11 and 12 including two revenue

quality meters, test switches, metering panels, junction box and secondary metering wire for each transformer.

- Design, provide, and install the control cabling running from the five sets of instrument transformers installed in the Interconnection Customer's collector substation.
- If requested, install a metering cabinet on the exterior of the POI substation fence in order to provide a Modbus or DNP output from the bidirectional meters to the retail service provider. The Transmission Provider will install an underground communication wire from the POI substation control building to the meter panel.
- Establish an Ethernet connection for retail sales and generation accounting via the MV-90 translation system.

Other

The following outlines the design, procurement, construction, installation, and ownership of equipment past the POI.

Transmission Provider to be Responsible For

- Aeolus-Shirley Basin #2 Transmission Line
  - o Procure any necessary rights of way, easements and/or permits to allow the construction of a new transmission line between Shirley Basin and Aeolus substation.
  - o Construct, own and maintain an approximately 16.5 mile 230 kV transmission line using double bundled 1158.4 ACSS/TW (Hudson) conductor between Shirley Basin and Aeolus substations.
  - o Install, own and maintained OPGW fiber optic cable on the entire length of the transmission line.
- Aeolus Substation
  - o Procure and install the necessary equipment to create a new line position for the line running from Shirley Basin substation including the following major equipment:
    - (1) – 230kV, circuit breaker
    - (3) – 230kV, CCVT's
    - (2) – 230kV, switch, breaker disconnect
    - (1) – 230 kV, switch, line disconnect
    - (3) – 230kV, surge arresters
  - o Terminate the new transmission line running from Shirley Basin substation in the new line position.

  - Procure and install a line current differential relay system for protection of the new transmission line to Shirley Basin substation.
  - Procure and install the necessary communication equipment to tie in the OPGW as well as to support protective relaying.
  - Provide and install fiber between the control building and the OPGW to be installed on the new transmission line running to Shirley Basin substation. Terminate the fiber in the control building communications rack.
- Remedial Action Scheme
  - Make the necessary adjustments to the Aeolus RAS assumed to be developed as part of an earlier queued project to add the Project. The Project will be tripped for various 500 kV outage scenarios associated with the Transmission Provider's planned Gateway West and Gateway South transmission lines. The RAS master controller will be installed in Aeolus substation. Primary communications to the Project will be on the existing fiber optic cable installed on the Aeolus-Shirley Basin #1 transmission line. The redundant communication will be on the new fiber optic cable on the Aeolus-Shirley Basin #2 transmission line.
  - If necessary, present for approval any generator tripping/load reduction schemes to the WECC Remedial Action Scheme Reliability Subcommittee ("RASRS").
- System Operations Centers
  - Update databases of the inclusion of the Project.

STANDARD LARGE GENERATOR

INTERCONNECTION AGREEMENT (LGIA)
between
PACIFICORP, on behalf of its Transmission function
and
PACIFICORP, on behalf of its Marketing function
TB Flats II – Q708

TABLE OF CONTENTS

STANDARD LARGE GENERATOR INTERCONNECTION AGREEMENT

THIS STANDARD LARGE GENERATOR INTERCONNECTION AGREEMENT ("Agreement") is made and entered into this 19th day of February, 20 19 by and between PacifiCorp, on behalf of its Marketing function, a corporation organized and existing under the laws of the State of Oregon ("Interconnection Customer") with a Large Generating Facility), and PacifiCorp, on behalf of its Transmission function, a corporation organized and existing under the laws of the State of Oregon ("Transmission Provider and/or Transmission Owner"). Interconnection Customer and Transmission Provider each may be referred to as a "Party" or collectively as the "Parties."

Recitals

WHEREAS, Transmission Provider operates the Transmission System; and

WHEREAS, Interconnection Customer intends to own, lease and/or control and operate the Generating Facility identified as a Large Generating Facility in Appendix C to this Agreement; and,

WHEREAS, Interconnection Customer and Transmission Provider have agreed to enter into this Agreement for the purpose of interconnecting the Large Generating Facility with the Transmission System;

NOW, THEREFORE, in consideration of and subject to the mutual covenants contained herein, it is agreed:

When used in this Standard Large Generator Interconnection Agreement, terms with initial capitalization that are not defined in Article 1 shall have the meanings specified in the Article in which they are used or the Open Access Transmission Tariff (Tariff).

Article 1. Definitions

Adverse System Impact shall mean the negative effects due to technical or operational limits on conductors or equipment being exceeded that may compromise the safety and reliability of the electric system.

Affected System shall mean an electric system other than the Transmission Provider's Transmission System that may be affected by the proposed interconnection.

Affected System Operator shall mean the entity that operates an Affected System.

Affiliate shall mean, with respect to a corporation, partnership or other entity, each such other corporation, partnership or other entity that directly or indirectly, through one or more intermediaries, controls, is controlled by, or is under common control with, such corporation, partnership or other entity.

Ancillary Services shall mean those services that are necessary to support the transmission of capacity and energy from resources to loads while maintaining reliable operation of the Transmission Provider's Transmission System in accordance with Good Utility Practice.

Applicable Laws and Regulations shall mean all duly promulgated applicable federal, state and local laws, regulations, rules, ordinances, codes, decrees, judgments, directives, or judicial or administrative orders, permits and other duly authorized actions of any Governmental Authority.

Applicable Reliability Council shall mean the reliability council applicable to the Transmission System to which the Generating Facility is directly interconnected.

Applicable Reliability Standards shall mean the requirements and guidelines of NERC, the Applicable Reliability Council, and the Control Area of the Transmission System to which the Generating Facility is directly interconnected.

Base Case shall mean the base case power flow, short circuit, and stability data bases used for the Interconnection Studies by the Transmission Provider or Interconnection Customer.

Breach shall mean the failure of a Party to perform or observe any material term or condition of the Standard Large Generator Interconnection Agreement.

Breaching Party shall mean a Party that is in Breach of the Standard Large Generator Interconnection Agreement.

Business Day shall mean Monday through Friday, excluding Federal Holidays.

Calendar Day shall mean any day including Saturday, Sunday or a Federal Holiday.

Clustering shall mean the process whereby a group of Interconnection Requests is studied together, instead of serially, for the purpose of conducting the Interconnection System Impact Study.

Commercial Operation shall mean the status of a Generating Facility that has commenced generating electricity for sale, excluding electricity generated during Trial Operation.

Commercial Operation Date of a unit shall mean the date on which the Generating Facility commences Commercial Operation as agreed to by the Parties pursuant to Appendix E to the Standard Large Generator Interconnection Agreement.

Confidential Information shall mean any confidential, proprietary or trade secret information of a plan, specification, pattern, procedure, design, device, list, concept, policy or compilation relating to the present or planned business of a Party, which is designated as confidential by the Party supplying the information, whether conveyed orally, electronically, in writing, through inspection, or otherwise.

Control Area shall mean an electrical system or systems bounded by interconnection metering and telemetry, capable of controlling generation to maintain its interchange schedule with other Control Areas and contributing to frequency regulation of the interconnection. A Control Area must be certified by the Applicable Reliability Council.

Default shall mean the failure of a Breaching Party to cure its Breach in accordance with Article 17 of the Standard Large Generator Interconnection Agreement.

Dispute Resolution shall mean the procedure for resolution of a dispute between the Parties in which they will first attempt to resolve the dispute on an informal basis.

Distribution System shall mean the Transmission Provider's facilities and equipment used to transmit electricity to ultimate usage points such as homes and industries directly from nearby generators or from interchanges with higher voltage transmission networks which transport bulk power over longer distances. The voltage levels at which distribution systems operate differ among areas.

Distribution Upgrades shall mean the additions, modifications, and upgrades to the Transmission Provider's Distribution System at or beyond the Point of Interconnection to facilitate interconnection of the Generating Facility and render the transmission service necessary to effect Interconnection Customer's wholesale sale of electricity in interstate commerce. Distribution Upgrades do not include Interconnection Facilities.

Effective Date shall mean the date on which the Standard Large Generator Interconnection Agreement becomes effective upon execution by the Parties subject to acceptance by FERC, or if filed unexecuted, upon the date specified by FERC.

Emergency Condition shall mean a condition or situation: (1) that in the judgment of the Party making the claim is imminently likely to endanger life or property; or (2) that, in the case of a Transmission Provider, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to Transmission Provider's Transmission System, Transmission Provider's Interconnection Facilities or the electric systems of others to which the Transmission Provider's Transmission System is directly connected; or (3) that, in the case of Interconnection Customer, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to, the Generating Facility or

Interconnection Customer's Interconnection Facilities. System restoration and black start shall be considered Emergency Conditions; provided, that Interconnection Customer is not obligated by the Standard Large Generator Interconnection Agreement to possess black start capability.

Energy Resource Interconnection Service shall mean an Interconnection Service that allows the Interconnection Customer to connect its Generating Facility to the Transmission Provider's Transmission System to be eligible to deliver the Generating Facility's electric output using the existing firm or nonfirm capacity of the Transmission Provider's Transmission System on an as available basis. Energy Resource Interconnection Service in and of itself does not convey transmission service.

Engineering & Procurement (E&P) Agreement shall mean an agreement that authorizes the Transmission Provider to begin engineering and procurement of long lead-time items necessary for the establishment of the interconnection in order to advance the implementation of the Interconnection Request.

Environmental Law shall mean Applicable Laws or Regulations relating to pollution or protection of the environment or natural resources.

Federal Power Act shall mean the Federal Power Act, as amended, 16 U.S.C. §§ 791a et seq.

FERC shall mean the Federal Energy Regulatory Commission (Commission) or its successor.

Force Majeure shall mean any act of God, labor disturbance, act of the public enemy, war, insurrection, riot, fire, storm or flood, explosion, breakage or accident to machinery or equipment, any order, regulation or restriction imposed by governmental, military or lawfully established civilian authorities, or any other cause beyond a Party's control. A Force Majeure event does not include acts of negligence or intentional wrongdoing by the Party claiming Force Majeure.

Generating Facility shall mean Interconnection Customer's device for the production of electricity identified in the Interconnection Request, but shall not

include the Interconnection Customer's Interconnection Facilities.

Generating Facility Capacity shall mean the net capacity of the Generating Facility and the aggregate net capacity of the Generating Facility where it includes multiple energy production devices.

Good Utility Practice shall mean any of the practices, methods and acts engaged in or approved by a significant portion of the electric industry during the relevant time period, or any of the practices, methods and acts which, in the exercise of reasonable judgment in light of the facts known at the time the decision was made, could have been expected to accomplish the desired result at a reasonable cost consistent with good business practices, reliability, safety and expedition. Good Utility Practice is not intended to be limited to the optimum practice, method, or act to the exclusion of all others, but rather to be acceptable practices, methods, or acts generally accepted in the region.

Governmental Authority shall mean any federal, state, local or other governmental regulatory or administrative agency, court, commission, department, board, or other governmental subdivision, legislature, rulemaking board, tribunal, or other governmental authority having jurisdiction over the Parties, their respective facilities, or the respective services they provide, and exercising or entitled to exercise any administrative, executive, police, or taxing authority or power; provided, however, that such term does not include Interconnection Customer, Transmission Provider, or any Affiliate thereof.

Hazardous Substances shall mean any chemicals, materials or substances defined as or included in the definition of "hazardous substances," "hazardous wastes," "hazardous materials," "hazardous constituents," "restricted hazardous materials," "extremely hazardous substances," "toxic substances," "radioactive substances," "contaminants," "pollutants," "toxic pollutants" or words of similar meaning and regulatory effect under any applicable Environmental Law, or any other chemical, material or substance, exposure to which is prohibited, limited or regulated by any applicable Environmental Law.

Initial Synchronization Date shall mean the date upon which the Generating Facility is initially synchronized and upon which Trial Operation begins.

In-Service Date shall mean the date upon which the Interconnection Customer reasonably expects it will be ready to begin use of the Transmission Provider's Interconnection Facilities to obtain back feed power.

Interconnection Customer shall mean any entity, including the Transmission Provider, Transmission Owner or any of the Affiliates or subsidiaries of either, that proposes to interconnect its Generating Facility with the Transmission Provider's Transmission System.

Interconnection Customer's Interconnection Facilities shall mean all facilities and equipment, as identified in Appendix A of the Standard Large Generator Interconnection Agreement, that are located between the Generating Facility and the Point of Change of Ownership, including any modification, addition, or upgrades to such facilities and equipment necessary to physically and electrically interconnect the Generating Facility to the Transmission Provider's Transmission System. Interconnection Customer's Interconnection Facilities are sole use facilities.

Interconnection Facilities shall mean the Transmission Provider's Interconnection Facilities and the Interconnection Customer's Interconnection Facilities. Collectively, Interconnection Facilities include all facilities and equipment between the Generating Facility and the Point of Interconnection, including any modification, additions or upgrades that are necessary to physically and electrically interconnect the Generating Facility to the Transmission Provider's Transmission System. Interconnection Facilities are sole use facilities and shall not include Distribution Upgrades, Stand Alone Network Upgrades or Network Upgrades.

Interconnection Facilities Study shall mean a study conducted by the Transmission Provider or a third party consultant for the Interconnection Customer to determine a list of facilities (including Transmission Provider's Interconnection Facilities and Network Upgrades as identified in the Interconnection System Impact Study), the cost of those facilities, and the time required to interconnect the Generating Facility with the Transmission

Provider's Transmission System. The scope of the study is defined in Section 43 of the Standard Large Generator Interconnection Procedures.

Interconnection Facilities Study Agreement shall mean the form of agreement contained in Appendix 4 of the Standard Large Generator Interconnection Procedures for conducting the Interconnection Facilities Study.

Interconnection Feasibility Study shall mean a preliminary evaluation of the system impact and cost of interconnecting the Generating Facility to the Transmission Provider's Transmission System, the scope of which is described in Section 41 of the Standard Large Generator Interconnection Procedures.

Interconnection Feasibility Study Agreement shall mean the form of agreement contained in Appendix 2 of the Standard Large Generator Interconnection Procedures for conducting the Interconnection Feasibility Study.

Interconnection Request shall mean an Interconnection Customer's request, in the form of Appendix 1 to the Standard Large Generator Interconnection Procedures, in accordance with the Tariff, to interconnect a new Generating Facility, or to increase the capacity of, or make a Material Modification to the operating characteristics of, an existing Generating Facility that is interconnected with the Transmission Provider's Transmission System.

Interconnection Service shall mean the service provided by the Transmission Provider associated with interconnecting the Interconnection Customer's Generating Facility to the Transmission Provider's Transmission System and enabling it to receive electric energy and capacity from the Generating Facility at the Point of Interconnection, pursuant to the terms of the Standard Large Generator Interconnection Agreement and, if applicable, the Transmission Provider's Tariff.

Interconnection Study shall mean any of the following studies: the Interconnection Feasibility Study, the Interconnection System Impact Study, and the Interconnection Facilities Study described in the Standard Large Generator Interconnection Procedures.

Interconnection System Impact Study shall mean an engineering study that evaluates the impact of the proposed interconnection on the safety and reliability of Transmission Provider's Transmission System and, if applicable, an Affected System. The study shall identify and detail the system impacts that would result if the Generating Facility were interconnected without project modifications or system modifications, focusing on the Adverse System Impacts identified in the Interconnection Feasibility Study, or to study potential impacts, including but not limited to those identified in the Scoping Meeting as described in the Standard Large Generator Interconnection Procedures.

Interconnection System Impact Study Agreement shall mean the form of agreement contained in Appendix 3 of the Standard Large Generator Interconnection Procedures for conducting the Interconnection System Impact Study.

IRS shall mean the Internal Revenue Service.

Joint Operating Committee shall be a group made up of representatives from Interconnection Customers and the Transmission Provider to coordinate operating and technical considerations of Interconnection Service.

Large Generating Facility shall mean a Generating Facility having a Generating Facility Capacity of more than 20 MW.

Loss shall mean any and all losses relating to injury to or death of any person or damage to property, demand, suits, recoveries, costs and expenses, court costs, attorney fees, and all other obligations by or to third parties, arising out of or resulting from the other Party's performance, or non-performance of its obligations under the Standard Large Generator Interconnection Agreement on behalf of the indemnifying Party, except in cases of gross negligence or intentional wrongdoing by the indemnifying Party.

Material Modification shall mean those modifications that have a material impact on the cost or timing of any Interconnection Request with a later queue priority date.

Metering Equipment shall mean all metering equipment installed or to be installed at the Generating Facility

pursuant to the Standard Large Generator Interconnection Agreement at the metering points, including but not limited to instrument transformers, MWh-meters, data acquisition equipment, transducers, remote terminal unit, communications equipment, phone lines, and fiber optics.

NERC shall mean the North American Electric Reliability Council or its successor organization.

Network Resource shall mean any designated generating resource owned, purchased, or leased by a Network Customer under the Network Integration Transmission Service Tariff. Network Resources do not include any resource, or any portion thereof, that is committed for sale to third parties or otherwise cannot be called upon to meet the Network Customer's Network Load on a non-interruptible basis.

Network Resource Interconnection Service shall mean an Interconnection Service that allows the Interconnection Customer to integrate its Large Generating Facility with the Transmission Provider's Transmission System (1) in a manner comparable to that in which the Transmission Provider integrates its generating facilities to serve native load customers; or (2) in an RTO or ISO with market based congestion management, in the same manner as Network Resources. Network Resource Interconnection Service in and of itself does not convey transmission service.

Network Upgrades shall mean the additions, modifications, and upgrades to the Transmission Provider's Transmission System required at or beyond the point at which the Interconnection Facilities connect to the Transmission Provider's Transmission System to accommodate the interconnection of the Large Generating Facility to the Transmission Provider's Transmission System.

Notice of Dispute shall mean a written notice of a dispute or claim that arises out of or in connection with the Standard Large Generator Interconnection Agreement or its performance.

Optional Interconnection Study shall mean a sensitivity analysis based on assumptions specified by the Interconnection Customer in the Optional Interconnection Study Agreement.

Optional Interconnection Study Agreement shall mean the form of agreement contained in Appendix 5 of the Standard Large Generator Interconnection Procedures for conducting the Optional Interconnection Study.

Party or Parties shall mean Transmission Provider, Transmission Owner, Interconnection Customer or any combination of the above.

Point of Change of Ownership shall mean the point, as set forth in Appendix A to the Standard Large Generator Interconnection Agreement, where the Interconnection Customer's Interconnection Facilities connect to the Transmission Provider's Interconnection Facilities.

Point of Interconnection shall mean the point, as set forth in Appendix A to the Standard Large Generator Interconnection Agreement, where the Interconnection Facilities connect to the Transmission Provider's Transmission System.

Queue Position shall mean the order of a valid Interconnection Request, relative to all other pending valid Interconnection Requests, that is established based upon the date and time of receipt of the valid Interconnection Request by the Transmission Provider.

Reasonable Efforts shall mean, with respect to an action required to be attempted or taken by a Party under the Standard Large Generator Interconnection Agreement, efforts that are timely and consistent with Good Utility Practice and are otherwise substantially equivalent to those a Party would use to protect its own interests.

Scoping Meeting shall mean the meeting between representatives of the Interconnection Customer and Transmission Provider conducted for the purpose of discussing alternative interconnection options, to exchange information including any transmission data and earlier study evaluations that would be reasonably expected to impact such interconnection options, to analyze such information, and to determine the potential feasible Points of Interconnection.

Site Control shall mean documentation reasonably demonstrating: (1) ownership of, a leasehold interest in, or a right to develop a site for the purpose of

constructing the Generating Facility; (2) an option to purchase or acquire a leasehold site for such purpose; or (3) an exclusivity or other business relationship between Interconnection Customer and the entity having the right to sell, lease or grant Interconnection Customer the right to possess or occupy a site for such purpose.

Small Generating Facility shall mean a Generating Facility that has a Generating Facility Capacity of no more than 20 MW.

Stand Alone Network Upgrades shall mean Network Upgrades that an Interconnection Customer may construct without affecting day-to-day operations of the Transmission System during their construction. Both the Transmission Provider and the Interconnection Customer must agree as to what constitutes Stand Alone Network Upgrades and identify them in Appendix A to the Standard Large Generator Interconnection Agreement.

Standard Large Generator Interconnection Agreement (LGIA) shall mean the form of interconnection agreement applicable to an Interconnection Request pertaining to a Large Generating Facility that is included in the Transmission Provider's Tariff.

Standard Large Generator Interconnection Procedures (LGIP) shall mean the interconnection procedures applicable to an Interconnection Request pertaining to a Large Generating Facility that are included in the Transmission Provider's Tariff.

System Protection Facilities shall mean the equipment, including necessary protection signal communications equipment, required to protect (1) the Transmission Provider's Transmission System from faults or other electrical disturbances occurring at the Generating Facility and (2) the Generating Facility from faults or other electrical system disturbances occurring on the Transmission Provider's Transmission System or on other delivery systems or other generating systems to which the Transmission Provider's Transmission System is directly connected.

Tariff shall mean the Transmission Provider's Tariff through which open access transmission service and Interconnection Service are offered, as filed with FERC,

and as amended or supplemented from time to time, or any successor tariff.

Transmission Owner shall mean an entity that owns, leases or otherwise possesses an interest in the portion of the Transmission System at the Point of Interconnection and may be a Party to the Standard Large Generator Interconnection Agreement to the extent necessary.

Transmission Provider shall mean the public utility (or its designated agent) that owns, controls, or operates transmission or distribution facilities used for the transmission of electricity in interstate commerce and provides transmission service under the Tariff. The term Transmission Provider should be read to include the Transmission Owner when the Transmission Owner is separate from the Transmission Provider.

Transmission Provider's Interconnection Facilities shall mean all facilities and equipment owned, controlled or operated by the Transmission Provider from the Point of Change of Ownership to the Point of Interconnection as identified in Appendix A to the Standard Large Generator Interconnection Agreement, including any modifications, additions or upgrades to such facilities and equipment. Transmission Provider's Interconnection Facilities are sole use facilities and shall not include Distribution Upgrades, Stand Alone Network Upgrades or Network Upgrades.

Transmission System shall mean the facilities owned, controlled or operated by the Transmission Provider or Transmission Owner that are used to provide transmission service under the Tariff.

Trial Operation shall mean the period during which Interconnection Customer is engaged in on-site test operations and commissioning of the Generating Facility prior to Commercial Operation.

Variable Energy Resource shall mean a device for the production of electricity that is characterized by an energy source that: (1) is renewable; (2) cannot be stored by the facility owner or operator; and (3) has variability that is beyond the control of the facility owner or operator.

Article 2. Effective Date, Term, and Termination

2.1 Effective Date. This LGIA shall become effective upon execution by the Parties subject to acceptance by FERC (if applicable), or if filed unexecuted, upon the date specified by FERC. Transmission Provider shall promptly file this LGIA with FERC upon execution in accordance with Article 3.1, if required.

2.2 Term of Agreement. Subject to the provisions of Article 2.3, this LGIA shall remain in effect for a period of ten (10) years from the Effective Date or such other longer period as Interconnection Customer may request (Term to be specified in individual agreements) and shall be automatically renewed for each successive one-year period thereafter.

2.3 Termination Procedures.

2.3.1 Written Notice. This LGIA may be terminated by Interconnection Customer after giving Transmission Provider ninety (90) Calendar Days advance written notice, or by Transmission Provider notifying FERC after the Generating Facility permanently ceases Commercial Operation.

2.3.2 Default. Either Party may terminate this LGIA in accordance with Article 17.

2.3.3 Notwithstanding Articles 2.3.1 and 2.3.2, no termination shall become effective until the Parties have complied with all Applicable Laws and Regulations applicable to such termination, including the filing with FERC of a notice of termination of this LGIA, which notice has been accepted for filing by FERC.

2.4 Termination Costs. If a Party elects to terminate this Agreement pursuant to Article 2.3 above, each Party shall pay all costs incurred (including any cancellation costs relating to orders or contracts for Interconnection Facilities and equipment) or charges assessed by the other Party, as of the date of the other Party's receipt of such notice of

termination, that are the responsibility of the Terminating Party under this LGIA. In the event of termination by a Party, the Parties shall use commercially Reasonable Efforts to mitigate the costs, damages and charges arising as a consequence of termination. Upon termination of this LGIA, unless otherwise ordered or approved by FERC:

2.4.1 With respect to any portion of Transmission Provider's Interconnection Facilities that have not yet been constructed or installed, Transmission Provider shall to the extent possible and with Interconnection Customer's authorization cancel any pending orders of, or return, any materials or equipment for, or contracts for construction of, such facilities; provided that in the event Interconnection Customer elects not to authorize such cancellation, Interconnection Customer shall assume all payment obligations with respect to such materials, equipment, and contracts, and Transmission Provider shall deliver such material and equipment, and, if necessary, assign such contracts, to Interconnection Customer as soon as practicable, at Interconnection Customer's expense. To the extent that Interconnection Customer has already paid Transmission Provider for any or all such costs of materials or equipment not taken by Interconnection Customer, Transmission Provider shall promptly refund such amounts to Interconnection Customer, less any costs, including penalties incurred by Transmission Provider to cancel any pending orders of or return such materials, equipment, or contracts.

If an Interconnection Customer terminates this LGIA, it shall be responsible for all costs incurred in association with that Interconnection Customer's interconnection, including any cancellation costs relating to orders or contracts for Interconnection Facilities

and equipment, and other expenses including any Network Upgrades for which Transmission Provider has incurred expenses and has not been reimbursed by Interconnection Customer.

2.4.2 Transmission Provider may, at its option, retain any portion of such materials, equipment, or facilities that Interconnection Customer chooses not to accept delivery of, in which case Transmission Provider shall be responsible for all costs associated with procuring such materials, equipment, or facilities.

2.4.3 With respect to any portion of the Interconnection Facilities, and any other facilities already installed or constructed pursuant to the terms of this LGIA, Interconnection Customer shall be responsible for all costs associated with the removal, relocation or other disposition or retirement of such materials, equipment, or facilities.

2.5 **Disconnection.** Upon termination of this LGIA, the Parties will take all appropriate steps to disconnect the Large Generating Facility from the Transmission System. All costs required to effectuate such disconnection shall be borne by the terminating Party, unless such termination resulted from the non-terminating Party's Default of this LGIA or such non-terminating Party otherwise is responsible for these costs under this LGIA.

2.6 **Survival.** This LGIA shall continue in effect after termination to the extent necessary to provide for final billings and payments and for costs incurred hereunder, including billings and payments pursuant to this LGIA; to permit the determination and enforcement of liability and indemnification obligations arising from acts or events that occurred while this LGIA was in effect; and to permit each Party to have access to the lands of the other Party pursuant to this LGIA or other applicable agreements, to disconnect, remove or salvage its own facilities and equipment.

Article 3. Regulatory Filings

3.1 Filing. Transmission Provider shall file this LGIA (and any amendment hereto) with the appropriate Governmental Authority, if required. Interconnection Customer may request that any information so provided be subject to the confidentiality provisions of Article 22. If Interconnection Customer has executed this LGIA, or any amendment thereto, Interconnection Customer shall reasonably cooperate with Transmission Provider with respect to such filing and to provide any information reasonably requested by Transmission Provider needed to comply with applicable regulatory requirements.

Article 4. Scope of Service

4.1 Interconnection Product Options. Interconnection Customer has selected the following (checked) type of Interconnection Service:

X **4.1.1 Energy Resource Interconnection Service.**

4.1.1.1 The Product. Energy Resource Interconnection Service allows Interconnection Customer to connect the Large Generating Facility to the Transmission System and be eligible to deliver the Large Generating Facility's output using the existing firm or non-firm capacity of the Transmission System on an "as available" basis. To the extent Interconnection Customer wants to receive Energy Resource Interconnection Service, Transmission Provider shall construct facilities identified in Attachment A.

4.1.1.2 Transmission Delivery Service Implications. Under Energy

Resource Interconnection Service, Interconnection Customer will be eligible to inject power from the Large Generating Facility into and deliver power across the interconnecting Transmission Provider's Transmission System on an "as available" basis up to the amount of MWs identified in the applicable stability and steady state studies to the extent the upgrades initially required to qualify for Energy Resource Interconnection Service have been constructed. Where eligible to do so (e.g., PJM, ISO-NE, NYISO), Interconnection Customer may place a bid to sell into the market up to the maximum identified Large Generating Facility output, subject to any conditions specified in the interconnection service approval, and the Large Generating Facility will be dispatched to the extent Interconnection Customer's bid clears. In all other instances, no transmission delivery service from the Large Generating Facility is assured, but Interconnection Customer may obtain Point-to-Point Transmission Service, Network Integration Transmission Service, or be used for secondary network transmission service, pursuant to Transmission Provider's Tariff, up to the maximum output identified in the stability and steady state studies. In those instances, in order for Interconnection Customer to obtain the right to deliver or inject energy beyond the Large Generating Facility Point of Interconnection or to improve its ability to do so, transmission

delivery service must be obtained pursuant to the provisions of Transmission Provider's Tariff. The Interconnection Customer's ability to inject its Large Generating Facility output beyond the Point of Interconnection, therefore, will depend on the existing capacity of Transmission Provider's Transmission System at such time as a transmission service request is made that would accommodate such delivery. The provision of firm Point-to-Point Transmission Service or Network Integration Transmission Service may require the construction of additional Network Upgrades.

☐ **4.1.2 Network Resource Interconnection Service.**

4.1.2.1 The Product. Transmission Provider must conduct the necessary studies and construct the Network Upgrades needed to integrate the Large Generating Facility (1) in a manner comparable to that in which Transmission Provider integrates its generating facilities to serve native load customers; or (2) in an ISO or RTO with market based congestion management, in the same manner as all Network Resources. To the extent Interconnection Customer wants to receive Network Resource Interconnection Service, Transmission Provider shall construct the facilities identified in Attachment A to this LGIA.

4.1.2.2 Transmission Delivery Service Implications. Network Resource

Interconnection Service allows Interconnection Customer's Large Generating Facility to be designated by any Network Customer under the Tariff on Transmission Provider's Transmission System as a Network Resource, up to the Large Generating Facility's full output, on the same basis as existing Network Resources interconnected to Transmission Provider's Transmission System, and to be studied as a Network Resource on the assumption that such a designation will occur. Although Network Resource Interconnection Service does not convey a reservation of transmission service, any Network Customer under the Tariff can utilize its network service under the Tariff to obtain delivery of energy from the interconnected Interconnection Customer's Large Generating Facility in the same manner as it accesses Network Resources. A Large Generating Facility receiving Network Resource Interconnection Service may also be used to provide Ancillary Services after technical studies and/or periodic analyses are performed with respect to the Large Generating Facility's ability to provide any applicable Ancillary Services, provided that such studies and analyses have been or would be required in connection with the provision of such Ancillary Services by any existing Network Resource. However, if an Interconnection Customer's Large Generating Facility has not been designated as a Network Resource by any load, it cannot be

required to provide Ancillary Services except to the extent such requirements extend to all generating facilities that are similarly situated. The provision of Network Integration Transmission Service or firm Point-to-Point Transmission Service may require additional studies and the construction of additional upgrades. Because such studies and upgrades would be associated with a request for delivery service under the Tariff, cost responsibility for the studies and upgrades would be in accordance with FERC's policy for pricing transmission delivery services.

Network Resource Interconnection Service does not necessarily provide Interconnection Customer with the capability to physically deliver the output of its Large Generating Facility to any particular load on Transmission Provider's Transmission System without incurring congestion costs. In the event of transmission constraints on Transmission Provider's Transmission System, Interconnection Customer's Large Generating Facility shall be subject to the applicable congestion management procedures in Transmission Provider's Transmission System in the same manner as Network Resources.

There is no requirement either at the time of study or interconnection, or at any point in the future, that Interconnection Customer's Large Generating Facility be designated

as a Network Resource by a Network Service Customer under the Tariff or that Interconnection Customer identify a specific buyer (or sink). To the extent a Network Customer does designate the Large Generating Facility as a Network Resource, it must do so pursuant to Transmission Provider's Tariff.

Once an Interconnection Customer satisfies the requirements for obtaining Network Resource Interconnection Service, any future transmission service request for delivery from the Large Generating Facility within Transmission Provider's Transmission System of any amount of capacity and/or energy, up to the amount initially studied, will not require that any additional studies be performed or that any further upgrades associated with such Large Generating Facility be undertaken, regardless of whether or not such Large Generating Facility is ever designated by a Network Customer as a Network Resource and regardless of changes in ownership of the Large Generating Facility. However, the reduction or elimination of congestion or redispatch costs may require additional studies and the construction of additional upgrades.

To the extent Interconnection Customer enters into an arrangement for long term transmission service for deliveries from the Large Generating Facility outside

Transmission Provider's Transmission System, such request may require additional studies and upgrades in order for Transmission Provider to grant such request.

4.2 **Provision of Service.** Transmission Provider shall provide Interconnection Service for the Large Generating Facility at the Point of Interconnection.

4.3 **Performance Standards.** Each Party shall perform all of its obligations under this LGIA in accordance with Applicable Laws and Regulations, Applicable Reliability Standards, and Good Utility Practice, and to the extent a Party is required or prevented or limited in taking any action by such regulations and standards, such Party shall not be deemed to be in Breach of this LGIA for its compliance therewith. If such Party is a Transmission Provider or Transmission Owner, then that Party shall amend the LGIA and submit the amendment to FERC for approval.

4.4 **No Transmission Delivery Service.** The execution of this LGIA does not constitute a request for, nor the provision of, any transmission delivery service under Transmission Provider's Tariff, and does not convey any right to deliver electricity to any specific customer or Point of Delivery.

4.5 **Interconnection Customer Provided Services.** The services provided by Interconnection Customer under this LGIA are set forth in Article 9.6 and Article 13.5.1.

Interconnection Customer shall be paid for such services in accordance with Article 11.6.

Article 5. Interconnection Facilities Engineering, Procurement, and Construction

5.1 **Options.** Unless otherwise mutually agreed to between the Parties, Interconnection Customer shall select the In-Service Date, Initial Synchronization Date, and Commercial Operation Date; and either Standard Option or Alternate Option set forth below for

completion of Transmission Provider's Interconnection Facilities and Network Upgrades as set forth in Appendix A, Interconnection Facilities and Network Upgrades, and such dates and selected option shall be set forth in Appendix B, Milestones.

5.1.1 **Standard Option.** Transmission Provider shall design, procure, and construct Transmission Provider's Interconnection Facilities and Network Upgrades, using Reasonable Efforts to complete Transmission Provider's Interconnection Facilities and Network Upgrades by the dates set forth in Appendix B, Milestones. Transmission Provider shall not be required to undertake any action which is inconsistent with its standard safety practices, its material and equipment specifications, its design criteria and construction procedures, its labor agreements, and Applicable Laws and Regulations. In the event Transmission Provider reasonably expects that it will not be able to complete Transmission Provider's Interconnection Facilities and Network Upgrades by the specified dates, Transmission Provider shall promptly provide written notice to Interconnection Customer and shall undertake Reasonable Efforts to meet the earliest dates thereafter.

5.1.2 **Alternate Option.** If the dates designated by Interconnection Customer are acceptable to Transmission Provider, Transmission Provider shall so notify Interconnection Customer within thirty (30) Calendar Days, and shall assume responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities by the designated dates.

If Transmission Provider subsequently fails to complete Transmission Provider's Interconnection Facilities by the In-Service Date, to the extent necessary to provide back feed power; or fails to

complete Network Upgrades by the Initial Synchronization Date to the extent necessary to allow for Trial Operation at full power output, unless other arrangements are made by the Parties for such Trial Operation; or fails to complete the Network Upgrades by the Commercial Operation Date, as such dates are reflected in Appendix B, Milestones; Transmission Provider shall pay Interconnection Customer liquidated damages in accordance with Article 5.3, Liquidated Damages, provided, however, the dates designated by Interconnection Customer shall be extended day for day for each day that the applicable RTO or ISO refuses to grant clearances to install equipment.

5.1.3 **Option to Build.** If the dates designated by Interconnection Customer are not acceptable to Transmission Provider, Transmission Provider shall so notify Interconnection Customer within thirty (30) Calendar Days, and unless the Parties agree otherwise, Interconnection Customer shall have the option to assume responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades on the dates specified in Article 5.1.2. Transmission Provider and Interconnection Customer must agree as to what constitutes Stand Alone Network Upgrades and identify such Stand Alone Network Upgrades in Appendix A. Except for Stand Alone Network Upgrades, Interconnection Customer shall have no right to construct Network Upgrades under this option.

5.1.4 **Negotiated Option.** If Interconnection Customer elects not to exercise its option under Article 5.1.3, Option to Build, Interconnection Customer shall so notify Transmission Provider within thirty (30) Calendar Days, and the Parties shall in

good faith attempt to negotiate terms and conditions (including revision of the specified dates and liquidated damages, the provision of incentives or the procurement and construction of a portion of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades by Interconnection Customer) pursuant to which Transmission Provider is responsible for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Network Upgrades. If the Parties are unable to reach agreement on such terms and conditions, Transmission Provider shall assume responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Network Upgrades pursuant to 5.1.1, Standard Option.

5.2 General Conditions Applicable to Option to Build. If Interconnection Customer assumes responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades,

(1) Interconnection Customer shall engineer, procure equipment, and construct Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades (or portions thereof) using Good Utility Practice and using standards and specifications provided in advance by Transmission Provider;

(2) Interconnection Customer's engineering, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades shall comply with all requirements of law to which Transmission Provider would be subject in the engineering, procurement or construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades;

(3) Transmission Provider shall review and approve the engineering design, equipment acceptance tests, and the construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades;

(4) prior to commencement of construction, Interconnection Customer shall provide to Transmission Provider a schedule for construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades, and shall promptly respond to requests for information from Transmission Provider;

(5) at any time during construction, Transmission Provider shall have the right to gain unrestricted access to Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades and to conduct inspections of the same;

(6) at any time during construction, should any phase of the engineering, equipment procurement, or construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades not meet the standards and specifications provided by Transmission Provider, Interconnection Customer shall be obligated to remedy deficiencies in that portion of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades;

(7) Interconnection Customer shall indemnify Transmission Provider for claims arising from Interconnection Customer's construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades under the terms and procedures applicable to Article 18.1 Indemnity;

(8) Interconnection Customer shall transfer control of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades to Transmission Provider;

(9) Unless Parties otherwise agree, Interconnection Customer shall transfer ownership of Transmission Provider's Interconnection Facilities and Stand-Alone Network Upgrades to Transmission Provider;

(10) Transmission Provider shall approve and accept for operation and maintenance Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades to the extent engineered, procured, and constructed in accordance with this Article 5.2; and

(11) Interconnection Customer shall deliver to Transmission Provider "as-built" drawings, information, and any other documents that are reasonably required by Transmission Provider to assure that the Interconnection Facilities and Stand-Alone Network Upgrades are built to the standards and specifications required by Transmission Provider.

5.3 Liquidated Damages. The actual damages to Interconnection Customer, in the event Transmission Provider's Interconnection Facilities or Network Upgrades are not completed by the dates designated by Interconnection Customer and accepted by Transmission Provider pursuant to subparagraphs 5.1.2 or 5.1.4, above, may include Interconnection Customer's fixed operation and maintenance costs and lost opportunity costs. Such actual damages are uncertain and impossible to determine at this time. Because of such uncertainty, any liquidated damages paid by Transmission Provider to Interconnection Customer in the event that Transmission Provider does not complete any portion of Transmission Provider's Interconnection Facilities or Network Upgrades by the applicable dates, shall be an amount equal to ½ of 1 percent per day of the actual cost of Transmission Provider's Interconnection Facilities and Network

Upgrades, in the aggregate, for which Transmission Provider has assumed responsibility to design, procure and construct.

However, in no event shall the total liquidated damages exceed 20 percent of the actual cost of Transmission Provider's Interconnection Facilities and Network Upgrades for which Transmission Provider has assumed responsibility to design, procure, and construct. The foregoing payments will be made by Transmission Provider to Interconnection Customer as just compensation for the damages caused to Interconnection Customer, which actual damages are uncertain and impossible to determine at this time, and as reasonable liquidated damages, but not as a penalty or a method to secure performance of this LGIA. Liquidated damages, when the Parties agree to them, are the exclusive remedy for the Transmission Provider's failure to meet its schedule.

No liquidated damages shall be paid to Interconnection Customer if: (1) Interconnection Customer is not ready to commence use of Transmission Provider's Interconnection Facilities or Network Upgrades to take the delivery of power for the Large Generating Facility's Trial Operation or to export power from the Large Generating Facility on the specified dates, unless Interconnection Customer would have been able to commence use of Transmission Provider's Interconnection Facilities or Network Upgrades to take the delivery of power for Large Generating Facility's Trial Operation or to export power from the Large Generating Facility, but for Transmission Provider's delay; (2) Transmission Provider's failure to meet the specified dates is the result of the action or inaction of Interconnection Customer or any other Interconnection Customer who has entered into an LGIA with Transmission Provider or any cause beyond Transmission Provider's reasonable control or reasonable ability to cure; (3) the interconnection Customer has assumed responsibility for the design, procurement and construction of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades; or (4) the Parties have otherwise agreed.

5.4 Power System Stabilizers. The Interconnection Customer shall procure, install, maintain and operate Power System Stabilizers in accordance with the guidelines and procedures established by the Applicable Reliability Council. Transmission Provider reserves the right to reasonably establish minimum acceptable settings for any installed Power System Stabilizers, subject to the design and operating limitations of the Large Generating Facility. If the Large Generating Facility's Power System Stabilizers are removed from service or not capable of automatic operation, Interconnection Customer shall immediately notify Transmission Provider's system operator, or its designated representative. The requirements of this paragraph shall not apply to wind generators.

5.5 Equipment Procurement. If responsibility for construction of Transmission Provider's Interconnection Facilities or Network Upgrades is to be borne by Transmission Provider, then Transmission Provider shall commence design of Transmission Provider's Interconnection Facilities or Network Upgrades and procure necessary equipment as soon as practicable after all of the following conditions are satisfied, unless the Parties otherwise agree in writing:

5.5.1 Transmission Provider has completed the Facilities Study pursuant to the Facilities Study Agreement;

5.5.2 Transmission Provider has received written authorization to proceed with design and procurement from Interconnection Customer by the date specified in Appendix B, Milestones; and

5.5.3 Interconnection Customer has provided security to Transmission Provider in accordance with Article 11.5 by the dates specified in Appendix B, Milestones.

5.6 Construction Commencement. Transmission Provider shall commence construction of Transmission Provider's Interconnection Facilities and Network Upgrades for which it is responsible as soon as

practicable after the following additional conditions are satisfied:

5.6.1 Approval of the appropriate Governmental Authority has been obtained for any facilities requiring regulatory approval;

5.6.2 Necessary real property rights and rights-of-way have been obtained, to the extent required for the construction of a discrete aspect of Transmission Provider's Interconnection Facilities and Network Upgrades;

5.6.3 Transmission Provider has received written authorization to proceed with construction from Interconnection Customer by the date specified in Appendix B, Milestones; and

5.6.4 Interconnection Customer has provided security to Transmission Provider in accordance with Article 11.5 by the dates specified in Appendix B, Milestones.

5.7 **Work Progress.** The Parties will keep each other advised periodically as to the progress of their respective design, procurement and construction efforts. Either Party may, at any time, request a progress report from the other Party. If, at any time, Interconnection Customer determines that the completion of Transmission Provider's Interconnection Facilities will not be required until after the specified In-Service Date, Interconnection Customer will provide written notice to Transmission Provider of such later date upon which the completion of Transmission Provider's Interconnection Facilities will be required.

5.8 **Information Exchange.** As soon as reasonably practicable after the Effective Date, the Parties shall exchange information regarding the design and compatibility of the Parties' Interconnection Facilities and compatibility of the Interconnection Facilities with Transmission Provider's Transmission System, and shall work diligently and in good faith to make any necessary design changes.

5.9 Limited Operation. If any of Transmission Provider's Interconnection Facilities or Network Upgrades are not reasonably expected to be completed prior to the Commercial Operation Date of the Large Generating Facility, Transmission Provider shall, upon the request and at the expense of Interconnection Customer, perform operating studies on a timely basis to determine the extent to which the Large Generating Facility and Interconnection Customer's Interconnection Facilities may operate prior to the completion of Transmission Provider's Interconnection Facilities or Network Upgrades consistent with Applicable Laws and Regulations, Applicable Reliability Standards, Good Utility Practice, and this LGIA. Transmission Provider shall permit Interconnection Customer to operate the Large Generating Facility and Interconnection Customer's Interconnection Facilities in accordance with the results of such studies.

5.10 Interconnection Customer's Interconnection Facilities ('ICIF'). Interconnection Customer shall, at its expense, design, procure, construct, own and install the ICIF, as set forth in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades.

5.10.1 Interconnection Customer's Interconnection Facility Specifications. Interconnection Customer shall submit initial specifications for the ICIF, including System Protection Facilities, to Transmission Provider at least one hundred eighty (180) Calendar Days prior to the Initial Synchronization Date; and final specifications for review and comment at least ninety (90) Calendar Days prior to the Initial Synchronization Date. Transmission Provider shall review such specifications to ensure that the ICIF are compatible with the technical specifications, operational control, and safety requirements of Transmission Provider and comment on such specifications within thirty (30) Calendar Days of Interconnection Customer's

submission. All specifications provided hereunder shall be deemed confidential.

5.10.2 **Transmission Provider's Review.** Transmission Provider's review of Interconnection Customer's final specifications shall not be construed as confirming, endorsing, or providing a warranty as to the design, fitness, safety, durability or reliability of the Large Generating Facility, or the ICIF. Interconnection Customer shall make such changes to the ICIF as may reasonably be required by Transmission Provider, in accordance with Good Utility Practice, to ensure that the ICIF are compatible with the technical specifications, operational control, and safety requirements of Transmission Provider.

5.10.3 **ICIF Construction.** The ICIF shall be designed and constructed in accordance with Good Utility Practice. Within one hundred twenty (120) Calendar Days after the Commercial Operation Date, unless the Parties agree on another mutually acceptable deadline, Interconnection Customer shall deliver to Transmission Provider "as-built" drawings, information and documents for the ICIF, such as: a one-line diagram, a site plan showing the Large Generating Facility and the ICIF, plan and elevation drawings showing the layout of the ICIF, a relay functional diagram, relaying AC and DC schematic wiring diagrams and relay settings for all facilities associated with Interconnection Customer's step-up transformers, the facilities connecting the Large Generating Facility to the step-up transformers and the ICIF, and the impedances (determined by factory tests) for the associated step-up transformers and the Large Generating Facility. The Interconnection Customer shall provide Transmission Provider specifications for the excitation system, automatic voltage regulator, Large

Generating Facility control and protection settings, transformer tap settings, and communications, if applicable.

5.11 Transmission Provider's Interconnection Facilities Construction. Transmission Provider's Interconnection Facilities shall be designed and constructed in accordance with Good Utility Practice. Upon request, within one hundred twenty (120) Calendar Days after the Commercial Operation Date, unless the Parties agree on another mutually acceptable deadline, Transmission Provider shall deliver to Interconnection Customer the following "as-built" drawings, information and documents for Transmission Provider's Interconnection Facilities [include appropriate drawings and relay diagrams].

Transmission Provider will obtain control of Transmission Provider's Interconnection Facilities and Stand Alone Network Upgrades upon completion of such facilities.

5.12 Access Rights. Upon reasonable notice and supervision by a Party, and subject to any required or necessary regulatory approvals, a Party ("Granting Party") shall furnish at no cost to the other Party ("Access Party") any rights of use, licenses, rights of way and easements with respect to lands owned or controlled by the Granting Party, its agents (if allowed under the applicable agency agreement), or any Affiliate, that are necessary to enable the Access Party to obtain ingress and egress to construct, operate, maintain, repair, test (or witness testing), inspect, replace or remove facilities and equipment to: (i) interconnect the Large Generating Facility with the Transmission System; (ii) operate and maintain the Large Generating Facility, the Interconnection Facilities and the Transmission System; and (iii) disconnect or remove the Access Party's facilities and equipment upon termination of this LGIA. In exercising such licenses, rights of way and easements, the Access Party shall not unreasonably disrupt or interfere with normal operation of the Granting Party's business and shall adhere to the safety rules and procedures established in advance, as may be changed

from time to time, by the Granting Party and provided to the Access Party.

5.13 **Lands of Other Property Owners**. If any part of Transmission Provider or Transmission Owner's Interconnection Facilities and/or Network Upgrades is to be installed on property owned by persons other than Interconnection Customer or Transmission Provider or Transmission Owner, Transmission Provider or Transmission Owner shall at Interconnection Customer's expense use efforts, similar in nature and extent to those that it typically undertakes on its own behalf or on behalf of its Affiliates, including use of its eminent domain authority, and to the extent consistent with state law, to procure from such persons any rights of use, licenses, rights of way and easements that are necessary to construct, operate, maintain, test, inspect, replace or remove Transmission Provider or Transmission Owner's Interconnection Facilities and/or Network Upgrades upon such property.

5.14 **Permits.** Transmission Provider or Transmission Owner and Interconnection Customer shall cooperate with each other in good faith in obtaining all permits, licenses and authorizations that are necessary to accomplish the interconnection in compliance with Applicable Laws and Regulations. With respect to this paragraph, Transmission Provider or Transmission Owner shall provide permitting assistance to Interconnection Customer comparable to that provided to Transmission Provider's own, or an Affiliate's generation.

5.15 **Early Construction of Base Case Facilities.** Interconnection Customer may request Transmission Provider to construct, and Transmission Provider shall construct, using Reasonable Efforts to accommodate Interconnection Customer's In-Service Date, all or any portion of any Network Upgrades required for Interconnection Customer to be interconnected to the Transmission System which are included in the Base Case of the Facilities Study for Interconnection Customer, and which also are required to be constructed for another Interconnection Customer, but where such construction is not

scheduled to be completed in time to achieve Interconnection Customer's In-Service Date.

5.16 Suspension. Interconnection Customer reserves the right, upon written notice to Transmission Provider, to suspend
at any time all work by Transmission Provider associated with the construction and installation of Transmission Provider's Interconnection Facilities and/or Network Upgrades required under this LGIA with the condition that Transmission System shall be left in a safe and reliable condition in accordance with Good Utility Practice and Transmission Provider's safety and reliability criteria. In such event, Interconnection Customer shall be responsible for all reasonable and necessary costs which Transmission Provider (i) has incurred pursuant to this LGIA prior to the suspension and (ii) incurs in suspending such work, including any costs incurred to perform such work as may be necessary to ensure the safety of persons and property and the integrity of the Transmission System during such suspension and, if applicable, any costs incurred in connection with the cancellation or suspension of material, equipment and labor contracts which Transmission Provider cannot reasonably avoid; provided, however, that prior to canceling or suspending any such material, equipment or labor contract, Transmission Provider shall obtain Interconnection Customer's authorization to do so.

Transmission Provider shall invoice Interconnection Customer for such costs pursuant to Article 12 and shall use due diligence to minimize its costs. In the event Interconnection Customer suspends work by Transmission Provider required under this LGIA pursuant to this Article 5.16, and has not requested Transmission Provider to recommence the work required under this LGIA on or before the expiration of three (3) years following commencement of such suspension, this LGIA shall be deemed terminated. The three-year period shall begin on the date the suspension is requested, or the date of the written notice to Transmission Provider, if no effective date is specified.

5.17 Taxes.

5.17.1 **Interconnection Customer Payments Not Taxable.** The Parties intend that all payments or property transfers made by Interconnection Customer to Transmission Provider for the installation of Transmission Provider's Interconnection Facilities and the Network Upgrades shall be non-taxable, either as contributions to capital, or as an advance, in accordance with the Internal Revenue Code and any applicable state income tax laws and shall not be taxable as contributions in aid of construction or otherwise under the Internal Revenue Code and any applicable state income tax laws.

5.17.2 **Representations and Covenants.** In accordance with IRS Notice 2001-82 and IRS Notice 88-129, Interconnection Customer represents and covenants that (i) ownership of the electricity generated at the Large Generating Facility will pass to another party prior to the transmission of the electricity on the Transmission System, (ii) for income tax purposes, the amount of any payments and the cost of any property transferred to Transmission Provider for Transmission Provider's Interconnection Facilities will be capitalized by Interconnection Customer as an intangible asset and recovered using the straight-line method over a useful life of twenty (20) years, and (iii) any portion of Transmission Provider's Interconnection Facilities that is a "dual-use intertie," within the meaning of IRS Notice 88-129, is reasonably expected to carry only a de minimis amount of electricity in the direction of the Large Generating Facility. For this purpose, "de minimis amount" means no more than 5 percent of the total power flows in both directions, calculated in accordance with the "5 percent test" set forth in IRS Notice 88-129. This is not intended to be an exclusive list of the relevant conditions that must be met to conform to

IRS requirements for non-taxable treatment.

At Transmission Provider's request, Interconnection Customer shall provide Transmission Provider with a report from an independent engineer confirming its representation in clause (iii), above. Transmission Provider represents and covenants that the cost of Transmission Provider's Interconnection Facilities paid for by Interconnection Customer will have no net effect on the base upon which rates are determined.

5.17.3 **Indemnification for the Cost Consequences of Current Tax Liability Imposed Upon the Transmission Provider.** Notwithstanding Article 5.17.1, Interconnection Customer shall protect, indemnify and hold harmless Transmission Provider from the cost consequences of any current tax liability imposed against Transmission Provider as the result of payments or property transfers made by Interconnection Customer to Transmission Provider under this LGIA for Interconnection Facilities, as well as any interest and penalties, other than interest and penalties attributable to any delay caused by Transmission Provider.

Transmission Provider shall not include a gross-up for the cost consequences of any current tax liability in the amounts it charges Interconnection Customer under this LGIA unless (i) Transmission Provider has determined, in good faith, that the payments or property transfers made by Interconnection Customer to Transmission Provider should be reported as income subject to taxation or (ii) any Governmental Authority directs Transmission Provider to report payments or property as income subject to taxation; provided, however, that Transmission Provider may require Interconnection Customer to provide security for

Interconnection Facilities, in a form reasonably acceptable to Transmission Provider (such as a parental guarantee or a letter of credit), in an amount equal to the cost consequences of any current tax liability under this Article 5.17. Interconnection Customer shall reimburse Transmission Provider for such costs on a fully grossed-up basis, in accordance with Article 5.17.4, within thirty (30) Calendar Days of receiving written notification from Transmission Provider of the amount due, including detail about how the amount was calculated.

The indemnification obligation shall terminate at the earlier of (1) the expiration of the ten year testing period and the applicable statute of limitation, as it may be extended by Transmission Provider upon request of the IRS, to keep these years open for audit or adjustment, or (2) the occurrence of a subsequent taxable event and the payment of any related indemnification obligations as contemplated by this Article 5.17.

5.17.4 **Tax Gross-Up Amount.** Interconnection Customer's liability for the cost consequences of any current tax liability under this Article 5.17 shall be calculated on a fully grossed-up basis. Except as may otherwise be agreed to by the parties, this means that Interconnection Customer will pay Transmission Provider, in addition to the amount paid for the Interconnection Facilities and Network Upgrades, an amount equal to (1) the current taxes imposed on Transmission Provider ("Current Taxes") on the excess of (a) the gross income realized by Transmission Provider as a result of payments or property transfers made by Interconnection Customer to Transmission Provider under this LGIA (without regard to any payments under this Article 5.17) (the "Gross Income Amount")

over (b) the present value of future tax deductions for depreciation that will be available as a result of such payments or property transfers (the "Present Value Depreciation Amount"), plus (2) an additional amount sufficient to permit Transmission Provider to receive and retain, after the payment of all Current Taxes, an amount equal to the net amount described in clause (1).

For this purpose, (i) Current Taxes shall be computed based on Transmission Provider's composite federal and state tax rates at the time the payments or property transfers are received and Transmission Provider will be treated as being subject to tax at the highest marginal rates in effect at that time (the "Current Tax Rate"), and (ii) the Present Value Depreciation Amount shall be computed by discounting Transmission Provider's anticipated tax depreciation deductions as a result of such payments or property transfers by Transmission Provider's current weighted average cost of capital. Thus, the formula for calculating Interconnection Customer's liability to Transmission Owner pursuant to this Article 5.17.4 can be expressed as follows: (Current Tax Rate x (Gross Income Amount – Present Value of Tax Depreciation))/(1-Current Tax Rate). Interconnection Customer's estimated tax liability in the event taxes are imposed shall be stated in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades.

5.17.5 **Private Letter Ruling or Change or Clarification of Law.** At Interconnection Customer's request and expense, Transmission Provider shall file with the IRS a request for a private letter ruling as to whether any property transferred or sums paid, or to be paid, by Interconnection Customer to Transmission

Provider under this LGIA are subject to federal income taxation. Interconnection Customer will prepare the initial draft of the request for a private letter ruling, and will certify under penalties of perjury that all facts represented in such request are true and accurate to the best of Interconnection Customer's knowledge. Transmission Provider and Interconnection Customer shall cooperate in good faith with respect to the submission of such request.

Transmission Provider shall keep Interconnection Customer fully informed of the status of such request for a private letter ruling and shall execute either a privacy act waiver or a limited power of attorney, in a form acceptable to the IRS, that authorizes Interconnection Customer to participate in all discussions with the IRS regarding such request for a private letter ruling. Transmission Provider shall allow Interconnection Customer to attend all meetings with IRS officials about the request and shall permit Interconnection Customer to prepare the initial drafts of any follow-up letters in connection with the request.

5.17.6 **Subsequent Taxable Events.** If, within 10 years from the date on which the relevant Transmission Provider's Interconnection Facilities are placed in service, (i) Interconnection Customer Breaches the covenants contained in Article 5.17.2, (ii) a "disqualification event" occurs within the meaning of IRS Notice 88-129, or (iii) this LGIA terminates and Transmission Provider retains ownership of the Interconnection Facilities and Network Upgrades, Interconnection Customer shall pay a tax gross-up for the cost consequences of any current tax liability imposed on Transmission Provider, calculated using the methodology described

in Article 5.17.4 and in accordance with IRS Notice 90-60.

5.17.7 **Contests.** In the event any Governmental Authority determines that Transmission Provider's receipt of payments or property constitutes income that is subject to taxation, Transmission Provider shall notify Interconnection Customer, in writing, within thirty (30) Calendar Days of receiving notification of such determination by a Governmental Authority. Upon the timely written request by Interconnection Customer and at Interconnection Customer's sole expense, Transmission Provider may appeal, protest, seek abatement of, or otherwise oppose such determination. Upon Interconnection Customer's written request and sole expense, Transmission Provider may file a claim for refund with respect to any taxes paid under this Article 5.17, whether or not it has received such a determination. Transmission Provider reserves the right to make all decisions with regard to the prosecution of such appeal, protest, abatement or other contest, including the selection of counsel and compromise or settlement of the claim, but Transmission Provider shall keep Interconnection Customer informed, shall consider in good faith suggestions from Interconnection Customer about the conduct of the contest, and shall reasonably permit Interconnection Customer or an Interconnection Customer representative to attend contest proceedings.

Interconnection Customer shall pay to Transmission Provider on a periodic basis, as invoiced by Transmission Provider, Transmission Provider's documented reasonable costs of prosecuting such appeal, protest, abatement or other contest. At any time during the contest, Transmission Provider may agree to a settlement either with Interconnection

Customer's consent or after obtaining written advice from nationally-recognized tax counsel, selected by Transmission Provider, but reasonably acceptable to Interconnection Customer, that the proposed settlement represents a reasonable settlement given the hazards of litigation. Interconnection Customer's obligation shall be based on the amount of the settlement agreed to by Interconnection Customer, or if a higher amount, so much of the settlement that is supported by the written advice from nationally-recognized tax counsel selected under the terms of the preceding sentence. The settlement amount shall be calculated on a fully grossed-up basis to cover any related cost consequences of the current tax liability. Any settlement without Interconnection Customer's consent or such written advice will relieve Interconnection Customer from any obligation to indemnify Transmission Provider for the tax at issue in the contest.

5.17.8 **Refund.** In the event that (a) a private letter ruling is issued to Transmission Provider which holds that any amount paid or the value of any property transferred by Interconnection Customer to Transmission Provider under the terms of this LGIA is not subject to federal income taxation, (b) any legislative change or administrative announcement, notice, ruling or other determination makes it reasonably clear to Transmission Provider in good faith that any amount paid or the value of any property transferred by Interconnection Customer to Transmission Provider under the terms of this LGIA is not taxable to Transmission Provider, (c) any abatement, appeal, protest, or other contest results in a determination that any payments or transfers made by Interconnection Customer to Transmission Provider are not subject to federal income

tax, or (d) if Transmission Provider receives a refund from any taxing authority for any overpayment of tax attributable to any payment or property transfer made by Interconnection Customer to Transmission Provider pursuant to this LGIA, Transmission Provider shall promptly refund to Interconnection Customer the following:

(i) any payment made by Interconnection Customer under this Article 5.17 for taxes that is attributable to the amount determined to be non-taxable, together with interest thereon,

(ii) interest on any amounts paid by Interconnection Customer to Transmission Provider for such taxes which Transmission Provider did not submit to the taxing authority, calculated in accordance with the methodology set forth in FERC's regulations at 18 CFR §35.19a(a)(2)(iii) from the date payment was made by Interconnection Customer to the date Transmission Provider refunds such payment to Interconnection Customer, and

(iii) with respect to any such taxes paid by Transmission Provider, any refund or credit Transmission Provider receives or to which it may be entitled from any Governmental Authority, interest (or that portion thereof attributable to the payment described in clause (i), above) owed to Transmission Provider for such overpayment of taxes (including any reduction in interest otherwise payable by Transmission Provider to any Governmental Authority resulting

from an offset or credit); _provided, however_, that Transmission Provider will remit such amount promptly to Interconnection Customer only after and to the extent that Transmission Provider has received a tax refund, credit or offset from any Governmental Authority for any applicable overpayment of income tax related to Transmission Provider's Interconnection Facilities.

The intent of this provision is to leave the Parties, to the extent practicable, in the event that no taxes are due with respect to any payment for Interconnection Facilities and Network Upgrades hereunder, in the same position they would have been in had no such tax payments been made.

5.17.9 **Taxes Other Than Income Taxes.** Upon the timely request by Interconnection Customer, and at Interconnection Customer's sole expense, Transmission Provider may appeal, protest, seek abatement of, or otherwise contest any tax (other than federal or state income tax) asserted or assessed against Transmission Provider for which Interconnection Customer may be required to reimburse Transmission Provider under the terms of this LGIA. Interconnection Customer shall pay to Transmission Provider on a periodic basis, as invoiced by Transmission Provider, Transmission Provider's documented reasonable costs of prosecuting such appeal, protest, abatement, or other contest. Interconnection Customer and Transmission Provider shall cooperate in good faith with respect to any such contest. Unless the payment of such taxes is a prerequisite to an appeal or abatement or cannot be deferred, no amount shall be payable by Interconnection Customer to Transmission Provider for such

taxes until they are assessed by a final, non-appealable order by any court or agency of competent jurisdiction. In the event that a tax payment is withheld and ultimately due and payable after appeal, Interconnection Customer will be responsible for all taxes, interest and penalties, other than penalties attributable to any delay caused by Transmission Provider.

5.17.10 Transmission Owners Who Are Not Transmission Providers. If Transmission Provider is not the same entity as the Transmission Owner, then (i) all references in this Article 5.17 to Transmission Provider shall be deemed also to refer to and to include the Transmission Owner, as appropriate, and (ii) this LGIA shall not become effective until such Transmission Owner shall have agreed in writing to assume all of the duties and obligations of Transmission Provider under this Article 5.17 of this LGIA.

5.18 Tax Status. Each Party shall cooperate with the other to maintain the other Party's tax status. Nothing in this LGIA is intended to adversely affect any Transmission Provider's tax exempt status with respect to the issuance of bonds including, but not limited to, Local Furnishing Bonds.

5.19 Modification.

5.19.1 General. Either Party may undertake modifications to its facilities. If a Party plans to undertake a modification that reasonably may be expected to affect the other Party's facilities, that Party shall provide to the other Party sufficient information regarding such modification so that the other Party may evaluate the potential impact of such modification prior to commencement of the work. Such information shall be deemed to be confidential hereunder and shall

include information concerning the timing of such modifications and whether such modifications are expected to interrupt the flow of electricity from the Large Generating Facility. The Party desiring to perform such work shall provide the relevant drawings, plans, and specifications to the other Party at least ninety (90) Calendar Days in advance of the commencement of the work or such shorter period upon which the Parties may agree, which agreement shall not unreasonably be withheld, conditioned or delayed.

In the case of Large Generating Facility modifications that do not require Interconnection Customer to submit an Interconnection Request, Transmission Provider shall provide, within thirty (30) Calendar Days (or such other time as the Parties may agree), an estimate of any additional modifications to the Transmission System, Transmission Provider's Interconnection Facilities or Network Upgrades necessitated by such Interconnection Customer modification and a good faith estimate of the costs thereof.

5.19.2 **Standards.** Any additions, modifications, or replacements made to a Party's facilities shall be designed, constructed and operated in accordance with this LGIA and Good Utility Practice.

5.19.3 **Modification Costs.** Interconnection Customer shall not be directly assigned for the costs of any additions, modifications, or replacements that Transmission Provider makes to Transmission Provider's Interconnection Facilities or the Transmission System to facilitate the interconnection of a third party to Transmission Provider's Interconnection Facilities or the Transmission System, or to provide

transmission service to a third party under Transmission Provider's Tariff. Interconnection Customer shall be responsible for the costs of any additions, modifications, or replacements to Interconnection Customer's Interconnection Facilities that may be necessary to maintain or upgrade such Interconnection Customer's Interconnection Facilities consistent with Applicable Laws and Regulations, Applicable Reliability Standards or Good Utility Practice.

Article 6. Testing and Inspection

6.1 Pre-Commercial Operation Date Testing and Modifications. Prior to the Commercial Operation Date, Transmission Provider shall test Transmission Provider's Interconnection Facilities and Network Upgrades and Interconnection Customer shall test the Large Generating Facility and Interconnection Customer's Interconnection Facilities to ensure their safe and reliable operation. Similar testing may be required after initial operation. Each Party shall make any modifications to its facilities that are found to be necessary as a result of such testing. Interconnection Customer shall bear the cost of all such testing and modifications. Interconnection Customer shall generate test energy at the Large Generating Facility only if it has arranged for the delivery of such test energy.

6.2 Post-Commercial Operation Date Testing and Modifications. Each Party shall at its own expense perform routine inspection and testing of its facilities and equipment in accordance with Good Utility Practice as may be necessary to ensure the continued interconnection of the Large Generating Facility with the Transmission System in a safe and reliable manner. Each Party shall have the right, upon advance written notice, to require reasonable additional testing of the other Party's facilities, at the requesting Party's expense, as may be in accordance with Good Utility Practice.

6.3 **Right to Observe Testing.** Each Party shall notify the other Party in advance of its performance of tests of its Interconnection Facilities. The other Party has the right, at its own expense, to observe such testing.

6.4 **Right to Inspect.** Each Party shall have the right, but shall have no obligation to: (i) observe the other Party's tests and/or inspection of any of its System Protection Facilities and other protective equipment, including Power System Stabilizers; (ii) review the settings of the other Party's System Protection Facilities and other protective equipment; and (iii) review the other Party's maintenance records relative to the Interconnection Facilities, the System Protection Facilities and other protective equipment. A Party may exercise these rights from time to time as it deems necessary upon reasonable notice to the other Party. The exercise or non-exercise by a Party of any such rights shall not be construed as an endorsement or confirmation of any element or condition of the Interconnection Facilities or the System Protection Facilities or other protective equipment or the operation thereof, or as a warranty as to the fitness, safety, desirability, or reliability of same. Any information that a Party obtains through the exercise of any of its rights under this Article 6.4 shall be deemed to be Confidential Information and treated pursuant to Article 22 of this LGIA.

Article 7. Metering

7.1 **General.** Each Party shall comply with the Applicable Reliability Council requirements. Unless otherwise agreed by the Parties, Transmission Provider shall install Metering Equipment at the Point of Interconnection prior to any operation of the Large Generating Facility and shall own, operate, test and maintain such Metering Equipment. Power flows to and from the Large Generating Facility shall be measured at or, at Transmission Provider's option, compensated to, the Point of Interconnection. Transmission Provider shall provide metering quantities, in analog and/or digital form, to Interconnection Customer upon request. Interconnection Customer shall bear all

reasonable documented costs associated with the purchase, installation, operation, testing and maintenance of the Metering Equipment.

7.2 Check Meters. Interconnection Customer, at its option and expense, may install and operate, on its premises and on its side of the Point of Interconnection, one or more check meters to check Transmission Provider's meters. Such check meters shall be for check purposes only and shall not be used for the measurement of power flows for purposes of this LGIA, except as provided in Article 7.4 below. The check meters shall be subject at all reasonable times to inspection and examination by Transmission Provider or its designee. The installation, operation and maintenance thereof shall be performed entirely by Interconnection Customer in accordance with Good Utility Practice.

7.3 Standards. Transmission Provider shall install, calibrate, and test revenue quality Metering Equipment in accordance with applicable ANSI standards.

7.4 Testing of Metering Equipment. Transmission Provider shall inspect and test all Transmission Provider-owned Metering Equipment upon installation and at least once every two (2) years thereafter. If requested to do so by Interconnection Customer, Transmission Provider shall, at Interconnection Customer's expense, inspect or test Metering Equipment more frequently than every two (2) years. Transmission Provider shall give reasonable notice of the time when any inspection or test shall take place, and Interconnection Customer may have representatives present at the test or inspection. If at any time Metering Equipment is found to be inaccurate or defective, it shall be adjusted, repaired or replaced at Interconnection Customer's expense, in order to provide accurate metering, unless the inaccuracy or defect is due to Transmission Provider's failure to maintain, then Transmission Provider shall pay. If Metering Equipment fails to register, or if the measurement made by Metering Equipment during a test varies by more than two percent from the measurement made by the standard meter used in the test, Transmission

Provider shall adjust the measurements by correcting all measurements for the period during which Metering Equipment was in error by using Interconnection Customer's check meters, if installed. If no such check meters are installed or if the period cannot be reasonably ascertained, the adjustment shall be for the period immediately preceding the test of the Metering Equipment equal to one-half the time from the date of the last previous test of the Metering Equipment.

7.5 Metering Data. At Interconnection Customer's expense, the metered data shall be telemetered to one or more locations designated by Transmission Provider and one or more locations designated by Interconnection Customer. Such telemetered data shall be used, under normal operating conditions, as the official measurement of the amount of energy delivered from the Large Generating Facility to the Point of Interconnection.

Article 8. Communications

8.1 Interconnection Customer Obligations. Interconnection Customer shall maintain satisfactory operating communications with Transmission Provider's Transmission System dispatcher or representative designated by Transmission Provider. Interconnection Customer shall provide standard voice line, dedicated voice line and facsimile communications at its Large Generating Facility control room or central dispatch facility through use of either the public telephone system, or a voice communications system that does not rely on the public telephone system. Interconnection Customer shall also provide the dedicated data circuit(s) necessary to provide Interconnection Customer data to Transmission Provider as set forth in Appendix D, Security Arrangements Details. The data circuit(s) shall extend from the Large Generating Facility to the location(s) specified by Transmission Provider. Any required maintenance of such communications equipment shall be performed by Interconnection Customer. Operational communications shall be activated and maintained under, but not be limited to, the following events: system paralleling or separation,

scheduled and unscheduled shutdowns, equipment clearances, and hourly and daily load data.

8.2 **Remote Terminal Unit.** Prior to the Initial Synchronization Date of the Large Generating Facility, a Remote Terminal Unit, or equivalent data collection and transfer equipment acceptable to the Parties, shall be installed by Interconnection Customer, or by Transmission Provider at Interconnection Customer's expense, to gather accumulated and instantaneous data to be telemetered to the location(s) designated by Transmission Provider through use of a dedicated point-to-point data circuit(s) as indicated in Article 8.1. The communication protocol for the data circuit(s) shall be specified by Transmission Provider. Instantaneous bi-directional analog real power and reactive power flow information must be telemetered directly to the location(s) specified by Transmission Provider.

Each Party will promptly advise the other Party if it detects or otherwise learns of any metering, telemetry or communications equipment errors or malfunctions that require the attention and/or correction by the other Party. The Party owning such equipment shall correct such error or malfunction as soon as reasonably feasible.

8.3 **No Annexation.** Any and all equipment placed on the premises of a Party shall be and remain the property of the Party providing such equipment regardless of the mode and manner of annexation or attachment to real property, unless otherwise mutually agreed by the Parties.

8.4 **Provision of Data from a Variable Energy Resource.** The Interconnection Customer whose Generating Facility is a Variable Energy Resource shall provide meteorological and forced outage data to the Transmission Provider to the extent necessary for the Transmission Provider's development and deployment of power production forecasts for that class of Variable Energy Resources. The Interconnection Customer with a Variable Energy Resource having wind as the energy source, at a minimum, will be required to provide the Transmission Provider with site-specific meteorological data including: temperature, wind

speed, wind direction, and atmospheric pressure. The Interconnection Customer with a Variable Energy Resource having solar as the energy source, at a minimum, will be required to provide the Transmission Provider with site-specific meteorological data including: temperature, atmospheric pressure, and irradiance. The Transmission Provider and Interconnection Customer whose Generating Facility is a Variable Energy Resource shall mutually agree to any additional meteorological data that are required for the development and deployment of a power production forecast. The Interconnection Customer whose Generating Facility is a Variable Energy Resource also shall submit data to the Transmission Provider regarding all forced outages to the extent necessary for the Transmission Provider's development and deployment of power production forecasts for that class of Variable Energy Resources. The exact specifications of the meteorological and forced outage data to be provided by the Interconnection Customer to the Transmission Provider, including the frequency and timing of data submittals, shall be made taking into account the size and configuration of the Variable Energy Resource, its characteristics, location, and its importance in maintaining generation resource adequacy and transmission system reliability in its area. All requirements for meteorological and forced outage data must be commensurate with the power production forecasting employed by the Transmission Provider. Such requirements for meteorological and forced outage data are set forth in Appendix C, Interconnection Details, of this LGIA, as they may change from time to time.

Article 9. Operations

9.1 **General.** Each Party shall comply with the Applicable Reliability Council requirements. Each Party shall provide to the other Party all information that may reasonably be required by the other Party to comply with Applicable Laws and Regulations and Applicable Reliability Standards.

9.2 **Control Area Notification**. At least three months before Initial Synchronization Date, Interconnection Customer shall notify Transmission Provider in

writing of the Control Area in which the Large Generating Facility will be located. If Interconnection Customer elects to locate the Large Generating Facility in a Control Area other than the Control Area in which the Large Generating Facility is physically located, and if permitted to do so by the relevant transmission tariffs, all necessary arrangements, including but not limited to those set forth in Article 7 and Article 8 of this LGIA, and remote Control Area generator interchange agreements, if applicable, and the appropriate measures under such agreements, shall be executed and implemented prior to the placement of the Large Generating Facility in the other Control Area.

9.3 Transmission Provider Obligations. Transmission Provider shall cause the Transmission System and Transmission Provider's Interconnection Facilities to be operated, maintained and controlled in a safe and reliable manner and in accordance with this LGIA. Transmission Provider may provide operating instructions to Interconnection Customer consistent with this LGIA and Transmission Provider's operating protocols and procedures as they may change from time to time. Transmission Provider will consider changes to its operating protocols and procedures proposed by Interconnection Customer.

9.4 Interconnection Customer Obligations. Interconnection Customer shall at its own expense operate, maintain and control the Large Generating Facility and Interconnection Customer's Interconnection Facilities in a safe and reliable manner and in accordance with this LGIA. Interconnection Customer shall operate the Large Generating Facility and Interconnection Customer's Interconnection Facilities in accordance with all applicable requirements of the Control Area of which it is part, as such requirements are set forth in Appendix C, Interconnection Details, of this LGIA. Appendix C, Interconnection Details, will be modified to reflect changes to the requirements as they may change from time to time. Either Party may request that the other Party provide copies of the requirements set forth in Appendix C, Interconnection Details, of this LGIA.

9.5 Start-Up and Synchronization. Consistent with the Parties' mutually acceptable procedures, Interconnection Customer is responsible for the proper synchronization of the Large Generating Facility to Transmission Provider's Transmission System.

9.6 Reactive Power and Primary Frequency Response.

9.6.1 Power Factor Design Criteria. Interconnection Customer shall design the Large Generating Facility to maintain a composite power delivery at continuous rated power output at the Point of Interconnection at a power factor within the range of 0.95 leading to 0.95 lagging, unless Transmission Provider has established different requirements that apply to all generators in the Control Area on a comparable basis. The requirements of this paragraph shall not apply to wind generators.

9.6.1.1 Synchronous Generation. Interconnection Customer shall design the Large Generating Facility to maintain a composite power deliver at continuous rated power output at the Point of Interconnection at a power factor within the range of 0.95 leading to 0.95 lagging, unless the Transmission Provider has established different requirements that apply to all synchronous generators in the Control Area on a comparable basis.

9.6.1.2 Non-Synchronous Generation. Interconnection Customer shall design the Large Generating Facility to maintain composite power delivery at continuous rated power output at the high-side of the generator substation at a power factor within the range of 0.95 leading to 0.95 lagging, unless the Transmission Provider has established a different power factor range that applies to all non-synchronous generators in the Control Area on a comparable basis. This power factor range standard shall be dynamic and can be met using, for example, power electronics designed to supply this level of reactive capability (taking into account any limitations due to voltage level, real power output, etc.) or fixed and switched capacitors, or a combination of the two. This requirement shall only apply to newly interconnecting non-synchronous generators that have not yet executed a Facilities Study Agreement as of the effective date of the Final Rule establishing this requirement (Order No. 827).

9.6.2 **Voltage Schedules.** Once Interconnection Customer has synchronized the Large Generating Facility with the Transmission System, Transmission Provider shall require Interconnection Customer to operate the Large Generating Facility to produce or absorb reactive power within the design limitations of the Large Generating Facility set forth in Article 9.6.1 (Power Factor Design Criteria). Transmission Provider's voltage schedules shall treat all sources of reactive power in the Control Area in an equitable and not unduly discriminatory manner. Transmission Provider shall exercise Reasonable Efforts to provide Interconnection Customer with such schedules at least one (1) day in advance,

and may make changes to such schedules as necessary to maintain the reliability of the Transmission System. Interconnection Customer shall operate the Large Generating Facility to maintain the specified output voltage or power factor at the Point of Interconnection within the design limitations of the Large Generating Facility set forth in Article 9.6.1 (Power Factor Design Criteria). If Interconnection Customer is unable to maintain the specified voltage or power factor, it shall promptly notify the System Operator.

9.6.2.1 Voltage Regulators. Whenever the Large Generating Facility is operated in parallel with the Transmission System and voltage regulators are capable of operation, Interconnection Customer shall operate the Large Generating Facility with its voltage regulators in automatic operation. If the Large Generating Facility's voltage regulators are not capable of such automatic operation, Interconnection Customer shall immediately notify Transmission Provider's system operator, or its designated representative, and ensure that such Large Generating Facility's reactive power production or absorption (measured in MVARs) are within the design capability of the Large Generating Facility's generating unit(s) and steady state stability limits. Interconnection Customer shall not cause its Large Generating Facility to disconnect automatically or instantaneously from the Transmission System or trip any generating unit comprising the Large Generating

Facility for an under or over frequency condition unless the abnormal frequency condition persists for a time period beyond the limits set forth in ANSI/IEEE Standard C37.106, or such other standard as applied to other generators in the Control Area on a comparable basis.

9.6.3 **Payment for Reactive Power.** Transmission Provider is required to pay Interconnection Customer for reactive power that Interconnection Customer provides or absorbs from the Large Generating Facility when Transmission Provider requests Interconnection Customer to operate its Large Generating Facility outside the range specified in Article 9.6.1, provided that if Transmission Provider pays its own or affiliated generators for reactive power service within the specified range, it must also pay Interconnection Customer. Payments shall be pursuant to Article 11.6 or such other agreement to which the Parties have otherwise agreed.

9.6.4 Primary Frequency Response. Interconnection Customer shall ensure the primary frequency response capability of its Large Generating Facility by installing, maintaining, and operating a functioning governor or equivalent controls. The term “functioning governor or equivalent controls” as used herein shall mean the required hardware and/or software that provides frequency responsive real power control with the ability to sense changes in system frequency and autonomously adjust the Large Generating Facility’s real power output in accordance with the droop and deadband parameters and in the direction needed to correct frequency deviations. Interconnection Customer is required to install a governor or equivalent controls with the capability of operating: (1) with a maximum 5 percent droop and ±0.036 Hz deadband; or (2) in accordance with the relevant droop, deadband, and timely and sustained response settings from an approved NERC Reliability Standard providing for equivalent or more stringent parameters. The droop characteristic shall be: (1) based on the nameplate capacity of the Large Generating Facility, and shall be linear in the range of frequencies between 59 to 61 Hz that are outside of the deadband parameter; or (2) based an approved NERC Reliability Standard providing for an equivalent or more stringent parameter. The deadband parameter shall be: the range of frequencies above and below nominal (60 Hz) in which the governor or equivalent controls is not expected to adjust the Large Generating Facility’s real power output in response to frequency deviations. The deadband shall be implemented: (1) without a step to the droop curve, that is, once the frequency deviation exceeds the deadband parameter, the expected change in the Large Generating Facility’s real power output in response to frequency deviations shall start from zero and then increase (for under-frequency deviations) or decrease (for over-frequency deviations) linearly in proportion to the magnitude of the frequency deviation; or (2) in accordance with an approved NERC Reliability Standard providing for an equivalent or more stringent parameter. Interconnection Customer shall notify Transmission Provider that the primary frequency response capability of the Large Generating Facility has been tested and confirmed during commissioning. Once Interconnection Customer has synchronized the Large Generating Facility with the Transmission System, Interconnection Customer shall operate the Large Generating Facility consistent with the provisions specified in Sections 9.6.4.1 and 9.6.4.2 of this Agreement. The primary frequency response requirements contained herein shall apply to both synchronous and non-synchronous Large Generating Facilities.

9.6.4.1 Governor or Equivalent Controls. Whenever the Large Generating Facility is operated in parallel with the Transmission System, Interconnection Customer shall operate the Large Generating Facility with its governor or equivalent controls in service and responsive to frequency. Interconnection Customer shall: (1) in coordination with Transmission Provider and/or the relevant balancing authority, set the deadband parameter to: (1) a maximum of ±0.036 Hz and set the droop parameter to a maximum of 5 percent; or (2) implement the relevant droop and deadband settings from an approved NERC Reliability Standard that provides for equivalent or more stringent parameters. Interconnection Customer shall be required to provide the status and settings of the governor or equivalent controls to Transmission Provider and/or the relevant balancing authority upon request. If Interconnection Customer needs to operate the Large Generating Facility with its governor or equivalent controls not in service, Interconnection Customer shall immediately notify Transmission Provider and the relevant balancing authority, and provide both with the following information: (1) the operating status of the governor or equivalent controls (i.e., whether it is currently out of service or when it will be taken out of service); (2) the reasons for removing the governor or equivalent controls from service; and (3) a reasonable estimate of when the governor or equivalent controls will be returned to service. Interconnection Customer shall make Reasonable Efforts to return its governor or equivalent controls into service as soon as practicable. Interconnection Customer shall make Reasonable Efforts to keep outages of the Large Generating Facility’s governor or equivalent controls to a minimum whenever the Large Generating Facility is operated in parallel with the Transmission System.

9.6.4.2 Timely and Sustained Response. Interconnection Customer shall ensure that the Large Generating Facility’s real power response to sustained frequency deviations outside of the deadband setting is automatically provided and shall begin immediately after frequency deviates outside of the deadband, and to the extent the Large Generating Facility has operating capability in the direction needed to correct the frequency deviation. Interconnection Customer shall not block or otherwise inhibit the ability of the governor or equivalent controls to respond and shall ensure that the response is not inhibited, except under certain operational constraints including, but not limited to, ambient temperature limitations, physical energy limitations, outages of mechanical equipment, or regulatory requirements. The Large Generating Facility shall sustain the real power response at least until system frequency returns to a value within the deadband setting of the governor or equivalent controls. A Commission-approved Reliability Standard with equivalent or more stringent requirements shall supersede the above requirements.

9.6.4.3 **Exemptions.** Large Generating Facilities that are regulated by the United States Nuclear Regulatory Commission shall be exempt from Sections 9.6.4, 9.6.4.1, and 9.6.4.2 of this Agreement. Large Generating Facilities that are behind the meter generation that is sized-to-load (i.e., the thermal load and the generation are near-balanced in real-time operation and the generation is primarily controlled to maintain the unique thermal, chemical, or mechanical output necessary for the operating requirements of its host facility) shall be required to install primary frequency response capability in accordance with the droop and deadband capability requirements specified in Section 9.6.4, but shall be otherwise exempt from the operating requirements in Sections 9.6.4, 9.6.4.1, 9.6.4.2, and 9.6.4.4 of this Agreement.

9.6.4.4 **Electric Storage Resources.** Interconnection Customer interconnecting an electric storage resource shall establish an operating range in Appendix C of its LGIA that specifies a minimum state of charge and a maximum state of charge between which the electric storage resource will be required to provide primary frequency response consistent with the conditions set forth in Sections 9.6.4, 9.6.4.1, 9.6.4.2, and 9.6.4.3 of this Agreement. Appendix C shall specify whether the operating range is static or dynamic, and shall consider (1) the expected magnitude of frequency deviations in the interconnection; (2) the expected duration that system frequency will remain outside of the deadband parameter in the interconnection; (3) the expected incidence of frequency deviations outside of the deadband parameter in the interconnection; (4) the physical capabilities of the electric storage resource; (5) operational limitations of the electric storage resource due to manufacturer specifications; and (6) any other relevant factors agreed to by Transmission Provider and Interconnection Customer, and in consultation with the relevant transmission owner or balancing authority as appropriate. If the operating range is dynamic, then Appendix C must establish how frequently the operating range will be reevaluated and the factors that may be considered during its reevaluation.

Interconnection Customer’s electric storage resource is required to provide timely and sustained primary frequency response consistent with Section 9.6.4.2 of this Agreement when it is online and dispatched to inject electricity to the Transmission System and/or receive electricity from the Transmission System. This excludes circumstances when the electric storage resource is not dispatched to inject electricity to the Transmission System and/or dispatched to receive electricity from the Transmission System. If Interconnection Customer’s electric storage resource is charging at the time of a frequency deviation outside of its deadband parameter, it is to increase (for over-frequency deviations) or decrease (for under-frequency deviations) the rate at which it is charging in accordance with its droop parameter. Interconnection Customer’s electric storage resource is not required to change from charging to discharging, or vice versa, unless the response necessitated by the droop and deadband settings requires it to do so and it is technically capable of making such a transition.

9.7 Outages and Interruptions.

9.7.1 Outages.

9.7.1.1 Outage Authority and Coordination. Each Party may in accordance with Good Utility Practice in coordination with the other Party remove from service any of its respective Interconnection Facilities or Network Upgrades that may impact the other Party's facilities as necessary to perform maintenance or testing or to install or replace equipment. Absent an Emergency Condition, the Party scheduling a removal of such facility(ies) from service will use Reasonable Efforts to schedule such removal on a date and time mutually acceptable to the Parties. In all circumstances, any Party planning to remove such facility(ies) from service shall use Reasonable Efforts to minimize the effect on the other Party of such removal.

9.7.1.2 **Outage Schedules.** Transmission Provider shall post scheduled outages of its transmission facilities on the OASIS. Interconnection Customer shall submit its planned maintenance schedules for the Large Generating Facility to Transmission Provider for a minimum of a rolling twenty-four month period. Interconnection Customer shall update its planned maintenance schedules as necessary. Transmission Provider may request Interconnection Customer to reschedule its maintenance as necessary to maintain the reliability of the Transmission System; provided, however, adequacy of generation supply shall not be a criterion in determining Transmission System reliability. Transmission Provider shall compensate Interconnection Customer for any additional direct costs that Interconnection Customer incurs as a result of having to reschedule maintenance, including any additional overtime, breaking of maintenance contracts or other costs above and beyond the cost Interconnection Customer would have incurred absent Transmission Provider's request to reschedule maintenance. Interconnection Customer will not be eligible to receive compensation, if during the twelve (12) months prior to the date of the scheduled maintenance, Interconnection Customer had modified its schedule of maintenance activities.

9.7.1.3 Outage Restoration. If an outage on a Party's Interconnection Facilities or Network Upgrades adversely affects the other Party's operations or facilities, the Party that owns or controls the facility that is out of service shall use Reasonable Efforts to promptly restore such facility(ies) to a normal operating condition consistent with the nature of the outage. The Party that owns or controls the facility that is out of service shall provide the other Party, to the extent such information is known, information on the nature of the Emergency Condition, an estimated time of restoration, and any corrective actions required. Initial verbal notice shall be followed up as soon as practicable with written notice explaining the nature of the outage.

9.7.2 Interruption of Service. If required by Good Utility Practice to do so, Transmission Provider may require Interconnection Customer to interrupt or reduce deliveries of electricity if such delivery of electricity could adversely affect Transmission Provider's ability to perform such activities as are necessary to safely and reliably operate and maintain the Transmission System. The following provisions shall apply to any interruption or reduction permitted under this Article 9.7.2:

9.7.2.1 The interruption or reduction shall continue only for so long as reasonably necessary under Good Utility Practice;

9.7.2.2 Any such interruption or reduction shall be made on an equitable, non-discriminatory basis with respect to all generating facilities directly connected to the Transmission System;

9.7.2.3 When the interruption or reduction must be made under circumstances which do not allow for advance notice, Transmission Provider shall notify Interconnection Customer by telephone as soon as practicable of the reasons for the curtailment, interruption, or reduction, and, if known, its expected duration. Telephone notification shall be followed by written notification as soon as practicable;

9.7.2.4 Except during the existence of an Emergency Condition, when the interruption or reduction can be scheduled without advance notice, Transmission Provider shall notify Interconnection Customer in advance regarding the timing of such scheduling and further notify Interconnection Customer of the expected duration. Transmission Provider shall coordinate with Interconnection Customer using Good Utility Practice to schedule the interruption or reduction during periods of least impact to Interconnection Customer and Transmission Provider;

9.7.2.5 The Parties shall cooperate and coordinate with each other to the extent necessary in order to restore the Large Generating Facility, Interconnection Facilities, and the Transmission System to their normal operating state, consistent with system conditions and Good Utility Practice.

9.7.3 **Under-Frequency and Over Frequency Conditions.** The Transmission System is designed to automatically activate a load-shed program as required by the Applicable Reliability Council in the event of an under-frequency system disturbance. Interconnection Customer shall implement under-frequency and over-frequency relay set points for the Large Generating Facility as required by the Applicable Reliability Council to ensure "ride through" capability of the Transmission System. Large Generating Facility response to frequency deviations of pre-determined magnitudes, both under-frequency and over-frequency deviations, shall be studied and coordinated with Transmission Provider in accordance with Good Utility Practice. The term "ride through" as used herein shall mean the ability of a Generating Facility to stay connected to and synchronized with the Transmission System during system disturbances within a range of under-frequency and over-frequency conditions, in accordance with Good Utility Practice.

9.7.4 **System Protection and Other Control Requirements.**

9.7.4.1 **System Protection Facilities.** Interconnection Customer shall, at its expense, install, operate and maintain System Protection Facilities as a part of the Large Generating Facility or

Interconnection Customer's Interconnection Facilities. Transmission Provider shall install at Interconnection Customer's expense any System Protection Facilities that may be required on Transmission Provider's Interconnection Facilities or the Transmission System as a result of the interconnection of the Large Generating Facility and Interconnection Customer's Interconnection Facilities.

9.7.4.2 Each Party's protection facilities shall be designed and coordinated with other systems in accordance with Good Utility Practice.

9.7.4.3 Each Party shall be responsible for protection of its facilities consistent with Good Utility Practice.

9.7.4.4 Each Party's protective relay design shall incorporate the necessary test switches to perform the tests required in Article 6. The required test switches will be placed such that they allow operation of lockout relays while preventing breaker failure schemes from operating and causing unnecessary breaker operations and/or the tripping of Interconnection Customer's units.

9.7.4.5 Each Party will test, operate and maintain System Protection Facilities in accordance with Good Utility Practice.

9.7.4.6 Prior to the In-Service Date, and again prior to the Commercial Operation Date, each Party or its agent shall perform a complete calibration test and functional trip test of the System Protection Facilities. At intervals suggested by Good Utility Practice and following any apparent malfunction of the System Protection Facilities, each Party shall perform both calibration and functional trip tests of its System Protection Facilities. These tests do not require the tripping of any in-service generation unit. These tests do, however, require that all protective relays and lockout contacts be activated.

9.7.5 Requirements for Protection. In compliance with Good Utility Practice, Interconnection Customer shall provide, install, own, and maintain relays, circuit breakers and all other devices necessary to remove any fault contribution of the Large Generating Facility to any short circuit occurring on the Transmission System not otherwise isolated by Transmission Provider's equipment, such that the removal of the fault contribution shall be coordinated with the protective requirements of the Transmission System. Such protective equipment shall include, without limitation, a disconnecting device or switch with load-interrupting capability located between the Large Generating Facility and the Transmission System at a site selected upon mutual agreement (not to be unreasonably withheld, conditioned or delayed) of the Parties. Interconnection Customer shall be responsible for protection of the Large Generating Facility and Interconnection Customer's other equipment from such conditions as negative sequence currents, over- or under-frequency, sudden load rejection, over- or under-voltage, and generator loss-of-field. Interconnection Customer shall be solely responsible to disconnect the Large Generating Facility and Interconnection Customer's other equipment if conditions on the Transmission System could adversely affect the Large Generating Facility.

9.7.6 Power Quality. Neither Party's facilities shall cause excessive voltage flicker nor introduce excessive distortion to the sinusoidal voltage or current waves as defined by ANSI Standard C84.1-1989, in accordance with IEEE Standard 519, or any applicable superseding electric industry standard. In the event of a conflict between ANSI Standard C84.1-1989, or any applicable superseding electric industry standard, ANSI Standard C84.1-1989, or the applicable superseding electric industry standard, shall control.

9.8 Switching and Tagging Rules. Each Party shall provide the other Party a copy of its switching and tagging rules that are applicable to the other Party's activities. Such switching and tagging rules shall be developed on a non-discriminatory basis. The Parties shall comply with applicable switching and tagging rules, as amended from time to time, in obtaining clearances for work or for switching operations on equipment.

9.9 Use of Interconnection Facilities by Third Parties.

9.9.1 Purpose of Interconnection Facilities. Except as may be required by Applicable Laws and Regulations, or as otherwise agreed to among the Parties, the Interconnection Facilities shall be constructed for the sole purpose of interconnecting the Large Generating Facility to the Transmission System and shall be used for no other purpose.

9.9.2 Third Party Users. If required by Applicable Laws and Regulations or if the Parties mutually agree, such agreement not to be unreasonably withheld, to allow one or more third parties to use Transmission Provider's Interconnection Facilities, or any part thereof, Interconnection Customer will be entitled to compensation for the capital expenses it incurred in connection with the Interconnection Facilities based upon the pro rata use of the Interconnection Facilities by Transmission Provider, all third party users, and Interconnection Customer, in accordance with Applicable Laws and Regulations or upon some other mutually-agreed upon methodology. In addition, cost responsibility for ongoing costs, including operation and maintenance costs associated with the Interconnection Facilities, will be allocated between Interconnection Customer and any third party users based upon the pro rata use of the Interconnection Facilities by Transmission Provider, all third party users, and Interconnection Customer, in accordance with Applicable Laws and Regulations or upon some other mutually agreed upon methodology. If the issue of such compensation or allocation cannot be resolved through such negotiations, it shall be submitted to FERC for resolution.

9.10 **Disturbance Analysis Data Exchange.** The Parties will cooperate with one another in the analysis of disturbances to either the Large Generating Facility or Transmission Provider's Transmission System by gathering and providing access to any information relating to any disturbance, including information from oscillography, protective relay targets, breaker operations and sequence of events records, and any disturbance information required by Good Utility Practice.

Article 10. Maintenance

10.1 **Transmission Provider Obligations.** Transmission Provider shall maintain the Transmission System and Transmission Provider's Interconnection Facilities in a safe and reliable manner and in accordance with this LGIA.

10.2 **Interconnection Customer Obligations.** Interconnection Customer shall maintain the Large Generating Facility and Interconnection Customer's Interconnection Facilities in a safe and reliable manner and in accordance with this LGIA.

10.3 **Coordination.** The Parties shall confer regularly to coordinate the planning, scheduling and performance of preventive and corrective maintenance on the Large Generating Facility and the Interconnection Facilities.

10.4 Secondary Systems. Each Party shall cooperate with the other in the inspection, maintenance, and testing of control or power circuits that operate below 600 volts, AC or DC, including, but not limited to, any hardware, control or protective devices, cables, conductors, electric raceways, secondary equipment panels, transducers, batteries, chargers, and voltage and current transformers that directly affect the operation of a Party's facilities and equipment which may reasonably be expected to impact the other Party. Each Party shall provide advance notice to the other Party before undertaking any work on such circuits, especially on electrical circuits involving circuit breaker trip and close contacts, current transformers, or potential transformers.

10.5 Operating and Maintenance Expenses. Subject to the provisions herein addressing the use of facilities by others, and except for operations and maintenance expenses associated with modifications made for providing interconnection or transmission service to a third party and such third party pays for such expenses, Interconnection Customer shall be responsible for all reasonable expenses including overheads, associated with: (1) owning, operating, maintaining, repairing, and replacing Interconnection Customer's Interconnection Facilities; and (2) operation, maintenance, repair and replacement of Transmission Provider's Interconnection Facilities.

Article 11. Performance Obligation

11.1 Interconnection Customer Interconnection Facilities. Interconnection Customer shall design, procure, construct, install, own and/or control Interconnection Customer Interconnection Facilities described in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades, at its sole expense.

11.2 Transmission Provider's Interconnection Facilities. Transmission Provider or Transmission Owner shall design, procure, construct, install, own and/or control the Transmission Provider's Interconnection Facilities described in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades, at the sole expense of the Interconnection Customer.

11.3 Network Upgrades and Distribution Upgrades. Transmission Provider or Transmission Owner shall design, procure, construct, install, and own the Network Upgrades and Distribution Upgrades described in Appendix A, Interconnection Facilities, Network Upgrades and Distribution Upgrades. The Interconnection Customer shall be responsible for all costs related to Distribution Upgrades. Unless Transmission Provider or Transmission Owner elects to fund the capital for the Network Upgrades, they shall be solely funded by Interconnection Customer. In the event that Transmission Provider must change the voltage levels of a discrete portion of the Transmission System to which the Interconnection Customer is connected, Transmission Provider shall give reasonable notice of such change and the Interconnection Customer shall be solely responsible for all costs related to upgrades or modifications to Interconnection Customer’s Interconnection Facilities resulting from Transmission Provider’s increase in the voltage levels of the Transmission System, in order to remain interconnected with the Transmission System at the new operating voltage. To the extent that the modifications necessary to upgrade Interconnection Facilities qualify as Network Upgrades, Transmission Provider shall be solely responsible for the expense of such modifications or upgrades.

11.4 Transmission Credits.

11.4.1 Repayment of Amounts Advanced for Network Upgrades. Interconnection Customer shall be entitled to a cash repayment, equal to the total amount paid to Transmission Provider and Affected System Operator, if any, for the Network Upgrades, including any tax gross-up or other tax-related payments associated with Network Upgrades, and not refunded to Interconnection

Customer pursuant to Article 5.17.8 or otherwise, to be paid to Interconnection Customer on a dollar-for-dollar basis for the non-usage sensitive portion of transmission charges, as payments are made under Transmission Provider's Tariff and Affected System's Tariff for transmission services with respect to the Large Generating Facility. Any repayment shall include interest calculated in accordance with the methodology set forth in FERC=s regulations at 18 C.F.R. § 35.19a(a)(2)(iii) from the date of any payment for Network Upgrades through the date on which the Interconnection Customer receives a repayment of such payment pursuant to this subparagraph. Interconnection Customer may assign such repayment rights to any person.

Notwithstanding the foregoing, Interconnection Customer, Transmission Provider, and Affected System Operator may adopt any alternative payment schedule that is mutually agreeable so long as Transmission Provider and Affected System Operator take one of the following actions no later than five years from the Commercial Operation Date: (1) return to Interconnection Customer any amounts advanced for Network Upgrades not previously repaid, or (2) declare in writing that Transmission Provider or Affected System Operator will continue to provide payments to Interconnection Customer on a dollar-for-dollar basis for the non-usage sensitive portion of transmission charges, or develop an alternative schedule that is mutually agreeable and provides for the return of all amounts advanced for Network Upgrades not previously repaid; however, full reimbursement shall not extend beyond twenty (20) years from the Commercial Operation Date.

If the Large Generating Facility fails to achieve commercial operation, but it or another Generating Facility is later constructed and makes use of the Network Upgrades, Transmission Provider and Affected System Operator shall at that time reimburse Interconnection Customer for the amounts advanced for the Network Upgrades. Before any such reimbursement can occur, the Interconnection Customer, or the entity that ultimately constructs the Generating Facility, if different, is responsible for identifying the entity to which reimbursement must be made.

11.4.2 **Special Provisions for Affected Systems.** Unless Transmission Provider provides, under the LGIA, for the repayment of amounts advanced to Affected System Operator for Network Upgrades, Interconnection Customer and Affected System Operator shall enter into an agreement that provides for such repayment. The agreement shall specify the terms governing payments to be made by Interconnection Customer to the Affected System Operator as well as the repayment by the Affected System Operator.

11.4.3 Notwithstanding any other provision of this LGIA, nothing herein shall be construed as relinquishing or foreclosing any rights, including but not limited to firm transmission rights, capacity rights, transmission congestion rights, or transmission credits, that Interconnection Customer, shall be entitled to, now or in the future under any other agreement or tariff as a result of, or otherwise associated with, the transmission capacity, if any, created by the Network Upgrades, including the right to obtain cash reimbursements or transmission credits for transmission service that is not associated with the Large Generating Facility.

11.5 Provision of Security. At least thirty (30) Calendar Days prior to the commencement of the first of the following to occur: design, procurement, installation, or construction of a discrete portion of a Transmission Provider's Interconnection Facilities, Network Upgrades, or Distribution Upgrades, Interconnection Customer shall provide Transmission Provider, at Interconnection Customer's option, a guarantee, a surety bond, letter of credit or other form of security that is reasonably acceptable to Transmission Provider and is consistent with the Uniform Commercial Code of the jurisdiction identified in Article 14.2.1. Such security for payment shall be in an amount sufficient to cover the costs for constructing, designing, procuring, and installing the applicable portion of Transmission Provider's Interconnection Facilities, Network Upgrades, or Distribution Upgrades and shall be reduced on a dollar-for-dollar basis for payments made to Transmission Provider for these purposes.

In addition:

11.5.1 The guarantee must be made by an entity that meets the creditworthiness requirements of Transmission Provider, and contain terms and conditions that guarantee payment of any amount that may be due from Interconnection Customer, up to an agreed-to maximum amount.

11.5.2 The letter of credit must be issued by a financial institution reasonably acceptable to Transmission Provider and must indicate that it would only expire upon final payment made to Transmission Provider to cover all relevant costs for designing, procuring, installing, and constructing the applicable portion of Interconnection Facilities, Network Upgrades, or Distribution Upgrades for which the letter of credit was provided.

11.5.3 The surety bond must be issued by an insurer reasonably acceptable to Transmission Provider and must indicate that it would only expire upon final payment made to Transmission Provider to cover all relevant costs for designing, procuring, installing, and constructing the applicable portion of Interconnection Facilities, Network Upgrades, or Distribution Upgrades for which the surety bond was provided.

11.6 Interconnection Customer Compensation. If Transmission Provider requests or directs Interconnection Customer to provide a service pursuant to Articles 9.6.3 (Payment for Reactive Power), or 13.5.1 of this LGIA, Transmission Provider shall compensate Interconnection Customer in accordance with Interconnection Customer's applicable rate schedule then in effect unless the provision of such service(s) is subject to an RTO or ISO FERC-approved rate schedule. Interconnection Customer shall serve Transmission Provider or RTO or ISO with any filing of a proposed rate schedule at the time of such filing with FERC. To the extent that no rate schedule is in effect at the time the Interconnection Customer is required to provide or absorb any Reactive Power under this LGIA, Transmission Provider agrees to compensate Interconnection Customer in such amount as would have been due Interconnection Customer had the rate schedule been in effect at the time service commenced; provided, however, that such rate schedule must be filed at FERC or other appropriate Governmental Authority within sixty (60) Calendar Days of the commencement of service.

11.6.1 Interconnection Customer Compensation for Actions During Emergency Condition. Transmission Provider or RTO or ISO shall compensate Interconnection Customer for its provision of real and reactive power and other Emergency Condition services that Interconnection Customer provides to support the Transmission System during an Emergency Condition in accordance with Article 11.6.

Article 12. Invoice

12.1 General. Each Party shall submit to the other Party, on a monthly basis, invoices of amounts due for the preceding month. Each invoice shall state the month to which the invoice applies and fully describe the services and equipment provided. The Parties may discharge mutual debts and payment obligations due and owing to each other on the same date through netting, in which case all amounts a Party owes to the other Party under this LGIA, including interest payments or credits, shall be netted so that only the net amount remaining due shall be paid by the owing Party.

12.2 Final Invoice. Within six months after completion of the construction of Transmission Provider's Interconnection Facilities and the Network Upgrades, Transmission Provider shall provide an invoice of the final cost of the construction of Transmission Provider's Interconnection Facilities and the Network Upgrades and shall set forth such costs in sufficient detail to enable Interconnection Customer to compare the actual costs with the estimates and to ascertain deviations, if any, from the cost estimates. Transmission Provider shall refund to Interconnection Customer any amount by which the actual payment by Interconnection Customer for estimated costs exceeds the actual costs of construction within thirty (30) Calendar Days of the issuance of such final construction invoice.

12.3 Payment. Invoices shall be rendered to the paying Party at the address specified in Appendix F. The Party receiving the invoice shall pay the invoice within thirty (30) Calendar Days of receipt. All payments shall be made in immediately available funds payable to the other Party, or by wire transfer to a bank named and account designated by the invoicing Party. Payment of invoices by either Party will not constitute a waiver of any rights or claims either Party may have under this LGIA.

12.4 Disputes. In the event of a billing dispute between Transmission Provider and Interconnection Customer, Transmission Provider shall continue to provide Interconnection Service under this LGIA as long as Interconnection Customer: (i) continues to make all payments not in dispute; and (ii) pays to Transmission Provider or into an independent escrow account the portion of the invoice in dispute, pending resolution of such dispute. If Interconnection Customer fails to meet these two requirements for continuation of service, then Transmission Provider may provide notice to Interconnection Customer of a Default pursuant to Article 17. Within thirty (30) Calendar Days after the resolution of the dispute, the Party that owes money to the other Party shall pay the amount due with interest calculated in accord with the methodology set forth in FERC's regulations at 18 CFR § 35.19a(a)(2)(iii).

Article 13. Emergencies

13.1 Definition. "Emergency Condition" shall mean a condition or situation: (i) that in the judgment of the Party making the claim is imminently likely to endanger life or property; or (ii) that, in the case of Transmission Provider, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to the Transmission System, Transmission Provider's Interconnection Facilities or the Transmission Systems of others to which the Transmission System is directly connected; or (iii) that, in the case of Interconnection Customer, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to, the Large Generating Facility or Interconnection Customer's Interconnection Facilities' System restoration and black start shall be considered Emergency Conditions; provided, that Interconnection Customer is not obligated by this LGIA to possess black start capability.

13.2 Obligations. Each Party shall comply with the Emergency Condition procedures of the applicable ISO/RTO, NERC, the Applicable Reliability Council, Applicable Laws and Regulations, and any emergency procedures agreed to by the Joint Operating Committee.

13.3 Notice. Transmission Provider shall notify Interconnection Customer promptly when it becomes aware of an Emergency Condition that affects Transmission Provider's Interconnection Facilities or the Transmission System that may reasonably be expected to affect Interconnection Customer's operation of the Large Generating Facility or Interconnection Customer's Interconnection Facilities. Interconnection Customer shall notify Transmission Provider promptly when it becomes aware of an Emergency Condition that affects the Large Generating Facility or Interconnection Customer's Interconnection Facilities that may reasonably be expected to affect the Transmission System or Transmission Provider's Interconnection Facilities. To the extent information is known, the notification shall describe the Emergency Condition, the extent of the damage or deficiency, the expected effect on the operation of Interconnection Customer's or Transmission Provider's facilities and operations, its anticipated duration and the corrective action taken and/or to be taken. The initial notice shall be followed as soon as practicable with written notice.

13.4 Immediate Action. Unless, in Interconnection Customer's reasonable judgment, immediate action is required, Interconnection Customer shall obtain the consent of Transmission Provider, such consent to not be unreasonably withheld, prior to performing any manual switching operations at the Large Generating Facility or Interconnection Customer's Interconnection Facilities in response to an Emergency Condition either declared by Transmission Provider or otherwise regarding the Transmission System.

13.5 Transmission Provider Authority.

13.5.1 General. Transmission Provider may take whatever actions or inactions with regard to the Transmission System or Transmission Provider's Interconnection Facilities it deems necessary during an Emergency Condition in order to (i) preserve public health and safety, (ii) preserve the reliability of the Transmission System or Transmission Provider's Interconnection

Facilities, (iii) limit or prevent damage, and (iv) expedite restoration of service.

Transmission Provider shall use Reasonable Efforts to minimize the effect of such actions or inactions on the Large Generating Facility or Interconnection Customer's Interconnection Facilities. Transmission Provider may, on the basis of technical considerations, require the Large Generating Facility to mitigate an Emergency Condition by taking actions necessary and limited in scope to remedy the Emergency Condition, including, but not limited to, directing Interconnection Customer to shut-down, start-up, increase or decrease the real or reactive power output of the Large Generating Facility; implementing a reduction or disconnection pursuant to Article 13.5.2; directing Interconnection Customer to assist with blackstart (if available) or restoration efforts; or altering the outage schedules of the Large Generating Facility and Interconnection Customer's Interconnection Facilities. Interconnection Customer shall comply with all of Transmission Provider's operating instructions concerning Large Generating Facility real power and reactive power output within the manufacturer's design limitations of the Large Generating Facility's equipment that is in service and physically available for operation at the time, in compliance with Applicable Laws and Regulations.

13.5.2 **Reduction and Disconnection.** Transmission Provider may reduce Interconnection Service or disconnect the Large Generating Facility or Interconnection Customer's Interconnection Facilities, when such, reduction or disconnection is necessary under Good Utility Practice due to Emergency Conditions. These rights are separate and distinct from any right of curtailment of Transmission Provider pursuant to Transmission Provider's Tariff. When

Transmission Provider can schedule the reduction or disconnection in advance, Transmission Provider shall notify Interconnection Customer of the reasons, timing and expected duration of the reduction or disconnection. Transmission Provider shall coordinate with Interconnection Customer using Good Utility Practice to schedule the reduction or disconnection during periods of least impact to Interconnection Customer and Transmission Provider. Any reduction or disconnection shall continue only for so long as reasonably necessary under Good Utility Practice. The Parties shall cooperate with each other to restore the Large Generating Facility, the Interconnection Facilities, and the Transmission System to their normal operating state as soon as practicable consistent with Good Utility Practice.

13.6 Interconnection Customer Authority. Consistent with Good Utility Practice and the LGIA and the LGIP, Interconnection Customer may take actions or inactions with regard to the Large Generating Facility or Interconnection Customer's Interconnection Facilities during an Emergency Condition in order to (i) preserve public health and safety, (ii) preserve the reliability of the Large Generating Facility or Interconnection Customer's Interconnection Facilities, (iii) limit or prevent damage, and (iv) expedite restoration of service. Interconnection Customer shall use Reasonable Efforts to minimize the effect of such actions or inactions on the Transmission System and Transmission Provider's Interconnection Facilities. Transmission Provider shall use Reasonable Efforts to assist Interconnection Customer in such actions.

13.7 Limited Liability. Except as otherwise provided in Article 11.6.1 of this LGIA, neither Party shall be liable to the other for any action it takes in responding to an Emergency Condition so long as such action is made in good faith and is consistent with Good Utility Practice.

Article 14. Regulatory Requirements and Governing Law

14.1 Regulatory Requirements. Each Party's obligations under this LGIA shall be subject to its receipt of any required approval or certificate from one or more Governmental Authorities in the form and substance satisfactory to the applying Party, or the Party making any required filings with, or providing notice to, such Governmental Authorities, and the expiration of any time period associated therewith. Each Party shall in good faith seek and use its Reasonable Efforts to obtain such other approvals. Nothing in this LGIA shall require Interconnection Customer to take any action that could result in its inability to obtain, or its loss of, status or exemption under the Federal Power Act, the Public Utility Holding Company Act of 1935, as amended, or the Public Utility Regulatory Policies Act of 1978.

14.2 Governing Law.

14.2.1 The validity, interpretation and performance of this LGIA and each of its provisions shall be governed by the laws of the state where the Point of Interconnection is located, without regard to its conflicts of law principles.

14.2.2 This LGIA is subject to all Applicable Laws and Regulations.

14.2.3 Each Party expressly reserves the right to seek changes in, appeal, or otherwise contest any laws, orders, rules, or regulations of a Governmental Authority.

Article 15. Notices.

15.1 General. Unless otherwise provided in this LGIA, any notice, demand or request required or permitted to be given by either Party to the other and any instrument required or permitted to be tendered or delivered by either Party in writing to the other shall be effective when delivered and may be so given, tendered or delivered, by recognized national courier, or by depositing the same with the United States Postal Service with postage prepaid, for delivery by certified or registered mail, addressed to the Party, or personally delivered to the Party, at the address set out in Appendix F, Addresses for Delivery of Notices and Billings.

Either Party may change the notice information in this LGIA by giving five (5) Business Days written notice prior to the effective date of the change.

15.2 Billings and Payments. Billings and payments shall be sent to the addresses set out in Appendix F.

15.3 Alternative Forms of Notice. Any notice or request required or permitted to be given by a Party to the other and not required by this Agreement to be given in writing may be so given by telephone, facsimile or email to the telephone numbers and email addresses set out in Appendix F.

15.4 Operations and Maintenance Notice. Each Party shall notify the other Party in writing of the identity of the person(s) that it designates as the point(s) of contact with respect to the implementation of Articles 9 and 10.

Article 16. Force Majeure

16.1 Force Majeure.

16.1.1 Economic hardship is not considered a Force Majeure event.

16.1.2 Neither Party shall be considered to be in Default with respect to any obligation hereunder, (including obligations under Article 4), other than the obligation to pay money when due, if prevented from fulfilling such obligation by Force Majeure. A Party unable to fulfill any obligation hereunder (other than an obligation to pay money when due) by reason of Force Majeure shall give notice and the full particulars of such Force Majeure to the other Party in writing or by telephone as soon as reasonably possible after the occurrence of the cause relied upon. Telephone notices given pursuant to this article shall be confirmed in writing as soon as reasonably possible and shall specifically state full particulars of the Force Majeure, the time and date when the Force Majeure occurred and when the Force Majeure is reasonably expected to cease. The Party affected shall exercise due diligence to remove such disability with reasonable dispatch, but shall not be required to accede or agree to any provision not satisfactory to it in order to settle and terminate a strike or other labor disturbance.

Article 17. Default

17.1 Default

17.1.1 **General.** No Default shall exist where such failure to discharge an obligation (other than the payment of money) is the result of Force Majeure as defined in this LGIA or the result of an act of omission of the other Party. Upon a Breach, the non-breaching Party shall give written notice of such Breach to the breaching Party. Except as provided in Article 17.1.2, the breaching Party shall have thirty (30) Calendar Days from receipt of the Default notice within which to cure such Breach; provided however, if such Breach is not capable of cure within thirty (30) Calendar Days, the breaching Party shall commence such cure within thirty (30) Calendar Days after notice and continuously and diligently complete such cure within ninety (90) Calendar Days from receipt of the Default notice; and, if cured within such time, the Breach specified in such notice shall cease to exist.

17.1.2 Right to Terminate. If a Breach is not cured as provided in this article, or if a Breach is not capable of being cured within the period provided for herein, the non-breaching Party shall have the right to declare a Default and terminate this LGIA by written notice at any time until cure occurs, and be relieved of any further obligation hereunder and, whether or not that Party terminates this LGIA, to recover from the breaching Party all amounts due hereunder, plus all other damages and remedies to which it is entitled at law or in equity. The provisions of this article will survive termination of this LGIA.

Article 18. Indemnity, Consequential Damages and Insurance

18.1 Indemnity. The Parties shall at all times indemnify, defend, and hold the other Party harmless from, any and all damages, losses, claims, including claims and actions relating to injury to or death of any person or damage to property, demand, suits, recoveries, costs and expenses, court costs, attorney fees, and all other obligations by or to third parties, arising out of or resulting from the other Party's action or inactions of its obligations under this LGIA on behalf of the Indemnifying Party, except in cases of gross negligence or intentional wrongdoing by the Indemnified Party.

18.1.1 Indemnified Person. If an Indemnified Person is entitled to indemnification under this Article 18 as a result of a claim by a third party, and the indemnifying Party fails, after notice and reasonable opportunity to proceed under Article 18.1, to assume the defense of such claim, such Indemnified Person may at the expense of the indemnifying Party contest, settle or consent to the entry of any judgment with respect to, or pay in full, such claim.

18.1.2 **Indemnifying Party**. If an Indemnifying Party is obligated to indemnify and hold any Indemnified Person harmless under this Article 18, the amount owing to the Indemnified Person shall be the amount of such Indemnified Person's actual Loss, net of any insurance or other recovery.

18.1.3 **Indemnity Procedures**. Promptly after receipt by an Indemnified Person of any claim or notice of the commencement of any action or administrative or legal proceeding or investigation as to which the indemnity provided for in Article 18.1 may apply, the Indemnified Person shall notify the Indemnifying Party of such fact. Any failure of or delay in such notification shall not affect a Party's indemnification obligation unless such failure or delay is materially prejudicial to the indemnifying Party.

The Indemnifying Party shall have the right to assume the defense thereof with counsel designated by such Indemnifying Party and reasonably satisfactory to the Indemnified Person. If the defendants in any such action include one or more Indemnified Persons and the Indemnifying Party and if the Indemnified Person reasonably concludes that there may be legal defenses available to it and/or other Indemnified Persons which are different from or additional to those available to the Indemnifying Party, the Indemnified Person shall have the right to select separate counsel to assert such legal defenses and to otherwise participate in the defense of such action on its own behalf. In such instances, the Indemnifying Party shall only be required to pay the fees and expenses of one additional attorney to represent an Indemnified Person or Indemnified Persons having such differing or additional legal defenses.

The Indemnified Person shall be entitled, at its expense, to participate in any such action, suit or proceeding, the defense of which has been assumed by the Indemnifying Party. Notwithstanding the foregoing, the Indemnifying Party (i) shall not be entitled to assume and control the defense of any such action, suit or proceedings if and to the extent that, in the opinion of the Indemnified Person and its counsel, such action, suit or proceeding involves the potential imposition of criminal liability on the Indemnified Person, or there exists a conflict or adversity of interest between the Indemnified Person and the Indemnifying Party, in such event the Indemnifying Party shall pay the reasonable expenses of the Indemnified Person, and (ii) shall not settle or consent to the entry of any judgment in any action, suit or proceeding without the consent of the Indemnified Person, which shall not be reasonably withheld, conditioned or delayed.

18.2 Consequential Damages. Other than the Liquidated Damages heretofore described, in no event shall either Party be liable under any provision of this LGIA for any losses, damages, costs or expenses for any special, indirect, incidental, consequential, or punitive damages, including but not limited to loss of profit or revenue, loss of the use of equipment, cost of capital, cost of temporary equipment or services, whether based in whole or in part in contract, in tort, including negligence, strict liability, or any other theory of liability; provided, however, that damages for which a Party may be liable to the other Party under another agreement will not be considered to be special, indirect, incidental, or consequential damages hereunder.

18.3 Insurance. Each party shall, at its own expense, maintain in force throughout the period of this LGIA, and until released by the other Party, the following minimum insurance coverages, with insurers authorized to do business in the state where the Point of Interconnection is located:

18.3.1 Employers' Liability and Workers' Compensation Insurance providing statutory benefits in accordance with the laws and regulations of the state in which the Point of Interconnection is located.

18.3.2 Commercial General Liability Insurance including premises and operations, personal injury, broad form property damage, broad form blanket contractual liability coverage (including coverage for the contractual indemnification) products and completed operations coverage, coverage for explosion, collapse and underground hazards, independent contractors coverage, coverage for pollution to the extent normally available and punitive damages to the extent normally available and a cross liability endorsement, with minimum limits of One Million Dollars ($1,000,000) per occurrence/One Million Dollars ($1,000,000) aggregate combined single limit for personal injury, bodily injury, including death and property damage.

18.3.3 Comprehensive Automobile Liability Insurance for coverage of owned and non-owned and hired vehicles, trailers or semi-trailers designed for travel on public roads, with a minimum, combined single limit of One Million Dollars ($1,000,000) per occurrence for bodily injury, including death, and property damage.

18.3.4 Excess Public Liability Insurance over and above the Employers' Liability Commercial General Liability and Comprehensive Automobile Liability Insurance coverage, with a minimum combined single limit of Twenty Million Dollars ($20,000,000) per occurrence/Twenty Million Dollars ($20,000,000) aggregate.

18.3.5 The Commercial General Liability Insurance, Comprehensive Automobile Insurance and Excess Public Liability Insurance policies shall name the other Party, its parent, associated and Affiliate companies and their respective directors, officers, agents, servants and employees ("Other Party Group") as additional insured. All policies shall contain provisions whereby the insurers waive all rights of subrogation in accordance with the provisions of this LGIA against the Other Party Group and provide thirty (30) Calendar Days advance written notice to the Other Party Group prior to anniversary date of cancellation or any material change in coverage or condition.

18.3.6 The Commercial General Liability Insurance, Comprehensive Automobile Liability Insurance and Excess Public Liability Insurance policies shall contain provisions that specify that the policies are primary and shall apply to such extent without consideration for other policies separately carried and shall state that each insured is provided coverage as though a separate policy had been issued to each, except the insurer's liability shall not be increased beyond the amount for which the insurer would have been liable had only one insured been covered. Each Party shall be responsible for its respective deductibles or retentions.

18.3.7 The Commercial General Liability Insurance, Comprehensive Automobile Liability Insurance and Excess Public Liability Insurance policies, if written on a Claims First Made Basis, shall be maintained in full force and effect for two (2) years after termination of this LGIA, which coverage may be in the form of tail coverage or extended reporting period coverage if agreed by the Parties.

18.3.8 The requirements contained herein as to the types and limits of all insurance to be maintained by the Parties are not intended to and shall not in any manner, limit or qualify the liabilities and obligations assumed by the Parties under this LGIA.

18.3.9 Within ten (10) days following execution of this LGIA, and as soon as practicable after the end of each fiscal year or at the renewal of the insurance policy and in any event within ninety (90) days thereafter, each Party shall provide certification of all insurance required in this LGIA, executed by each insurer or by an authorized representative of each insurer.

18.3.10 Notwithstanding the foregoing, each Party may self-insure to meet the minimum insurance requirements of Articles 18.3.2 through 18.3.8 to the extent it maintains a self-insurance program; provided that, such Party's senior secured debt is rated at investment grade or better by Standard & Poor's and that its self-insurance program meets the minimum insurance requirements of Articles 18.3.2 through 18.3.8. For any period of time that a Party's senior secured debt is unrated by Standard & Poor's or is rated at less than investment grade by Standard & Poor's, such Party shall comply with the insurance requirements applicable to it under Articles 18.3.2 through 18.3.9. In the event that a Party is permitted to self-insure pursuant to this article, it shall notify the other Party that it meets the requirements to self-insure and that its self-insurance program meets the minimum insurance requirements in a manner consistent with that specified in Article 18.3.9.

18.3.11 The Parties agree to report to each other in writing as soon as practical all accidents or occurrences resulting in injuries to any person, including death, and any property damage arising out of this LGIA.

Article 19. Assignment

19.1 Assignment. This LGIA may be assigned by either Party only with the written consent of the other; provided that either Party may assign this LGIA without the consent of the other Party to any Affiliate of the assigning Party with an equal or greater credit rating and with the legal authority and operational ability to satisfy the obligations of the assigning Party under this LGIA; and provided further that Interconnection Customer shall have the right to assign this LGIA, without the consent of Transmission Provider, for collateral security purposes to aid in providing financing for the Large Generating Facility, provided that Interconnection Customer will promptly notify Transmission Provider of any such assignment. Any financing arrangement entered into by Interconnection Customer pursuant to this article will provide that prior to or upon the exercise of the secured Party's, trustee's or mortgagee's assignment rights pursuant to said arrangement, the secured creditor, the trustee or mortgagee will notify Transmission Provider of the date and particulars of any such exercise of assignment right(s), including providing the Transmission Provider with proof that it meets the requirements of Articles 11.5 and 18.3. Any attempted assignment that violates this article is void and ineffective. Any assignment under this LGIA shall not relieve a Party of its obligations, nor shall a Party's obligations be enlarged, in whole or in part, by reason thereof. Where required, consent to assignment will not be unreasonably withheld, conditioned or delayed.

Article 20. Severability

20.1 Severability. If any provision in this LGIA is finally determined to be invalid, void or unenforceable by any court or other Governmental

Authority having jurisdiction, such determination shall not invalidate, void or make unenforceable any other provision, agreement or covenant of this LGIA; provided that if Interconnection Customer (or any third party, but only if such third party is not acting at the direction of Transmission Provider) seeks and obtains such a final determination with respect to any provision of the Alternate Option (Article 5.1.2), or the Negotiated Option (Article 5.1.4), then none of these provisions shall thereafter have any force or effect and the Parties' rights and obligations shall be governed solely by the Standard Option (Article 5.1.1).

Article 21. Comparability

21.1 Comparability. The Parties will comply with all applicable comparability and code of conduct laws, rules and regulations, as amended from time to time.

Article 22. Confidentiality

22.1 Confidentiality. Confidential Information shall include, without limitation, all information relating to a Party's technology, research and development, business affairs, and pricing, and any information supplied by either of the Parties to the other prior to the execution of this LGIA.

Information is Confidential Information only if it is clearly designated or marked in writing as confidential on the face of the document, or, if the information is conveyed orally or by inspection, if the Party providing the information orally informs the Party receiving the information that the information is confidential.

If requested by either Party, the other Party shall provide in writing, the basis for asserting that the information referred to in this Article 22 warrants confidential treatment, and the requesting Party may disclose such writing to the appropriate Governmental Authority. Each Party shall be responsible for the costs associated with affording confidential treatment to its information.

22.1.1 **Term.** During the term of this LGIA, and for a period of three (3) years after the expiration or termination of this LGIA, except as otherwise provided in this Article 22, each Party shall hold in confidence and shall not disclose to any person Confidential Information.

22.1.2 **Scope.** Confidential Information shall not include information that the receiving Party can demonstrate: (1) is generally available to the public other than as a result of a disclosure by the receiving Party; (2) was in the lawful possession of the receiving Party on a non-confidential basis before receiving it from the disclosing Party; (3) was supplied to the receiving Party without restriction by a third party, who, to the knowledge of the receiving Party after due inquiry, was under no obligation to the disclosing Party to keep such information confidential; (4) was independently developed by the receiving Party without reference to Confidential Information of the disclosing Party; (5) is, or becomes, publicly known, through no wrongful act or omission of the receiving Party or Breach of this LGIA; or (6) is required, in accordance with Article 22.1.7 of the LGIA, Order of Disclosure, to be disclosed by any Governmental Authority or is otherwise required to be disclosed by law or subpoena, or is necessary in any legal proceeding establishing rights and obligations under this LGIA. Information designated as Confidential Information will no longer be deemed confidential if the Party that designated the information as confidential notifies the other Party that it no longer is confidential.

22.1.3 **Release of Confidential Information.** Neither Party shall release or disclose Confidential Information to any other person, except to its Affiliates (limited by the Standards of Conduct requirements), subcontractors, employees, consultants, or to parties who may be or considering providing financing to or equity participation with Interconnection Customer, or to potential purchasers or assignees of Interconnection Customer, on a need-to-know basis in connection with this LGIA, unless such person has first been advised of the confidentiality provisions of this Article 22 and has agreed to comply with such provisions. Notwithstanding the foregoing, a Party providing Confidential Information to any person shall remain primarily responsible for any release of Confidential Information in contravention of this Article 22.

22.1.4 **Rights**. Each Party retains all rights, title, and interest in the Confidential Information that each Party discloses to the other Party. The disclosure by each Party to the other Party of Confidential Information shall not be deemed a waiver by either Party or any other person or entity of the right to protect the Confidential Information from public disclosure.

22.1.5 **No Warranties**. By providing Confidential Information, neither Party makes any warranties or representations as to its accuracy or completeness. In addition, by supplying Confidential Information, neither Party obligates itself to provide any particular information or Confidential Information to the other Party nor to enter into any further agreements or proceed with any other relationship or joint venture.

22.1.6 **Standard of Care**. Each Party shall use at least the same standard of care to protect Confidential Information it receives as it uses to protect its own Confidential Information from unauthorized disclosure, publication or dissemination. Each Party may use Confidential Information solely to fulfill its obligations to the other Party under this LGIA or its regulatory requirements.

22.1.7 **Order of Disclosure.** If a court or a Government Authority or entity with the right, power, and apparent authority to do so requests or requires either Party, by subpoena, oral deposition, interrogatories, requests for production of documents, administrative order, or otherwise, to disclose Confidential Information, that Party shall provide the other Party with prompt notice of such request(s) or requirement(s) so that the other Party may seek an appropriate protective order or waive compliance with the terms of this LGIA.

Notwithstanding the absence of a protective order or waiver, the Party may disclose such Confidential Information which, in the opinion of its counsel, the Party is legally compelled to disclose. Each Party will use Reasonable Efforts to obtain reliable assurance that confidential treatment will be accorded any Confidential Information so furnished.

22.1.8 **Termination of Agreement.** Upon termination of this LGIA for any reason, each Party shall, within ten (10) Calendar Days of receipt of a written request from the other Party, use Reasonable Efforts to destroy, erase, or delete (with such destruction, erasure, and deletion certified in writing to the other Party) or return to the other Party, without retaining copies thereof, any and all written or electronic Confidential Information received from the other Party.

22.1.9 **Remedies.** The Parties agree that monetary damages would be inadequate to compensate a Party for the other Party's Breach of its obligations under this Article 22. Each Party accordingly agrees that the other Party shall be entitled to equitable relief, by way of injunction or otherwise, if the first Party Breaches or threatens to Breach its obligations under this Article 22, which equitable relief shall be granted without bond or proof of damages, and the receiving Party shall not plead in defense that there would be an adequate remedy at law. Such remedy shall not be deemed an exclusive remedy for the Breach of this Article 22, but shall be in addition to all other remedies available at law or in equity. The Parties further acknowledge and agree that the covenants contained herein are necessary for the protection of legitimate business interests and are reasonable in scope. No Party, however, shall be liable for indirect, incidental, or consequential or punitive damages of any nature or kind resulting from or arising in connection with this Article 22.

22.1.10 **Disclosure to FERC, its Staff, or a State.** Notwithstanding anything in this Article 22 to the contrary, and pursuant to 18 CFR section 1b.20, if FERC or its staff, during the course of an investigation or otherwise, requests information from one of the Parties that is otherwise required to be maintained in confidence pursuant to this LGIA, the Party shall provide the requested information to FERC or its staff, within the time provided for in the request for information. In providing the information to FERC or its staff, the Party must, consistent with 18 CFR section 388.112, request that the information be treated as confidential and non-public by FERC and its staff and that the information be withheld from public disclosure. Parties are prohibited from notifying the other Party to this LGIA prior to the release of the Confidential Information to FERC or its staff. The

Party shall notify the other Party to the LGIA when it is notified by FERC or its staff that a request to release Confidential Information has been received by FERC, at which time either of the Parties may respond before such information would be made public, pursuant to 18 CFR section 388.112. Requests from a state regulatory body conducting a confidential investigation shall be treated in a similar manner if consistent with the applicable state rules and regulations.

22.1.11 Subject to the exception in Article 22.1.10, any information that a Party claims is competitively sensitive, commercial or financial information under this LGIA ("Confidential Information") shall not be disclosed by the other Party to any person not employed or retained by the other Party, except to the extent disclosure is (i) required by law; (ii) reasonably deemed by the disclosing Party to be required to be disclosed in connection with a dispute between or among the Parties, or the defense of litigation or dispute; (iii) otherwise permitted by consent of the other Party, such consent not to be unreasonably withheld; or (iv) necessary to fulfill its obligations under this LGIA or as a transmission service provider or a Control Area operator including disclosing the Confidential Information to an RTO or ISO or to a regional or national reliability organization. The Party asserting confidentiality shall notify the other Party in writing of the information it claims is confidential. Prior to any disclosures of the other Party's Confidential Information under this subparagraph, or if any third party or Governmental Authority makes any request or demand for any of the information described in this subparagraph, the disclosing Party agrees to promptly notify the other Party in writing and agrees to assert confidentiality and cooperate with the other Party in seeking to protect the Confidential Information from public disclosure by confidentiality agreement, protective order or other reasonable measures.

Article 23. Environmental Releases

23.1 Each Party shall notify the other Party, first orally and then in writing, of the release of any Hazardous Substances, any asbestos or lead abatement activities, or any type of remediation activities related to the Large Generating Facility or the Interconnection Facilities, each of which may reasonably be expected to affect the other Party. The notifying Party shall: (i) provide the notice as soon as practicable, provided such Party makes a good faith effort to provide the notice no later than twenty-four hours after such Party becomes aware of the occurrence; and (ii) promptly furnish to the other Party copies of any publicly available reports filed with any Governmental Authorities addressing such events.

Article 24. Information Requirements

24.1 **Information Acquisition**. Transmission Provider and Interconnection Customer shall submit specific information regarding the electrical characteristics of their respective facilities to each other as described below and in accordance with Applicable Reliability Standards.

24.2 **Information Submission by Transmission Provider**. The initial information submission by Transmission Provider shall occur no later than one hundred eighty (180) Calendar Days prior to Trial Operation and shall include Transmission System information necessary to allow Interconnection Customer to select equipment and meet any system protection and stability requirements, unless otherwise agreed to by the Parties. On a monthly basis Transmission Provider shall provide Interconnection Customer a status report on the construction and installation of Transmission Provider's Interconnection Facilities and Network Upgrades, including, but not limited to, the following information: (1) progress to date; (2) a description of the activities since the last report; (3) a description of the action items for the next period; and (4) the delivery status of equipment ordered.

24.3 Updated Information Submission by Interconnection Customer. The updated information submission by Interconnection Customer, including manufacturer information, shall occur no later than one hundred eighty (180) Calendar Days prior to the Trial Operation. Interconnection Customer shall submit a completed copy of the Large Generating Facility data requirements contained in Appendix 1 to the LGIP. It shall also include any additional information provided to Transmission Provider for the Feasibility and Facilities Study. Information in this submission shall be the most current Large Generating Facility design or expected performance data. Information submitted for stability models shall be compatible with Transmission Provider standard models. If there is no compatible model, Interconnection Customer will work with a consultant mutually agreed to by the Parties to develop and supply a standard model and associated information.

If Interconnection Customer's data is materially different from what was originally provided to Transmission Provider pursuant to the Interconnection Study Agreement between Transmission Provider and Interconnection Customer, then Transmission Provider will conduct appropriate studies to determine the impact on Transmission Provider Transmission System based on the actual data submitted pursuant to this Article 24.3. The Interconnection Customer shall not begin Trial Operation until such studies are completed.

24.4 Information Supplementation. Prior to the Operation Date, the Parties shall supplement their information submissions described above in this Article 24 with any and all "as-built" Large Generating Facility information or "as-tested" performance information that differs from the initial submissions or, alternatively, written confirmation that no such differences exist. The Interconnection Customer shall conduct tests on the Large Generating Facility as required by Good Utility Practice such as an open circuit "step voltage" test on the Large Generating Facility to verify proper operation of the Large Generating Facility's automatic voltage regulator.

Unless otherwise agreed, the test conditions shall include: (1) Large Generating Facility at synchronous speed; (2) automatic voltage regulator on and in voltage control mode; and (3) a five percent change in Large Generating Facility terminal voltage initiated by a change in the voltage regulators reference voltage. Interconnection Customer shall provide validated test recordings showing the responses of Large Generating Facility terminal and field voltages. In the event that direct recordings of these voltages is impractical, recordings of other voltages or currents that mirror the response of the Large Generating Facility's terminal or field voltage are acceptable if information necessary to translate these alternate quantities to actual Large Generating Facility terminal or field voltages is provided. Large Generating Facility testing shall be conducted and results provided to Transmission Provider for each individual generating unit in a station.

Subsequent to the Operation Date, Interconnection Customer shall provide Transmission Provider any information changes due to equipment replacement, repair, or adjustment. Transmission Provider shall provide Interconnection Customer any information changes due to equipment replacement, repair or adjustment in the directly connected substation or any adjacent Transmission Provider-owned substation that may affect Interconnection Customer's Interconnection Facilities equipment ratings, protection or operating requirements. The Parties shall provide such information no later than thirty (30) Calendar Days after the date of the equipment replacement, repair or adjustment.

Article 25. Information Access and Audit Rights

25.1 Information Access. Each Party (the "disclosing Party") shall make available to the other Party information that is in the possession of the disclosing Party and is necessary in order for the other Party to: (i) verify the costs incurred by the disclosing Party for which the other Party is responsible under this LGIA; and (ii) carry out its obligations and responsibilities under this LGIA. The Parties shall not use such information for purposes other than those set forth in this Article 25.1 and to enforce their rights under this LGIA.

25.2 Reporting of Non-Force Majeure Events. Each Party (the "notifying Party") shall notify the other Party when the notifying Party becomes aware of its inability to comply with the provisions of this LGIA for a reason other than a Force Majeure event. The Parties agree to cooperate with each other and provide necessary information regarding such inability to comply, including the date, duration, reason for the inability to comply, and corrective actions taken or planned to be taken with respect to such inability to comply. Notwithstanding the foregoing, notification, cooperation or information provided under this article shall not entitle the Party receiving such notification to allege a cause for anticipatory breach of this LGIA.

25.3 Audit Rights. Subject to the requirements of confidentiality under Article 22 of this LGIA, each Party shall have the right, during normal business hours, and upon prior reasonable notice to the other Party, to audit at its own expense the other Party's accounts and records pertaining to either Party's performance or either Party's satisfaction of obligations under this LGIA. Such audit rights shall include audits of the other Party's costs, calculation of invoiced amounts, Transmission Provider's efforts to allocate responsibility for the provision of reactive support to the Transmission System, Transmission Provider's efforts to allocate responsibility for interruption or reduction of generation on the Transmission System, and each Party's actions in an Emergency Condition. Any audit authorized by this article shall be performed at the offices where such accounts and records are maintained and shall be limited to those portions of such accounts and records that relate to each Party's performance and satisfaction of obligations under this LGIA. Each Party shall keep such accounts and records for a period equivalent to the audit rights periods described in Article 25.4.

25.4 Audit Rights Periods.

25.4.1 **Audit Rights Period for Construction-Related Accounts and Records.** Accounts and records related to the design, engineering, procurement, and construction of Transmission Provider's Interconnection Facilities and Network Upgrades shall be subject to audit for a period of twenty-four months following Transmission Provider's issuance of a final invoice in accordance with Article 12.2.

25.4.2 **Audit Rights Period for All Other Accounts and Records.** Accounts and records related to either Party's performance or satisfaction of all obligations under this LGIA other than those described in Article 25.4.1 shall be subject to audit as follows: (i) for an audit relating to cost obligations, the applicable audit rights period shall be twenty-four months after the auditing Party's receipt of an invoice giving rise to such cost obligations; and (ii) for an audit relating to all other obligations, the applicable audit rights period shall be twenty-four months after the event for which the audit is sought.

25.5 Audit Results. If an audit by a Party determines that an overpayment or an underpayment has occurred, a notice of such overpayment or underpayment shall be given to the other Party together with those records from the audit which support such determination.

Article 26. Subcontractors

26.1 General. Nothing in this LGIA shall prevent a Party from utilizing the services of any subcontractor as it deems appropriate to perform its obligations under this LGIA; provided, however, that each Party shall require its subcontractors to comply with all applicable terms and conditions of this LGIA in providing such services and each Party shall remain primarily liable to the other Party for the performance of such subcontractor.

26.2 Responsibility of Principal. The creation of any subcontract relationship shall not relieve the hiring Party of any of its obligations under this LGIA. The hiring Party shall be fully responsible to the other Party for the acts or omissions of any subcontractor the hiring Party hires as if no subcontract had been made; provided, however, that in no event shall Transmission Provider be liable for the actions or inactions of Interconnection Customer or its subcontractors with respect to obligations of Interconnection Customer under Article 5 of this LGIA. Any applicable obligation imposed by this LGIA upon the hiring Party shall be equally binding upon, and shall be construed as having application to, any subcontractor of such Party.

26.3 No Limitation by Insurance. The obligations under this Article 26 will not be limited in any way by any limitation of subcontractor's insurance.

Article 27. Disputes

27.1 Submission. In the event either Party has a dispute, or asserts a claim, that arises out of or in connection with this LGIA or its performance, such Party (the "disputing Party") shall provide the other Party with written notice of the dispute or claim ("Notice of Dispute"). Such dispute or claim shall be referred to a designated senior representative of each Party for resolution on an informal basis as promptly as practicable after receipt of the Notice of Dispute by the other Party. In the event the designated representatives are unable to resolve the claim or dispute through unassisted or assisted negotiations within thirty (30) Calendar Days of the other Party's receipt of the Notice of Dispute, such claim or dispute may, upon mutual agreement of the Parties, be submitted to arbitration and resolved in accordance with the arbitration procedures set forth below. In the event the Parties do not agree to submit such claim or dispute to arbitration, each Party may exercise whatever rights and remedies it may have in equity or at law consistent with the terms of this LGIA.

27.2 External Arbitration Procedures. Any arbitration initiated under this LGIA shall be conducted before a single neutral arbitrator appointed by the Parties. If the Parties fail to agree upon a single arbitrator within ten (10) Calendar Days of the submission of the dispute to arbitration, each Party shall choose one arbitrator who shall sit on a three-member arbitration panel. The two arbitrators so chosen shall within twenty (20) Calendar Days select a third arbitrator to chair the arbitration panel. In either case, the arbitrators shall be knowledgeable in electric utility matters, including electric transmission and bulk power issues, and shall not have any current or past substantial business or financial relationships with any party to the arbitration (except prior arbitration). The arbitrator(s) shall provide each of the Parties an opportunity to be heard and, except as otherwise provided herein, shall conduct the arbitration in accordance with the Commercial Arbitration Rules of the American Arbitration Association ("Arbitration Rules") and any applicable FERC regulations or RTO rules; provided, however, in the event of a conflict between the Arbitration Rules and the terms of this Article 27, the terms of this Article 27 shall prevail.

27.3 Arbitration Decisions. Unless otherwise agreed by the Parties, the arbitrator(s) shall render a decision within ninety (90) Calendar Days of appointment and shall notify the Parties in writing of such decision and the reasons therefore. The arbitrator(s) shall be authorized only to interpret and apply the provisions of this LGIA and shall have no power to modify or change any provision of this Agreement in any manner. The decision of the arbitrator(s) shall be final and binding upon the Parties, and judgment on the award may be entered in any court having jurisdiction. The decision of the arbitrator(s) may be appealed solely on the grounds that the conduct of the arbitrator(s), or the decision itself, violated the standards set forth in the Federal Arbitration Act or the Administrative Dispute Resolution Act. The final decision of the arbitrator must also be filed with FERC if it affects jurisdictional rates, terms and conditions of service, Interconnection Facilities, or Network Upgrades.

27.4 Costs. Each Party shall be responsible for its own costs incurred during the arbitration process and for the following costs, if applicable: (1) the cost of the arbitrator chosen by the Party to sit on the three member panel and one half of the cost of the third arbitrator chosen; or (2) one half the cost of the single arbitrator jointly chosen by the Parties.

Article 28. Representations, Warranties, and Covenants

28.1 General. Each Party makes the following representations, warranties and covenants:

28.1.1 Good Standing. Such Party is duly organized, validly existing and in good standing under the laws of the state in which it is organized, formed, or incorporated, as applicable; that it is qualified to do business in the state or states in which the Large Generating Facility, Interconnection Facilities and Network Upgrades owned by such Party, as applicable, are located; and that it has the corporate power and authority to own its properties, to carry on its business as now being conducted and to enter into this LGIA and carry out the transactions contemplated hereby and perform and carry out all covenants and obligations on its part to be performed under and pursuant to this LGIA.

28.1.2 Authority. Such Party has the right, power and authority to enter into this LGIA, to become a Party hereto and to perform its obligations hereunder. This LGIA is a legal, valid and binding obligation of such Party, enforceable against such Party in accordance with its terms, except as the enforceability thereof may be limited by applicable bankruptcy, insolvency, reorganization or other similar laws affecting creditors' rights generally and by general equitable principles (regardless of whether enforceability is sought in a proceeding in equity or at law).

28.1.3 **No Conflict**. The execution, delivery and performance of this LGIA does not violate or conflict with the organizational or formation documents, or bylaws or operating agreement, of such Party, or any judgment, license, permit, order, material agreement or instrument applicable to or binding upon such Party or any of its assets.

28.1.4 **Consent and Approval**. Such Party has sought or obtained, or, in accordance with this LGIA will seek or obtain, each consent, approval, authorization, order, or acceptance by any Governmental Authority in connection with the execution, delivery and performance of this LGIA, and it will provide to any Governmental Authority notice of any actions under this LGIA that are required by Applicable Laws and Regulations.

Article 29. Joint Operating Committee

29.1 Joint Operating Committee. Except in the case of ISOs and RTOs, Transmission Provider shall constitute a Joint Operating Committee to coordinate operating and technical considerations of Interconnection Service. At least six (6) months prior to the expected Initial Synchronization Date, Interconnection Customer and Transmission Provider shall each appoint one representative and one alternate to the Joint Operating Committee. Each Interconnection Customer shall notify Transmission Provider of its appointment in writing. Such appointments may be changed at any time by similar notice. The Joint Operating Committee shall meet as necessary, but not less than once each calendar year, to carry out the duties set forth herein. The Joint Operating Committee shall hold a meeting at the request of either Party, at a time and place agreed upon by the representatives. The Joint Operating Committee shall perform all of its duties consistent with the provisions of this LGIA. Each Party shall cooperate in providing to the Joint Operating Committee all information required in the performance of the Joint Operating Committee's duties. All decisions and agreements, if any, made by the Joint Operating Committee, shall be evidenced in writing. The duties of the Joint Operating Committee shall include the following:

29.1.1 Establish data requirements and operating record requirements.

29.1.2 Review the requirements, standards, and procedures for data acquisition equipment, protective equipment, and any other equipment or software.

29.1.3 Annually review the one (1) year forecast of maintenance and planned outage schedules of Transmission Provider's and Interconnection Customer's facilities at the Point of Interconnection.

29.1.4 Coordinate the scheduling of maintenance and planned outages on the Interconnection Facilities, the Large Generating Facility and other facilities that impact the normal operation of the interconnection of the Large Generating Facility to the Transmission System.

29.1.5 Ensure that information is being provided by each Party regarding equipment availability.

29.1.6 Perform such other duties as may be conferred upon it by mutual agreement of the Parties.

Article 30. Miscellaneous

30.1 Binding Effect. This LGIA and the rights and obligations hereof, shall be binding upon and shall inure to the benefit of the successors and assigns of the Parties hereto.

30.2 Conflicts. In the event of a conflict between the body of this LGIA and any attachment, appendices or exhibits hereto, the terms and provisions of the body of this LGIA shall prevail and be deemed the final intent of the Parties.

30.3 Rules of Interpretation. This LGIA, unless a clear contrary intention appears, shall be construed and interpreted as follows: (1) the singular number includes the plural number and vice versa; (2) reference to any person includes such person's successors and assigns but, in the case of a Party, only if such successors and assigns are permitted by this LGIA, and reference to a person in a particular capacity excludes such person in any other capacity or individually; (3) reference to any agreement (including this LGIA), document, instrument or tariff means such agreement, document, instrument, or tariff as amended or modified and in effect from time to time in accordance with the terms thereof and, if applicable, the terms hereof; (4) reference to any Applicable Laws and Regulations means such Applicable Laws and Regulations as amended, modified, codified, or reenacted, in whole or in part, and in effect from time to time, including, if applicable, rules and regulations promulgated thereunder; (5) unless expressly stated otherwise, reference to any Article, Section or Appendix means such Article of this LGIA or such Appendix to this LGIA, or such Section to the LGIP or such Appendix to the LGIP, as the case may be; (6) "hereunder", "hereof", "herein", "hereto" and words of similar import shall be deemed references to this LGIA as a whole and not to any particular Article or other provision hereof or thereof; (7) "including" (and with correlative meaning "include") means including without limiting the generality of any description preceding such term; and (8) relative to the determination of any period of time, "from" means "from and including", "to" means "to but excluding" and "through" means "through and including".

30.4 Entire Agreement. This LGIA, including all Appendices and Schedules attached hereto, constitutes the entire agreement between the Parties with reference to the subject matter hereof, and supersedes all prior and contemporaneous understandings or agreements, oral or written, between the Parties with respect to the subject matter of this LGIA. There are no other agreements, representations, warranties, or covenants which constitute any part of the consideration for, or any condition to, either Party's compliance with its obligations under this LGIA.

30.5 No Third Party Beneficiaries. This LGIA is not intended to and does not create rights, remedies, or benefits of any character whatsoever in favor of any persons, corporations, associations, or entities other than the Parties, and the obligations herein assumed are solely for the use and benefit of the Parties, their successors in interest and, where permitted, their assigns.

30.6 Waiver. The failure of a Party to this LGIA to insist, on any occasion, upon strict performance of any provision of this LGIA will not be considered a waiver of any obligation, right, or duty of, or imposed upon, such Party. Any waiver at any time by either Party of its rights with respect to this LGIA shall not be deemed a continuing waiver or a waiver with respect to any other failure to comply with any other obligation, right, duty of this LGIA. Termination or Default of this LGIA for any reason by Interconnection Customer shall not constitute a waiver of Interconnection Customer's legal rights to obtain an interconnection from Transmission Provider. Any waiver of this LGIA shall, if requested, be provided in writing.

30.7 Headings. The descriptive headings of the various Articles of this LGIA have been inserted for convenience of reference only and are of no significance in the interpretation or construction of this LGIA.

30.8 Multiple Counterparts. This LGIA may be executed in two or more counterparts, each of which is deemed an original but all constitute one and the same instrument.

30.9 Amendment. The Parties may by mutual agreement amend this LGIA by a written instrument duly executed by the Parties.

30.10 Modification by the Parties. The Parties may by mutual agreement amend the Appendices to this LGIA by a written instrument duly executed by the Parties. Such amendment shall become effective and a part of this LGIA upon satisfaction of all Applicable Laws and Regulations.

30.11 Reservation of Rights. Transmission Provider shall have the right to make a unilateral filing with FERC to modify this LGIA with respect to any rates, terms and conditions, charges, classifications of service, rule or regulation under section 205 or any other applicable provision of the Federal Power Act and FERC's rules and regulations thereunder, and Interconnection Customer shall have the right to make a unilateral filing with FERC to modify this LGIA pursuant to section 206 or any other applicable provision of the Federal Power Act and FERC's rules and regulations thereunder; provided that each Party shall have the right to protest any such filing by the other Party and to participate fully in any proceeding before FERC in which such modifications may be considered. Nothing in this LGIA shall limit the rights of the Parties or of FERC under sections 205 or 206 of the Federal Power Act and FERC's rules and regulations thereunder, except to the extent that the Parties otherwise mutually agree as provided herein.

30.12 No Partnership. This LGIA shall not be interpreted or construed to create an association, joint venture, agency relationship, or partnership between the Parties or to impose any partnership obligation or partnership liability upon either Party. Neither Party shall have any right, power or authority to enter into any agreement or undertaking for, or act on behalf of, or to act as or be an agent or representative of, or to otherwise bind, the other Party.

IN WITNESS WHEREOF, the Parties have executed this LGIA in duplicate originals, each of which shall constitute and be an original effective Agreement between the Parties.

Appendix A to LGIA

Interconnection Facilities, Network Upgrades and Distribution Upgrades

1. **Interconnection Facilities:**

   (a) **Interconnection Customer's Interconnection Facilities:** Two (2) circuit breakers, one each on the high side of the Interconnection Customer's step up transformers, connected to an approximately 12 mile 230 kV transmission line. The transmission line is then connected to a circuit breaker to be installed in the collector substation constructed for the Interconnection Request assigned queue position Q0707. From that point the Interconnection Customer will share the Interconnection Facilities installed for Q0707including a short generator tie line to the Point of Interconnection (Shirley Basin) substation. Please see Exhibit 1 to Attachment A.

   (b) **Transmission Provider's Interconnection Facilities:** Five (5) production meters located at the high side of the step up transformers at the Interconnection Customer collector substations as well as relaying and communications equipment, low side metering, one (1) interchange meter at the Point of Change of Ownership, and one line position (dead end structure, disconnect switch, metering structure) located at the Point of Interconnection (Shirley Basin) substation. Please see Exhibit 1 to Attachment A.

2. **Network Upgrades:**

   (a) **Stand Alone Network Upgrades:** None

   (b) **Other Network Upgrades:** RAS relaying upgrades at Shirley Basin and other substations.

3. **Distribution Upgrades:** None

4. **Contingent Facilities:** As identified in the System Impact Study for this project dated August 21, 2018 the following Network Upgrades are required to be in-service prior to this project:

- Segment D2 (500 kV line Aeolus-Anticline/Bridger). (Transmission Provider internal, 2020)
- A Remedial Action Scheme ("RAS") that will drop up to 600 MW of generation for various 500 kV outages. (Transmission Provider internal, 2020)
- All Interconnection Facilities and associated Network Upgrades required for the Interconnection Request assigned queue position Q0707 including a new 230 kV transmission line between Shirley Basin and Aeolus substations. (2020)

If the schedule for completion of these upgrades changes the Transmission Provider reserves the right to restudy this project to determine any additional requirements to assign to this project necessary to facilitate interconnection of this project by the date required.

5. Point of Interconnection ("POI"): The point at which Transmission Provider Interconnection Facilities connect to the substation bus at the Shirley Basin substation (see Exhibit 1 to Appendix A).

6. Point of Change of Ownership: The point at which Interconnection Customer and Transmission Provider Interconnection Facilities meet (see Exhibit 1 to Appendix A)

7. One-Line Diagram: is attached to this agreement as Exhibit 1 to Appendix A.

8. **Estimated Project Cost:** $1,440,000
Direct Assigned: $1,440,000
Network Upgrade: $0

Appendix B To LGIA

Milestones

Milestone	Party
Execute Interconnection Agreement January 23, 2019	Interconnection Customer
Provision of Financial Security ($250,000) January 23, 2019	Interconnection Customer
Design Information Provided January 23, 2019	Interconnection Customer
Property/Permits/ROW Procured February 1, 2019	Interconnection Customer
Provide construction approval April 1, 2019	Interconnection Customer
**Energy Imbalance Market Modeling Data Submittal April 10, 2019	Interconnection Customer
Engineering Design Complete April 10, 2019	Transmission Provider
Construction Begins May 1, 2019	Transmission Provider
Facilities Receive Backfeed Power June 15, 2020	Interconnection Customer
***Contingent facilities complete October 1, 2020	Transmission Provider
Initial Synchronization and Generation Testing October 1, 2020	Interconnection Customer
Commercial Operation November 1, 2020	Interconnection Customer

*As applicable and determined by the Transmission Provider, within 60 days of the Interconnection Customer’s authorization for the Transmission Provider to begin engineering, the Interconnection Customer shall provide a detailed short circuit model of its generation system. This model must be constructed using the ASPEN One-Line short circuit simulation program and contain all individual electrical components of the Interconnection Customer's generation system.

**Any design modifications to the Interconnection Customer's Generating Facility after this date requiring updates to the Transmission Provider's network model will result in a minimum of 3 months added to all future milestones including Commercial Operation.

***Delays in completion of Contingent Facilities will impact the in-service date of the project.

Term of Agreement: In accordance with LGIA Article 2.2, the Parties agree that the term of the LGIA shall be ten (10) years from the Effective Date and shall be automatically renewed for each successive one-year period thereafter.

Construction Option: The Network Upgrades, Direct Assignment Facilities and Transmission Provider Interconnection Facilities will be designed, procured and constructed by the Transmission Provider in accordance with the Standard Option outlined in Article 5.1.1 of this Agreement. The Network Upgrades, Direct Assignment Facilities and Transmission Provider Interconnection Facilities shall be constructed in accordance with the Scope of Work attached to this LGIA as Exhibit 1 to Appendix B. The Network Upgrades, Direct Assignment Facilities and Transmission Provider's Interconnection Facilities shall be designed, procured and constructed in a timely manner to support the Milestone Dates stated above.

Appendix C To LGIA

Interconnection Details

Description of the Large Generating Facility: The Interconnection Customer's Large Generating Facility consists of fourteen (14) Vestas V110 2.0 and fifty-three (53) Vestas V136 4.3 turbines connected to twelve (12) 34.5 kV strings for a total generation output of 250 MW as measured at the POI. The Large Generating facility is separated in two parts, three (3) strings of turbines are connected to the collector substation constructed for the Interconnection Request assigned queue position Q0707 and nine (9) strings of turbines are located approximately 11.6 miles away (with corresponding tie line to the Q0707 collector substation). The strings are then connected to five (in parallel) 75/100/125 MVA 34.5 – 230 kV (7.5% impedance) transformers. The Large Generating Facility is located in Carbon County, Wyoming.

Please see Exhibit 1 to Attachment A.

Control Area Requirements: Interconnection Customer shall interconnect and operate the Large Generating Facility in accordance with the Transmission Provider's Facility Interconnection Requirements for Transmission Systems, as may be revised from time to time, attached hereto as Exhibit 1 to Appendix C and by this reference incorporated herein.

Interconnection Details:
Metering. With reference to Article 7.1, Transmission Provider will own and maintain the bi-directional revenue Metering Equipment in Transmission Provider's Point of Interconnection substation at the Interconnection Customer's expense.

Under Frequency and Over Frequency Conditions. Consistent with LGIA Article 9.7.3, Transmission Provider shall design, procure, install and maintain frequency and voltage protection to trip feeder breakers in accordance with the settings shown in Exhibit 1 to Appendix C.

Reactive Power and Voltage Schedule. All interconnecting synchronous and non-synchronous generators are required to design their Generating Facilities with reactive power capabilities necessary to operate within the full power factor range of 0.95 leading to 0.95 lagging. This power factor range shall be dynamic and can be met using a combination of the inherent dynamic reactive power capability of the generator or inverter, dynamic reactive power devices and static reactive power devices. For non-synchronous generators, the power factor requirement is to be measured at the high-side of the generator substation. The Generating Facility must provide dynamic reactive power to the system over the full range of real power output. If the Generating Facility is not capable of providing positive reactive support (i.e., supplying reactive power to the system) immediately following the removal of a fault or other transient low voltage perturbations, the facility will be required to add dynamic voltage support equipment. These additional dynamic reactive devices shall have correct protection settings such that the devices will remain on line and active during and immediately following a fault event.

Generators shall be equipped with automatic voltage-control equipment and normally operated with the voltage regulation control mode enabled unless written authorization, or directive, from the Transmission Provider is given to operate in another control mode (e.g., constant power factor control). The control mode of generating units shall be accurately represented in operating studies. The generators shall be capable of operating continuously at their rated power output within +/- 5% of its rated terminal voltage. Phasor Measurement Units will be required at any Generating Facilities with an individual or aggregate nameplate capacity of 75 MVA or greater.

As required by NERC standard VAR-001-1a, the Transmission Provider will provide a voltage schedule for the Point of Interconnection. In general, Generating Facilities should be operated so as to maintain the voltage at the Point of Interconnection, or other designated point as deemed appropriated by Transmission Provider, in accordance with Transmission Provider Policy 139.

Generating Facilities capable of operating with a voltage droop are required to do so. Studies will be required to coordinate voltage droop settings if there are other facilities in the area. It will be the Interconnection Customer’s responsibility to ensure that a voltage coordination study is performed, in coordination with Transmission Provider, and implemented with appropriate coordination settings prior to unit testing. If the need for a master controller is identified, the cost and all related installation requirements will be the responsibility of the

Interconnection Customer. Participation by the Generation Facility in subsequent interaction/coordination studies will be required pre- and post-commercial operation in order ensure system reliability.

All generators must meet the Federal Energy Regulatory Commission (FERC) and WECC low voltage ride-through requirements.

As the Transmission Provider cannot submit a user written model to WECC for inclusion in base cases, a standard model from the WECC Approved Dynamic Model Library is required 180 days prior to trial operation. The list of approved generator models is continually updated and is available on the http://www.WECC.biz website.

Property Requirements. Subject to LGIA Articles 5.12 and 5.13, Interconnection Customer is required to obtain for the benefit of Transmission Provider at Interconnection Customer’s sole cost and expense all real property rights, including but not limited to fee ownership, easements and/or rights of way, as applicable, for Transmission Provider owned facilities using forms acceptable to Transmission Provider. Transmission Provider shall not be obligated to accept any such real property right that does not, at Transmission Provider’s sole discretion, confer sufficient rights to access, operate, construct, modify, maintain, place and remove Transmission Provider owned facilities or is otherwise conveyed using forms unacceptable to Transmission Provider. Further, all real property on which Transmission Provider’s facilities are to be located must be environmentally, physically and operationally acceptable to the Transmission Provider in accordance with Good Utility Practice.

Subject to LGIA Article 5.14, Interconnection Customer is responsible for obtaining all permits required by all relevant jurisdictions for the project, including but not limited to, conditional use permits and construction permits; provided however, Transmission Provider shall obtain, at Interconnection Customer’s cost and schedule risk, the permits necessary to construct Transmission Provider’s facilities that are to be located on real property currently owned or held in fee or right by Transmission Provider.

Subject to applicable provisions in the Agreement and an express written waiver by an authorized officer of Transmission Provider, all of the foregoing permits and real property rights (conferring rights on real property that is environmentally, physically and operationally acceptable to Transmission Provider) shall be acquired as provided herein as a condition to Transmission Provider's contractual obligation to construct or take possession of facilities to be owned by the Transmission Provider under this Agreement. Transmission Provider shall have no liability for any project delays or cost overruns caused by delays in acquiring any of the foregoing permits and/or real property rights, whether such delay results from the failure to obtain such permits or rights or the failure of such permits or rights to meet the requirements set forth herein. Further, any completion dates, if any, set forth herein with regard to Transmission Provider's obligations shall be equitably extended based on the length and impact of any such delays.

With respect to the fiber optic cable on Interconnection Customer's tie line that will be owned by the Transmission Provider, the Interconnection Customer and the Transmission Provider agree that Transmission Provider's ownership and operation of fiber optic cable that is attached to poles or other structures that are owned or maintained by the Interconnection Customer is subject to LGIA Article 5.12, Good Utility Practice, and Transmission Provider's Interconnection Policy 139 (Exhibit 1 to Appendix C to LGIA).

Appendix D To LGIA

Security Arrangements Details

Infrastructure security of Transmission System equipment and operations and control hardware and software is essential to ensure day-to-day Transmission System reliability and operational security. FERC will expect all Transmission Providers, market participants, and Interconnection Customers interconnected to the Transmission System to comply with the recommendations offered by the President's Critical Infrastructure Protection Board and, eventually, best practice recommendations from the electric reliability authority. All public utilities will be expected to meet basic standards for system infrastructure and operational security, including physical, operational, and cyber-security practices.

Automatic Data Transfer. Throughout the term of this Agreement, Interconnection Customer shall provide the data specified below by automatic data transfer to the Transmission Provider Control Center specified by Transmission Provider or to a Third-Party System Operator designated by Transmission Provider (or both):

From the Interconnection Customer’s collector substation:

- Analogs:
  - Transformer # 1 real power
  - Transformer # 1 reactive power
  - Real power flow through 34.5 kV line feeder breaker 1
  - Reactive power flow through 34.5 kV line feeder breaker 1
  - Real power flow through 34.5 kV line feeder breaker 2
  - Reactive power flow through 34.5 kV line feeder breaker 2
  - Real power flow through 34.5 kV line feeder breaker 3
  - Reactive power flow through 34.5 kV line feeder breaker 3
  - Real power flow through 34.5 kV line feeder breaker 4
  - Reactive power flow through 34.5 kV line feeder breaker 4

- Real power flow through 34.5 kV line feeder breaker 5
- Reactive power flow through 34.5 kV line feeder breaker 5
- Reactive power flow through 34.5 kV reactor breaker T1-R1
- Reactive power flow through 34.5 kV capacitor breaker T1-C1
- Transformer # 2 real power
- Transformer # 2 reactive power
- Real power flow through 34.5 kV line feeder breaker 6
- Reactive power flow through 34.5 kV line feeder breaker 6
- Real power flow through 34.5 kV line feeder breaker 7
- Reactive power flow through 34.5 kV line feeder breaker 7
- Real power flow through 34.5 kV line feeder breaker 8
- Reactive power flow through 34.5 kV line feeder breaker 8
- Real power flow through 34.5 kV line feeder breaker 9
- Reactive power flow through 34.5 kV line feeder breaker 9
- Reactive power flow through 34.5 kV reactor breaker T2-R1
- Reactive power flow through 34.5 kV capacitor breaker T2-C1
- A phase 230 kV transmission voltage
- B phase 230 kV transmission voltage
- C phase 230 kV transmission voltage
- Average Wind speed
- Average Plant Atmospheric Pressure (Bar)
- Average Plant Temperature (Celsius)

- Status:
    - 230 kV breaker T1
    - 34.5 kV collector circuit breaker 1
    - 34.5 kV collector circuit breaker 2
    - 34.5 kV collector circuit breaker 3
    - 34.5 kV collector circuit breaker 4
    - 34.5 kV collector circuit breaker 5
    - 34.5 kV reactor circuit breaker T1-R1
    - 34.5 kV capacitor circuit breaker T1-C1
    - 230 kV breaker T2
    - 34.5 kV collector circuit breaker 6

- o 34.5 kV collector circuit breaker 7
- o 34.5 kV collector circuit breaker 8
- o 34.5 kV collector circuit breaker 9
- o 34.5 kV reactor circuit breaker T2-R1
- o 34.5 kV capacitor circuit breaker T2-C1

Billing Meter Data. Bi-directional revenue meter at the Point of Interconnection will not be configured to allow direct dial-up access by Interconnection Customer. The Transmission Provider will provide alternatives, at the Interconnection Customer's expense, upon request.

Additional Data. Interconnection Customer shall, at its sole expense, provide any additional Generating Facility data reasonably required and necessary for the Transmission Provider to operate the Transmission System in accordance with Good Utility Practice and Exhibit 1 to Appendix C, Facility Interconnection Requirements for Transmission Systems.

Relay and Control Settings

If Interconnection Customer requires modifications to the settings associated with control/protective devices connected to the distribution and/or transmission system, Interconnection Customer will contact PacifiCorp and provide in writing the justification for the proposed modifications. This will allow PacifiCorp to analyze the modifications and ensure there will be no negative impacts to connected systems and customers. Any modifications of control and/or relay settings without review and acknowledgement of acceptance by PacifiCorp will be considered a breach of the Interconnection Agreement and grounds for disconnection from the PacifiCorp system.

Appendix G to LGIA

INTERCONNECTION REQUIREMENTS FOR A WIND GENERATING PLANT

Appendix G sets forth requirements and provisions specific to a wind generating plant. All other requirements of this LGIA continue to apply to wind generating plant interconnections.

A. Technical Standards Applicable to a Wind Generating Plant

i. Low Voltage Ride-Through (LVRT) Capability

A wind generating plant shall be able to remain online during voltage disturbances up to the time periods and associated voltage levels set forth in the standard below. The LVRT standard provides for a transition period standard and a post-transition period standard.

Transition Period LVRT Standard

The transition period standard applies to wind generating plants subject to FERC Order 661 that have either: (i) interconnection agreements signed and filed with the Commission, filed with the Commission in unexecuted form, or filed with the Commission as non-conforming agreements between January 1, 2006 and December 31, 2006, with a scheduled in-service date no later than December 31, 2007, or (ii) wind generating turbines subject to a wind turbine procurement contract executed prior to December 31, 2005, for delivery through 2007.

1. Wind generating plants are required to remain in-service during three-phase faults with normal clearing (which is a time period of approximately 4 – 9 cycles) and single line to ground faults with delayed clearing, and subsequent post-fault voltage recovery to prefault voltage unless clearing the fault effectively disconnects the generator from the system. The clearing time requirement for a three-phase fault will be specific to the wind generating plant substation location, as determined by and documented by the transmission provider. The maximum clearing time the wind generating plant shall be required to withstand for a three-phase fault shall be 9 cycles at a voltage as low as 0.15 p.u., as measured at the high side of the wind generating

plant step-up transformer (i.e. the transformer that steps the voltage up to the transmission interconnection voltage or “GSU”), after which, if the fault remains following the location-specific normal clearing time for three-phase faults, the wind generating plant may disconnect from the transmission system.

2. This requirement does not apply to faults that would occur between the wind generator terminals and the high side of the GSU or to faults that would result in a voltage lower than 0.15 per unit on the high side of the GSU serving the facility.

3. Wind generating plants may be tripped after the fault period if this action is intended as part of a special protection system.

4. Wind generating plants may meet the LVRT requirements of this standard by the performance of the generators or by installing additional equipment (e.g., Static VAr Compensator, etc.) within the wind generating plant or by a combination of generator performance and additional equipment.

5. Existing individual generator units that are, or have been, interconnected to the network at the same location at the effective date of the Appendix G LVRT Standard are exempt from meeting the Appendix G LVRT Standard for the remaining life of the existing generation equipment. Existing individual generator units that are replaced are required to meet the Appendix G LVRT Standard.

Post-transition Period LVRT Standard

All wind generating plants subject to FERC Order No. 661 and not covered by the transition period described above must meet the following requirements:

1. Wind generating plants are required to remain in-service during three-phase faults with normal clearing (which is a time period of approximately 4 – 9 cycles) and single line to ground faults with delayed clearing, and subsequent post-fault voltage recovery to prefault voltage unless clearing the

fault effectively disconnects the generator from the system. The clearing time requirement for a three-phase fault will be specific to the wind generating plant substation location, as determined by and documented by the transmission provider. The maximum clearing time the wind generating plant shall be required to withstand for a three-phase fault shall be 9 cycles after which, if the fault remains following the location-specific normal clearing time for three-phase faults, the wind generating plant may disconnect from the transmission system. A wind generating plant shall remain interconnected during such a fault on the transmission system for a voltage level as low as zero volts, as measured at the high voltage side of the wind GSU.

2. This requirement does not apply to faults that would occur between the wind generator terminals and the high side of the GSU.

3. Wind generating plants may be tripped after the fault period if this action is intended as part of a special protection system.

4. Wind generating plants may meet the LVRT requirements of this standard by the performance of the generators or by installing additional equipment (e.g., Static VAr Compensator) within the wind generating plant or by a combination of generator performance and additional equipment.

5. Existing individual generator units that are, or have been, interconnected to the network at the same location at the effective date of the Appendix G LVRT Standard are exempt from meeting the Appendix G LVRT Standard for the remaining life of the existing generation equipment. Existing individual generator units that are replaced are required to meet the Appendix G LVRT Standard.

ii. Power Factor Design Criteria (Reactive Power)

The following reactive power requirements apply only to a newly interconnecting wind generating plant that has executed a Facilities Study Agreement as of the effective

date of the Final Rule establishing the reactive power requirements for non-synchronous generators in section 9.6.1 of this LGIA (Order No. 827). A wind generating plant to which this provision applies shall maintain a power factor within the range of 0.95 leading to 0.95 lagging, measured at the Point of Interconnection as defined in this LGIA, if the Transmission Provider's System Impact Study shows that such a requirement is necessary to ensure safety or reliability. The power factor range standard can be met by using, for example, power electronics designed to supply this level of reactive capability (taking into account any limitations due to voltage level, real power output, etc.) or fixed and switched capacitors if agreed to by the Transmission Provider, or a combination of the two. The Interconnection Customer shall not disable power factor equipment while the wind plant is in operation. Wind plants shall also be able to provide sufficient dynamic voltage support in lieu of the power system stabilizer and automatic voltage regulation at the generator excitation system if the System Impact Study shows this to be required for system safety or reliability.

iii. Supervisory Control and Data Acquisition (SCADA) Capability

The wind plant shall provide SCADA capability to transmit data and receive instructions from the Transmission Provider to protect system reliability. The Transmission Provider and the wind plant Interconnection Customer shall determine what SCADA information is essential for the proposed wind plant, taking into account the size of the plant and its characteristics, location, and importance in maintaining generation resource adequacy and transmission system reliability in its area.

Exhibit 1 to Appendix A to LGIA

One-Line Diagram

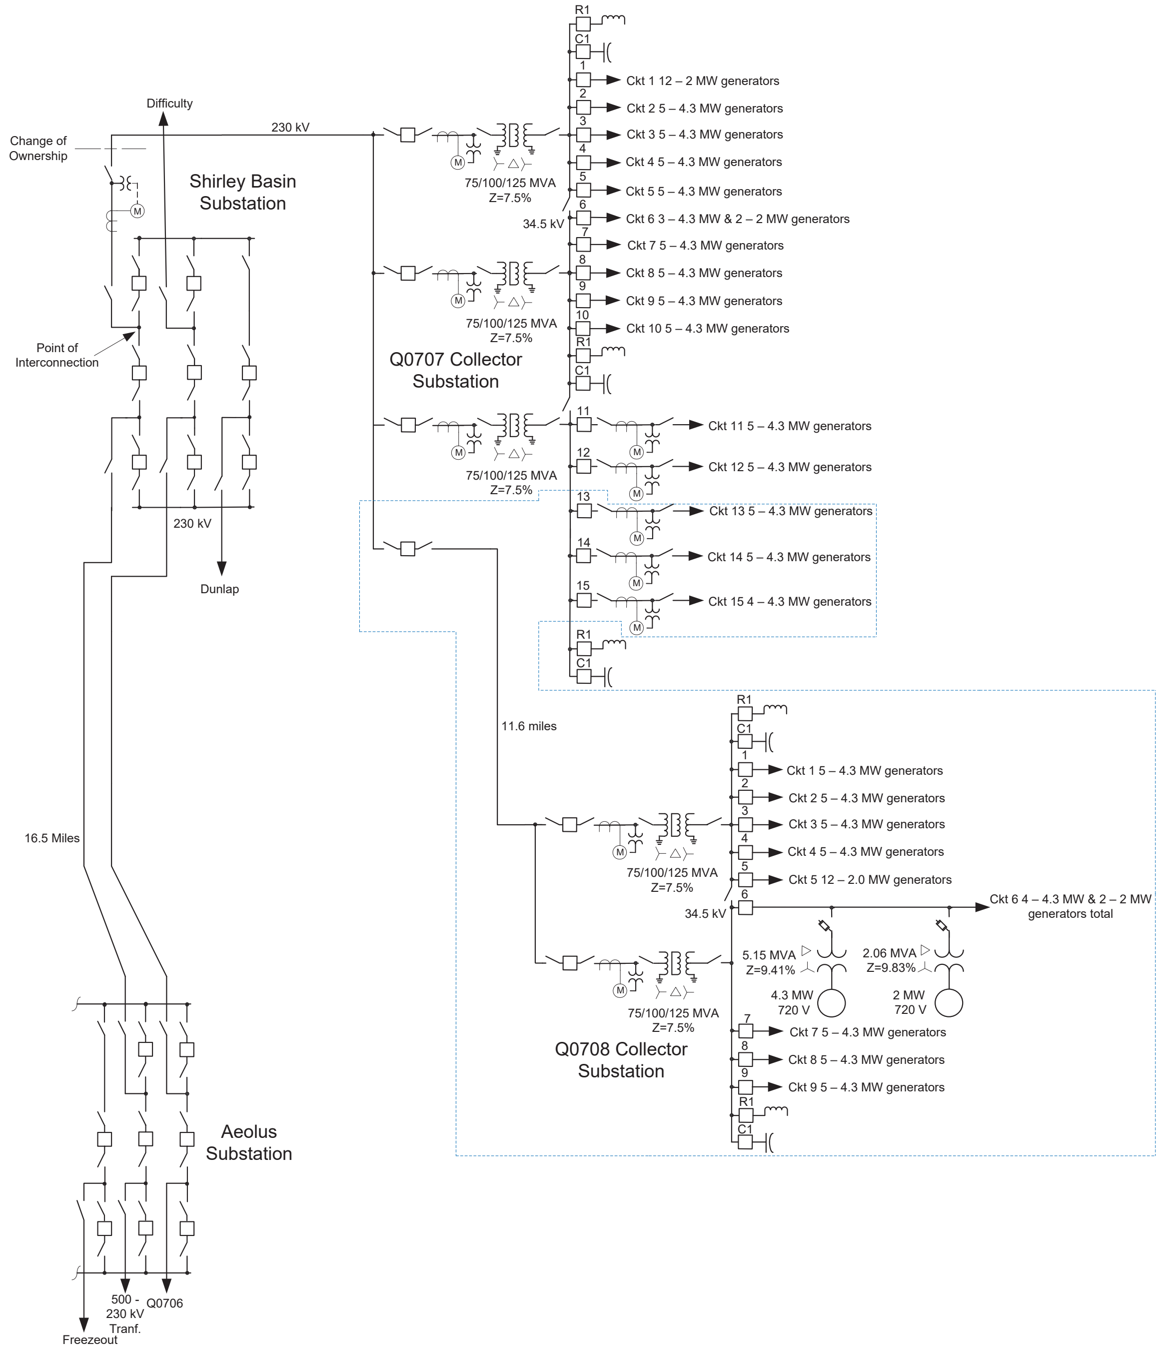

Exhibit 1 to Appendix B to LGIA

Scope of Work

Generating Facility Modifications

The following outlines the design, procurement, construction, installation, and ownership of equipment at the Interconnection Customer's Generation Facility.

INTERCONNECTION CUSTOMER TO BE RESPONSIBLE FOR

- Procure all necessary permits, lands, rights of way and easements required for the construction and continued maintenance of the Large Generating Facility and collector substation.
- Design, procure, construct, own and maintain the Interconnection Customer's Generating Facility and associated collector substation.
- Procure any necessary agreements to allow the Project to utilize the interconnection facilities associated with the Q0707 project.
- Design the Generating Facility with reactive power capabilities necessary to operate within the full power factor range of 0.95 leading to 0.95 lagging as measured at the high side of the Interconnection Customer's GSU transformer. This power factor range shall be dynamic and can be met using a combination of the inherent dynamic reactive power capability of the generator or inverter, dynamic reactive power devices and static reactive power devices to make up for losses.
- Design the generating facility such that it can provide positive reactive support (i.e., supply reactive power to the system) immediately following the removal of a fault or other transient low voltage perturbations or install dynamic voltage support equipment. These additional dynamic reactive devices shall have correct protection settings such that the devices will remain on line and active during and immediately following a fault event.
- Equip the Generating Facility with automatic voltage-control equipment and operate with the voltage regulation control mode enabled unless explicitly authorized to operate another control mode by the Transmission Provider.
- Provide data to the Phasor Measurement Unit to be installed at this location by a previous project.

The data must be collected and be able to stream to the Planning Coordinator for each of the Generator Facility’s step-up transformers measured on the low side of the GSU at a sample rate of at least 30 samples per second and synchronized within +/- 2 milliseconds of the Coordinated Universal Time (UTC). Initially, the following data must be collected:

- o Three phase voltage and voltage angle (analog)
- o Three phase current (analog)

Data requirements are subject to change as deemed necessary to comply with local and federal regulations.

- Operate the Generating Facility so as to maintain the voltage at the POI, or other designated point as deemed appropriate by Transmission Provider, at a voltage schedule to be provided by the Transmission Provider following testing.
- Operate the Generating Facility with a voltage droop.
- Participate in any Transmission Provider required studies, such as a voltage coordination study. Any additional requirements identified in these studies will be the responsibility of the Interconnection Customer.
- Meet the Federal Energy Regulatory Commission (FERC) and WECC low voltage ride-through requirements as specified in the interconnection agreement.
- Provide test results to the Transmission Provider verifying that the inverters for this Project have been programmed to meet all PRC-024 requirements rather than manufacturer IEEE distribution standards.
- Provide the Transmission Provider a standard model from the WECC Approved Dynamic Model Library.
- The Transmission Provider recommends that the Interconnection Customer perform special studies and provide documentation that its turbines have been equipped with SSCI functionality.
- Procure and install a set of line relays to detect and clear faults on the 230 kV line running between the Q0707 and Q0708 collector substations. The relays must be capable of clearing faults in five cycle or less.
- Design, procure, and install a Transmission Provider approved data concentrator to transfer data from the

Interconnection Customer collector substation to the Transmission Provider's RTU located at the POI substation via an optical fiber communications circuit in DNP3 protocol. The Transmission Provider will input and hold the second level passwords for the data concentrator. Password control ensures the Transmission Provider is aware of and is accepting of the changes being requested by the Interconnection Customer.

- Design, procure and install conduit and control cabling and hard wire the Interconnection Customer's source devices to the data concentrator. Replicated values are not acceptable.
- Provide the following points which are based on the Interconnection Customer's most recent design information. Please note that this list of points could change if the Interconnection Customer's final design changes:

  Analogs:
  - Transformer # 1 real power
  - Transformer # 1 reactive power
  - Real power flow through 34.5 kV line feeder breaker 1
  - Reactive power flow through 34.5 kV line feeder breaker 1
  - Real power flow through 34.5 kV line feeder breaker 2
  - Reactive power flow through 34.5 kV line feeder breaker 2
  - Real power flow through 34.5 kV line feeder breaker 3
  - Reactive power flow through 34.5 kV line feeder breaker 3
  - Real power flow through 34.5 kV line feeder breaker 4
  - Reactive power flow through 34.5 kV line feeder breaker 4
  - Real power flow through 34.5 kV line feeder breaker 5
  - Reactive power flow through 34.5 kV line feeder breaker 5
  - Reactive power flow through 34.5 kV reactor breaker T1-R1
  - Reactive power flow through 34.5 kV capacitor breaker T1-C1
  - Transformer # 2 real power
  - Transformer # 2 reactive power

- o Real power flow through 34.5 kV line feeder breaker 6
- o Reactive power flow through 34.5 kV line feeder breaker 6
- o Real power flow through 34.5 kV line feeder breaker 7
- o Reactive power flow through 34.5 kV line feeder breaker 7
- o Real power flow through 34.5 kV line feeder breaker 8
- o Reactive power flow through 34.5 kV line feeder breaker 8
- o Real power flow through 34.5 kV line feeder breaker 9
- o Reactive power flow through 34.5 kV line feeder breaker 9
- o Reactive power flow through 34.5 kV reactor breaker T2-R1
- o Reactive power flow through 34.5 kV capacitor breaker T2-C1
- o A phase 230 kV transmission voltage
- o B phase 230 kV transmission voltage
- o C phase 230 kV transmission voltage
- o Average Wind speed
- o Average Plant Atmospheric Pressure (Bar)
- o Average Plant Temperature (Celsius)

Status:

- o 230 kV breaker T1
- o 34.5 kV collector circuit breaker 1
- o 34.5 kV collector circuit breaker 2
- o 34.5 kV collector circuit breaker 3
- o 34.5 kV collector circuit breaker 4
- o 34.5 kV collector circuit breaker 5
- o 34.5 kV reactor circuit breaker T1-R1
- o 34.5 kV capacitor circuit breaker T1-C1
- o 230 kV breaker T2
- o 34.5 kV collector circuit breaker 6
- o 34.5 kV collector circuit breaker 7
- o 34.5 kV collector circuit breaker 8
- o 34.5 kV collector circuit breaker 9
- o 34.5 kV reactor circuit breaker T2-R1
- o 34.5 kV capacitor circuit breaker T2-C1

- Provide separate graded, grounded and fenced areas along the perimeter of the Interconnection Customer collector substation for the Transmission Provider to install control building. The Transmission Provider’s control building will share a fence and ground grid with the Interconnection Customer's collector substation and have separate, unencumbered access for the Transmission Provider. Fencing, gates and road access shall meet Transmission Provider standards.

- Perform a CDEGS grounding analysis for the Transmission Provider control building site and provide the results to the Transmission Provider.
- Provide AC power to the Transmission Provider's control building for permanent power. Also, design and provide construction and backup retail service.
- Install fiber optic cable in conduit from the Interconnection Customer's data concentrator to the Transmission Provider's control building. The fiber will be terminated in the control building by the Transmission Provider.
- Install fiber optic cable in conduit from the Transmission Provider's control building to a splice box on the Interconnection Customer's transmission tie line. The fiber will be terminated in the control building by the Transmission Provider.
- Design, provide and install complete conduit and control cable from both sets of the Transmission Provider's metering instrument transformers to the Transmission Provider's control building.
- Provide Transmission Provider unfettered and maintained access to both sets of the Transmission Provider's metering instrument transformers.
- Procure and install disconnect switches on each side of each of the Transmission Provider's meters.
- Arrange for and provide permanent retail service for power that will flow from the Transmission Provider's system when the Project is not generating with the retail service provider in this area. This will require the retail service provider to obtain transmission service from the Transmission Provider. These arrangements must be in place prior to approval for backfeed.
- Provide any construction or backup retail service necessary for the Project.
- Procure or construct a Transmission Provider approved redundant communications path from the Transmission Provider's collector substation control building to the POI substation. This redundant path is required as a backup meter data source and must

be separate from the primary fiber optic cable being installed on the transmission tie line.

Transmission Provider to be Responsible For

- Provide the Interconnection Customer the designated point at which the voltage is to be maintained and the associated voltage schedule.
- Identify any necessary studies that the Interconnection Customer must participate in.
- Identify the values to be stored in the PMU.
- Procure and install a control building on the property prepared by the Interconnection Customer adjacent to the Interconnection Customer collector substation.
- Procure and install a backup DC battery system for the Transmission Provider control building.
- Procure and install a communications rack and associated communications equipment in the Transmission Provider's control building and terminate the fiber provided by the Interconnection Customer.
- Design, procure and install 230 kV revenue metering equipment on the high side of each of the Interconnection Customer power transformers including a metering panels, instrument transformers, primary and secondary revenue quality meters, test switches, junction boxes and secondary metering wire at each site.
- Establish an Ethernet connection for retail sales and generation accounting via the MV-90 translation system.

Interconnection Customer Tie Line Requirements

The following outlines the design, procurement, construction, installation, and ownership of equipment associated with the radial line connecting the Interconnection Customer's Generating Facility to the collector substation to be constructed as part of the Interconnection Request assigned queued position Q0707.

Interconnection Customer to be Responsible For

- Procure all necessary permits, property rights and/or the rights of way for the new transmission line between the Interconnection Customer's collector substation and the Q0707 collector substation. Interconnection Customer will be responsible for all required regulatory or compliance reporting associated with its transmission tie line facilities.

- Design, procure, construct, own and maintain the approximately 12 mile 230 kV transmission line between the Interconnection Customer's collector substation and the Q0707 collector substation.
- Design, procure, install, own and maintain Transmission Provider standard OPGW fiber optic cable and associated communications equipment from the Interconnection Customer collector substation to the Q0707 collector substation. One buffer tube with at least 12 fibers shall be provided to the Transmission Provider for its sole use.
- Provide and install fiber splices for the fiber running from both the Transmission Provider's collector substation control building and the POI substation fiber patch panel. The fiber shall be spliced to the Transmission Provider's sole use buffer tube.
- Design around and coordinate with the Transmission Provider regarding any crossings the Interconnection Customer's tie line will have with existing Transmission Provider facilities.

Transmission Provider to be Responsible For

- Coordinate with the Interconnection Customer regarding any crossings the Interconnection Customer's tie line will have with existing Transmission Provider transmission lines.
- Procure and install any required transmission structures to maintain necessary clearance should the Interconnection Customer's tie line cross existing Transmission Provider facilities and are unable to meet clearance requirements.

Q0707 Collector Substation Requirements

The following outlines the design, procurement, construction, installation, and ownership of equipment associated with the collector substation to be constructed as part of the Interconnection Request assigned queue positon Q0707.

Interconnection Customer to be Responsible For

- Procure any necessary agreements to allow the Project to utilize the Q0707 Interconnection Facilities.

- Install two sets of current transformers ("CT") from the Interconnection Customer tie line circuit breaker and provide the output to be fed into the Transmission Provider's POI substation bus differential relays with current transformer ratio matching the CT ratio of the breakers at the POI substation.
- Modify the design of the collector substation such that the expanded portion of the collector substation ground grid supporting the Project can be connected to the POI substation ground grid to support the installation of a Transmission Provider owned and maintained bus differential scheme. The Interconnect Customer is responsible to ensure the ground grid design supports safe step and touch potentials.
- Design, provide and install control cabling (number and size TBD) and hard wire the Interconnection Customer's source devices to the marshalling cabinet. Replicated values are not acceptable.
- Provide and install complete conduit system, as designed by Transmission Provider, from each Transmission Provider metering instrument transformer to the POI substation marshalling cabinet just inside the fence of the POI substation.
- Provide the following data points from the Q0707 collector substation via hardwire to the marshalling cabinet located in the POI substation:

  Analogs:
  - Collector substation Net Generation real power
  - Collector substation Net Generator reactive power
  - Collector substation Interchange energy register
  - Real power flow through 34.5 kV line feeder breaker 13
  - Reactive power flow through 34.5 kV line feeder breaker 13
  - Real power flow through 34.5 kV line feeder breaker 14
  - Reactive power flow through 34.5 kV line feeder breaker 14
  - Real power flow through 34.5 kV line feeder breaker 15
  - Reactive power flow through 34.5 kV line feeder breaker 15

  Status:
  - 230 kV tie line breaker

- o 34.5 kV collector circuit breaker 13
- o 34.5 kV collector circuit breaker 14
- o 34.5 kV collector circuit breaker 15
- Provide Transmission Provider unfettered and maintained access to all of the Transmission Provider's metering instrument transformers.

Transmission Provider to be Responsible For

- Procure, install, own and maintain 34.5 kV instrument transformers on the low side of the Interconnection Customer step up transformer 3 on circuits 13, 14 and 15. Please note that these circuit identification numbers are based on the most recent one line diagram provided to the Transmission Provider. These numbers could change based on the Interconnection Customer's final design.
- Design complete conduit and control cable from each Transmission Provider metering instrument transformers to the POI substation marshalling cabinet just inside the fence of the POI substation.
- Install metering control cable in metering conduit system installed by Interconnection Customer.

Point of Interconnection

The following outlines the design, procurement, construction, installation, and ownership of equipment at the POI.

Interconnection Customer to be Responsible For

- Design, procure, install, own and maintain ADSS fiber optic cable and associated equipment from Interconnection Customer's transmission tie line OPGW splice to POI substation control building as specified by Transmission Provider. This will require the installation of a 3" conduit from the tie line structure splice case to the POI substation fence. At the POI substation, the fiber will be terminated in a Transmission Provider owned and maintained rack. Testing and commissioning of this communication path between the Interconnection Customer's data concentrator device and the POI substation RTU will be the responsibility of the Interconnection Customer and coordinated with the Transmission Provider.

Transmission Provider to be Responsible For

- Design ADSS fiber optic conduit system from the POI substation control building to the OPGW splice. Interconnection Customer will provide and install ADSS from the Tie Line dead end to the POI substation control building.
- Modify existing relay elements to monitor under/over voltage and over/under frequency of the Generating Facility.
- Procure and install the necessary communication equipment to tie data being provided by the Interconnection Customer into the Transmission Provider’s communications network.
- Design, procure and install three sets of 34.5 kV revenue metering equipment to totalize Interconnection Customer circuits 13, 14 and 15 with the Interconnection Customer collector substation generation. This will require two revenue quality meters, test switches, metering panels, junction boxes and secondary metering wire for each circuit.
- Design, provide and install control cabling running from the three sets of instrument transformers installed in the Q0707 collector substation.
- If requested, install a metering cabinet on the exterior of the POI substation fence in order to provide a Modbus or DNP output from the bidirectional meters to the retail service provider. The Transmission Provider will install an underground communication wire from the POI substation control building to the meter panel.
- Establish an Ethernet connection for retail sales and generation accounting via the MV-90 translation system.

Other
The following outlines the design, procurement, construction, installation, and ownership of equipment past the POI.

Transmission Provider to be Responsible For

- Remedial Action Scheme
  - Make the necessary adjustments to the Aeolus RAS assumed to be developed as part of a prior queued project to add the Project. The Project will be tripped for various 500 kV outage scenarios associated with the Transmission Provider’s planned Gateway West and Gateway South

transmission lines. The RAS master controller will be installed in Aeolus substation. Primary communications to the Project will be on the existing fiber optic cable installed on the Aeolus-Shirley Basin #1 transmission line. The redundant communication will be on the fiber optic cable on the Aeolus-Shirley Basin #2 transmission line assumed to be constructed as part of the Q0707 project.

- Develop a new RAS to trip the Project offline for an outage of the Aeolus-Shirley Basin #2 transmission line.
- If necessary, present for approval any generator tripping/load reduction schemes to the WECC Remedial Action Scheme Reliability Subcommittee (“RASRS”).

- Redundant Communications
  - Install any necessary equipment to tie in the Interconnection Customer’s redundant communications link coming from the Interconnection Customer’s collector substation.

- System Operations Centers
  - Update databases for the inclusion of the Interconnection Customer and Transmission Provider Interconnection Facilities and Network Upgrades.

Exhibit 1 to Appendix C to LGIA

Facility Connection Requirements for Transmission Systems

(see attached)

INTERCONNECTION ASSIGNMENT AND ASSUMPTION AGREEMENT

THIS INTERCONNECTION ASSIGNMENT AND ASSUMPTION AGREEMENT (this "Assignment") is dated as of January 2, 2019, and is by and between **PACIFICORP**, an Oregon corporation, acting solely in its resource development capacity ("Assignee") and **INVENERGY WIND DEVELOPMENT LLC,** a Delaware limited liability company ("IWD"), **TB FLATS WIND ENERGY LLC**, a Delaware limited liability company ("TB Flats"), and **TB FLATS WIND ENERGY II LLC,** a Delaware limited liability company ("TB Flats II" and, together with IWD and TB Flats, collectively "Assignor"). Capitalized terms used herein and not defined shall have the same meanings when used herein as in the Purchase Agreement (as hereinafter defined).

RECITALS

WHEREAS, Assignor and Assignee have entered into that certain Development Transfer Agreement, dated as of June 30, 2017 (the "Purchase Agreement"), pursuant to which, among other terms, Assignor has agreed to assign to Assignee all of its right, title and interest in and to the following items as of the date hereof (each of which shall have the meaning ascribed to it in the Purchase Agreement): the interconnection rights described on Exhibit A hereto (collectively, the "Interconnection Assets");

WHEREAS, pursuant to the Purchase Agreement, Assignee shall assume all of the Assumed Liabilities (as defined in the Purchase Agreement) relating to the Interconnection Assets; and

WHEREAS, Assignor and Assignee desire to enter into this Assignment to effect such assignment and assumption.

AGREEMENT

NOW, THEREFORE, for good and valuable consideration, the receipt and sufficiency of which are hereby acknowledged, Assignor and Assignee agree as follows effective as of the Closing:

1. Pursuant to and in accordance with the terms of the Purchase Agreement, Assignor hereby assigns, transfers, sells and conveys to Assignee all of Assignor's right, title and interest in and to the Interconnection Assets, free and clear of all Liens other than Permitted Liens.

2. Pursuant to and in accordance with the terms of the Purchase Agreement, Assignee hereby assumes, and agrees to pay and perform or discharge when due, the Assumed Liabilities relating to the Interconnection Assets.

3. None of the Excluded Assets and none of the Excluded Liabilities are assigned or transferred by Assignor to, or assumed by, Assignee.

4. Unless required by Applicable Law or otherwise agreed to by the Parties after the date hereof, Assignor and Assignee hereby agree that this Assignment and Assumption Agreement shall not be recorded in the public records of any Governmental Entity.

5. This Assignment is intended to evidence the consummation of the transactions contemplated by the Purchase Agreement. This Assignment is made without representation or warranty except as expressly provided herein or as provided in and by the Purchase Agreement. This Assignment is in all respects subject to the provisions of the Purchase Agreement and is not intended in any way to supersede, limit, alter or qualify any obligation in or provision of the Purchase Agreement.

6. Assignor does hereby agree, from time to time as and when reasonably requested by Assignee, to execute and deliver (or cause to be executed and delivered) such documents or instruments and to take (or cause to be taken) such further or other actions, as may be reasonably necessary to carry out the purposes of this Assignment.

7. This Assignment shall be construed, interpreted and the rights of the parties hereto determined in accordance with the Laws of the State of New York without reference to its choice of law provisions.

8. This Agreement shall be binding upon and inure to the benefit of the parties hereto and their respective successors and permitted assigns. This Assignment may be executed in counterparts, each of which will be deemed to be an original and all of which together constitute one and the same instrument.

[SIGNATURE PAGES FOLLOW]

IN WITNESS WHEREOF, Assignor and Assignee have caused this Interconnection Assignment and Assumption Agreement to be duly executed by their respective representatives thereunto duly authorized, all as of the day and year first above written.

ASSIGNOR

Invenergy Wind Development LLC,
a Delaware limited liability company

By:______________________________
Name: James Williams
Title: Vice President

TB Flats Wind Energy LLC,
a Delaware limited liability company

By:______________________________
Name: James Williams
Title: Vice President

TB Flats Wind Energy II LLC,
a Delaware limited liability company

Title:
Date:

EXHIBIT A

TO INTERCONNECTION ASSIGNMENT AND ASSUMPTION AGREEMENT

Interconnection Rights

(a) Any and all of Assignor's rights, title and interest in connection with the tendered interconnection agreements for Q707 and Q708, including (i) any and all amounts deposited with the Transmission Provider by Transmission Customer and (ii) any and all refunds or credits due or owing from the Transmission Provider to Transmission Customer, now or hereafter, and related to the TB Flats I Project or the TB Flats II Project, other than reimbursements under the E&P Agreements (it being acknowledged by the parties that the assignment of the rights set forth in this clause (a) shall not relieve Assignee of its obligations pursuant to Section 7.12 or 9.3(iii) of the DTA);

(b) all rights and obligations under the Engineering and Procurement Agreement, dated September 14, 2018, between PacifiCorp (in its transmission capacity) and Invenergy Wind Development, LLC regarding Q707, and the Engineering and Procurement Agreement, dated September 14, 2018, between PacifiCorp (in its transmission capacity) and Invenergy Wind Development, LLC regarding Q70 (collectively, the "E&P Agreements"), other than the rights to reimbursement for payments made by or on behalf of Assignor thereunder prior to the Closing,

(c) any and all of the assignable rights and interests of Transmission Customer in the TB Flats I Project's and the TB Flats II Project's transmission interconnection queue position;

(d) the application for interconnection of the TB Flats I Project and the TB Flats II Project filed by Transmission Customer with the Transmission Provider;

(e) any studies, reports or other documents regarding the TB Flats I Project or the TB Flats II Project provided by the Transmission Provider or Transmission Owner;

(f) other rights with respect to the tendered interconnection agreements for Q707 and Q708 that the Transmission Customer may have with the Transmission Provider or Transmission Owner, and

(g) any and all other assignable rights relating to the interconnection of the TB Flats I Project or the TB Flats II Project to the transmission grid.

Capitalized terms used in this Exhibit A but not defined in the Purchase Agreement shall have the meanings given to them in the tendered interconnection agreements for Q707 and Q708.

TB Flats Permit Status Record

February 2020

TB Flats Wind Energy Project
Wyoming Industrial Siting Permit Conditions Compliance Tracking Table
Overall Permit Status
Wednesday, October 30, 2019

Item ID	Issuing Agency Permit Name	Permit	Details	Status	Open/ Closed
1	FAA	Notice of proposed Construction or Alteration	Receive Notice of Proposed Construction or Alternation (7460-1 Form)	Complete, form 7460-1 approvals were received for all WTG locations and alternative locations	Closed
2	USACE	Clean Water Act Section 404	Clean Water Act - Section 404 Nationwide or Individual Permit (if wetlands or waterways distubed)	Nation wide permti submitted on May 29, 2019	Closed
3	EPA	Spill Prevention Control and Countermeasure (SPCC) Plan	Pending final design, a SPCC will be filed for construction	5-Mar-19	Closed
4	USFWS	Eagle Conservation Plan - Voluntary Guidelines for wind energy projects		Ongoing, plan drafted and being updated. No actual permit issued. Work will continue through the Summary of 2019	Open
5		Bird and Bat Conservation Strategy		Ongoing, plan drafted and being updated. No actual permit issued. Work will continue through the Summary of 2019	Open
6	Department of Commerce - NTIA	Impact to Telecommunication Systems and RADAR's		Complete, NTIA on September 13, 2018 there was no objection to turbine consturction in the design area	Closed
7	FCC	Licensed Microwave Study		Complete	Closed
8	FEMA	Floodplain Considerations	FEMA Flood plan considierations	FEMA has no applicalbe maps; maps of river and creeks has been generated and been reviewed; Structures associated with the TB Flats wind energy project are placed above the 100 year incident mark	Closed
9	WYDEQ	Wyoming ISD Section 109	Wyoming Industrial Development Information and Siting Act, Section 109	Complete, ISD permit was issued on July 30, 2018.	Closed
10		Wyoming Pollutant Discharge Elimination System (WYPDES) - Large Construction Permit	Large Construction General Permit covers water discharges from construction greater than 5 acres.	SWPPP completed n April 10, 2019	Closed
11		Permit to Construction small wastewater facilities	A permit is required for the installation, repair or replacement of small wastewater systems, also known as septic tanks and leach fields. Septic systems that handle more than 2,000 gallons per day require a large capacity septic system permit, which are issued by the Underground Injection Control (UIC) Program.	Ongoing, PacifiCorp and its EPC contractor will be submitting a request for permit in early 2020.	Open
12		Temporary / Portable source air permit/ fugitive dust permit	Tempoarary / Portable source air permit and fugitive dust permit for the project site.	Burnett Quarry WYDEQ Air Quality Permit # CT-2899, we will also be using relocatable permit CT-7415 & RE-1032-2. TB Flats Batch PlantWYDEQ Air Quality Permit #s RE 9984 & RE-208	Closed
13		Mining/quarry permit (non-coal) for gravel quarry and constriction materials		See above	Closed
14		Wetland mitigation permit		Nationwide permit utilized	Closed
15	WSED	Temporary Water Use Agreement		Tempoary water agreement met with landowner	Closed
16		Permit to appropriate groundwater for well for operations & maintenance building		Water agreement met with Q Creek to supply the O&M building	Closed
17	WSHPO	Cultural resources and property review	Clutural resousrces and property review of both state and private property	Review completed March 30, 2019	Closed
18	WOSLI	Special Use lease for wind energy	Wind Energy Lease Agreement (WL-1603)	Complete, Wind Energy Lease executed on August 17, 2017	Closed
19	WYDOT	Port of Entry authorizations for oversized/overweight loads	Apply to the Wyoming Department of Transportation and Highway Patrol for Port of Energy Permission to move oversize/weight loads	Ongoing, Port of Enetry authorixation for oversize/overweight loads, will be obtained by PacifiCorp's WTG supplier prior to the 2020 delivery date	Open

20	WYDOT	Approach permit/Right of ways Access	Apply to the Wyoming Department of Transportation for relocation and right-of-way approval as needed to delivery WTG	Access permits granted on August 7, 2019	Closed
21		State Road Use Agreement	PacifiCorp will acquire a State of Wyoming Department of Transportation Road Use Agreement 30 days prior to construction	Closed, State Road Use Agreement executed on Febrary 22, 2019	Closed
22		*Conditional Use Permit*			
23		COA 2. Notice of material change to project, as needed	Conditional Use Permit is granted for up to 200 wind turbines and accessory uses as generally described in the application. The Applicant(s) shall notify the Carbon County Planning & Development Department in writing of any material changes to the Project subsequent to the County issuance of the Conditional Use Permit.	No action required unless material change is planned.	Open
24		COA 3 . Submit Copy of all Federal and State approvals	This permit is subject to final approval and issuance of a permit by the Industrial Siting Council. The Applicant(s) shall submit a copy of all subsequent Federal and State approvals, including all required studies, reports and certifications prior to the issue of any applicable building permits.	Closed, Submission made on March 25, 2019 and acceppted by Carbon County on April 1	Closed
25		COA 4-5-8. WTG & O&M building permit & Land owner approval & WTG Location	PacifiCorp's contractor will obtain building permits prior to construction	All permits received excluding the O&M building	Open
26		COA 12. Submit detail Site Map (90 days after operation)	To the extent not inconsistent with confidentiality and security obligations under State and\or Federal law, the Owner(s) or Operator(s) shall provide the Carbon County Planning and Development Department with a detailed map of the site within ninety (90) days after operation begins. The Project Map will include the geographic coordinates of each WECS structure, all roads within the WECS Project area, and public roads and turnouts connecting to roads of the WECS Project. The Project Map shall be updated by the Owner(s) or Operator(s) every five (5) years or after the completion of any significant additional construction.	Ongoing, will be submitted once construction is complete	Open
27		COA 13. Annual Proof of Insurance	The Owner(s) or Operator(s) of the WECS Project shall maintain a current General Liability Policy issued by an insurance company authorized to do business in Wyoming covering bodily injury and property damage with limits of at least $1 million per occurrence and $1 million in the aggregate. The Applicant(s) shall provide proof of insurance to the Board of County Commissioners prior to the Board's approval of the submitted application or otherwise demonstrate adequate self-insurance. If the application is approved, the Owner(s) or Operator(s) of the WECS shall provide proof of insurance to the Board annually. Proof of insurance may be made by providing a certificate of insurance	Closed, PacifiCorp submitted proof of insurancce on March 4, 2019	Closed
28		COA 15. PacifiCorp agreement to CUP provisions	No conditional use permit shall be transferred without the prior approval of the Board of County Commissioners. The Board's approval shall not be unreasonably withheld upon good cause shown. Any transferee shall agree in writing to be bound by the terms of the Conditional Use Permit. It is specifically understood and agreed that as of the date of the Carbon County Commission hearing on April 3rd, 2018, the Applicant intends to transfer this permit to PacifiCorp for construction, development, and operation of the Project. The Board hereby approves of such transfer, subject to PacifiCorp agreeing in writing to be bound by all of the terms of the Conditional Use Permit as the owner of the permit. This conditional use permit shall not have any additional transfers other than the aforementioned transfer under this paragraph 14 without the prior approval of the Board of County Commissioners.	Closed, PacifiCorp submitted assignment and agreement letter to Carbon County on January 10, 2019	Closed
29		COA 16. Initial 6 Month Status update and annual P&Z status report and appearance	Within six (6) months of the Board's approval, and on an annual basis thereafter until construction is completed, the permit holder shall provide a progress report of the WECS Project to the County Planning and Zoning Commission. The annual report\progress report shall include a written summary of Project's progress and include an appearance at a regularly scheduled County Planning and Zoning Commission meeting.	Ongoing, Construction Phase	Open
30		*Carbon County Road Use Agreement*			

31	Carbon County	4. Identify haul routes and courting roads to be used	The Company is hereby authorized to operate and move its commercial vehicles on all such Haul Routes and Roads, so long as such use is in accordance with this Agreement. The Haul Routes and County Roads utilized for project must be identified and approved in writing by the Carbon County Superindent of Road and Bridge prior to any construction. Attached hereto as Exhibit A is a list of the restrictions on the Company's use of the Haul Route Roads. The Company shall use commercially reasonable efforts to comply with the restrictions listed on Exhibit A. It is specifically understood and agreed that personal vehicles and other light-duty vehicles will not be bound by the restrictions of Exhibit A	Closed, on February 14, 2019 PacifiCorp notified Carbon County of its planned hual routes	Closed
32		6.a-b. Post security of $50,000 per mile	a) The County may require that the Company post security during construction for repairs that are required by paragraph 9(c) below, in an amount to be specified by the County. b) If the County requires that the Company post security, the Company shall not haul goods, equipment or materials on the Roads forming the Haul Route until: i. II has delivered to the County the security required (in the form of surety bond in the minimum amount of $50,000.00 (Fifty Thousand dollars per mile of affected Carbon County Roads); and ii. A Pre-Inspection pursuant to 7.1 has been completed.	Closed, PacifiCorp provided bonding on March 27, 2019 to Carbon County	Closed
33		7.1 Pre Construction Inspection (15 days before construction)	The Company and the County shall agree as to the condition of the Haul Route Roads both within fifteen (15) days prior to commencement of construction of the Wind power Facilities and within fifteen (15) days following completion of construction of the Wind power Facilities. Video recordings and photographs of the current conditions of the Haul Route Roads will be undertaken by the Company (or a third party hired by the Company), at the Company's expense and provided to the County for its review and retention (i) prior to the start of any construction activities by the Company, and (ii) following the Company's completion of construction of the Windpower Facilities. The County shall have the right, if so desired, (i) to observe these recordings/photographs as they are being taken and (ii) to require the Company to undertake certain types of recordings and photographs or reasonable additional inspections if the County reasonably believes the recordings/photographs are inadequate representations of the impacted roads current conditions.	Closed, Completed on April 15	Closed
34		7.1 Post Construction Inspection (15 after construction)	The Company and the County shall agree as to the condition of the Haul Route Roads both within fifteen (15) days prior to commencement of construction of the Wind power Facilities and within fifteen (15) days following completion of construction of the Wind power Facilities. Video recordings and photographs of the current conditions of the Haul Route Roads will be undertaken by the Company (or a third party hired by the Company), at the Company's expense and provided to the County for its review and retention (i) prior to the start of any construction activities by the Company, and (ii) following the Company's completion of construction of the Windpower Facilities. The County shall have the right, if so desired, (i) to observe these recordings/photographs as they are being taken and (ii) to require the Company to undertake certain types of recordings and photographs or reasonable additional inspections if the County reasonably believes the recordings/photographs are inadequate representations of the impacted roads current conditions.	Ongoing, post construction survey to be conducted	Open
35		11 Assignment	Except as otherwise provided herein, this Agreement shall not be assigned by either party hereto without the prior written consent of the other party, which consent shall not unreasonably be withheld.	Closed , Assignment approved on March 18, 2019 by Carbon County	Closed

Large Generator Interconnection Agreement Cedar Springs

February 2020

FIRST AMENDED AND RESTATED
STANDARD LARGE GENERATOR
INTERCONNECTION AGREEMENT (LGIA)
between
PACIFICORP
and
CEDAR SPRINGS WIND, LLC
CEDAR SPRINGS TRANSMISSION LLC
CEDAR SPRINGS WIND III, LLC

CEDAR SPRINGS 1

TABLE OF CONTENTS

STANDARD LARGE GENERATOR INTERCONNECTION AGREEMENT

THIS STANDARD LARGE GENERATOR INTERCONNECTION AGREEMENT ("Agreement") is made and entered into this ___ day of ____________, 20__ by and between Cedar Springs Wind, LLC, Cedar Springs Transmission LLC, and Cedar Springs Wind III, LLC, limited liability companies organized and existing under the laws of the State of Delaware (collectively referred to as the "Interconnection Customer") with a Large Generating Facility, and PacifiCorp a corporation organized and existing under the laws of the State of Oregon ("Transmission Provider and/or Transmission Owner"). Interconnection Customer and Transmission Provider each may be referred to as a "Party" or collectively as the "Parties."

Recitals

WHEREAS, Transmission Provider operates the Transmission System; and

WHEREAS, Interconnection Customer intends to own, lease and/or control and operate the Generating Facility identified as a Large Generating Facility in Appendix C to this Agreement; and,

WHEREAS, Interconnection Customer and Transmission Provider have agreed to enter into this Agreement for the purpose of interconnecting the Large Generating Facility with the Transmission System;

WHEREAS, Cedar Springs Wind, LLC, Cedar Springs Transmission LLC, and Cedar Springs Wind III, LLC agree to act as a single Interconnection Customer under this LGIA according to the terms of Appendix H of this LGIA.

NOW, THEREFORE, in consideration of and subject to the mutual covenants contained herein, it is agreed:

When used in this Standard Large Generator Interconnection Agreement, terms with initial capitalization that are not defined in Article 1 shall have the meanings specified in the Article in which they are used or the Open Access Transmission Tariff (Tariff).

Article 1. Definitions

Adverse System Impact shall mean the negative effects due to technical or operational limits on conductors or equipment being exceeded that may compromise the safety and reliability of the electric system.

Affected System shall mean an electric system other than the Transmission Provider's Transmission System that may be affected by the proposed interconnection.

Affected System Operator shall mean the entity that operates an Affected System.

Affiliate shall mean, with respect to a corporation, partnership or other entity, each such other corporation, partnership or other entity that directly or indirectly, through one or more intermediaries, controls, is controlled by, or is under common control with, such corporation, partnership or other entity.

Ancillary Services shall mean those services that are necessary to support the transmission of capacity and energy from resources to loads while maintaining reliable operation of the Transmission Provider's Transmission System in accordance with Good Utility Practice.

Applicable Laws and Regulations shall mean all duly promulgated applicable federal, state and local laws, regulations, rules, ordinances, codes, decrees, judgments, directives, or judicial or administrative orders, permits and other duly authorized actions of any Governmental Authority.

Applicable Reliability Council shall mean the reliability council applicable to the Transmission System to which the Generating Facility is directly interconnected.

Applicable Reliability Standards shall mean the requirements and guidelines of NERC, the Applicable Reliability Council, and the Control Area of the

Transmission System to which the Generating Facility is directly interconnected.

Base Case shall mean the base case power flow, short circuit, and stability data bases used for the Interconnection Studies by the Transmission Provider or Interconnection Customer.

Breach shall mean the failure of a Party to perform or observe any material term or condition of the Standard Large Generator Interconnection Agreement.

Breaching Party shall mean a Party that is in Breach of the Standard Large Generator Interconnection Agreement.

Business Day shall mean Monday through Friday, excluding Federal Holidays.

Calendar Day shall mean any day including Saturday, Sunday or a Federal Holiday.

Clustering shall mean the process whereby a group of Interconnection Requests is studied together, instead of serially, for the purpose of conducting the Interconnection System Impact Study.

Commercial Operation shall mean the status of a Generating Facility that has commenced generating electricity for sale, excluding electricity generated during Trial Operation.

Commercial Operation Date of a unit shall mean the date on which the Generating Facility commences Commercial Operation as agreed to by the Parties pursuant to Appendix E to the Standard Large Generator Interconnection Agreement.

Confidential Information shall mean any confidential, proprietary or trade secret information of a plan, specification, pattern, procedure, design, device, list, concept, policy or compilation relating to the present or planned business of a Party, which is designated as confidential by the Party supplying the information, whether conveyed orally, electronically, in writing, through inspection, or otherwise.

Control Area shall mean an electrical system or systems bounded by interconnection metering and telemetry, capable of controlling generation to maintain its interchange schedule with other Control Areas and contributing to frequency regulation of the interconnection. A Control Area must be certified by the Applicable Reliability Council.

Default shall mean the failure of a Breaching Party to cure its Breach in accordance with Article 17 of the Standard Large Generator Interconnection Agreement.

Dispute Resolution shall mean the procedure for resolution of a dispute between the Parties in which they will first attempt to resolve the dispute on an informal basis.

Distribution System shall mean the Transmission Provider's facilities and equipment used to transmit electricity to ultimate usage points such as homes and industries directly from nearby generators or from interchanges with higher voltage transmission networks which transport bulk power over longer distances. The voltage levels at which distribution systems operate differ among areas.

Distribution Upgrades shall mean the additions, modifications, and upgrades to the Transmission Provider's Distribution System at or beyond the Point of Interconnection to facilitate interconnection of the Generating Facility and render the transmission service necessary to effect Interconnection Customer's wholesale sale of electricity in interstate commerce. Distribution Upgrades do not include Interconnection Facilities.

Effective Date shall mean the date on which the Standard Large Generator Interconnection Agreement becomes effective upon execution by the Parties subject to acceptance by FERC, or if filed unexecuted, upon the date specified by FERC.

Emergency Condition shall mean a condition or situation: (1) that in the judgment of the Party making the claim is imminently likely to endanger life or property; or (2) that, in the case of a Transmission Provider, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to Transmission Provider's Transmission System, Transmission Provider's Interconnection Facilities or the electric systems of others to which the Transmission Provider's Transmission System is directly connected; or (3) that, in the case of Interconnection Customer, is imminently likely (as determined in a non-discriminatory manner) to cause a material adverse effect on the security of, or damage to, the Generating Facility or Interconnection Customer's Interconnection Facilities. System restoration and black start shall be considered Emergency Conditions; provided, that Interconnection Customer is not obligated by the Standard Large Generator Interconnection Agreement to possess black start capability.

Energy Resource Interconnection Service shall mean an Interconnection Service that allows the Interconnection Customer to connect its Generating Facility to the Transmission Provider's Transmission System to be eligible to deliver the Generating Facility's electric output using the existing firm or nonfirm capacity of the Transmission Provider's Transmission System on an as available basis. Energy Resource Interconnection Service in and of itself does not convey transmission service.

Engineering & Procurement (E&P) Agreement shall mean an agreement that authorizes the Transmission Provider to begin engineering and procurement of long lead-time items necessary for the establishment of the interconnection in order to advance the implementation of the Interconnection Request.

Environmental Law shall mean Applicable Laws or Regulations relating to pollution or protection of the environment or natural resources.

Federal Power Act shall mean the Federal Power Act, as amended, 16 U.S.C. §§ 791a et seq.

FERC shall mean the Federal Energy Regulatory Commission (Commission) or its successor.

Force Majeure shall mean any act of God, labor disturbance, act of the public enemy, war, insurrection, riot, fire, storm or flood, explosion, breakage or accident to machinery or equipment, any order, regulation or restriction imposed by governmental, military or lawfully established civilian authorities, or any other cause beyond a Party's control. A Force Majeure event does not include acts of negligence or intentional wrongdoing by the Party claiming Force Majeure.

Generating Facility shall mean Interconnection Customer's device for the production of electricity identified in the Interconnection Request, but shall not include the Interconnection Customer's Interconnection Facilities.

Generating Facility Capacity shall mean the net capacity of the Generating Facility and the aggregate net capacity of the Generating Facility where it includes multiple energy production devices.

Good Utility Practice shall mean any of the practices, methods and acts engaged in or approved by a significant portion of the electric industry during the relevant time period, or any of the practices, methods and acts which, in the exercise of reasonable judgment in light of the facts known at the time the decision was made, could have been expected to accomplish the desired result at a reasonable cost consistent with good business practices, reliability, safety and expedition. Good Utility Practice is not intended to be limited to the optimum practice, method, or act to the exclusion of all others, but rather to be acceptable practices, methods, or acts generally accepted in the region.

Governmental Authority shall mean any federal, state, local or other governmental regulatory or administrative agency, court, commission, department, board, or other governmental subdivision, legislature, rulemaking board, tribunal, or other governmental authority having jurisdiction over the Parties, their respective facilities, or the respective services they provide, and exercising or entitled to exercise any administrative, executive, police, or taxing authority or power; provided, however, that such term does not include Interconnection Customer, Transmission Provider, or any Affiliate thereof.

Hazardous Substances shall mean any chemicals, materials or substances defined as or included in the definition of "hazardous substances," "hazardous wastes," "hazardous materials," "hazardous constituents," "restricted hazardous materials," "extremely hazardous substances," "toxic substances," "radioactive substances," "contaminants," "pollutants," "toxic pollutants" or words of similar meaning and regulatory effect under any applicable Environmental Law, or any other chemical, material or substance, exposure to which is prohibited, limited or regulated by any applicable Environmental Law.

Initial Synchronization Date shall mean the date upon which the Generating Facility is initially synchronized and upon which Trial Operation begins.

In-Service Date shall mean the date upon which the Interconnection Customer reasonably expects it will be ready to begin use of the Transmission Provider's Interconnection Facilities to obtain back feed power.

Interconnection Customer shall mean any entity, including the Transmission Provider, Transmission Owner or any of the Affiliates or subsidiaries of either, that proposes to interconnect its Generating Facility with the Transmission Provider's Transmission System.

Interconnection Customer's Interconnection Facilities shall mean all facilities and equipment, as identified in Appendix A of the Standard Large Generator Interconnection Agreement, that are located between the Generating Facility and the Point of Change of Ownership, including any modification, addition, or upgrades to such facilities and equipment necessary to physically and electrically interconnect the Generating Facility to the Transmission Provider's Transmission System. Interconnection Customer's Interconnection Facilities are sole use facilities.
